Ms. Kirsten Walli
Board Secretary
Ontario Energy Board
PO Box 2319
2300 Yonge Street, 27th floor
Toronto, ON M4P 1E4

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges – Wireline Rate Interrogatory Responses – Confidentiality Request
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Pursuant to the OEB's Rules of Practice and Procedure and Practice Direction On Confidential Filings Toronto Hydro requests confidential treatment of the hourly labour rates included in its responses to interrogatories Carriers-12 part (e) and Carriers-14 part (i).

Toronto Hydro submits that this information is commercially sensitive and that its disclosure could interfere significantly in Toronto Hydro's negotiations with external contractors, as it may put upward pressure on contract prices. Such interference could result in a significant cost to the utility and, by extension, reduced value for rate payers. In addition, the utility notes that this information has not been previously disclosed in the public domain, and that it is consistently treated as confidential by Toronto Hydro.

Toronto Hydro notes in the Decision on Confidentiality and Procedural Order No. 4 (January 7, 2014), the OEB granted the utility's request to maintain in confidence the cost differences between internal and external construction of projects. The current request for confidentiality is analogous. Toronto Hydro respectfully submits that the information should therefore be kept confidential.

Please contact me if you have any questions.

Yours truly,

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting ("Custom IR") Application for 2015-2019 Electricity Distribution Rates and Charges – Confidentiality Request – OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Pursuant to Rule 10.01 of the OEB's Rules of Practice and Procedure, Toronto Hydro requests confidential treatment of the annual increases for labour and electrical design and construction contractors for the years 2015-2017, in its Supplemental Response to Technical Conference Undertaking J2.29-CUPE-9. This information relates to the cost differences between internal and external construction of projects. Confidential treatment of this type of information was previously granted by the OEB in this proceeding[1].

In addition, Toronto Hydro requests confidential treatment of certain portions of its updated evidence regarding the Copeland Transformer Station project (Exhibit 2B, Section E7.9). The redacted information pertains to commercially sensitive issues between Toronto Hydro and its general contractor on the project. Public disclosure of this information could interfere significantly with on-going dealings between the parties and could prejudice Toronto Hydro's legal position and its ability to resolve contract and performance related issues. Toronto Hydro respectfully submits that this information should be kept confidential.

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting ("Custom IR") Application for 2015-2019 Electricity Distribution Rates and Charges – Confidential Revisions - OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

On July 31, 2014, Toronto Hydro filed its 2015 – 2019 Custom IR Application, and requested confidential treatment of certain information in its pre-filed evidence.

Pursuant to Rule 11.03 of the OEB's Rules of Practice and Procedure, enclosed are revisions to the following Schedules over which the Toronto Hydro requests confidential treatment in its original filing on July 31, 2014. The revisions are marked DC and provided in blue paper:

- Exhibit 2B, Section E8.3, Appendix A;
- Exhibit 2B, Section E8.3, Appendix B;
- Exhibit 8, Tab 3, Schedule 2;
- Exhibit 8, Tab 3, Schedule 3; and
- Exhibit 9, Tab 3, Schedule 1.

Please do not hesitate to contact me if you have any questions.

Ms. Kirsten Walli
Board Secretary
Ontario Energy Board
PO Box 2319
2300 Yonge Street, 27th floor
Toronto, ON M4P 1E4

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges – Wireline Pole Attachments Update
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Pursuant to Rule 11.03 of the OEB's Rules of Practice and Procedure, enclosed are corrections and updates to the following Schedules, marked by OEB and provided in blue paper:

- Exhibit 3, Tab 2, Schedule 1, pages 1, 4, and 5;
- Exhibit 3, Tab 2, Schedule 2, Appendix 2-H;
- Exhibit 8, Tab 2, Schedule 1, page 2; and
- Exhibit 8, Tab 2, Schedule 1, Appendix B, page 1.

The enclosed updates reflect a reduction to the proposed wireline attachment rate, and corresponding revenue offset forecasts for 2015. The reduction is due to an adjustment to one of the inputs to the wireline cost model. More specifically, Toronto Hydro has adjusted the 2015 net book value of the assets that support wireline attachments to exclude the street lighting poles that it proposes to transfer into rate base in 2015, as these assets are generally not capital supporting wireline attachments.

The revenue requirement and bill impacts associated with the above-noted change are immaterial. Therefore, Toronto Hydro has not updated those parts of the evidence, but proposes to do so as part of the Draft Rate Order process, following the OEB's decision with respect to the proposed wireline rate.

Please do not hesitate to contact if you have any questions.

Yours truly,

2300 Yonge Street, 27th floor
Toronto, ON M4P 1E4

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited (³Toronto Hydro ´)
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges ±Wireline Pole Attachments Update
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board (³OEB ´) in respect of the above-noted matter.

3 X U V X D Q W W R 5 X O H Rules of Practice and Procedure, enclosed are updates to the following Schedules, marked by /C and provided in blue paper:

- Exhibit 3, Tab 2, Schedule 1, pages 1, 4, and 5;
- Exhibit 3, Tab 2, Schedule 2, Appendix 2-H;
- Exhibit 8, Tab 2, Schedule 1, page 2;
- Exhibit 8, Tab 2, Schedule 1, Appendix B, page 1, 2 and 4;
- Interrogatory Response to 8-OEB-100(a), pages 4-5 and 5-A;
- Interrogatory Response to WR-Carriers-7 part (c), page 2;
- Interrogatory Response to WR-Carriers-13 part (a), pages 3 to 7; and
- Interrogatory Response to WR-Carriers-15 part (a), pages 2 and 3.

The enclosed materials reflect the following updates to the proposed wireline attachment rate:

- **Administration Cost Methodology**. Upon a closer review of the record in the CCTA proceeding (RP-2003-0249), Toronto Hydro has adjusted its methodology for calculating the Administration Cost per pole to more closely align itself with the methodology used in that proceeding. In particular, Toronto Hydro had calculated Administration Cost per pole by dividing the total administration costs by the number of invoiced attachments, rather than by dividing the total administration costs by the number of poles, and further by the number of average attachers per pole. The updated Administration Cost per pole reflects this methodological change.
- **Administration Cost Inputs**. The Administration Costs per pole was also updated to exclude costs related to field inspectors in the Asset Attachment and Leases function because Toronto Hydro determined that these costs are recovered through other means (e.g., permit and make-ready fees, direct costing to specific projects such as the pole inspection program and other distribution projects).
- **Additional Site Visits for Pole Replacement** March 26, 2015, Toronto Hydro agreed that additional site visit costs for pole replacements with wireline attachments should be removed from the indirect Net Embedded Cost per Pole. These costs are directly attributable to the presence of wireline attachments on the pole, and therefore should be recovered as direct costs under Loss in Productivity. The updated Net Embedded Cost per pole and related Depreciation Expense reflects this change.

Please do not hesitate to contact me if you have any questions.

Ms. Kirsten Walli
Board Secretary
Ontario Energy Board
PO Box 2319
2300 Yonge Street, 27th floor
Toronto, ON M4P 1E4

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges – Wireline Pole Attachments Update
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Pursuant to Rule 11.03 of the OEB's Rules of Practice and Procedure, enclosed are updates to the following Schedules, marked by Attachment and provided in blue paper:

- Exhibit 3, Tab 2, Schedule 1, pages 1, 4, and 5;
- Exhibit 3, Tab 2, Schedule 2, Appendix 2-H;
- Exhibit 8, Tab 2, Schedule 1, page 2;
- Exhibit 8, Tab 2, Schedule 1, Appendix B, pages 1 and 5; and
- Interrogatory Response to 3-SIA-30 part (d).

The enclosed updates reflect two changes to the proposed wireline attachment rate that were identified by Toronto Hydro in the course of preparing responses to the interrogatories filed earlier today:

- The Pole Maintenance Expense was updated to address a discrepancy between the between the figures used to derive the Annualized Total OM Inspection and Treatment Program cost per pole and the amounts planned for the program in 2015. This change was identified in the response to interrogatory Carries-12(a).

- The Capital Carrying Cost was updated to reflect the proposed WACC rate of 6.19%. This change was identified in the response to interrogatory Carriers-16(b).

The revenue requirement and bill impacts associated with the above-noted changes are immaterial. Therefore, Toronto Hydro has not updated those parts of the evidence, but proposes to do so as part of the Draft Rate Order process, following the OEB's decision with respect to the proposed wireline rate.

Please do not hesitate to contact if you have any questions.

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges – Update re Monthly Billing and Regulatory Costs
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Pursuant to Rule 11.03 of the OEB's *Rules of Practice and Procedure*, Toronto Hydro is filing an evidentiary update to:

1. request a new deferral account for the costs and savings associated with the implementation of monthly billing, as outlined in the OEB's proposed DSC amendments issued on February 5, 2015; and
2. inform the OEB that the utility proposes to record the amortized regulatory costs, as described in Exhibit 4A, Tab 2, Schedule 17, in Account 1525.

Enclosed are updates to the following Schedules, marked by /C and provided in blue paper:

- Exhibit 1B, Tab 1, Schedule 1, pages 4-5;
- Exhibit 4A, Tab 2, Schedule 17, page 9;
- Exhibit 9, Tab 1, Schedule 1, pages 30-31; and
- Exhibit 9, Tab 1, Schedule 1, Appendix B, pages 4-5.

Toronto Hydro will provide electronic copies of the updated consolidated Application and Evidence to parties upon request.

Please do not hesitate to contact me if you have any questions.

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges – Updates and Corrections
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Toronto Hydro is filing an evidentiary update. The primary purpose of this update is to provide a revised forecast with respect to the Copeland Transformer Station ("TS") project schedule. More specifically, Toronto Hydro expects the construction of Copeland TS to be completed in the second quarter of 2016. The project's overall cost is expected to remain within the OEB-approved amount.

For a complete summary of the updates being filed, please refer to the enclosed table of revisions (Appendix A), which describes the original evidence, each revision to the evidence, and if the change was numerical, the difference between the original evidence and the revision(s).

Pursuant to Rule 11.03 of the OEB's Rules of Practice and Procedure, enclosed are corrections and updates to the following Schedules, marked by and provided in blue paper:

- Exhibit 1A, Tab 1, Schedule 1, Table of Contents/Index;
- Exhibit 1A, Tab 2, Schedule 1, pages 15-17, 20-21, and 24-26;
- Exhibit 1B, Tab 2, Schedule 3, pages 9 to 11 and 13;
- Exhibit 1B, Tab 2, Schedule 4, pages 4 and 6;

- Exhibit 1B, Tab 2, Schedule 4, Appendix C [previously filed in an incorrect exhibit];
- Exhibit 2A, Tab 1, Schedule 1, pages 1, 3-6, and 9-14;
- Exhibit 2A, Tab 1, Schedule 2, pages 1-2;
- Exhibit 2A, Tab 1, Schedule 2, Appendix A;

- Exhibit 2B, Section E7.9, pages 4-5, 11, 28, and 40-41 [redacted version];
- Exhibit 3, Tab 1, Schedule 1, page 1;
- Exhibit 3, Tab 1, Schedule 1, Appendices E-1, E-2 and E-3;
- Exhibit 4B, Tab 1, Schedule 1, Appendix A;
- Exhibit 4B, Tab 2, Schedule 1, page 1 and 5-6;
- Exhibit 4B, Tab 2, Schedule 2, pages 2-3, 12-13, 16-21 and 24-27 [Excel version of the model is also provided];
- Exhibit 6, Tab 1, Schedule 1, pages 1, and 3-4;
- Exhibit 6, Tab 1, Schedule 2;
- Exhibit 7, Tab 1, Schedule 1, pages 1 and 7;
- Exhibit 7, Tab 1, Schedule 2, pages 6-16 of required pages only [Excel version of the model is also provided];
- Exhibit 7, Tab 2, Schedule 1;
- Exhibit 8, Tab 1, Schedule 1, pages 2 and 4-6;
- Exhibit 8, Tab 1, Schedule 2;
- Exhibit 8, Tab 3, Schedule 2;
- Exhibit 8, Tab 3, Schedule 3;
- Exhibit 8, Tab 4, Schedule 1; and
- Exhibit 8, Tab 7, Schedule 1.

In addition, enclosed are the following new Schedules:

- Exhibit 1B, Tab 2, Schedule 5, Appendix C [previously filed as a confidential document];
- Exhibit 2B, Section B, Appendix D – IESO Letter of Comment; and
- Exhibit 2B, Section B, Appendix E – Planning Status Letter.

Toronto Hydro is also providing corrections to the following interrogatory and undertaking responses:

- Issue 2B, CCC Interrogatory 2-24 [corrected reference on line 19]
- Issue 2B, CCC Interrogatory 2-25 [corrected reference on line 12]
- Issue 2B, VECC Interrogatory 1-8 [corrected header]
- Issue 4A, SIA Interrogatory 3-9 [corrected reference on line 12]
- November 17, 2014 Technical Conference Undertaking Response to J1.2-EP-50, Appendix A; and
- November 18, 2014 Technical Conference Undertaking Response to J2.29-CUPE-9, Supplemental Response.

Please note that the enclosed evidentiary updates to Exhibit 2B, Section 7.9 and the Supplemental Response to Undertaking J2.29-CUPE-9 are redacted versions. Under separate cover, Toronto Hydro requests confidential treatment of these materials.

In advance of the Oral Hearing, Toronto Hydro will file electronic copies of consolidated versions of the Application and Evidence, Interrogatory Responses, and Undertaking Responses, and will send the parties electronic copies of the consolidated materials.

Please do not hesitate to contact me if you have any questions.

Yours truly,

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges – Updates and Corrections
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Pursuant to Rule 11.03 of the OEB's Rules of Practice and Procedure, enclosed are corrections and updates to the following Schedules, marked Copy 2 and provided in blue paper:

- x Exhibit 1A, Tab 2, Schedule 1, pages 13-14, 26 and 30;
- x Exhibit 1A, Tab 3, Schedule 1, page 6;
- x Exhibit 1B, Tab 2, Schedule 3, pages 9 to 11 and 13;
- x Exhibit 1B, Tab 2, Schedule 6, page 4;
- x Exhibit 1B, Tab 2, Schedule 7, pages 6 to 9;
- x Exhibit 2B, Section C, pages 4 and 4-A;
- x Exhibit 2B, Section D1, page 12;
- x Exhibit 3, Tab 1, Schedule 1, page 1;
- x Exhibit 3, Tab 1, Schedule 1, Appendices E-1, E-2 and E-3;
- x Exhibit 6, Tab 1, Schedule 1, pages 1, and 3-4;
- x Exhibit 6, Tab 1, Schedule 2;
- x Exhibit 7, Tab 1, Schedule 1, pages 1 and 7;
- x Exhibit 7, Tab 1, Schedule 2, pages 6-15; [excel version of the model is also enclosed]
- x Exhibit 7, Tab 2, Schedule 1;

- x Exhibit 8, Tab 1, Schedule 1, pages 2, 4-5 and 11-12;
- x Exhibit 8, Tab 1, Schedule 2;
- x Exhibit 8, Tab 3, Schedule 2;
- x Exhibit 8, Tab 3, Schedule 3;
- x Exhibit 8, Tab 4, Schedule 1;
- x Exhibit 8, Tab 5, Schedule 1;
- x Exhibit 8, Tab 7, Schedule 1;
- x Exhibit 9, Tab 1, Schedule 1 pages 3, 4A-6, 18-A, and 22-25;
- x Exhibit 9, Tab 2, Schedule 1; and
- x Exhibit 9, Tab 3, Schedule 1 (REDACTED).

In addition, enclosed are the following new Schedules:

- x Exhibit 1B, Tab 2, Schedule 7, Appendix D – Sample Key Account Presentation; and
- x Exhibit 9, Tab 1, Schedule 1, Appendix C – OEB Letter dated January 9, 2015 regarding the Audit of THESL's Deferral and Variance Accounts.

Along with these materials, Toronto Hydro has prepared a table of revisions (Appendix A) describing the original evidence, each revision to the evidence, and if the change was numerical, the difference between the original evidence and the revision(s).

Toronto Hydro is also providing an update to its response to interrogatory 4A-VECC-46 part (b), which was filed on November 5, 2014.

Please do not hesitate to contact if you have any questions.

Yours truly,

Ms. Kirsten Walli
Board Secretary
Ontario Energy Board
PO Box 2319
2300 Yonge Street, 27th floor
Toronto, ON M4P 1E4

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges –Evidence and Interrogatory Response Corrections
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Toronto Hydro filed Corrections to its Pre-filed Evidence on September 23, 2014 and November 14, 2014. Further to those corrections and pursuant to Rule 11.03 of the OEB's Rules of Practice and Procedure, enclosed are corrections to the following Schedules, marked by /C and provided in blue paper:

- x Exhibit 2A, Tab 10, Schedule 1, pages 1 and 2;
- x Exhibit 2A, Tab 10, Schedule 3;
- x Exhibit 4A, Tab 1, Schedule 2;
- x Exhibit 4A, Tab 1, Schedule 3;
- x Exhibit 4A, Tab 1, Schedule 4;
- x Exhibit 4A, Tab 2, Schedule 5;
- x Exhibit 4A, Tab 4, Schedule 3, pages 2 and 9
- x Exhibit 8, Tab 2, Schedule 1, pages 2 and 7; and
- x Exhibit 9, Tab 1, Schedule 1, Appendix B page 2, lines 22-23.

Along with these corrections, Toronto Hydro has prepared a table (Appendix A) describing the original evidence, each revision to the evidence, and if the change was numerical, the difference between the original evidence and the revision(s).

Toronto Hydro is also providing corrections to the following interrogatory responses which were filed on November 5, 2014:

- x 1B-SIA-2 Appendix A;
- x 1B-BOMA-72;
- x 2B-CUPE-3; and
- x 4A-Society-5 part (a).

Toronto Hydro has also identified two additional documents which are responsive to interrogatory 1B-SEC-8, and is filing these studies as Appendices N and O to that response.

In addition, Toronto Hydro is filing a redacted copy of the THC Business Plan which was originally filed in confidence, in its entirety, on November 14, 2014, as a Supplemental Response to interrogatory 1A-CCC-1. Toronto Hydro maintains its request for confidentiality over the redacted parts of the Business Plan, as set out in its Confidential Filing Letter dated November 14, 2014.

Please do not hesitate to contact me if you have any questions.

Yours truly,

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting Application for 2015-2019 Electricity Distribution Rates and Charges – Corrections and Supplemental Interrogatory Responses
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

Toronto Hydro filed Corrections to its Pre-filed Evidence on September 23, 2014. Further to those corrections and pursuant to Rule 11.03 of the OEB's Rules of Practice and Procedure, enclosed are corrections to the following Schedules, marked "C" and provided in blue paper:

- Exhibit 3A ,Tab 2, Schedule 1, pages 1 and 4;
- Exhibit 3A, Tab 2, Schedule 2; and
- Exhibit 4A, Tab 4, Schedule 2.

Along with these corrections, Toronto Hydro has prepared a table (Appendix A) describing the original evidence, each revision to the evidence, and if the change was numerical, the difference between the original evidence and the revision(s).

Toronto Hydro is also providing its response to interrogatory 1A-VECC-1, and corrections to the following interrogatories:

- 4A-Society-4, Appendix A;
- 4A-SIA-32, Appendix A; and
- 4A-VECC-48, Appendix A.

In addition, Toronto Hydro is filing a supplemental response to interrogatory 1A-CCC-1. Under separate cover, Toronto Hydro requests that this supplemental response be treated confidentially, pursuant to the OEB's Rules of Practice and Procedure and the OEB's Practice Direction on Confidential Filings.

Please do not hesitate to contact me if you have any questions.

September 23, 2014

via RESS e-filing – signed original to follow by courier

Ms. Kirsten Walli
Board Secretary
Ontario Energy Board
PO Box 2319
2300 Yonge Street, 27th floor
Toronto, ON M4P 1E4

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited ("Toronto Hydro")
Custom Incentive Rate-setting ("Custom IR") Application for 2015-2019 Electricity Distribution Rates and Charges – Revisions
OEB File No. EB-2014-0116

Toronto Hydro writes to the Ontario Energy Board ("OEB") in respect of the above-noted matter.

On July 31, 2014, Toronto Hydro filed its 2015 – 2019 Custom IR Application (the "Application"). In the accompanying cover letter, Toronto Hydro advised the OEB that it had identified a number of small changes to be made to the pre-filed evidence, and proposed to file an update in the fall. Further to the July 31, 2014 cover letter, enclosed are revisions to the Application.

The nature of the enclosed evidentiary updates is largely administrative. The majority of updates consist of minor revisions that were necessary to align the underlying financial information with the requested relief, or minor corrections to numerical and narrative evidence. As an example, Toronto Hydro updated its revenue requirement calculations to align with changes to the revenue offset forecasts.

Toronto Hydro confirms that the enclosed updates do not have a material effect on the Application. As a result of the changes, Toronto Hydro's requested revenue requirement for 2015 has decreased by approximately $10 million. From a rates perspective, the combined effect of the enclosed updates is a reduction for most rate classes. For an average residential customer, the reduction is approximately $0.60 in the monthly bill for 2015 and $1.40 by 2019. On average, for each of the next five years (2015-2019), the bill impacts associated with the Application (including all of the proposed rate riders) have decreased from approximately $3.54 to approximately $3.25 per month for residential customers.

For ease of reference, and pursuant to Rule 11.03 of the OEB's Rules of Practice and Procedure, all revisions have been marked by "/C" and are being provided in blue paper. In addition, Toronto Hydro has prepared a table (Appendix A) describing the original evidence, each revision to the evidence, and if the change was numerical, the difference between the original evidence and the revision(s).

Please do not hesitate to contact me if you have any questions.

Yours truly,

July 31st, 2014

via RESS e-filing ±signed original to follow by courier

Ms. Kirsten Walli
Board Secretary
Ontario Energy Board
PO Box 2319
2300 Yonge Street, 27th floor
Toronto, ON M4P 1E4

Dear Ms. Walli:

Re: Toronto Hydro-Electric System Limited
Custom Incentive Rate-Setting Application for 2015 ±2019 Electricity Distribution Rates and Charges
OEB File No. EB-2014-0116

Toronto Hydro writes to inform the Board of the above-noted matter.

Please find enclosed an electronic Custom IR Application for 2015 ±2019 Electricity Distribution Rates and Charges. Two physical copies of the Application will follow shortly via courier.

While Toronto Hydro has aligned this Application with the 2015 Filing Requirements[1] was prepared under the 2013 Custom IR Filing Requirements and contains elements. As the Application addresses a five-year period of significant activity, Toronto Hydro requests that the Board convene an Evidence Conference and Settlement Conference preceding the technical conference. The evidence conference would be an opportunity for Toronto Hydro witnesses to provide OEB panel members and other parties with an overview of the central, custom components of the Application. Toronto Hydro proposes that testimony given at the evidence conference would be transcribed and form part of the record of the proceeding. It is hope that this procedural step will help clarify its requests and proposals, ultimately expediting and simplifying subsequent stages of the proceeding.

While finalizing the Application, Toronto Hydro has identified a small number of inconsistencies between the financial information and the relief requested in the Application. For example, Toronto Hydro has requested approval of changes to its specific service charges, resulting in increased revenue offsets. However, the corresponding decrease in revenue requirement is not reflected in the evidence as-filed. Toronto Hydro proposes to update the evidence in the normal course, by the early fall. While

[1] Alignment with the Renewed Regulatory Framework for Electricity Distributors and the Filing Requirements is discussed in detail in Exhibit 1B, Tab 2, Schedule 2.

Toronto Hydro is in the process of addressing these inconsistencies, it does not currently expect that any will have a material effect on the Application.

Toronto Hydro encloses live Excel versions of the following documents:

- PILs model for Bridge and Test Years (Exhibit 4B, Tab 2, Schedule 2)
- Revenue Requirement Workform Model for 2015 Filers (Exhibit 6, Tab 1, Schedule 2)
- Cost Allocation Model (Exhibit 7, Tab 1, Schedule 2)
- Retail Transmission Service Rates Model (Exhibit 8, Tab 6, Schedule 1)
- Fixed Asset Continuity Schedule (Exhibit 2A, Tab 1, Schedule 2)
- Capital Expenditures Summary (Exhibit 2A, Tab 6, Schedule 3)
- Deferral and Variance Accounts Continuity Schedules (Exhibit 9, Tab 2, Schedule 1)

A small number of documents within the Application contain confidential information. Under separate cover, Toronto Hydro requests that this information be treated confidentially in accordance with the *Rules of Practice and Procedure* and *Practice Direction on Confidential Filings*.

Please do not hesitate to contact me if you have any questions.

Yours truly,

Appendix A: Table of Revisions (January 15, 2015), Toronto Hydro 2015-2019 Custom IR Application, OEB File No. EB-2014-0116

Original Evidence (as originally filed or subsequently updated)	Revised Evidence (Filed January 15, 2015)	Numerical Differences
Executive Summary (Exhibit 1A, Tab 2, Schedule 1)	Section 3.3.1: Updated to clarify Innovative Group's customer engagement work. Section 3.3.2: Updated to include a brief summary of storm related operational changes and investments that have been undertaken or that are planned to be undertaken over the CIR period. Section 4.4 . Updated the Bill Impacts Summary Table, to correspond with the updated Revenue Requirement (Exhibit 6) and Cost Allocation Model (Exhibit 7). Section 4.9 Updated the total net DVA balances proposed for disposal from $60.4M to $53.7M to reflect the removal and addition of DVA riders as described below (Exhibit 9, Tab 1, Schedule 1).	Due to the size of the Bill Impacts table, the numerical differences cannot be summarized for the purposes of this table. Please refer to updated schedule.
Administrative Information (Exhibit 1A, Tab 3, Schedule 1)	Updated section 8 to refer to evidence (namely Exhibit 8, Tab 5, Schedule 1 and Exhibit 9, Tab 1, Schedule 1) regarding Toronto Hydro's previous undertaking to evaluate options to measure or estimate actual line losses and the impacts on Account 1588 balances.	N/A

1. FOREWORD AND INTRODUCTION

This custom incentive rate application covers the next five years (2015-2019) for Toronto Hydro-Electric System Limited ("Toronto Hydro"), and touches on all aspects of what the utility needs in order to serve its customers effectively and efficiently, and ensure a safe and reliable source of electricity for the dynamic and complex urban environment that is the City of Toronto.

This application represents a five-year commitment by the utility at a crucial period in its history. Investments are required now in order to address aging infrastructure, ensure a safe and reliable source of electricity and acceptable customer service levels – during the next five years and in the future.

In Toronto Hydro's last Incremental Capital Module ("ICM") rate application, the Ontario Energy Board ("OEB") approved funding for a substantial capital work program, and the method of performing that work program.[1] This application builds on that foundation. Toronto Hydro has identified the system requirements based on prevailing engineering and utility practice, and has developed detailed and coordinated plans to deliver the program.

The proposals within this application are interdependent. They are the result of a planning approach in which the utility considered, among other things, operational and system needs, customer preferences, productivity, value-for-money and rate impacts.

[1] EB-2012-0064, Partial Decision and Order (April 2, 2013).

Much of Toronto Hydro ¶ proposed work has been reviewed and validated by external experts. Toronto Hydro has filed over a dozen third party reports in this application.

Toronto Hydro has also reached out to its customers in an unprecedented manner. The utility surveyed its customers on its plans. It learned that the majority of those customers accept the need for timely renewal of the distribution system, while acknowledging that this will mean an increase in their monthly bills.

And while Toronto Hydro ¶ engineers consider that an overall program larger than that represented in this application is optimal, the utility has chosen to restrain and constrain its work to achieve the pace and rate impacts that fall within a tolerable range.

Toronto Hydro has been an efficient organization. Through this application, it will continue that history of productivity, and share those benefits with ratepayers.

Finally, this application has been prepared in a manner that is consistent with the OEB ¶ guidance as expressed in its Renewed Regulatory Framework for Electricity Distributors policy (³RRFE ´).

In this Executive Summary, Toronto Hydro sets out the context in which it operates, its approach to this application, and a summary of key application details. References to evidence in the application where further details can be located are provided throughout.

2. ABOUT TORONTO HYDRO FACTS AND CONTEXT

Toronto Hydro is an electricity distributor licensed by the OEB to provide electricity to the City of Toronto, in accordance with its Distribution Licence.[2] In 2013, Toronto Hydro distributed 24.4 terawatt-hours of electricity representing approximately 18 percent of the electricity consumed in the province of Ontario, and served a peak demand of 4,914 megawatts. Toronto Hydro distributes electricity at voltages up to 27.6kV, and the utility ¶ asset base includes approximately 175,000 poles, 60,600 distribution transformers, 15,000 kilometres of overhead wires, 11,200 kilometres of underground wires, 16,000 primary switches and 167 municipal substations.

For more information about Toronto Hydro ¶ distribution system, please refer to Exhibit 1C, Tab 1, Schedules 1 and 2; and Exhibit 2B, Section D2.

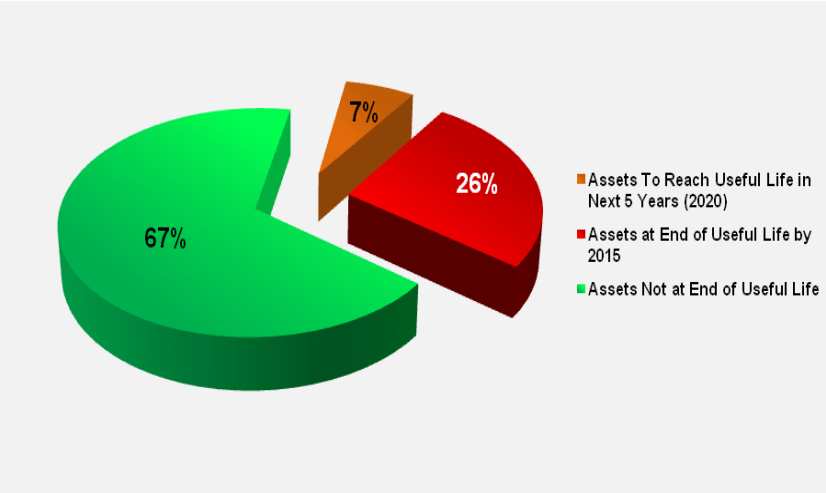
Toronto Hydro is the successor to the six former hydro-electric commissions of the municipalities which amalgamated on January 1, 1998 to form the City of Toronto. The utility is a wholly-owned subsidiary of Toronto Hydro Corporation (THC), whose sole shareholder is the City of Toronto.

To learn more about Toronto Hydro ¶ Corporate Structure and Governance, please refer to Exhibit 1C, Tab 2, Schedule 1.

[2] ED-2002-0497.

2.1 Toronto Hydro ¶s Customers

Toronto Hydro serves approximately 730,000 customer accounts, ranging from individual residential consumers up to large industrial and commercial businesses. In addition, Toronto is home to the country ¶ largest banks, stock exchanges and other large customers that are sensitive to service interruptions. The utility powers non-residential customers from a wide variety of sectors, including: approximately 360 hospitals and healthcare facility accounts, 690 school accounts, 140 colleges and universities accounts, plus data centers as well as large industrial and manufacturing facilities. Toronto Hydro also supplies electricity to Ontario ¶ Provincial Legislature and Ministries, as well as Toronto ¶ municipal government. The utility also has over 2,900 high-rise multi-residential condominium and apartment buildings accounts, many of which are bulk-metered. Taking these behind-the-meter customers into account, Toronto Hydro ¶ effective customer base exceeds one million customers.



To learn more about the breadth and diversity of Toronto Hydro ¶ customer base, please refer to Exhibit 1B, Tab 2, Schedule 7.

2.2 Challenges Faced by the Utility

Toronto Hydro operates in a mature, congested urban environment. In undertaking its capital and maintenance work, the utility must contend with complexities including the intensification of development (like condominium complexes, the Pan-Am Games, and waterfront redevelopment), limited space for utility equipment installation, over a century of previous construction by various agencies often with missing or inaccurate historical records, and coordination with other City and utility reconstruction programs. Toronto ¶ densely populated downtown core, served by a complex arrangement of equipment

including a secondary network system, is unique in its span and configuration in Ontario ¶ distribution sector.

Toronto Hydro ¶ distribution system includes a large and growing backlog of assets that are operating beyond their expected useful lives ± an estimated 26% by 2015. If the utility were to invest in a minimal and reactive way (i.e., run-to-failure), this number is forecast to reach 32% by 2020 and reliability would likely deteriorate.[3] Toronto Hydro ¶ system also faces pressures from economic (system load) growth and capacity constraints. This results in part from large-scale projects in Toronto such as transit projects, and increased proliferation of distributed generation. Changes in climate and extreme weather also put additional strain on the distribution system.

In addition, approximately 50% of Toronto Hydro ¶ workforce is projected to retire over the next decade, and 25% during the next five years. Of that 25%,

[3] Toronto Hydro projects that a run-to-failure approach would result in SAIFI (System Average Interruption Frequency Index) worsening by approximately 30% and SAIDI (System Average Interruption Duration Index) worsening by approximately 24% from 2015-2019.

approximately half are from key segments (certified and skilled trades, designated and technical professionals, and supervisory positions). These personnel are critical to maintaining and operating the distribution system in a safe and efficient manner, and new personnel for these positions take up to six years to train.

These are among several of the realities that drive Toronto Hydro ¶s costs. To learn more about these challenges and other cost drivers, please refer to Exhibit 1B, Tab 2, Schedules 3-5; Exhibit 2B, and Exhibit 4A.

2.3 Toronto Hydro ¶s Corporate Strategy

The utility ¶s strategic vision is to continuously maximize customers ¶and stakeholders ¶ satisfaction by operating in a safe, reliable and environmentally responsible manner at optimal costs. To realize this vision, Toronto Hydro employs a framework consisting of four strategic pillars:

1. ***Customer Service***: deliver value-for-money to Toronto Hydro ¶s customers, including making it easier for them to work with the utility, helping them conserve energy and providing them with tools and technology;
2. ***Operations***: improve reliability through optimal and sustainable system management, including keeping the system safe, building a grid that supports a modern city and maintaining productivity;
3. ***People***: fully-engaged, safe and healthy workforce, that meets the changing business environment; and
4. ***Financial Strength***: meet financial objectives including obtaining a fair return.

These strategic pillars guide the establishment of the utility ¶ goals and business plans, and focus the organization. Toronto Hydro uses a comprehensive framework of Key Performance Indicators (³KPIs ´) and a balanced scorecard approach to track the implementation and execution of its plans against its strategic goals.

These pillars, and Toronto Hydro ¶ approach to business planning, execution and performance measurement, are well-aligned with the OEB ¶ performance outcomes described in the RRFE: Customer Focus, Operational Effectiveness, Public Policy Responsiveness and Financial Performance (together the ³RRFE Outcomes ´).

For more information, please refer to Exhibit 1C, Tab 3, Schedules 1 and 2.

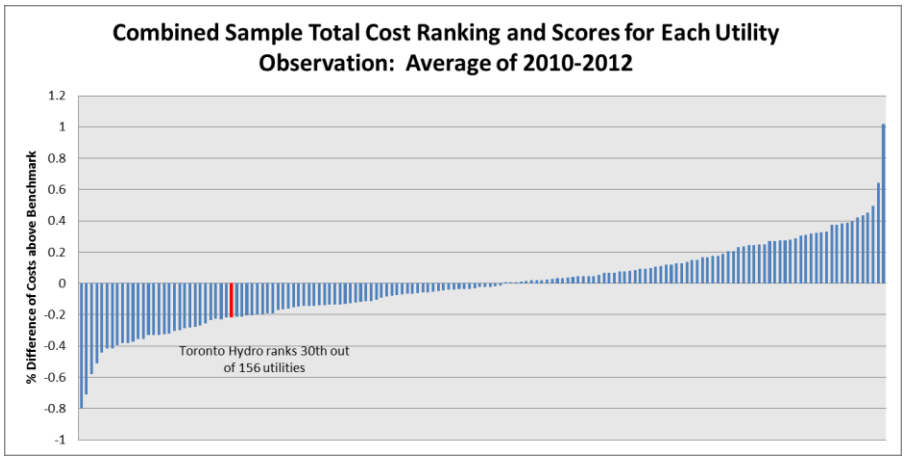
3. APPROACH TO THIS APPLICATION

3.1 Planning for the Next Five years

Toronto Hydro ¶ approach to the planning that underlies this application entailed: (a) developing a proposed capital program that balances the needs of the distribution system with a level of rate increases that customers accept; and (b) building an Operations, Maintenance & Administration (³OM&A ´) plan that, following rebasing, requires the utility to operate with funding that is less than inflation for non-capital expenditures.

Consistent with its Strategic Pillars and the RRFE Outcomes, Toronto Hydro ¶ proposals and plans were informed by a number of operational needs such as asset investment requirements, maintenance requirements, staffing requirements and legislative and regulatory obligations. The plans are also informed by other important considerations such as customer needs and preferences (including service levels and consumption-management tools), rate impacts, value-for-money, productivity, and maintaining the financial health and viability of the utility.

To this end, for both capital and OM&A expenditures, Toronto Hydro did not put forward all possible and reasonable funding requests that would represent what the utility may believe is operationally optimal or required. For example, while Toronto Hydro views that a capital investment approach well above $500 million per year over the 2015-2019 period is optimal from an assets-needs perspective, in light of rate impacts and execution logistics, it has constrained its actual plan (and corresponding funding request to the OEB) to approximately $500 million per year over the 2015-2019 period. Toronto Hydro believes that a capital plan of this magnitude fairly balances system requirements with the needs of current and future customers.



To learn more about the details of Toronto Hydro ¶ approach to business and financial planning, as well as its specific approaches to building the capital and OM&A proposals contained within this application, please see Exhibit 1B, Tab 2, Schedule 3; Exhibit 1B, Tab 2, Schedule7; Exhibit 1C, Tab 3, Schedule 2; Exhibit 2B; and Exhibit 4A.

3.2 Productivity And Performance

Toronto Hydro ¶ commitment to productivity and performance is embodied within its strategic pillars. Toronto Hydro has a long-standing productivity culture which has evolved over time in line with operating challenges, changes in government policy, and expectations that underlie the regulatory regimes that govern the utility ¶ operations. Toronto Hydro assesses that since amalgamation in 1998, its productivity efforts have resulted in significant savings for ratepayers.

The utility ¶ commitment to productivity and performance are embedded throughout its plans and proposals in this application. For example, Toronto Hydro has developed a ratemaking framework for this application, which by its nature provides incentives for the utility to seek out further productivity and efficiency improvements over the 2015-2019 timeframe and beyond. This framework also requires the utility to *share the benefits* of these improvements with its customers. Further, and in addition to the OEB Scorecard to measure performance, the utility has proposed a framework of capital performance metrics to facilitate the continuous improvement in the efficiency of capital planning and execution. Finally, the plans and proposals that Toronto Hydro has put forward in this application focus on delivering value-for-money to its customers.

Among other reasons, Toronto Hydro ¶ commitment to productivity and performance makes it a strong cost performer in comparison to other utilities. A third party total cost econometric benchmarking report concludes that the utility is below expected reasonable costs, and ranks Toronto Hydro ¶ total cost performance in the top quartile ±30th out of 156 Ontario and U.S. utilities.

To learn more about Toronto Hydro ¶ commitment and approach to productivity and performance, please refer to Exhibit 1B, Tab 2, Schedule 5 (including Appendixes A and B); Exhibit 2B, Section C; and Exhibit 4A.

3.3 Customers

Toronto Hydro ¶ commitment to its customers is embodied within its strategic pillars. On average, Toronto Hydro receives approximately 100,000 written enquiries and nearly 600,000 telephone calls a year. Toronto Hydro seeks to provide customer satisfaction and improve the customer experience: overall, the utility performs well against the OEB ¶ customer service quality indicators. Further, the utility consistently seeks opportunities to meaningfully engage with its customers, expand the range and quality of service that it provides, and integrate new technological tools and solutions to improve service levels and find efficiencies.

3.3.1 Engagement on Capital Plans

Toronto Hydro serves a broad and diverse customer base, with which it engages on a regular basis through ordinary-course interactions. In addition to these ordinary-course interactions, it reached out to its most populous rate classes, the residential and small general service customers, through Innovative Research Group, regarding the utility's capital plans for 2015-2019 (Exhibit 1B, Tab 2, Schedule 7, Appendix B). The results of this exercise provided Toronto Hydro valuable insight into these customers' perceptions of the utility's priorities. Among other things, Toronto Hydro learned that customers' preferences align with the central pillars of the utility's capital plan. And while these customers reasonably expect that the utility will make prudent investment decisions, the majority accept the need for timely renewal of the distribution system, while acknowledging that this will mean an increase in their monthly bills.

/C

3.3.2 Emergency and Extreme Weather Response

Recent extreme weather events such as the July 2013 flood and the December 2013 ice storm have had significant effects on Toronto Hydro's customers, and drive Toronto Hydro to continue to emphasize plans and programs that facilitate and improve its system resiliency, and ability to respond to these events.

At the core of the utility's emergency operations framework lies the Emergency Response Program, which provides an around-the-clock response to any urgent and

/C

unplanned events in Toronto's dense urban environment 365 days a year.[4] Moreover, to enhance the utility's operations during sustained and large-scale emergency events, Toronto Hydro is proposing a new Disaster Preparedness Management program (Exhibit 4A, Tab 2, Schedule 4) that aims to establish industry best practices for the planning, communication and coordination of work prior to, during and after major events across the utility and in relation to customers and key stakeholders.[5] Beyond the introduction of new communication and decision-making frameworks, the proposed program seeks to expand emergency training for Toronto Hydro's employees and facilitate the negotiation of Mutual Aid agreements with utilities that operate systems similar to Toronto's.

Toronto Hydro has also received valuable feedback from its customers regarding their experiences of communicating with the utility during the 2013 ice storm, and has implemented a number of key enhancements to its emergency communications systems. These include:

- An expanded Interactive Voice Response (IVR) capability to ensure that Toronto Hydro customers can successfully reach the utility to report an outage during emergencies when call volumes significantly exceed the typical levels.

- A new mobile-friendly website OutageTO.com, available in eight languages. The website consolidates all outage-related content in a single location, including detailed and frequent alerts through a variety of platforms, safety tips for customers without power, and a capability for customers to report new outages.

/C

[4] Exhibit 4A, Tab 2, Schedule 3
[5] Exhibit 4A, Tab 2, Schedule 4

- Planned enhancements to the 311 Toronto website and customer contact centre, to simplify customers' ability to reach the utility through the 311 platform to report outages and obtain relevant information.

In addition to recently implemented and planned operational enhancements, Toronto Hydro's application includes a number of capital investments and maintenance activities that can be expected to improve system performance against extreme weather, in addition to addressing their respective primary drivers. These include:

- Overhead Infrastructure Relocation (Trigger Driver – Functional Obsolescence);[6]
- Rear Lot Conversion (Trigger Driver – Functional Obsolescence);[7]
- Box Construction Conversion (Trigger Driver – Functional Obsolescence);[8]
- Feeder Automation (Trigger Driver – System Efficiency);[9]
- Contingency Enhancement (Trigger Driver – Reliability);[10]
- Downtown Contingency (Trigger Driver – Reliability);[11]
- Design Enhancement (Trigger Driver: Reliability); and[12]
- Vegetation Management (Trigger Driver – Reliability).[13]

Over the 2015-2019 timeframe, the utility anticipates taking further steps to enhance its storm-related operational practices and capabilities, including an upgrade of its Outage Management System, enhancements to the damage assessment activities and outage

restoration time estimation practices, and other improvements recommended by the report of the independent panel that reviewed Toronto Hydro's performance during the 2013 ice storm.[14] /C

To learn more about Toronto Hydro's customer focus, engagement, and relevant plans and proposals, please see Exhibit 1B, Tab 2, Schedule 7; Exhibit 2B; and Exhibit 4A.

3.4 Consideration of OEB Guidance and Rate Setting

Toronto Hydro approached this application from the perspective of alignment with policy guidance provided by the OEB. This includes the form of the rate-setting mechanism, the RRFE Outcomes, as well as the scope and nature of the evidence the utility filed regarding productivity, capital planning, customer engagement and operational expenditures. In addition to aligning with policy direction, Toronto Hydro believes that its approach aids in the utility's application being more accessible to the OEB, intervenors and the public.

Toronto Hydro has proposed a rate-setting framework that constrains operational funding increases to less than inflation after rebasing. This approach reconciles the utility's need for significant multi-year capital investment with a level of rate increases that its customers are willing to accept. The framework is based on a forward test year for 2015, and a custom Price Cap Index ("PCI") for 2016 through 2019.

To learn more about how Toronto Hydro's application aligns with the OEB policy guidance and the utility's approach to rate making, please refer to Exhibit 1B, Tab 2, Schedules 2 and 3.

[14] Exhibit 4A, Tab 2, Schedule 4, Appendix A.

4.SUMMARY OF KEY DETAILS OF THE APPLICATION

4.1 Capital Expenditures And Rate Base

4.1.1Capital Expenditures

The nature and amount of capital spending in this application builds on the foundation that the OEB accepted in Toronto Hydro's 2012-2014 ICM application.[15] The majority of the capital programs are continuations of the work programs the OEB approved in the ICM application. New programs are driven by public policy responsiveness, additional system renewal needs, evolving system conditions, and enhancing customer value. Toronto Hydro's proposed capital plan has been validated by a third party expert,[16] and its pillars are accepted by the utility's customers.

Toronto Hydro's requested Capital Expenditures for the period 2015-2019 are approximately $500 million per year, which is comparable to the average annual spending since the utility's last rebasing in 2011 (approximately $440 million per year). Forecasted capital expenditures for the 2015 test year are approximately $ 531.1 million, which represents an increase of approximately $152.3

/C

/C

[16] Exhibit 1B, Tab 2, Schedule 4, Appendix B.

million, or 40.2 percent, from the utility's last rebasing application in 2011.[17] For 2016 to 2019, Toronto Hydro is proposing capital expenditures as summarized below. /C

Table 1: 2016 – 2019 Requested Capital Expenditures ($ Millions)

	2016	2017	2018	2019
Capital Expenditures	518.8	467.4	470.0	502.2

/C

To learn more about Toronto Hydro's proposed multi-year capital funding needs, please refer to Exhibit 1B, Tab 2, Schedule 4, and Exhibit 2B.

Capital Investment Drivers

The "trigger" investment drivers of Toronto Hydro's DSP are summarized below. Trigger drivers are the primary reason that a program must be carried out. Most DSP programs also have secondary drivers that may be more consequential than the trigger driver. For example, although Safety and Reliability are trigger drivers for relatively few programs, these important drivers are the most common, relating to 32 and 23 programs respectively.

[17] EB-2010-0142

1 **Table 2: Trigger Drivers for Capital Investments from 2015 to 2019 ($ Millions)**

Trigger Driver	2015	2016	2017	2018	2019
Failure Risk	156.9	130.3	134.9	151.4	156.8
Functional Obsolescence	80.6	105.5	78.3	75.1	74.5
Customer Service Requests / Third Party Requests	55.3	71.7	82.9	76.6	69.8
System Maintenance & Capital Investment Support	80.3	52.1	28.9	32.1	27.9
Capacity Constraints	44.0	44.0	37.1	22.5	44.4
Failure	31.9	32.7	33.1	33.6	34.2
Other[18]	10.3	19.8	28.7	37.9	49.4
Mandated Service Obligations	30.8	21.8	18.0	13.8	15.7
Reliability	11.0	9.4	13.8	13.8	17.4
System Efficiency	11.7	16.2	11.6	13.2	12.2
Safety	16.5	13.7	0.0	0.0	0.0
Total Capital Expenditures	**539.6**	**504.2**	**467.4**	**470.1**	**502.2**

/C

[18] "Other" capital includes expenditures that do not fit in a discrete capital program, such as Historic Road Cut Repairs and inflation for the capital program. For more details, see Exhibit 2B, Section E4.

Costs Associated with REG Connections

Toronto Hydro's proposed Capital Expenditures over the 2015 to 2019 period include the following costs associated with renewable energy generation ("REG") connections:[9]

Table 3: Renewable Enabling Improvements (REI) from 2015 to 2019 ($ Millions)

Program	2015	2016	2017	2018	2019
Generation Protection Control and Monitoring[10]	6.12	5.19	3.26	2.10	2.02
Energy Storage[11]	0.54	1.09	2.16	3.24	3.78
Total REG Costs	**6.66**	**6.27**	**5.43**	**5.34**	**5.79**

/C

The total amount that Toronto Hydro seeks to recover from provincial ratepayers, pursuant to Ontario Regulation 330/09, is summarized below in Table 4.

Table 4: Provincial Rate Protection Amounts from 2015 to 2019 ($Millions)

	2015	2016	2017	2018	2019
Provincial Rate Protection	0.31	1.00	1.69	2.31	2.93

/C

[10] Exhibit 2B, E5.05.
[11] Exhibit 2B, E7.11.

Smart Grid Costs

Toronto Hydro's proposed Capital Expenditures over the 2015 to 2019 period include the following costs associated with smart grid investments:[12]

Table 5: Smart Grid Related Costs from 2015 to 2019 ($Millions)

Program	2015	2016	2017	2018	2019
Metering (Exhibit 2B, E5.1)	24.7	16.6	14.7	11.7	13.7
Network Unit Renewal (Exhibit 2B, E6.10)	5.2	7.4	7.3	7.3	7.3
Stations Control & Monitoring (Exhibit 2B, E6.16)	0.1	0.9	1.1	1.5	1.4
Distribution System Communication Infrastructure (Exhibit 2B, E6.22)	6.1	6.0	4.0	0.0	0.0
Feeder Automation (E7.3)	11.1	15.1	9.4	10.0	8.5
Overhead Momentary Reduction (Exhibit 2B, E7.4)	0.0	0.0	0.6	0.6	0.6
Local Demand Response (Exhibit 2B, E7.10)	0.2	2.4	0.6	0.5	0.3
Total Smart Grid Costs	**47.4**	**48.4**	**37.7**	**31.6**	**31.8**

/C

/C

[12] Exhibit 2B, E1.3.2

In addition to the programs listed above, Toronto Hydro's Overhead Circuit Renewal program[23] includes costs for standardizing SCADAMATE related communications technology in areas currently using an obsolete radio communication system.

Regional Planning Investments

Toronto Hydro's proposed Capital Expenditures over the 2015 to 2019 period include the following costs associated with regional planning investments:

Table 6: Regional Planning Investments from 2015 to 2019 ($ Millions)

Program	2015	2016	2017	2018	2019
Generation Protection, Monitoring and Control (Exhibit 2B, E5.5)	6.12	5.19	3.26	2.10	2.02
Stations Expansion (Exhibit 2B, E7.9)	43.8	41.6	36.5	22.0	44.0
Local Demand Response (Exhibit 2B, E7.10)	0.17	2.4	0.60	0.50	0.35

/C

[23] Exhibit 2B, E6.4.

4.1.2 Rate Base

Toronto Hydro's requested rate base for the 2015 Test Year is $3,247.6 million, which represents an increase of approximately $949.4 million, or 41.3%, from the rate base amount of $2,298.2 million approved by the OEB in the utility's last rebasing application in 2011.[24] /C /C

The change in rate base is driven by an increase of approximately $1,003.5 million in the average net book value ("NBV") of property, plant and equipment ("PP&E"), which is offset by a decrease of approximately $55 million in the working capital allowance ("WCA") component of rate base due to an updated WCA rate, as per Toronto Hydro's updated Lead Lag study. The growth in PP&E includes investments Toronto Hydro has made under the ICM framework during the 2012-14 period, as well as the addition of street lighting assets into rate base. /C

For more information about Toronto Hydro's rate base, please refer to Exhibit 2A.

[24] EB-2010-0142.

4.2 Operations, Maintenance And Administrative (OM&A)

Toronto Hydro's plan is intended to efficiently maintain functional requirements such as safe and reliable grid operations and system performance, service levels, as well as legal and regulatory compliance. New or materially-expanded OM&A activities since the utility's last rebasing in 2011 include: disaster preparedness and increased preventative and predictive maintenance.

Toronto Hydro's OM&A expense for the test year is $269.5 million, which represents an increase of $31.5 million, or 13.2%, from the utility's last rebasing in 2011. This translates into an average annual increase of approximately 3.3% over the 2011-2015 timeframe.

/C

4.2.1 Cost Drivers

Table 7 below provides a summary of the overall drivers and cost trends for operating expenditures:

Table 7: OM&A 2015-2019 Cost Drivers[15]

OM&A	2011 Actuals	2012 Actuals	2013 Actuals	2014 Bridge	2015 Test
Reporting Basis	CGAAP	USGAAP	USGAAP	USGAAP	MIFRS
Opening Balance	**$238.0**	**$238.6**	**$215.8**	**$246.4**	**$246.6**
Workforce Compensation (net)		($12.0)	$3.0	$14.5	$1.4
Distribution Operations Programs[16]	-	$4.7	$5.8	($13.6)	$13.4
Customer Service and Communications	$0.7	($1.3)	$1.5	$1.6	$3.7
Human Resources	-	($0.6)	$1.0	($0.5)	$0.6
Information Technology Services	-	($1.1)	$1.9	$2.2	$0.8
Common Corporate Costs	-	($11.4)	$10.0	($0.3)	($1.3)
Facilities Maintenance	-	($0.3)	$0.9	$3.3	$0.2
Other Various	($0.1)	($0.8)	$6.6	($7.0)	$4.0
Closing Balance	**$238.6**	**$215.8**	**$246.4**	**$246.6**	**$269.5**
Restructuring Costs[17]		$27.7			
Closing Balance - Including Restructuring Costs	**$238.6**	**$243.5**	**$246.4**	**$246.6**	**$269.5**

[15] For a more detailed presentation of Toronto Hydro's 2011-2015 OM&A cost drivers, please see Exhibit 4A, Tab 1, Schedule 2, (OEB Appendix 2-JB).
[16] Includes storm restoration expenditures such as Hurricane Sandy, the December 2013 ice storm, and others.
[17] OEB Account 6310 - Extraordinary Deduction

4.2.2 Inflation Rates and Economic Assumptions

Toronto Hydro used both general and specific cost and economic assumptions in its 2015 forecast for operating costs. For further details, please see section 4.5 below.

4.2.3 Compensation

Toronto Hydro's forecasted total compensation cost for the 2015 test year are approximately $225.3 million, which represents a *decrease* of approximately 9.3 million, or 4.0%, from 2011 actuals. Because Toronto Hydro's last rebasing application was settled on an envelope basis, the utility is unable to detail the OEB-approved compensation costs for 2011.[28]

4.3 Revenue Requirement

For the 2015 test year, Toronto Hydro requests a base revenue requirement of $655.0 million, which represents an increase of $132.9 million, or 25.5%, from the base revenue requirement previously approved by the OEB in the utility's last rebasing application. **/C** **/C**

The main drivers of the increase in base revenue requirement for the 2015 test year are the additions to rate base due to Toronto Hydro's significant capital program over the 2012-15 period, and an increase in OM&A expenses.

To learn more about Toronto Hydro's revenue requirement and related drivers, please see Exhibit 6, Tab 1, Schedule 1.

[28] EB-2010-0142, Partial Decision and Order (July 7, 2011), at Appendix C, s. 3.4 of the Settlement Agreement.

4.4 Bill Impacts

On average, for each of the next five years, Toronto Hydro calculates that the bill impacts associated with its application (including all of the proposed rate riders) are approximately $ $3.26 per month for the residential customer, or less than a 3% increase to the overall bill.[29] **/C**

Table 8 below provides a summary of total bill impacts (before taxes and the Ontario Clean Energy Benefit) for typical customers in all classes.

[29] Calculation of approximate percentage increase to bill resulting from Toronto Hydro's application is based on other bill components being what they are today.

Table 8: Summary of Total Bill Impacts by Rate Class

Rate Class	Change in Bill	2015 Proposed	2016 Proposed	2017 Proposed	2018 Proposed	2019 Proposed
Residential	$/30 days	$3.28	$2.64	$3.36	$5.30	$1.71
	%	2.5%	1.9%	2.4%	3.7%	1.2%
Competitive Sector Multir Unit Residential	$/30 days	$0.52	$1.72	$2.60	$3.21	$1.10
	%	0.8%	2.5%	3.6%	4.3%	1.4%

	%	6.4%	2.8%	4.1%	5.2%	2.7%

/C

4.5 Budgeting and Accounting Assumptions

Toronto Hydro used both general inflation and specific cost assumptions in its 2015 forecast of operating costs. Labour costs have been adjusted to reflect the annual rate adjustment that the utility is required to pay under its collective agreements. The labour cost forecast was also adjusted to reflect market-competitive increases for non-unionized employees.

An inflation rate of 1.7% was applied to the test year operational expenditure forecasts, consistent with the OEB ¶ current inflation factor. An inflation factor of 2.07% was applied to the utility ¶ capital expenditures over the 2016 to 2019 rate period, consistent with Statistics Canada Consumer Price Index (³CPI ´) for the City of Toronto.

To learn more about Toronto Hydro ¶ budgeting and accounting assumptions, please see Exhibit 1B, Tab 2, Schedule 3; Exhibit 1C, Tab 3, Schedule 2; Exhibit 2A, Tab 6, Schedule 1; Exhibit 4A, Tab 1, Schedule 1; and Exhibit 4A, Tab 4, Schedule 5.

4.6 Load Forecast Summary

Toronto Hydro ¶ load forecast was developed using multivariate regression models by customer class to derive loads based on input variables for economic activity, weather and other drivers of energy consumption. The forecast explicitly accounts for conservation and demand management (³CDM ´) impacts on load.

Toronto Hydro ¶ customer forecast was developed using extrapolation models for each rate class.

The following table summarizes the total historic and load and customer values for 2011-2019.

Table 9: Total Load and Total Customers for 2011-2019

Year	Total Load (GWh)	Total Customers
2011	25,419	705,756
2012	25,639	713,093
2013	25,213	724,144
2014	25,018	736,974
2015	24,993	749,679
2016	24,027	763,091
2017	24,842	773,850
2018	24,697	785,107
2019	24,611	796,865

/C

To learn more about Toronto Hydro's forecast of loads and customers, please see Exhibit 3, Tab 1, Schedule 1.

4.7 Cost Of Capital

Toronto Hydro calculated its Cost of Capital based on the OEB's Cost of Capital guidelines. For the purpose of 2015 revenue requirement, Toronto Hydro used a Return on Equity ("ROE") forecast rate of 9.30% based on the latest forecasts of inputs into the OEB's ROE formula. The utility will update this value once the OEB has determined the applicable ROE for 2015. Debt costs were forecast based on Toronto Hydro's embedded and new debt costs.

To learn more about Toronto Hydro's approach to Cost of Capital, please refer to Exhibit 5, Tab 1, Schedule 1.

4.8 Cost Allocation And Rate Design

The 2015 base revenue requirement has been allocated to the company ¶ eight rate classes using the OEB ¶ cost allocation model. The resulting revenue to cost ratios for all classes are within the OEB ¶ guidelines as established in EB-2010-0219.

Toronto Hydro proposes fixed and variable rates for all rate classes based on the current split of revenue generated through each of these components. The OEB has initiated a process to review rate design for the Residential and GS<50 kW rate classes. If the OEB issues directions to distributors as a result of that process, Toronto Hydro anticipates incorporating those directions at that time.

4.8.1 Rate Year Synchronization

Toronto Hydro ¶ fiscal year is January 1 to December 31. As a public debt issuer, Toronto Hydro is required to produce public financial statements on a fiscal year basis, and to regularly explain these statements to financial markets (i.e., bond holders, credit rating agencies, short-term creditors), and to the utility ¶ shareholder. When revenues received by the utility are not aligned with the costs, presentation of this material can become more complex and less transparent.

Toronto Hydro is accordingly seeking approval in this application to align its rate year with its fiscal year effective January 1, 2016. Rates for 2015, the utility ¶ rebasing year, are proposed to be effective May 1, 2015. Rates for the first year under the proposed Price Cap Index (³PCI ´) would be effective January 1, 2016.

To learn more about Toronto Hydro's approach and proposals regarding cost allocation and rate year synchronization, please refer to Exhibit 7, Tab 1, Schedule 1, and Exhibit 8, Tab 1, Schedule 1, respectively.

4.9 Deferral and Variance Accounts

Toronto Hydro proposes new rate riders to clear a number of Deferral and Variance Accounts ("DVAs") balances. Toronto Hydro also seeks approval to clear to customers amounts related to Gains on Sale of properties associated with the Operational Centers Consolidation Plan ("OCCP"), tax refunds related to past tax reassessments, and lost revenue amounts related to the operation of the IRM mechanism over the 2012-14 period.

The total net DVA balances proposed for disposal are $53.7 million. The proposed disposition periods vary from one to five years. **/C**

Toronto Hydro seeks approval of three new deferral and variance accounts: 1) a variance account in respect of externally-initiated plant relocations and expansions; 2) a variance account in respect of de-recognition losses; and 3) a variance account to record the difference between the actual costs of approved eligible investments and the revenue received from the IESO relating to Provincial Rate Protection amounts.

For more information about DVA accounts, and amounts proposed for clearance, please refer to Exhibit 8, Tab 1, Schedule 1, and Exhibit 9, Tab 1, Schedule 1.

ADMINISTRATIVE INFORMATION

In accordance with the 2 (% ¶FWing Requirements (July 17, 2013), this schedule provides information about the following subjects:

1. Notice of Application, including:
    - a) a statement as to who will be affected by this application,
    - b) publication information; and
    - c) a summary of the bill impacts.
2. Concordance with the Filing Requirements;
3. 7 R U R Q W R aterial y Rnf¶ Vholl P;
4. Accounting treatment of non-utility business;
5. Existing accounting orders and departures from USoA;
6. Changes to methodologies used on previous applications;
7. Accounting Standard
8. Previous OEB Directives and Undertakings;
9. Conditions of Service; and
10. Internet address for viewing the application;

1. NOTICE OF APPLICATION

a) Affected Customers

Toronto Hydro has approximately 730,000 distribution customers across its service areas that will be affected by this Application. For more information D E R X W 7 R U R Q W R + \ G U F customer base, refer to the Executive Summary in Exhibit 1A, Tab 2, Schedule 1, and the Customer Engagement evidence at Exhibit 1B, Tab 2, Schedule 7.

b) Publication Information

Toronto Hydro proposes to publish a notice of this application to appear in the Toronto Star and L ¶Express newspapers, both of which are paid publications, as well as on the Company ¶ website www.torontohydro.com. L ¶Express is a weekly French language newspaper serving Toronto and the Greater Toronto Area, which has a circulation of approximately 22,000 readers per week. The Toronto Star is a daily newspaper serving Toronto and the surrounding area, has a total average daily circulation of approximately 360,000 readers. Toronto Hydro proposes to publish the notice of its application in these publications because they are the most-widely circulated newspapers in the City of Toronto in Canada ¶ official languages.

c) Summary of Bill Impacts

Table 1 below provides a summary of the distribution-only bill impacts (per sub-total A of Appendix 2-W, which is filed at Exhibit 8, Tab 7) to be used for the notice of application for a typical residential customer using 800 kWh per month and for a General Service <50kW customer using 2000 kWh per month.

Table 1: Summary of Bill Impacts (Distribution Only) for Notice of Application

Residential (800 kWh)					
Distribution Bill	**2015**	**2016**	**2017**	**2018**	**2019**
Subtotal A $	$ 4.05	$ 2.97	$ 3.29	$ 5.47	$ 2.56
Subtotal A %	12.29%	8.01%	8.22%	12.64%	5.24%
GS < 50 kW (2000 kWh)					
Distribution Bill	**2015**	**2016**	**2017**	**2018**	**2019**
Subtotal A $	$ 12.33	$ 3.80	$ 2.17	$ 11.51	$ 5.89
Subtotal A %	14.87%	3.99%	2.19%	11.37%	5.23%

2. MATERIALITY THRESHOLD

In accordance with section 3.2.2.2 of the Filing Requirements, Toronto Hydro ¶ materiality threshold is $1 million because its distribution revenue requirement exceeds $200 million. Unless otherwise noted, Toronto Hydro has generally applied this threshold throughout the application.

3. ACCOUNTING TREATMENT OF NON-UTILITY BUSINESS

Toronto Hydro confirms that it has segregated the activities of its non-utility business from rate regulated activities.

4. EXISTING ACCOUNTING ORDERS AND DEPARTURES FROM USOA

Toronto Hydro confirms that it has complied with the Uniform System of Accounts (³USoA ´) as set out in the 2 (% ¶ Accounting Procedures Handbook (³APH ´), and with the following utility-specific accounting orders:

- Impact for USGAAP Deferral Account, effective January 1, 2012, to record the financial impacts resulting from the transition to and implementation of USGAAP;[1]
- Sub-Accounts to Account 1508 ±Other Regulatory Assets, effective June 1, 2013, relating to Incremental Capital Module (³ICM ´) amounts;[2] and
- Sub-Accounts to Account 1508 ±Other Regulatory Assets, to record the costs and revenues associated with wireless pole attachments.[3]

5. CONCORDANCE WITH THE FILING REQUIREMENTS

Toronto Hydro is filing a Custom Incentive Rate-setting (³Custom IR ´) Application. In preparing this A S S O L F D W L R Q 7 R U R Q W R + \ G U R K D V F R Q V L G H U H G Filing Requirements for Electricity Distribution Rate Applications issued July 17, 2013

[1] EB-2012-0079, Decision and Order (June 7, 2012).
[2] EB-2012-0064, Rate Order (May 9, 2013).
[3] EB-2012-0234, Decision and Accounting Order (June 5, 2014).

(the "Filing Requirements") issued on December 20, 2013. Departures from the Filing Requirements are noted in the Checklist filed at Exhibit 1A, Tab 3, Schedule 2. [4]

6. METHODOLOGY CHANGES

Since its last rebasing application in 2011 (EB-2010-0142), Toronto Hydro has made the following methodology changes:

- Accounting Standard changes, as discussed in section 7 below; and
- Working Capital Allowance rate changes, as outlined in Exhibit 2A, Tab 03.

7. ACCOUNTING STANDARD

Toronto Hydro plans to adopt International Financial Reporting Standards ("IFRS") for financial reporting purposes in the year beginning on January 1, 2015. Under IFRS 1, Toronto Hydro is required to present one year of comparative information under IFRS in its first set of IFRS financial statements. The first day of the comparative year is referred to as the "IFRS transition date". The utility has chosen to early adopt IFRS in accordance with the APH. For Toronto Hydro, the transition date is January 1, 2014, and the changeover date is January 1, 2015.

Article 510 *Transitional Issues Relating to the Adoption of IFRS* of the APH directs distributors to use modified IFRS ("mIFRS") as of the changeover date and requires distributors to compare the balances as determined under previous GAAP on December 31, 2014 to the corresponding balances at December 31, 2014 determined in accordance with mIFRS. Toronto Hydro has recorded the differences to opening Plant Property & Equipment ("PP&E") balances in Account 1575. For more information, refer to Exhibit 9, Tab 1, Schedule 1.

The adoption of IFRS 1 and compliance to APH 510 resulted in the following material impact to the 2015 test year revenue requirement in comparison to the revenue requirement under previous GAAP: [5]

- **Derecognition**: $33.9 million increase to depreciation expense;
- **Borrowing Costs**: $0.8 million increase to allowance for borrowed costs applied to fund construction work in progress ("CWIP"); and
- **Asset Retirement Obligations ("ARO"):** $0.9 million decrease in depreciation expense

For more information, please refer to Exhibit 2A, Tab 7, Schedule 1 and Exhibit 4B, Tab 1, Schedule 1.

8. PREVIOUS OEB DIRECTIVES AND UNDERTAKINGS

The summary below identifies previous OEB directives and undertakings and how these are being addressed in the current Application:

- File a cost allocation model that will disaggregate meter reading costs appropriately into Account 5310.[6] All USofA amounts used in the Cost Allocation model have been reviewed. The full Cost Allocation model is filed at Exhibit 7, Tab 1, Schedule 2, in printed and excel format.
- Review each of the assumptions set out in the Decision and Order when its cost allocation study is refreshed for its next cost of service application.[7] Please refer to Exhibit 7, Tab 1, Schedule 1 for an explanation of the inputs to the Cost Allocation model.

[5] Toronto Hydro expects that there would also be an impact to Payments in Lieu of Taxes (PILs), but has not quantified this impact for the purpose of the Application.
[6] EB-2010-0142, Decision on Draft Order Regarding Suite Metering Issues (April 17, 2012) at page 4.
[7] EB-2010-0142, Decision and Order On Suite Metering (February 22, 2012 and as corrected March 9, 2012) at page 29.

- Provide external evidence related to productivity and capital planning in the next cost of service application.[8] For external evidence relating to productivity, please refer to the Power System Engineering Report, which has been filed as Appendix B to Exhibit 1B, Tab 2, Schedule 5. For external evidence relating to capital planning, please refer to the Navigant Report which is filed as Appendix B to Exhibit 1B, Tab 2, Schedule 4.
- Provide seminar on FIM to Intervenors before filing 2015 application.[9] A seminar was provided at the second stakeholdering session on July 3, 2014. For more information, please refer to the evidence at Exhibit 1B, Tab 2, Schedule 8.
- Use best efforts to track any assets taken out of service before the end of their useful lives associated with the completion of ICM work segments approved in Phase 2 of this proceeding.[10] Toronto Hydro proposes to defer ICM true-up to a separate proceeding (Exhibit 2A, Tab 9), and intends to comply with this directive, as part of that proceeding.
- Evaluate options to measure or estimate actual line losses and the impacts on Account 1588 balances in accordance with the Accounting Procedures Handbook. File the results in its application for 2015 rates. Please refer to Exhibit 8, Tab 5, Schedule 1 for an update on this particular item. **/C**

9. CONDITIONS OF SERVICE

Toronto Hydro's current Conditions of Service can be found at the following link: http://www.torontohydro.com/sites/electricsystem/business/ConditionsofService/Pages/default.aspx. At this time, Toronto Hydro does not expect any of the approvals in this Application to result in a substantive change to its Conditions of Service.

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
GENERAL			
Ch 1 p4	Confidential Information - Practice Direction has been followed	**Yes**	
2	In advance of scheduled application - meet threshold established in Board letter (April 20, 2010)	**N/A**	
2	Align rate year with fiscal year - rationale for proposed alignment	**Yes**	Exhibit 8, Tab 1, Schedule 1
3	Text searchable and bookmarked PDF documents	**Yes**	
EXHIBIT 1 - ADMINISTRATIVE DOCUMENTS			
7	Overall business strategy including narrative of how the four RRFE outcomes are supported	**Yes**	Exhibit 1A, Tab 2, Schedule 1
7	Revenue Requirement - service RR, increase from previously approved, main drivers	**Yes**	Exhibit 1A, Tab 2, Schedule 1
7	Budgeting Assumptions - economic overview	**Yes**	Exhibit 1A, Tab 2, Schedule 1
7	Load Forecast Summary - load and customer growth, change in kWh and customer numbers, methodology description	**Yes**	Exhibit 1A, Tab 2, Schedule 1
7	Rate Base and Capital Plan - major drivers of DSP, rate base for test year, change from last approved, capex for test year, change from last approved, costs for any REG	**Yes**	Exhibit 1A, Tab 2, Schedule 1
8	OM&A for test year and change from last approved, summary of drivers, inflation assumed, total compensation for test year and change from last approved.	**Yes**	Exhibit 1A, Tab 2, Schedule 1
8	Statement regarding use of Board's cost of capital parameters; summary of any deviations	**Yes**	Exhibit 1A, Tab 2, Schedule 1
8	Cost Allocation & Rate Design - summary of any deviations from Board methodologies and significant changes	**Yes**	Exhibit 1A, Tab 2, Schedule 1
8	Deferral and Variance Account - total disposition (RPP and non-RPP), disposition period, new accounts requested	**Yes**	Exhibit 1A, Tab 2, Schedule 1
8	Bill Impact - total impacts ($ and %)for all classes for typical customers	**Yes**	Exhibit 1A, Tab 2, Schedule 1
8	Overview of customer engagement activities; description of engagement, how customer needs are reflected in application. Explanation if no customer engagement	**Yes**	Exhibit 1B, Tab 2, Schedule 7
9 & 34	Audited Financial Statements for 2 most recent historical years (i.e. 3 years of historical actuals)	**Yes**	Exhibit 1C, Tab 4, Schedule 2
9	Detailed reconciliation of AFS with regulatory financial results filed in the application	**Yes**	Exhibit 1C, Tab 4, Schedule 3
9	Annual Report and MD&A for most recent year of parent company	**Yes**	Exhibit 1C, Tab 4, Schedule 4 and 5
9	Rating Agency Reports, if available; Prospectuses, etc. for recent and planned public issuances	**Yes**	Exhibit 1C, Tab 4, Schedule 6 and 7
10	Materiality threshold; additional details beyond the threshold if necessary	**Yes**	Exhibi 1A, Tab 3, Schedule 1
Ch 1 p2	Certification that evidence is accurate, consistent and complete	**Yes**	Exhibit 1A, Tab 5, Schedule 1
10	Table of Contents	**Yes**	Exhibit 1A, Tab 1, Schedule 1
10	Statement of who will be affected by application	**Yes**	Exhibit 1A, Tab 3, Schedule 1
10	Publication information (paid, readership, circulation)	**Yes**	Exhibit 1A, Tab 3, Schedule 1
10	Applicant's internet address for viewing of application	**Yes**	Exhibit 1A, Tab 3, Schedule 1
10	Primary contact information (name, address, phone, fax, email)	**Yes**	Exhibit 1A, Tab 3, Schedule 1
10	Identification of legal (or other) representation	**Yes**	Exhibit 1B, Tab 1, Schedule 1, Appendix A
10	Requested effective date	**Yes**	Exhibit 1B, Tab 1, Schedule 1
10	Bill impacts - distribution only impacts for 800 kWh residential and 2000 kWh GS<50 (sub-total A of Appendix 2-W)	**Yes**	Exhibit 1A, Tab 2, Schedule 1
11	Form of hearing requested and why	**Yes**	Exhibit 1B, Tab 1, Schedule 1
11	List of approvals requested (and relevant section of legislation), including accounting orders	**Yes**	Exhibit 1B, Tab 1, Schedule 1

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
11	Change in tax status	N/A	No change in tax status.
11	Existing accounting orders and departures from USoA including references to the accounting orders	Yes	Exhibit 1A, Tab 3, Schedule 1
11	Description of Operating Environment (including map, list of neighbouring utilities)	Yes	Exhibit 1C, Tab 1, Schedule 1
11	Identification of embedded and/or host distributors	N/A	Applicant does not have any embedded/host distributors; see Exhibit 1C, Tab 1, Schedule 1
11	Corporate and Utility Organizational Structure, planned changes, corporate entities relationship chart, reporting relationships between LDC and parent	Yes	Exhibit 1C, Tab 2, Schedule 1
12 & 13	Corporate Governance: Number of Directors on Board, number of independent directors, how independent judgement is facilitated - Board Mandate; Schedule of Board Meetings - Orientation and Continuing Education for directors - Ethical Business Conduct - written code where available - Process for Nomination of Directors - Committees - function and charter for each committee - Audit Committee - number of independent members, whether members are financially literate	Yes	Exhibit 1C, Tab 2, Schedule 1
13	Statement regarding any transmission assets previously deemed distribution and whether LDC seeks deeming in current application	Yes	Exhibit 1C, Tab 1, Schedule 1
5, 6 & 13 Appendices	Accounting Standard used and when it was adopted. - MIFRS - Adoption of IFRS effective Jan 1-15, Jan 1-14 or earlier - CGAAP - must implement regulatory accounting changes for depreciation and capitalization by Jan 1-13 - USGAAP or ASPE - evidence of eligibility, authorization, benefits. Must implement regulatory accounting changes for depreciation and capitalization by Jan 1-13 Summary of changes to accounting policies and quantification of revenue requirement impact. LDC may choose to file Appendix 2-YA (MIFRS) or 2-YB (CGAAP or ASPE).	Yes	Exhibit 1A, Tab 3, Schedule 1; Applicant has not filed Appendix 2-YA at this time.
13	Statement identifying all deviations from Filing Requirements	Yes	Exhibi 1A, Tab 3, Schedule 1
13	Statement identifying and describing any changes to methodologies used vs previous applications	Yes	Exhibi 1A, Tab 3, Schedule 1
13	Confirmation that accounting treatment of any non-utility business has segregated activities from rate regulated activities	Yes	Exhibi 1A, Tab 3, Schedule 1
13	Identification of Board Directives from previous Board Decisions, and how addressed	Yes	Exhibi 1A, Tab 3, Schedule 1
13	Reference to Conditions of Service - LDC does not need to file Conditions of Service, but must provide reference to website and confirm version is current; identify if there are changes to Conditions of Service as a result of application	Yes	Exhibi 1A, Tab 3, Schedule 1
EXHIBIT 2 - RATE BASE			
14 & 15	Completed Appendix 2-BA1 or 2-BA2 (application material and Excel)	Yes	Exhibit 2A, Tab 1, Schedule 2
14	Opening and Closing balances, average of opening and closing balances for gross assets and accumulated depreciation; working capital allowance (historical actual, bridge and test year forecast)	Yes	Exhibit 2A, Tab 1
14	Continuity statements (year end balance, including interest during construction and overheads). Year over year variance analysis; explanation where variance greater than materiality Hist. Brd-Approved vs Hist. Actual Hist. Act. Vs previous Hist. Act. Bridge vs. Test	Yes	Exhibit 2A, Tab 1

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
14 & 15	Opening and closing balances of gross assets and accumulated depreciation must correspond to fixed asset continuity statements. If not, an explanation must be provided (eg. WIP, ARO, smart meter balances). Reconciliation must be between YE 2013 and YE 2014 net book value balances reported on Appendix 2-BA and balances included in rate base calculation	Yes	Exhibit 2A, Tab 1
15	Gross Assets Breakdown by Function and by major plant account; description of major plant items for test year	Yes	Exhibit 2A, Tab 2, Schedule 1
15	Summary of any ICM adjustment from IRM	Yes	Exhibit 2A, Tab 1, Schedule 1; Exhibit 2A, Tab 9, Schedule 1
15 & 32	Continuity statements must reconcile to calculated depreciation expenses and presented by asset account	Yes	Exhibit 2A, Tab 1, Schedule 1; Exhibit 4B, Tab 1, Schedule 1
15	Working Capital - 13% allowance or Lead/Lag Study or Previous Board Direction	Yes	Lead Lag Study - Exhibit 2A, Tab 3
16	Cost of Power must be determined by split between RPP and non-RPP customers based on actual data, use most current RPP price, use current UTR. Should include SME charge.	Yes	Exhibit 2A, Tab 3, Schedule 1
16	Lead/Lag Study - leads and lags measured in days, dollar-weighted	Yes	Exhibit 2A, Tab 4
17 & 18	Stranded Meters - if not previously addressed by the Board, proposed treatment for recovery that conforms to Board approach: NBV of stranded meters at YE 2013, proposed stranded meter rate riders for applicable customer classes. Explanation for approaches that are not the Board approach Completed Appendix 2-S.	Yes	Exhibit 2A, Tab 4
19	DSP filed as a stand-alone document	Yes	Exhibit 2B
Ch 5 p9	Where applicable, explanation for section headings other than Chapter 5 headings; cross reference table	Yes	Exhibit 2B, Section A0 (see also Exhibit 1B , Tab 2, Schedule 4)
Ch 5 p9-10	Distribution System Plan Overview - key elements, sources of cost savings, period covered, vintage of information on investment drivers, changes to asset management process since last DSP filing, dependencies	Yes	Exhibit 2B, Sections and D
Ch 5 p10-11	Coordinated Planning with 3rd parties - description of consultations - deliverables of the Regional Planning Process, or status of deliverables - OPA letter in relation to REG investments (Ch 5 p8&9) and Dx response letter	Yes	Exhibit 2B, Section B
Ch 5 p11	Performance Measurement - identify and define methods and measures used to monitor DSP performance - summary of performance and trends over historical period. Must include SAIFI, SAIDI and CAIDI for all interruptions and all interruptions excluding loss of supply - explain how information has affected DSP	Yes	Exhibit 2B, Section C
Ch5 p12	Asset Management Process Overview - description of AM objectives/corporate goals and how Dx ranks objectives for prioritizing investments	Yes	Exhibit 2B, Section D, Schedule D1
Ch5 p12	Inputs/Outputs of the AM process and information flow for investments; flowchart recommended	Yes	Exhibit 2B, Section D, Schedule D1
Ch 5 p13	Overview of Assets Managed - description of service area (including evolution of features in forecast period affecting DSP), - description of system configuration - service profile and condition by asset type (tables and/or figures) - date data compiled - assessment of degree the capacity of system assets is utilized	Yes	Exhibit 2B, Section D, Schedule D2
Ch 5 p13-14	Asset Lifecycle Optimization - description of asset lifecycle optimization policies and practices, including asset replacement and refurbishment, maintenance planning criteria and assumptions - description of asset life cycle risk management policies and practices, assessment methods and approaches to mitigation	Yes	Exhibit 2B, Section D, Schedule D3

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
Ch 5 p14-15	Capital Expenditure Plan Summary for significant projects and activities to be undertaken - capability to connect new load or Gx customers, total annual capex over forecast period by investment category, description of how AMP and Capex planning have affected capital expenditures for each category - list, description and total capital cost of material capital expenditures sorted by category (table recommended) - information related to Regional Planning Process (Needs Assessment Report, Regional Planning Status Letter, Regional Infrastructure Plan - as appropriate) - description of customer engagement - Dx expectations of system development over next 5 years - list, description and total capital cost of projects planned in response to customer preferences, to take advantage of technology based opportunities, to study innovative processes (table recommended)	**Yes**	Exhibit 2B, Section E, Schedule E1
Ch 5 p15	Capital Expenditure Planning Process Overview - description of capex planning objectives/criteria/ assumptions, relationship with AM objectives, policy on consideration of non-distribution alternatives, processes used to identify projects in each investment category, customer feedback and impact on plan, method and criteria used to prioritise REG investments	**Yes**	Exhibit 2B, Section E, Schedule E2
Ch 5 p16	System Capability Assessment for REG - REG applications > 10 kW, number and MW of REG connections for forecast period, capacity of Dx to connect REG, connection constraints	**Yes**	Exhibit 2B, Section E, Schedule E3
Ch 5 p16-18 **Ch 2 p19**	Capital Expenditure Summary by Investment Category - completed Table 2 of Ch 5 for historical and forecast period, explanation of markedly different variances plan vs actual, explanation of markedly different variances year over year Table 2 of Ch 5 is provided in Excel format in Appendix 2-AB	**Yes**	Exhibit 2B, Section E, Schedule E4; Exhibit 2A, Tab 6, Schedule 3
Ch5 p19	Overall Plan - comparative expenditures by category over historical period, forecast impact of system investment on O&M, drivers of investments by category, information related to Dx system capability assessment	**Yes**	Exhibit 2B, Section E, Schedules E1 and E4
Ch 5 p19-25	Material Investments - For each project that meets materiality threshold set in Ch 2 p10 - general information - total capital, customer attachments, dates, risks, variances, REG investments - evaluation criteria - may include: efficiency, customer value, reliability, etc. - category specific requirements for each project - system access, system renewal, system service, general plant (as applicable)	**Yes**	Exhibit 2B, Section E, Schedules E5 - E8 (see also Exhibit 1B, Tab 2, Schedule 4)
19	Capital Expenditures - completed Appendix 2-AA showing capex on a project specific basis for 5 historical years, bridge and test; explanation of variances, accounting treatment for projects with life cycle greater than one year	**Yes**	Exhibit 2A, Tab 6
19	Non-distribution activities - capital expenditures and reconciliation to total capital budget	**Yes**	Exhibit 2A, Tab 6, Schedule 1
5 & 19-20	Capitalization policy, changes to capitalization since previous rebasing - explanations must be provided. The changes must be identified (eg. capitalization of indirect costs, etc) and the causes of the changes must also be identified.	**Yes**	Exhibit 2A, Tab 7, Schedule 1
20	Capitalization of overhead - Completed Appendix 2-DA (MIFRS) or 2-DB (CGAAP or ASPE) Burden rates must be identified; changes from last rebasing must be identified; LDC must identify burden rates prior to and after the change	**N/A**	Exhibit 2A, Tab 7, Schedule 2; Applicant has not made any changes to capitalized overhead since the last rebasing (EB-2010-0142).
20	For Eligible Investments - proposal to divide costs per O.Reg. 330/09	**Yes**	Exhibit 2A, Tab 8, Schedule 1
21	Appendices 2-FA through 2-FC must be filed identifying eligible investments	**Yes**	Exhibit 2A, Tab 8, Schedules 2 to 4
21	Distributor with approved ICM - schedule of ICM amounts, variances and explanation	**N/A** **N/A**	Proposal to defer ICM true up to seperate application; see Exhibit 2A, Tab 9, Schedule 1.

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
21	Balances in 1508 sub-accounts, reconciliation with proposed rate base amounts; recalculated revenue requirement should be compared with rate rider revenue	N/A	Proposal to defer ICM true up to seperate application; see Exhibit 2A, Tab 9, Schedule 1.
22	5 historical years of ESQRs, explanation for any under-performance and actions taken	Yes	Exhibit 2A, Tab 10, Schedule 1
22	5 historical years of SAIDI and SAIFI - for all interruptions and all interruptions excluding loss of supply, explanation for any under-performance and actions taken	Yes	Exhibit 2A, Tab 10, Schedule 2
22	Completed Appendix 2-G	Yes	Exhibit 2A, Tab 10, Schedule 3
EXHIBIT 3 - OPERATING REVENUE			
22 & 25	Customer, volume and revenue forecast	Yes	Exhibit 3, Tab 1
22	Explanation of causes, assumptions and adjustments for volume forecast. Economic assumptions and data sources for load and customer forecast	Yes	Exhibit 3, Tab 1
23 & 24	Regression Model - rationale for choice, regression statistics, explanation for any unintuitive relationships, explanation of modeling approaches and alternative models tested, explanation of weather normalization methodology, sources of data for endogenous and exogenous variables, explanation of any constructed variables; data used in load forecast must be provided in Excel format, including derivation of constructed variables	Yes	Exhibit 3, Tab 1
24	NAC Model - rationale for choice, data supporting NAC variables, description of accounting for CDM including licence conditions, discussion of weather normalization considerations	Yes	Exhibit 3, Tab 1
24 & 25	CDM Adjustment - 2013 and 2014 CDM reductions must take into account 2011 and 2012 CDM program results reported by OPA. CDM adjustment should take into account historical CDM results factored into base load forecast before CDM adjustment	Yes	Exhibit 3, Tab 1
25	CDM savings for 2014 LRAMVA balance and adjustment to 2014 load forecast; data by customer class	Yes	Exhibit 3, Tab 1
25	Completed Appendix 2-I, or alternative with explanation	Yes	Exhibit 3, Tab 1
22 & 25	Schedule of volumes, revenues, customer/connection count by class and total system load: 5 years historical, Board approved, 5 years historical weather normalized, bridge year and test year.	Yes	Exhibit 3, Tab 1
25	Customer count increases or decreases for test year - explanation by class; confirmation of year end or average format	Yes	Exhibit 3, Tab 1
25	Explanation for any changes in definition or composition of class	Yes	Exhibit 3, Tab 1
25	Weather normalized average consumption per customer for historical 5 years, bridge and test	Yes	Exhibit 3, Tab 1
25	Explanation of net change in average consumption from last Board approved, and actual historical, bridge and test - for each rate class	Yes	Exhibit 3, Tab 1
25	Details of development of billing kW	Yes	Exhibit 3, Tab 1
26	Revenues on existing and proposed rates	Yes	Exhibit 3, Tab 1
26	Variance analysis of volumes, revenues, customer/connection count and total system load: Historical Board approved vs Historical Actual (and Historical Actual weather normalized) Year over year historical weather normalized variance, weather normalized bridge, test year	Yes	Exhibit 3, Tab 1
24 & 26	Data used to determine forecast should be filed as Excel	Yes	Exhibit 3, Tab 1
26	Breakdown of other distribution revenue accounts; completed Appendix 2-H	Yes	Exhibit 3, Tab 2
26	Variance analysis - year over year, historical, bridge and test	Yes	Exhibit 3, Tab 2
26	Any new proposed specific service charges	Yes	Exhibit 3, Tab 2; Exhibit 8A, Tab 2
26 & 30	Revenue from affiliate transactions, shared services, corporate cost allocation	Yes	Exhibit 3, Tab 2

		Yes/No/N/A	Evidence Reference, Notes
EXHIBIT 4 - OPERATING COSTS			
27	Brief explanation of test year OM&A levels, cost drivers, significant changes, trends, inflation rate assumed, business environment changes	**Yes**	Exhibit 4A, Tab 1 and Tab 2.
28	Summary of recoverable OM&A expenses; Appendix 2-JA	**Yes**	Exhibit 4A, Tab 1
28	OM&A cost drivers; Appendix 2-JB	**Yes**	Exhibit 4A, Tab 1
28	Recoverable OM&A Cost per customer and per FTE; Appendix 2-L	**Yes**	Exhibit 4A, Tab 1
28	Identification of change in OM&A in test year in relation to change in capitalized overhead.	**N/A**	Applicant has not made any changes to capitalized overhead since last rebasing (see Exhibit 2A, Tab 7, Schedule 2)
28	OM&A variance analysis for test year with respect to bridge and historical years; Appendix 2-DA or 2-DB	**Yes**	For variance analysis see Exhibit 4A, Tab 2; Re Appendix 2-DA: Applicant has not made any changes to capitalized overhead since last rebasing (see Exhibit 2A, Tab 7, Schedule 2)
28	Completed Appendix 2-JC OM&A Programs Table - by program or major functions; include variance analysis between test year and last Board approved and most recent actual	**Yes**	Exhibit 4A, Tab 1 and Tab 2.
28	Employee Compensation - complete Appendix 2-K	**Yes**	Exhibit 4A, Tab 4, Schedule 2
29	Description of compensation strategy	**Yes**	Exhibit 4A, Tab 4, Schedule 5
29	Explanation for material changes to head count and compensation: year over year variances, inflation, plans for new employees, details on collective agreements, basis for performance pay, filing of any relevant studies	**Yes**	Exhibit 4A, Tab 4, Schedules 3 and 5
29	Details of employee benefit programs including pensions for last Board approved, historical, bridge and test; must agree with tax section	**Yes**	Exhibit 4A, Tab 4, Schedule 5
29	Most recent actuary report	**Yes**	Ehxibit 4A, Tab 4, Schedule 7
30	Identification of all shared services among affiliates	**Yes**	Exhibit 4A, Tab 5
30	Allocation methodology for corporate and shared services, list of costs and allocators, including any third party review	**Yes**	Exhibit 4A, Tab 5
26 & 30	Completed Appendix 2-N for service provided or received for historical, bridge and test; including reconciliation with revenue included in Other Revenue	**Yes**	Exhibit 4A, Tab 5, Schedule 2
30	Identification of any Board of Director costs for affiliates included in LDC costs	**Yes**	Exhibit 4A, Tab 5, Schedule 2
30	Shared Service and Corporate Cost Variance analysis - test year vs last Board approved and most recent actual	**Yes**	Exhibit 4A, Tab 5, Schedule 1
30	Purchased Services - file a copy of procurement policy (signing authority, tendering process, non-affiliate service purchase compliance)	**Yes**	Exhibit 4A, Tab 3, Schedule 2
30 & 31	Explanation for procurements above materiality threshold without competitive tender	**Yes**	Exhibit 4A, Tab 3, Schedule 1
31	Identification of one-time costs in historical, bridge, test; explanation of cost recovery in test (or future years)	**Yes**	Exhibit 4A, Tab 2, Schedule 20.
31	Regulatory costs - breakdown of actual and forecast, supporting information related to CoS application, proposed recovery (ie amortized?). Completed Appendix 2-M	**Yes**	Exhibit 4A, Tab 2, Schedule 17
31	LEAP - the greater of 0.12% of forecasted service revenue requirement or $2,000 should be included in OM&A and recovered from all rate classes	**Yes**	Exhibit 4A, Tab 2, Schedule 19
32	Statement whether test year revenue requirement includes legacy programs. If yes, identify programs	**Yes**	Test year revenue reuqirement does not inlcude legacy programs; see Exhibit 4A, Tab 2, Schedule 19
32	Charitable Donations - amounts paid from last Board approved up to test year	**Yes**	Exhibit 4A, Tab 2, Schedule 19
32	Detailed information for any proposal to recover charitable donations (outside of assistance for payment of electricity bills)	**N/A**	Applicant does not propose to recover any charitable donationations.
32	Any non-recoverable contributions identified and removed from revenue requirement. Confirm that no political contributions have been included for recovery	**Yes**	Exhibit 4A, Tab 2, Schedule 19

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
15 & 32	Depreciation, Amortization and Depletion details by asset group for historical, bridge and test years. Include asset amount and rate of depreciation/amortization. Must tie back to accumulated depreciation balances in continuity schedule under rate base. Ensure that significant parts of each item of PP&E are depreciated separately	Yes	Exhibit 4B, Tab 1, Schedule 1
32	Identify any Asset Retirement Obligations and associated depreciation	Yes	Exhibit 4B, Tab 1, Schedule 1
32	Historical depreciation practice and proposal for test year. Variances from the half year rule must be documented with supporting rationale	Yes	Exhibit 4B, Tab 1, Schedule 1
33	Copy of depreciation/amortization policy, or equivalent written description; summary of changes to depreciation/amortization policy since last CoS	Yes	Exhibit 4B, Tab 1, Schedule 1
33	Regulatory Accounting changes for depreciation and capitalization - use of Kinectrics study or another study to justify changes in useful life - list detailing all asset service lives tied to USoA, detail and explain differences in TUL from Kinectrics - Appendix 2-BB - recalculation to determine average remaining service life of opening balance on date of making depreciation changes	N/A	Applicant has not made any material changes to depreciation and capitalization since its last rebasing application (EB-2010-0142); see Exhibit 2A, Tab 7, Schedule 1 and Exhibit 4B, Tab 1, Schedule 1.
33 Appendices	Filing under MIFRS - applicable depreciation appendices (Appendix 2-CA to 2-CM)	N/A	Applicant has not made any material changes to depreciation and capitalization since its last rebasing application (EB-2010-0142); see Exhibit 2A, Tab 7, Schedule 1 and Exhibit 4B, Tab 1, Schedule 1.
33 Appendices	Filing under CGAAP,ASPE,USGAAP - applicable depreciation appendices (CGAAP or ASPE Appendix 2-CN to 2-CU, USGAAP Appendix 2-CV); details of TUL whether Kinectrics or other, impacts and justification for change	N/A	Applicant has not made any material changes to depreciation and capitalization since its last rebasing application (EB-2010-0142); see Exhibit 2A, Tab 7, Schedule 1 and Exhibit 4B, Tab 1, Schedule 1.
33	Completed version of the PILs model (PDF and Excel); derivation of adjustments for historical, bridge, test	Yes	Applicant filed completed PILs model for the bridge and test year; see Exhibit 4B, Tab 2, Schedule 2.
33	Supporting schedules and calculations identifying reconciling items	Yes	Exhibit 4B, Tab 2, Schedules 1 and 2
34	Most recent federal and provincial tax returns	Yes	Exhibit 4B, Tab 2, Schedule 3
9 & 34	Financial Statements included with tax returns if different from those filed with application	N/A	Financial statements included with tax returns are not different from those filed at Exhibit 1C, Tab 4, Schedule 2.
34	Calculation of Tax Credits	Yes	Exhibit 4B, Tab 2, Schedules 1 and 2
34	Supporting schedules, calculations and explanations for other additions and deductions	Yes	Exhibit 4B, Tab 2, Schedule 2
34	Exclude from regulatory tax calculation any non-recoverable or disallowed expenses	Yes	Exhibit 4B, Tab 2, Schedule 1
34 & 35	Completion of Integrity checks listed on p34-35; statement confirming completion	Yes	Exhibit 4B, Tab 2, Schedule 1
EXHIBIT 5 - COST OF CAPITAL AND CAPITAL STRUCTURE			
36	Statement that LDC adopting Board's guidelines for cost of capital and confirming updates will be done. Alternatively - utility specific cost of capital with supporting evidence	Yes	Exhibit 5, Tab 1, Schedule 1
3 & 36 Appendices	Completed Appendix 2-OA for last Board approved and test year; total capitalization (debt and equity) must equate to total rate base	Yes	Exhibit 5, Tab 1, Schedule 2
36	Completed Appendix 2-OB for historical, bridge and test year	Yes	Exhibit 5, Tab 1, Schedule 3
37	Explanation for any changes in capital structure	N/A	Applicant has not made any changes in capital structure
37	Calculation of cost for each capital component	Yes	Exhibit 5, Tab 1
37	Profit or loss on redemption of debt	N/A	Not applicable
37	Copies of promissory notes or other debt arrangements with affiliates	Yes	Exhibit 1C, Tab 4, Schedule 6
37	Explanation of debt rate for each existing debt instrument	Yes	Exhibit 5, Tab 1, Schedule 1
37	Forecast of new debt in bridge and test year - details including estimate of rate	Yes	Exhibit 5, Tab 1, Schedule 1

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
37	Not for Profit Corporations - evidence that excess revenue is used to build up operating and capital reserves	N/A	
EXHIBIT 6 - REVENUE DEFICIENCY/SUFFICIENCY			
37 & 38	Calculation of Delivery-Related Revenue Deficiency/Sufficiency: net utility income, rate base, actual return on rate base, indicated rate of return, requested rate of return, def/sufficiency, gross def/sufficiency. Def/sufficiency must be net of other costs (eg. electricity price).	Yes	Exhibit 6, Tab 1
38	Summary of drivers for test year def/sufficiency, how much each driver contributes; references in evidence mapped to drivers	Yes	Exhibit 6, Tab 1
38	Impacts of any changes in methodologies to def/sufficiency	N/A	Applicant has not made any changes in methodologies.
38	RRWF - in PDF and Excel. Revenue requirement, def/sufficiency, data entered in RRWF must correspond with other exhibits	Yes	Exhibit 6, Tab 1, Schedule 2
EXHIBIT 7 - COST ALLOCATION			
39	Completed cost allocation study reflecting future loads and costs. Excel version of 2014 cost allocation model (updated load profiles or scaled version of HONI CAIF)	Yes	Exhibit 7, Tab 1
39	Description of weighting factors, and rationale for use of default values (if applicable)	Yes	Exhibit 7, Tab 1
39	Hard copy of sheets I-6, I-8, O-1 and O-2 (first page)	Yes	
39 &40	Host Dx - evidence of consultation with embedded Dx - Statement regarding embedded Dx support for approach to allocation of costs - If embedded Dx is separate class - class in cost allocation study and Appendix 2-P - If new embedded Dx class - rationale and supporting evidence (cost of serving, load served, asset ownership information, distribution charges); include in cost allocation study and Appendix 2-P - If embedded Dx billed as GS customer - , include with the GS class in cost allocation model and Appendix 2-P. Provide cost of serving, load served, asset ownership information, distribution charges, appropriateness of rate class. LDC may choose to file Appendix 2-Q.	N/A	Applicant is not a host Dx (see Exhibit 1C, Tab 1, Schedule 1).
40	New customer class or eliminated customer class - rationale and restatement of revenue requirement from previous CoS	N/A	
41	Completed Appendix 2-P; supporting information for any proposal to re-balance rates	Yes	Exhibit 7, Tab 2
41	Proposal to re-balance to bring R:C ratio into Board policy range; any proposal to re-balance beyond test year.	Yes	Exhibit 7, Tab 2
42	If Cost Allocation Model other than Board model used - exclude LV, exclude DVA such as smart meters	N/A	
EXHIBIT 8 - RATE DESIGN			
42	Monthly fixed charges - 2 decimal places; variable charges - 4 decimal places	Yes	Exhibit 8, Tab 1
42	Current and Proposed F/V proportion with explanation for any changes	Yes	Exhibit 8, Tab 1
42 & 43	Table comparing current and proposed fixed charge with floor and ceiling from cost allocation study. Explanation for MFC that exceed the ceiling; analysis must be net of adders and riders	Yes	Exhibit 8, Tab 1
43	Retail Transmission Service Rate Work Form - PDF and Excel	Yes	Exhibit 8, Tab 6
16 & 43	RTSR information must be consistent with working capital allowance calculation	No	RTSR (Exhibit 8, Tab 6, Schedule 1) are based on current UTR, as required by model. The Cost of Power forecast used for working capital allowance (Exhibit 2a, Tab 3, Schedule 1) includes a forecast of UTR to better reflect expected transmission charges in 2015.
43	If proposing changes to Retail Service Charge - evidence of consultation and notice	N/A	
44	Wholesale Market Service Rate - reflect $0.0056 in application or justify otherwise	Yes	Rate is $.0057 for 2015; Exhibit 8, Tab 1
44	Smart Metering Charge - reflect $0.79 in application for Residential and GS<50	Yes	Exhibit 8, Tab 1
44	Specific Service Charge description/purpose/reason for new and revised SSC; calculations to support charges	Yes	Exhibit 8, Tab 2

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
44	Identify any rates and charges in Conditions of Service that do not appear on tariff sheet Explain nature of costs, schedule outlining revenues 2009-2012, bridge and test Whether these charges are included on tariff sheet	Yes	Exhibit 8, Tab 2; Exhibit 3, Tab 2.
45	Ensure revenue from SSC corresponds with Operating Revenue evidence	Yes	Exhibit 8, Tab 2; Exhibit 3, Tab 2.
45	Low Voltage Cost (historical, bridge, test), variances and explanations for substantive changes	N/A	
45	Support for forecast LV, e.g. Hydro One Sub-Transmission charges	N/A	
45	Allocation of LV cost to customer classes (typically proportional to Tx connection revenue)	N/A	
45	Proposed LV rates by customer class	N/A	
45	Proposed SFLF and Total Loss Factor for test year	Yes	Exhibit 8, Tab 1, Schedule 1
45	Statement as to whether LDC is embedded	N/A	Applicant is not embedded
45	Study of losses if required by previous decision	N/A	Not required by decision
45	3-5 years of historical loss factor data - Completed Appendix 2-R	N/A	As noted in Exhibit 8, Tab 1, Schedule 1, a review of loss factors is currently underway, and will be filed as an update to the Applicaiton.
46	Explanation of losses >5%	N/A	Current approved losses <5%
46	If proposed loss factor >5%, action plan to reduce losses going forward	N/A	Current approved losses <5%
46	Explanation of SFLF if not standard	N/A	Standard applied
46	Current Tariff of Rates and Charges	Yes	Exhibit 8, Tab 3, Schedule 1
46	Track Changes version of current tariff showing proposed changes	Yes	Exhibit 8, Tab 3, Schedule 2
46	Proposed Tariff of Rates - Appendix 2-Z	Yes	Exhibit 8, Tab 3, Schedule 3
46	Explanation of changes to terms and conditions of service if changes affect application of rates	N/A	No changes affecting application of rates
46	Calculations of revenue per class under current and proposed rates; reconciliation of rate class revenue and other revenue to total revenue requirement	Yes	Exhibit 8, Tab 1, Schedule 2
46	Completed Appendix 2-V (Revenue Reconciliation)	Yes	Exhibit 8, Tab 4
46 & 47	Bill Impacts - completed Appendix 2-W for all classes for representative samples of end-users. Must provide residential 800 kWh and GS<50 2,000 kWh. Commodity and regulatory charges held constant	Yes	Exhibit 8, Tab 7
47 & 48	Mitigation plan if total bill increase for any customer class is >10% including: specification of class and magnitude of increase, description of mitigation measures, justification, revised impact calculation	N/A	Total bill increase is not > 10% for any customer class.
48	Rate Harmonization Plans, if applicable - including impact analysis	Yes	Exhibit 8, Tab 1, Schedule 1
EXHIBIT 9 - DEFERRAL AND VARIANCE ACCOUNTS			
48	List of all outstanding DVA and sub-accounts; provide description of DVAs that were used differently than as described in the APH	Yes	Exhibit 9, Tab 1; no deviation from APH.
48 & 49	Completed DVA continuity schedule for period following last disposition to present - Excel format	Yes	Exhibit 9, Tab 2, Schedule 1
49	Interest rates applied to calculate carrying charges (month or quarter)	Yes	Exhibit 9, Tab 2, Schedule 2
49 & 55	Explanation if account balances in continuity schedule differs from trial balance in RRR and AFS	Yes	No deviation from AFS; Exhibit 9, Tab 2, Schedule 1.
49	Identification of Group 2 accounts that will continue/discontinue going forward, with explanation	Yes	Exhibit 9, Tab 1, Schedule 1
49	Proposed allocators for DVA for which Board has not established approved allocator	Yes	Exhibit 9, Tab 1, Schedule 1; Exhibit 9, Tab 3, Schedule 1
48 & 49	Statement as to any new accounts, and justification.	Yes	Exhibit 9, Tab 1, Schedule 1
49	Statement whether any adjustments made to DVA balances previously approved by Board on final basis; explanation and amount of adjustment	N/A	No adjustments to DVA
49	Breakdown of energy sales and cost of power by USoA - as reported in AFS mapped to USoA. Provide explanation if making a profit or loss on commodity.	Yes	Exhibit 9, Tab 2, Schedule 2
49	Statement confirming that IESO GA charge is pro-rated into RPP and non-RPP; provide explanation if not pro-rated.	Yes	Exhibit 9, Tab 2, Schedules 1 and 2
50	If not addressed previously, disposition of Account 1592 - Completed Appendix 2-TA	Yes	Exhibit 9, Tab 2, Schedule 3

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
50	If not addressed previously, disposition of Account 1592 sub-account HST/OVAT ITC - analysis that supports conformity with Dec 2010 APH FAQ (particularly #4) - completed Appendix 2-TB Applicant must state the period that the account covers (i.e. Jul 1-2010 up to start of new rate year (year of rebasing))	Yes	Exhibit 9, Tab 1, Schedule 1.
50 & 51	Assuming 2014 CoS filed under MIFRS: One time IFRS transition costs - If IFRS transition costs in rates, file for disposition of balance in IFRS variance account; - completed Appendix 2-U - statement whether any one time IFRS transition costs are embedded in 2014 revenue requirement where it is embedded - explanation for each category of cost recorded in 1508 sub-account - explanation for material variances - statement that no capital costs, ongoing IFRS compliance costs are recorded in 1508 sub-account; provide explanation if this is not the case	N/A	Applicant is not seeking to recover IFRS transitions costs in this Application.
51 & 52	Assuming 2014 CoS filed under MIFRS - 1575 IFRS-CGAAP PP&E account - breakdown of balance, Appendix 2-EA, 2-EB or 2-EC - listing and quantification of drivers - a breakdown for quantification of any accounting changes arising from IFRS in relation to PP&E - volumetric rate rider to clear 1575; explain basis for disposition period - rate of return component is to be applied to 1575 but not recorded in 1575 - statement confirming no carrying charges applied to 1575 - show the balance in DVA continuity schedule	Yes	Exhibit 9, Tab 1 and 3
53 & 54	Assuming 2014 CoS filed under CGAAP or ASPE, or 2014 CoS under MIFRS with changes to depreciation and capitalization in 2012 or 2013 - 1576 IFRS-CGAAP PP&E account - Appendix 2-BA1 or 2-BA2 must not be adjusted for 1576 - breakdown of balance related to 1576, Appendix 2-ED or 2-EE - volumetric rate rider to clear 1576; explain basis for disposition period - rate of return component is to be applied to 1576 but not recorded in 1576 - statement confirming no carrying charges applied to 1576 - show the balance in DVA continuity schedule	N/A	
54	Retail Service Charges - material balance in 1518 or 1548 - confirm variances are incremental costs of providing retail services - identify drivers - provide schedule identifying all revenues and expenses listed by USoA for 2012, bridge and test years - state whether Article 490 of APH has been followed; explanation if not followed	Yes	Exhibit 9, Tab 2, Schedule 1
54	Retail Service Charges - zero balance in 1518 or 1548 - state whether Article 490 of APH has been followed; explanation if not followed	No	Exhibit 9, Tab 2, Schedule 1; did not follow Article 490 of the APH due to immateriality; included in revenue offset Exhibit 3, Tab 2.
4 & 55	Identify all accounts for which LDC is seeking disposition; identify DVA for which LDC is not proposing disposition and the reasons why Proposal for disposition of deferral accounts for renewable generation connection and smart grid as set out in FR "Distribution System Plans - Filing Under Deemed Conditions of Licence"	Yes	Exhibit 9, Tab 2, Schedule 1
55	Proposed rate riders (Separate rate rider for RSVA GA for non-RPP customers). Default disposition period of 1 year and provide explanation for deviations from default period. Show calculations - allocation of each account, billing determinants and length of disposition period	Yes	Exhibit 9, Tab 1, Schedule 1; Exhibit 9, Tab 3, Schedule 1
49 & 55	Statement whether DVA balances before forecasted interest match the last AFS	Yes	Yes DVA balances before forecasted interest match the AFS.

Filing Requirements Checklist

Toronto Hydro-Electric System Limited ("Toronto Hydro")

EB-2014-0116

Date:July 22, 2014

Filing Requirement Page # Reference		Yes/No/N/A	Evidence Reference, Notes
55	Provide an explanation of variance > 5% between amounts proposed for disposition and amounts reported in RRR for each account. Provide explanations even if such variances are < 5% threshold if the variances in question relate to: (1) matters of principle (i.e. conformance with the APH or prior Board decisions, and prior period adjustments); and/or, (2) the cumulative effect of immaterial differences over several accounts totaling to a material difference between what is proposed for disposition in total before forecasted interest and what is recorded in the RRR filings	Yes	Exhibit 9, Tab 1, Schedule 1.
55	New DVA - must meet causation, materiality, prudence criteria; include draft accounting order	Yes	Exhibit 9, Tab 1, Schedule 1
56	LRAMVA - disposition of balance - statement indicating use of most recent input assumptions when calculating lost revenue -statement indicating reliance on most recent CDM evaluation report from OPA; copy of report - Tables for each rate class showing lost revenue by year - lost revenue calculations - energy savings by class and Board approved variable charge - statement that indicates if carrying charges are requested - Third party report for any Board-approved programs	Yes	Exhibit 9, Tab 2, Schedule 5
57	Smart Meters - if applying for final disposition, completed smart meter model (excel) must be filed. Refer to G-2011-0001 regarding proposal to dispose of balances. Any previous approval should be documented.	N/A	Smart meter disposition approved by OEB in EB-2013-0287.
	TOTAL "NO"	**2**	

RESPONSE TO THE LETTERS OF COMMENT

In the course of Toronto Hydro's 2015-2019 Custom IR application, the Ontario Energy Board ("OEB") received three letters of comment from Toronto Hydro's customers, namely from Messrs. Norm Hann, Ron Dash, Sr., and Richard Cassel. Toronto Hydro appreciates its customers sharing their observations and provides the following response.

While each author raised a number of points, the above-noted letters generally addressed three major areas, including Toronto Hydro's variable compensation structure, efficiencies/savings available within Toronto Hydro's budget and the electricity sector more generally, as well as Toronto Hydro's system planning and response procedures associated with major storms. Toronto Hydro will address each of these topics in order.

Incentive/Variable Compensation

In his commentary, Mr. Cassel requests that the OEB give consideration to mandating that Management employee's variable compensation structures be based on multiple criteria (including maintenance standards, safety record, profit and customer satisfaction and be determined by an independent third party).

As discussed in Exhibit 4A, Tab 4 Schedule 5 of Toronto Hydro's application the utility's "variable performance pay rewards employees for their contribution to the achievement of business goals and objectives tied to the utility's pillars in combination with the successfully demonstrated corporate competencies."[1] In other words, each eligible employee's variable compensation pay depends on their performance relative to specific objectives outlined in their annual performance contracts, and their contribution to a set of departmental and corporate measures, known as the Key Performance Indicators, relating to customer service, operating activities, financial performance and employee

[1] Exhibit 4A, Tab 4 Schedule 5, p.7

health and safety. More information regarding Toronto Hydro's corporate Key Performance Indicators can be found in Toronto Hydro's response to interrogatory 1B-SIA-2.

With respect to Mr. Cassel's suggestions regarding the third-party evaluation of variable compensation amounts for Toronto Hydro's management, the utility notes that it has filed in this proceeding an independent third-party study which benchmarks its compensation and benefits program relative to other energy sector entities, as well as general industry organizations. This study, prepared by Towers Watson, can be found at Exhibit 4A, Tab 4, Schedule 6.

To summarize, Toronto Hydro's variable pay structure is based in part on the individuals' contribution to a broad range of corporate objectives, and is subject to a third-party assessment as part of an overall compensation and benefits benchmarking exercise.

Available Savings and Efficiencies

Toronto Hydro is not in a position to comment on Mr. Dabor's observations regarding Ontario Power Generation (OPG) and its operations. However, the utility notes that in the current application, it has provided a significant amount of evidence regarding efficiency and productivity. This evidence is located at Exhibit 1B, Tab 2, Schedule 5 and includes:

- an econometric total cost benchmarking study prepared by Power System Engineering Inc. that evaluates Toronto Hydro's historical and projected total cost levels against the model-derived efficient cost levels for a utility with Toronto Hydro's business characteristics,
- a past productivity study that details the significant productivity/efficiency efforts undertaken by the utility from the time of Toronto's municipal amalgamation to 201, and

- evidence discussing Toronto Hydro's corporate approach to productivity and performance measurement which contains multiple examples of current and planned initiatives underlying the utility's culture of continuous improvement.

Finally, Toronto Hydro notes that its application is underlined by a custom Price Cap Index formula, which is designed to incent the utility to continuously seek operating efficiencies throughout the remainder of its 2015-2019 plan.

To summarize, Toronto Hydro has advanced a substantive and comprehensive account of its productivity and efficiency accomplishments to date, the reasonableness of its cost forecasts and the key tenets of the utility's productivity and continuous improvement culture.

Storm-Related Investments

In his letter, Mr. Hann raises a number of technical issues pertaining to Toronto Hydro's storm-related system design parameters and operating practices, as well as the specific circumstances surrounding the utility's response to the December 2013 Ice Storm.

Toronto Hydro notes that these issues surrounding major event preparedness and response have been thoroughly canvassed in the Report of the Independent Review Panel filed at Exhibit 4A, Tab 2, Schedule 4, Appendix A.

As stated in the Executive Summary [Exhibit 1A, Tab 2, Schedule 1], over the 2015-2019 timeframe, Toronto Hydro's plans supporting its funding requests include taking a number of steps to enhance its storm-related operational practices and capabilities, including an upgrade of its Outage Management System, enhancements to the damage

assessment activities, outage restoration time estimation practices, and other improvements recommended by the Panel's Report.[2]

In addition, Toronto Hydro's application contains a number of proposed capital investments and maintenance activities that can be expected to improve system performance against extreme weather, as well as to address their respective primary drivers. Among these programs are:

- Overhead Infrastructure Relocation;
- Rear Lot Conversion;
- Box Construction Conversion;
- Feeder Automation;
- Contingency Enhancement;
- Downtown Contingency;
- Design Enhancement; and
- Vegetation Management.

Toronto Hydro assesses that undertaking the above-referenced investments, activities and operating enhancements, and leveraging the practical experience and insights gained from the 2013 December Ice Storm will enable the utility to increase its service levels in future emergency situations.

OFFICER'S CERTIFICATE

As the Executive Vice President, Chief Regulatory Officer and General Counsel of Toronto Hydro-Electric System Limited ("Toronto Hydro"), I hereby certify that the evidence submitted in support of Toronto Hydro's 2015-2019 Custom Incentive Rate-setting Application (EB-2014-0116) as filed with the Ontario Energy Board is accurate, consistent and complete to the best of my knowledge.

This certificate is given pursuant to the Ontario Energy Board's *Filing Requirements for Electricity Distribution Rate Applications* (revised July 17, 2013).

DATED this 31st day of July, 2014.

Paul Sommerville
Executive Vice President, Chief Regulatory Officer and General Counsel

Glossary

"Affiliate Relationships Code" or "ARC" refers to the OEB's Affiliate Relationships Code for Electricity Distributors and Transmitters.

"AFUDC" refers to Allowance For Funds Used During Construction.

"AWG" refers to aluminum conductor steel reinforced assets.

"ACM" refers to Asbestos Containing Material.

"ACA" refers to Toronto Hydro's asset condition assessment.

"AFS" refers to Toronto Hydro's audited financial statements

"APH" refers to the OEB's Accounting Procedures Handbook.

"ARO" refer to Asset Retirement Obligation.

"ATS" refers to Automatic Transfer Switches.

"BAS" refers to Building Automation Systems.

"BCE" refers to business case evaluation.

"CAIDI" refers to the Customer Average Interruption Duration Index and is a measure (in hours) of the average duration of interruptions experienced by customers, not including MED. CAIDI represents the quotient obtained by dividing SAIDI by SAIFI.

"Capital Expenditures" or "Capex" refers to expenditures relating to property, plant and equipment and intangible assets.

"Catastrophic Failure" refers to a mode of failure of an electrical distribution component in which incidental damage to other equipment and/or injury to a person

occurs or could occur, in addition to the loss of the electrical distribution function of the component itself. Arc flashes, fires, falling poles, and structural collapse are examples of catastrophic failure. Catastrophic failure is distinguished from failure-by-design and simple failure modes in which a component, such as a fuse, performs according to design to interrupt the flow of electricity.

"CC&B" refers to the Customer Care & Billing system, Toronto Hydro's main customer care interface used for billing and customer information.

"CDM" refers to conservation and demand management.

"CDP" refer to Toronto Hydro's corporate disaster preparedness framework.

"CDS" refers to Cogeco Data Services.

"CEA" refers to the Canadian Electricity Association.

"CEMLC" refers to Commercial Energy Management & Load Control,

"CGAAP" refer to Canadian Generally Accepted Accounting Principles,

"CHI" refers to Customer Hours Interrupted,

"CI" refers to Customer Interruptions.

"CIS" refers to customer information system. Toronto Hydro's current CIS is the CC&B.

"City" refers to the City of Toronto.

"C&I" refers to Commercial and Institutional customers.

"CO" refers to Carbon Monoxide

"CPCP" refers to a Certified Power Cable Person.

"CPLP" refers to a Certified Power Line Person

"CRD" refers to Compact Radial Design assets.

"CWDM" refers to Coarse Wavelength Division Multiplexing.

"CUPE One" or "CUPE" refers to the Canadian Union of Public Employees, Local One

"CWIP" refers to Construction Work In Progress

"DOS" refers to Days Of Service.

"Distribution System Code" or "DSC" refers to the OEB's Distribution System Code.

"DMS" refer to Toronto Hydro's Distribution Management System.

"DRH" refers to the OEB's Electricity Distribution Rate Handbook..

"DST" refers to the Distribution System Technologist.

"DVA" refers to Deferral and Variance Accounts.

"EHS" refers to Environment, Health and Safety.

"EHSMS" refer to the Environmental, Health and Safety Management System.

"Electricity Act" refers to the Electricity Act, 1998, S.O. 1998, c. 15, Sched. A (Ontario), as amended.

"EUSR" refers to the Electrical Utilities Safety Rules.

"ERM" refers to Enterprise Risk Management.

"ERP" refers to an Enterprise Resource Planning system.

"ESQR" refers to Electricity Service Quality Requirements as mandated by the OEB's Distribution System Code.

"FCI" refers to a Faulted Circuit Indicator.

"FESI" refers to Feeders Experiencing Sustained Interruptions.

"Filing Requirements" refers to Chapters 2 and 5 of the OEB Filing Requirements for Electricity Distribution Rate Applications (July 17, 2013).

"FIM" refers to Toronto Hydro's Feeder Investment Model.

"GIS" refers to the Geographical Information System.

"GEAR" refers to the Geospatially Enabled Asset Registry, a geospatial information system used by Toronto Hydro that provides a graphic representation of distribution assets and their relationship to other assets within Toronto Hydro's network.

"GEA" or "Green Energy Act" refers to the Green Energy and Green Economy Act, 2009, S.O. 2009, C. 12 (Ontario), as amended.

"GWh" refers to a gigawatt-hour, a standard unit for measuring electrical energy produced or consumed over time. One GWh is the amount of electricity consumed by one million kWh.

"HST" refer to Harmonized Sales Tax.

"HVAC" refers to Heating, Ventilation, and Air-Conditioning.

"Hydro One" or "HONI" refers to Hydro One Networks Inc.

"IAS" refers to International Accounting Standards.

"IED" refers to an Intelligent Electronic Device.

"IEEE" refers to the Institute of Electrical and Electronic Engineers Inc.

"IESO" refers to the Independent Electricity System Operator.

"IFRS" refers to the International Financial Reporting Standards.

"IHD" refers to an In-Home Display.

"IRRP" refers to the Integrated Regional Resource Plan.

"ISA" refers to an in-service addition of assets to the utility's rate base.

"IT" refers to Information Technology.

"IVR" refer to the Interactive Voice Response technology that assists customers with their account management enquiries by providing updated account balances, payment option information, bill amount predictors and other related tools.

"KPI" refers to Key Performance Indicators.

"kW" refers to a kilowatt, a common measure of electrical power equal to 1,000 Watts.

"kWh" refers to a kilowatt-hour, a standard unit for measuring electrical energy produced or consumed over time. One kWh is the amount of electricity consumed by ten 100 Watt light bulbs burning for one hour.

"LEAP" refers to the financial assistance portion of the OEB's Low-Income Energy Assistance Program.

"LCA" refers to a Life Cycle Analysis.

"LRAM" refers to the Lost Revenue Adjustment Mechanism.

"LRAMVA" refers to the Lost Revenue Adjustment Mechanism Variance Account.

"MED" refers to major event days as defined by Institute of Electrical & Electronic Engineers Inc. specification 1366.

"MCR" refers to the City of Toronto's Municipal Consent Requirements for the Installation of Plant Within City of Toronto Streets.

"mIFRS" or "MIFRS" refers to Modified IFRS.

"MAIFI" refers to the Momentary Average Interruption Frequency Index.

"MW" refers to megawatt, a common measure of electrical power equal to one million watts.

"NBV" refers to Net Book Value.

"NPV" refers to Net Present Value.

"NERC" refers to the North American Electric Reliability Corporation.

"OCCP" refer to the Operational Orders Consolidation Program.

"OEB" refers to the Ontario Energy Board.

"OEM" refers to the Original Equipment Manufacturer.

"OHSA" refers to the Occupational Health and Safety Act, R.S.O. 1990, c. O.1.

"OMERS" refers to the Ontario Municipal Employees Retirement System, a multi-employer, contributory, defined benefit pension plan established in 1962 by the Province for employees of municipalities, local boards and school boards in Ontario.

"OMS" refers to Toronto Hydro's Outage Management System.

"OPA" refers to the Ontario Power Authority.

"OSC" refer to the Ontario Securities Commission.

"OTO" refers to Orders to Operate.

"PCT" refers to a Programmable Communicating Thermostat.

"PFA" refers to police, fire and ambulance emergency calls.

"PILs" refers to the Payment In Lieu of Corporate Taxes.

"PILC" refers to Paper-Insulated Lead Cable.

"PPE" refers to Personal Protective Equipment.

"PP&E" refer to Property, Plant and Equipment.

"PSC" refers to a Power System Controller.

"PSE" refers to Power System Engineering Inc.

"RPB" refers to Reverse Power Breakers.

"REG" refers to Renewable Energy Generation.

"RRFE" refers to the OEB's policy for a Renewed Regulatory Framework for Electricity Distributors.

"RRR" refers to the OEB's Reporting & Record Keeping Requirements.

"RSC" refers to the OEB's Retail Settlement Code.

"RTU" refers to a Remote Terminal Unit.

"SAIDI" refers to the System Average Interruption Duration Index and is a measure (in hours) of the annual system average interruption duration for customers served, not

including MED. SAIDI represents the quotient obtained by dividing the total customer hours of interruptions longer than one minute by the number of customers served.

"SAIFI" refers to the System Average Interruption Frequency Index and is a measure of the frequency of service interruptions for customers served, not including MED. SAIFI represents the quotient obtained by dividing the total number of customer interruptions longer than one minute by the number of customers served.

"SCADA" refers to Supervisory Control and Data Acquisition.

"Smart Meter" refers to a metering device capable of recording and transmitting hourly consumption information of a residential or general service customer.\

"SSS" refers to the OEB Standard Supply Service Code for Electricity Distributors.

"Toronto Hydro" refers to Toronto Hydro-Electric System Limited.

"TOU" refer to Time of Use billing practices

"Transmission System Code" or "TSC" refers to the OEB's Transmission System Code.

"TRC" refers to Total Resource Cost.

"TSSA" refers to the Technical Standards and Safety Authority.

"URD" refers to Underground Residential Distribution.

"USGAAP" refers to United States Generally Accepted Accounting Principles.

"USL" refer to the Unmetered Scattered Load rate class.

"USofA" refers to the Uniform System of Accounts set out in the Accounting Procedures Handbook.

“WCA” refers to the Working Capital Allowance.

“Watt” or “W” refers to a common measure of electrical power. One Watt equals the power used when one ampere of current flows through an electrical circuit with a potential of one volt.

“WMS” refer to the Warehouse Management System.

“WSIB” refers to the Workplace Safety and Insurance Board.

DISCLAIMER

The information in these materials is provided to the OEB for the purpose of presenting the OEB with Toronto Hydro's electricity distribution rates application pursuant to the OEB's Custom Incentive Rate-Setting framework (the "Application"). Toronto Hydro does not warrant the accuracy, reliability, completeness or timeliness of the information and undertakes no obligation to revise or update these materials, except as required for purposes of providing new information that represents a material change to the evidentiary record in the Application before the OEB. Toronto Hydro (including its directors, officers, employees, agents and subcontractors) hereby waives any and all liability for damages of whatever kind and nature which may occur or be suffered as a result of the use of these materials or reliance on the information therein.

These materials may also contain forward-looking information within the meaning of applicable securities laws in Canada ("Forward-Looking Information"). The purpose of the Forward-Looking Information is to provide Toronto Hydro's expectations and future requirements for 2015 through 2019, and may not be appropriate for other purposes. All Forward-Looking Information is given pursuant to the "safe harbour" provisions of applicable Canadian securities legislation. The words "aims", "anticipates", "believes", "budgets", "committed", "could", "estimates", "expects", "forecasts", "intends", "may", "might", "plans", "projects", "schedule", "should", "strives", "will", "would" and similar expressions are often intended to identify Forward-Looking Information, although not all Forward-Looking Information contains these identifying words.

The Forward-Looking Information reflects the current beliefs of, and is based on information currently available to, Toronto Hydro's management. The Forward-Looking Information in these materials includes, but is not limited to, statements regarding Toronto Hydro's future results and performance, as well as expected nature, timing and cost of capital and operational programs. The statements that make up the Forward-Looking Information are based on assumptions that include, but are not limited to, expected load and customer growth, externally driven plant relocation requests, estimated project costs, receipt of applicable regulatory approvals and requested rate orders. The Forward-Looking Information is subject to risks, uncertainties and other factors that could cause actual results to differ materially from historical results or results anticipated by the Forward-Looking Information. The factors which could cause results or events to differ from current expectations include, but are not limited to, the rate of deterioration of Toronto Hydro's assets, weather and environmental factors, unexpected increases or decreases in load and customer growth, differences between estimated and actual project costs, project delay due to factors beyond the control of Toronto Hydro's management, and legislative, judicial or regulatory developments that could affect Toronto Hydro's ability to meet the goals set out in this application. Toronto Hydro cautions that this list of factors is not exclusive.

All Forward-Looking Information in these materials is qualified in its entirety by the above cautionary statements, except as required by law, or by the OEB for the purposes of the Application. Toronto Hydro undertakes no obligation to revise or update any Forward-Looking Information as a result of new information, future events or otherwise after the date hereof, except as required under securities laws, or by the OEB for the purposes of the Application.

IN THE MATTER OF the *Ontario Energy Board Act, 1998*, Schedule B to the *Energy Competition Act, 1998*, S.O. 1998, c.15;

AND IN THE MATTER OF an Application by Toronto Hydro-Electric System Limited for an Order or Orders approving or fixing just and reasonable distribution rates and other charges, effective May 1, 2015 to December 31, 2019.

The Applicant, Toronto Hydro-Electric System Limited (referred to in this application as the "Applicant, "Toronto Hydro", "THESL", the "Company" or the "Utility"), is a corporation incorporated under the *Business Corporations Act*, (Ontario), and is licensed by the Ontario Energy Board (the "OEB") under licence number ED-2002-0497 to distribute electricity in the City of Toronto.

Toronto Hydro hereby applies to the OEB pursuant to section 78 of the *Ontario Energy Board Act, 1998* (the "OEB Act") as amended, for approval of its proposed

1) electricity distribution rates and other charges effective May 1, 2015; and
2) custom Price Cap Index ("Custom PCI") framework to set distribution rates effective for the period January 1, 2016 to December 31, 2019, and the rates and charges resulting from it.

This application is prepared in accordance with the following OEB documents:

1) Filing Requirements for Electricity Distribution Rate Applications issued by the OEB on November 14, 2006 under file number EB-2006-0170, and updated on July 17, 2013 (the "Filing Requirements"); and

2) Report of the Board: Renewed Regulatory Framework for Electricity Distributors: A Performance - Based Approach, issued by the OEB on October 18, 2012 under file numbers EB-2010-0377, EB-2010-0378, EB-2010-0379, EB-2011-0043 and EB-2011-0004 (the "RRFE Report").

This application is supported by pre-filed written evidence, which may be amended from time to time, prior to the OEB's final decision on this application.

I. FORM OF HEARING REQUESTED

Toronto Hydro requests that this application be disposed of by way of an oral hearing.

II. PROPOSED EFFECTIVE DATE

The applicant requests that the OEB make its Rate Order effective May 1, 2015, notwithstanding that the OEB's Decision with Reasons approving or fixing these rates and other charges may not be delivered until after that date. In the alternative, the Applicant requests an interim Order making the Applicant's current distribution rates and charges effective on an interim basis as of May 1, 2015 and establishing an account to recover any differences between the interim rates and the actual rates effective May 1, 2015 based on the OEB's Decision and Order.

III. PROPOSED DISTRIBUTION RATES AND OTHER CHARGES

The Tariff of Rates and Charges proposed in this application is identified in Exhibit 8, Tab 3, Schedule 3. In addition to the evidence in support of those rates and charges for 2015 test year, Toronto Hydro also files with this application evidence in support of its Custom Incentive Rate-Setting ("Custom IR" or "CIR") framework and the rates resulting from it.

IV. PROPOSED DISTRIBUTION RATES ARE JUST AND REASONABLE

For all the reason set out in this application. Toronto Hydro submits that the proposed distribution rates and other charges are just and reasonable.

V. SPECIFIC RELIEF REQUESTED

With this application, Toronto Hydro requests:

1) Approval of 2015 base revenue requirement as proposed in Exhibit 6, Tab 1. For greater clarity, this includes:

a) cost of capital and debt to fund rate base, as set out in Exhibit 2A;
b) revenue offset forecasts, as set out in Exhibit 3, Tab 2; and
c) operations, maintenance and administration expenses, as set out in Exhibit 4A,
d) a depreciation expense, as set out in Exhibit 4B, Tab 1; and
e) payments in lieu of taxes, as set out in Exhibit 4B, Tab 2;

2) Approval of 2015 electricity distribution rates and charges as proposed in Exhibit 8, including a number of credits to customers. In particular:

a) base distribution rates as set out in Exhibit 8, Tab 1, Schedule 1;
b) rate riders as set out in Exhibit 9, Tab 3, Schedule 1; and
c) Specific Service Charges as set out in Exhibit 8, Tab 2, Schedule 1.

3) Approvals related to deferral and variance accounts as proposed in Exhibit 9. In particular:

a) to dispose of balances in existing deferral and variance accounts as at December 31, 2013 as detailed in Exhibit 9, Tab 1, Schedule 1;

b) approval of the continuation of existing deferral and variance accounts, as set out in Exhibit 9, Tab 1, Schedule 1;

c) relief from having to record amounts to Retailer Cost Variance Accounts as set out in Exhibit 9, Tab 1, Schedule 1; and

d) approval of four new deferral and variance accounts as proposed in Exhibit 9, Tab 1, Schedule 1: /C

   i) a variance account in respect of externally-initiated plant relocations and expansions;

   ii) a variance account in respect of derecognition losses;

   iii) a variance account to record the difference between the actual costs of approved eligible investments and the revenue received from the IESO relating to Provincial Rate Protection amounts; and

   iv) a deferral account in respect of costs and savings related to the mandatory transitioning of certain customers to monthly billing. /C

4) Approval of the rate-setting formula and related elements, as proposed in Exhibit 1B, Tab 2, Schedule 3.

5) Approval to implement rate year synchronization effective January 1, 2016, as proposed in Exhibit 8, Tab 1, Schedule 1.

6) Approval of annual reporting as proposed in Exhibit 1B, Tab 2, Schedule 6;

7) Deferral of the Incremental Capital Module true-up from EB-2012-0064, and approval to bring forward a separate application in 2015 as proposed in Exhibit 2A, Tab 9, Schedule 1.

8) Other items or amounts that may be requested by the Applicant in the course of the proceeding, and such other relief or entitlements as the OEB may grant.

DATED at Toronto, Ontario, this 13 day of February, 2015. **/C**

2015 – 2019 CUSTOM IR FRAMEWORK INTRODUCTION

The purpose of this schedule is to provide a brief overview of the documents contained in the Exhibit 1B, Tab 2, which describe the key elements of Toronto Hydro's Custom Incentive Rate-Setting (Custom IR) application. The evidence sets out Toronto Hydro's proposal for and justification of the Custom IR framework underlying this application, and provides references to other supporting evidence throughout the Application.

Exhibit 1B, Tab 2 consists of eight schedules:

1) Schedule 1, Introduction (this document)
2) Schedule 2, Alignment with OEB Guidance: Describes how Toronto Hydro's Custom IR application aligns with the OEB's guidance in the Renewed Regulatory Framework for Electricity (RRFE) report and Chapters 2 and 5 of the Filing Requirements for Electricity Distribution Rate applications.
3) Schedule 3, Rate Framework: Details Toronto Hydro's proposed rate-setting framework , including the custom Price Cap Index approach to setting rates for the 2016-2019 period, following the establishment of 2015 base rates through a traditional test year approach.
4) Schedule 4, Capital Investment (and Appendices): Provides an overview of Toronto Hydro's Distribution System Plan (DSP), the utility's approach to capital planning, and Toronto Hydro's operating environment, which presents certain planning and work execution challenges. This schedule also includes a third-party review of Toronto Hydro's DSP, performed by Navigant Consulting Inc. (Navigant).
5) Schedule 5, Efficiency, Productivity and Continuous Improvement (and Appendices): Centralizes Toronto Hydro's evidence in support of the adequacy of its past and future productivity levels, describes Toronto Hydro's approaches to performance measurement and continuous improvements, and provides references

to other parts of the application where productivity and efficiency initiatives are described in more detail. This schedule also includes a third-party econometric benchmarking study of Toronto Hydro's total costs and reliability conducted by Power System Engineering Inc. (PSE).

6) Schedule 6, Annual Reporting: Provides information about the scope and manner of the annual reporting activities that Toronto Hydro proposes to undertake over the 2015-2019 Custom IR period.
7) Schedule 7, Customer Engagement (and Appendices): Details the utility's approach to customer engagement both in the ordinary course of its operations, as well as for this application, particularly relating to the DSP.
8) Schedule 8, Stakeholder Consultation (and Appendices): Describes Toronto Hydro's approach to, and results of, the stakeholdering activities undertaken in preparing this application.

ALIGNMENT WITH OEB GUIDANCE

1. OVERVIEW

The purpose of this schedule is to describe how Toronto Hydro's 2015-2019 Custom Incentive Rate-Setting ("Custom IR" or "CIR") application aligns with the Ontario Energy Board's ("OEB") guidance contained within the Renewed Regulatory Framework for Electricity Distributors, and the Filing Requirements (together, "OEB Guidance").

Specifically, in preparing this application, Toronto Hydro has considered the tenets of the Report of the Board "Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach" issued October 18, 2012 (the "RRFE Report"), as well as Chapters 2 and 5 of the OEB's Filing Requirements for Electricity Distribution Rate applications issued July 17, 2013 (the "Filing Requirements").

Toronto Hydro has applied this approach understanding that aside from Chapter 5 of the Filing Requirements, there are no specific filing requirements for the CIR applicants. However, and as discussed in more detail below, Toronto Hydro's view is that the RRFE Report clearly conveys a number of key policy and mechanistic/administrative components of the OEB's expectations for CIR applications. These include the form of the rate-setting mechanism, areas of focus for the enquiry, and the scope and nature of evidence filed in support of the applications.

Toronto Hydro's view is that, in addition to substantive reasons to follow OEB Guidance, doing so also aids in the utility's application being accessible and digestible to the OEB, intervenors and the public. In particular, Toronto Hydro's Custom IR application aligns with OEB Guidance as follows:

1) The mechanism of the CIR Rate-Setting Framework;
2) The scope and nature of productivity evidence, including benchmarking;

3) Capital planning and implementation performance measures;
4) Evidence of customer engagement on the proposed capital investments;
5) A Distribution System Plan ("DSP") that conforms to Chapter 5 of Filing Requirements;
6) A program-based presentation of the Capital, Maintenance & Administration ("OM&A") expenditures; and
7) General adherence to Chapter 2 of the Filing Requirements.

Table 1 below provides a brief overview of these seven aspects.

Table 1: OEB Guidance Addressed in Toronto Hydro's 2015-2019 CIR Application

	OEB Guidance	Toronto Hydro's 2015-2019 CIR Application	Evidence Reference
1	A Custom Index rate-setting model, incorporating benefit-sharing through a Productivity Factor and a Stretch Factor, using the OEB's Inflation and Productivity analysis.[3]	OEB Guidance Addressed. The Application is based on a Custom Index rate-setting approach, incorporating the elements of the OEB's PCI framework, and the results of the OEB's inflation and productivity analysis.	Exhibit 1B, Tab 2, Schedule 3. Exhibit 1B, Tab 2, Schedule 5.
2	CIR productivity evidence should enable a sufficiently rigorous assessment of adequacy of the past and future productivity levels.[4] CIR applicants are expected to provide benchmarking evidence in support of reasonableness of their cost forecasts.[5]	OEB Guidance Addressed. The application includes a review of the utility's past productivity achievements, a Custom Total Cost and Reliability Econometric Benchmarking study, along with specific examples of current and anticipated productivity/efficiency initiatives and the utility's	Exhibit 1B, Tab 2, Schedule 5, and Appendices.

[3] RRFE Report at page 13.
[4] RRFE Report at page 70.
[5] RRFE Report at page 13, Table 1.

	OEB Guidance	Toronto Hydro's 2015-2019 CIR Application	Evidence Reference
		corporate culture of productivity.	
3	DSP filings must be supported by Performance Measures covering Customer-Oriented Performance, Cost Efficiency / Effectiveness of Planning and Implementation, and Asset / System Performance.[6]	OEB Guidance Addressed. Toronto Hydro's DSP includes 12 capital performance measures that the utility proposes to track and report on over the CIR timeframe. The measures address all three specific OEB-mandated categories.	Exhibit 2B, Section C.
4	Applications must showcase the applicants' efforts to engage their customers on their capital plans and planning processes.[7]	OEB Guidance Addressed. Toronto Hydro's application details the steps taken by the utility to engage its customers on the proposed DSP, along with the results of these engagements.	Exhibit 1B, Tab 2 Schedule 7
5	CIR applicants are required to file a DSP as specified in Chapter 5 of the OEB's Filing Requirements.[8]	OEB Guidance Addressed. Toronto Hydro's DSP has been prepared according to the Chapter 5 requirements.	Exhibit 2B and Appendices.
6	Applicants should showcase their year over year variance analyses based on their OM&A programs.[9]	OEB Guidance Addressed. Toronto Hydro Historical, Bridge and Test Year OM&A expenditures are presented on a	Exhibit 4A.

[6] Filing Requirements, Chapter 5 at page 11, section 5.2.3.
[7] Filing Requirements, Chapter 5 at page 15, section 5.4.2.
[8] Filing Requirements, Chapter 5 at page 7, section 5.1.3.
[9] Filing Requirements, Chapter 2 at page 27, section 2.7.

	OEB Guidance	Toronto Hydro's 2015-2019 CIR Application	Evidence Reference
		program basis.	
7	The Cost of Service Filing Requirements are relevant for Custom IR filers.[10]	OEB Guidance Addressed. Toronto Hydro's application for the 2015 Test Year is sufficiently compliant with the Chapter 2 Filing Requirements.	Exhibit 1A, Tab 3, Schedule 2 All Exhibits.

The remainder of this schedule discusses each of the above-noted elements of the RRFE guidance and the manner in which Toronto Hydro's 2015-2019 CIR application reflects this guidance in more detail. Toronto Hydro's evidence for the 2015-2019 CIR application addresses each of the above-noted OEB expectations.

2. CIR RATE-SETTING FRAMEWORK

2.1. OEB Expectations

In the RRFE Report, the OEB notes its expectation that the form of the CIR applications is to be that of a "Custom Index", covering Capital and OM&A expenditures, supplemented with a Productivity Factor, and a benefit-sharing mechanism in the form of a Stretch Factor or another construct determined on a case-by-case basis.[12]

The RRFE Report also notes that a distributor's rate trend will be set on the basis of a combination of:

- A distributor's cost, inflation and productivity forecasts;
- The OEB's productivity analysis; and
- Benchmarking to assess the reasonableness of a distributor's forecasts.

[10] RRFE Report at page 70.
[12] RRFE Report at page 13.

2.2. Toronto Hydro's Approach

As detailed in Exhibit 1B, Tab 2, Schedule 3 and 4, Toronto Hydro's proposed rate-setting model for the 2015-2019 CIR application addresses each of the above-noted OEB expectations. In particular, the utility's rate-setting model entails:

- (a) a forward test year rebasing approach to establish the 2015 Revenue Requirement and base rates; and
- (b) a Custom Index proposal for rate adjustments over the 2016-2019 period.

The Custom Index incorporates the OEB's long-standing Price Cap Index ("PCI") approach for the escalation of the OM&A portion of the 2015 Revenue Requirement over the out-years, augmented by a Custom Capital Factor ("CCF" or "C-factor") to account for the costs of forecasted capital additions over the 2016-2019 years.

The proposed Custom Index rate adjustment mechanism covers both OM&A and capital expenditures, and provides for sharing of benefits of efficiency and productivity improvements incented through the PCI framework with Toronto Hydro's customers. The values for the Inflation and Productivity Factors in the proposed Custom Index will be set on the basis of the OEB's analysis contemplated under the 4th Generation IR rate adjustment framework. Toronto Hydro proposes a custom stretch factor that will apply the OEB's methodology, but will be set on the basis of benchmarking evidence that Toronto Hydro has filed at Exhibit 1B, Tab 2, Schedule 5 in support of the reasonableness of its cost forecasts.

Toronto Hydro submits that the proposed rate-setting framework meets the OEB's expectations as to the form, function and outcomes of the CIR rate-setting framework.

3. PRODUCTIVITY EVIDENCE AND BENCHMARKING

3.1. OEB Expectations

The RRFE Report indicates the OEB's expectation that Custom IR applications will enable "an assessment of the adequacy of past and future productivity levels."[13] Elsewhere in the RRFE Report, the OEB states that it expects to use benchmarking evidence "to assess the reasonableness of the distributor's forecasts."[14]

3.2. Toronto Hydro's Approach

As detailed in Exhibit 1B, Tab 2, Schedule 5 and the associated Appendices, Toronto Hydro's evidence for the 2015-2019 CIR application addresses each of the above-noted OEB expectations. In particular, Toronto Hydro's evidence contains a detailed description of the utility's past and future productivity levels, as well as the reasonableness of the utility's 2015-2019 cost forecasts. The evidence also outlines the features of the proposed CIR rate-setting framework and its supporting elements, which in Toronto Hydro's submission, provide sufficient incentives for the utility to seek further productivity and efficiency improvements over the CIR timeframe, and to share the benefits of these improvements with its customers.

In support of the adequacy of Toronto Hydro's past and future productivity levels are: (i) a Review of Past Productivity Initiatives that recaps and quantifies, at a high level, the utility's productivity improvements since the time of Toronto Hydro's amalgamation; and (ii) a comprehensive Total Cost Econometric Benchmarking Study, evaluating the efficiency of Toronto Hydro's past and forecasted expenditures against a large sample of electric utilities in Ontario and the United States.

[13] RRFE Report at page 70.
[14] RRFE Report at page 13, Table 1.

In addition, Toronto Hydro's DSP (Exhibit 2B, Section C) contains a framework of capital performance metrics that the utility proposes to track over the CIR timeframe, consistent with section 5.1.3 in the Chapter 5 Filing Requirements. By monitoring its performance, Toronto Hydro expects to facilitate continuous improvement in the efficiency of execution in respect of capital additions and related costs.

Finally, Toronto Hydro's productivity and efficiency evidence provides specific examples of initiatives that utility is in the process of implementing, or expects to introduce over the CIR rate period.

4. PERFORMANCE MEASURES AND METRICS

4.1. OEB Expectations

Section 5.2.3 in Chapter 5 of the Filing Requirements notes the OEB's expectation for utilities to identify qualitative and quantitative measures and metrics to assess the performance of their capital planning and implementation practices as a part of their DSP filing. The Chapter 5 Filing Requirements specifically break down the measures that the utilities are expected to provide into three categories, namely:

- Customer-Oriented Performance;
- Cost Efficiency of Planning Quality and Implementation; and
- Asset / System Operation Performance.[15]

More generally, Performance Measurement and Continuous Improvement section of the RRFE Report, the OEB notes the expectation that,

> Under the renewed regulatory framework, a distributor will be expected to continuously improve its understanding of the needs and expectations of its

[15] Filing Requirements, Chapter 5 at page 11, section 5.2.3.

customers and its delivery of services, which in turn can lead to reduced costs for customers.[16]

4.2. Toronto Hydro's Approach

Exhibit 1B, Tab 2, Schedule 5 addresses each of the above-noted OEB expectations. In Toronto Hydro's assessment, the objectives of understanding customer needs and improving service delivery processes are best supported by quantitative performance measurement tools and processes. In evidence, Toronto Hydro accordingly showcases a number of activity-specific performance measures that the utility has put in place or plans to develop and refine over the 2015-2019 timeframe.

More specifically, in accordance with the section 5.2.3 in the Chapter 5 Filing Requirements, Section C of Toronto Hydro's DSP provides a framework of 12 performance measures related specifically to capital performance. Along with the Efficiency/Productivity measures discussed in the previous section, the proposed performance measurement framework includes measures of Customer-Oriented Performance and Asset and System Operational Performance, thereby addressing all three measure categories outlined in the Chapter 5 Filing Requirements. The proposed measures include advanced reliability measures such as Momentary Average Interruption Frequency Index ("MAIFI"), and Feeders Experiencing Sustained Interruptions ("FESI").

[16] RRFE Report at page 55.

5. CUSTOMER ENGAGEMENT ON PROPOSED CAPITAL INVESTMENTS

5.1. OEB Expectations

Section 5.4.2 in the Chapter 5 Filing Requirements expresses the OEB's expectations that the applicants' DSP submissions be supported by information related to the distributors' efforts to engage their customers on various facets of their capital planning processes. In particular, the OEB states that distributors should provide details regarding the approach they use "to engage customers for the purpose of identifying their needs, priorities and preferences", and "the aspects of the DSP that have been particularly affected by consideration of that information."[17]

5.2. Toronto Hydro's Approach

Exhibit 1B, Tab 2 Schedule 7 of Toronto Hydro's evidence for the 2015-2019 CIR application addresses each of the above-noted OEB expectations. To facilitate customer dialogue and input, the utility developed a series of comprehensive workbooks containing customer-friendly explanations of the components of Toronto Hydro's distribution system, key issues facing its asset base, and draft plans as to how to address these issues. The workbooks were tailored specifically towards different subsets of the utility's customers (e.g., residential and commercial), and contain a range of customer class-specific specific questions seeking feedback on the information presented in the workbook. Toronto Hydro posted its workbooks on its website and advertised them through a number of channels.

In addition to generating and seeking online feedback on its workbook, Toronto Hydro (with the assistance of its external consultant) undertook a series of focus group sessions with representatives of different customer classes, supplementing these activities with an

[17] Filing Requirements, Chapter 5 at page 15, section 5.4.2.

on-line questionnaire and a tele-survey. The evidence at Exhibit 1B, Tab 2, Schedule 7 discusses the results of these and other related customer engagement activities, and explains how the insights gained through this work relate to the utility's planned work program.

6. CAPITAL AND DISTRIBUTION SYSTEM PLAN

6.1. OEB Expectations

The RRFE Report clearly states that the OEB's expectations with respect to the nature and content of a distributor's DSP and applicable supporting materials are set out in Chapter 5 of the Filing Requirements.[19] Among other things, the Chapter 5 Filing Requirements oblige a distributor to outline its capital planning objectives; the criteria used for planning; processes used to identify and implement alternatives; and tools and processes used to identify, select, prioritize and pace the proposed expenditures.

6.2. Toronto Hydro's Approach

Toronto Hydro's DSP, filed at Exhibit 2B of this application, addresses the above-noted OEB expectations. Each proposed capital program identified in the DSP is supported by a detailed Business Case justification that provides the following information:

- A description of the proposed capital program and its purpose;
- Primary and secondary drivers for the investments (consistent with the guidance in the Chapter 5 Filing Requirements);
- Asset lifecycle information and failure impacts (where applicable);
- Approach to the timing and pacing of investments;
- Description of program benefits, including customer value;
- Program execution approach and mitigation of associated risks; and
- Other pertinent information.

[19] RRFE Report at page 52.

For all of the applicable distribution plant programs, the DSP also includes a benefit calculation of undertaking the investments performed by the utility's Feeder Investment Model ("FIM"). The FIM received a positive review from the OEB in Toronto Hydro's Incremental Capital Module ("ICM") application[20]:

> The Board finds that the FIM is a useful tool to compare the financial consequences of failure of aging assets to the benefits of delaying the work and to assess capital spending associated with replacement by extending service life as long as possible.

A comprehensive discussion of Toronto Hydro's approach to asset management, capital planning and execution, that is responsive to specific requirements previously mentioned, supports the individual Business Cases in the DSP. Toronto Hydro submits that the scope and level of detail contained within the DSP provides the OEB valuable insight into the utility's capital planning and execution processes. Toronto Hydro's DSP also provides empirical support as to the need of proposed capital investments, along with information of the customer-oriented, utility-specific, and public policy outcomes underlying each proposed capital program.

7. OM&A EVIDENCE

7.1. OEB Expectations

As discussed in Chapter 2 of the Filing Requirements, the OEB is moving towards a program-focused review of the applicants' OM&A expenditures,[21] and expects applicants to present their OM&A variance analyses and other related information in a program-based format to facilitate this transition.

[20] EB-2012-0064, Partial Decision and Order (April 2, 2013) at page 21.
[21] Filing Requirements, Chapter 2 at page 27, section 2.7.

7.2. Toronto Hydro's Approach

Toronto Hydro's OM&A evidence at Exhibit 4, Tab 2 addresses each of the above-noted OEB expectations. Specifically, the evidence provides a program-based view of the utility's historical and forecast OM&A expenditures, describes each program and its main objectives, justifies the Historical, Bridge, and Test Year expenditures, and discusses notable improvements in the areas of productivity, efficiency and service delivery. Toronto Hydro's general approach in preparing the OM&A evidence was to thoroughly explain the activities and functions comprising each program, and highlight their value to customers and the utility.

8. OEB FILING REQUIREMENTS

8.1. OEB Expectations

The RRFE Report conveys the OEB's expectation that "much of the material in Cost of Service Filing Requirements will be relevant for Custom IR filers."[22] Elsewhere in the RRFE Report, the OEB mentions that it sees merit in receiving the evidence of third-party experts while reviewing the applications under the RRFE, particularly in the area of distribution system planning.[23]

8.2. Toronto Hydro's Approach

In preparing this application, Toronto Hydro followed the Filing Requirements (where practicable and possible), in order to provide the OEB visibility into the utility's rate application in a familiar format that aids accessibility and provides the OEB a detailed view of the utility's operations and plans. Specifically, to support its evidence, Toronto Hydro has completed all the relevant Excel-based OEB appendices. Beyond the 2015 Test Year, Toronto Hydro's CIR application provides the OEB with insight into the

[22] RRFE Report at page 70.
[23] RRFE Report at page 37.

utility's proposed 2016-2019 capital expenditures to enable the determination of need and other relevant considerations, and to support the calculation of the Custom Capital Factor as proposed in the Exhibit 1B, Tab 2, Schedules 3 and 4.

Toronto Hydro's DSP is supported by a third-party review of the proposed investments and overall capital planning approaches and tools. This review was performed by Navigant and a copy of the report is filed as an Appendix to Exhibit 1B, Tab 2, Schedule 4. In addition to the Navigant Report, this application contains a number of other third-party assessments and evaluations of Toronto Hydro's operations and proposed plans.

RATE FRAMEWORK

This schedule describes the rate framework that Toronto Hydro proposes to apply for the 2015 to 2019 period.

Toronto Hydro submits that the proposed rate framework is:

- Concordant with OEB policy, and in particular with the objectives and guidance set out in the Report of the Board "Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach" issued on October 8, 2012 (the "RRFE Report");
- Based on sound ratemaking principles; and,
- Expected to provide funding that:
  - Reconciles Toronto Hydro's significant, multi-year investment needs; and,
  - Constrains operational funding increases going forward at less than the rate of inflation.

1. SUMMARY

To better conform to the OEB's Guidance for CIR applicants, Toronto Hydro is proposing a rate framework that is a modification of the standard 4th Generation IR approach.

Year 1 is a traditional rebasing year, with costs allocated and rates set on the basis of a forecast Test Year.

Distribution rates in Years 2 through 5 are adjusted annually by a custom Price Cap Index ("PCI"):

$$PCI = I - X + C$$

Where,

- "**I**" is the OEB's inflation factor, determined annually **/C**
- "**X**" is the sum of:
  - The Board's productivity factor.
  - Toronto Hydro's custom stretch factor.
- "**C**" provides funds incremental to "I – X" that are necessary to reconcile Toronto Hydro's capital need within a PCI framework.

Toronto Hydro submits that the proposed framework is concordant with OEB policy in the following respects:

- The proposed rate framework is comprehensive.
- The proposed rate framework is informed by Toronto Hydro's forecasts.
- The proposed rate framework is informed by the OEB's inflation and productivity analyses.
- The proposed rate framework is informed by benchmarking to assess the reasonableness of the Toronto Hydro's forecasts.
- The proposed rate framework includes a productivity and stretch factor.
- The proposed rate framework covers the entirety of the application's five year term.

In this way, Toronto Hydro is proposing a rate framework that differs from previous CIR filers.

2. YEAR 1: STANDARD REBASING

The first year of the proposed rate application is a standard rebasing year, consistent with the OEB's 4th Generation Incentive Rate-Setting ("4th Generation IR") approach.

Toronto Hydro developed and submitted in this application a forecast of its base revenue requirement for 2015. The utility developed forecasts of its costs based on its capital and operational plans for 2015. The Distribution System Plan ("DSP") and Operations, Maintenance & Administration ("OM&A") evidence contained in Exhibits 2B and 4A, respectively, provides the details supporting these projected costs. The calculated revenue requirement resulting from these projections is detailed in the Revenue Requirement evidence filed at Exhibit 6.

Similarly, Toronto Hydro employed the OEB's Cost Allocation model to allocate the revenue requirement to its eight rate classes and developed base distribution rates for each class. The standard rebasing approach maintains revenue-to-cost ratios for each class within the boundaries set out in the OEB's 2011 Review of Electricity Cost Allocation Policy.[1] For more information about Cost Allocation and Rate Design, please refer to Exhibits 7 and 8, respectively.

In addition to the base distribution rates, Toronto Hydro is applying to clear a number of Deferral and Variance accounts. Based on the values Toronto Hydro proposed for clearance, a number of new rate riders are proposed. These rate riders are proposed to be implemented beginning in 2015, and have various clearance time-frames. For more information about these rate riders, please refer to Exhibit 9, Tab 3.

3. YEARS 2 TO 5: CUSTOM PCI

Under 4th Generation IR, the years following a rebasing year constitute a period where distribution rates are subject to an incentive rate mechanism ("IRM"). The IRM is a formulaic approach to rate making under which distribution rates are adjusted annually using a two-component PCI:

[1] EB-2010-0219

$$PCI = I - X$$

The I-factor is intended to reflect changes to the input prices faced by the industry (i.e., inflation), while the X-factor is intended to capture changes in the productivity of the Ontario electricity distribution industry as a whole, and differences between utilities within it.

In the RRFE Report, the OEB offers alternative forms of rate making "to accommodate differences in the operations of distributors, some of which have capital programs that are expected to be significant."[2] The OEB notes that the CIR option in particular "will be most appropriate for distributors with significant large multi-year… investment commitments that exceed historical levels," whereas 4th Generation IR is more suitable for utilities with "some" incremental needs.[3] The evidence at Exhibit 1B, Tab 2, Schedule 4 and the Distribution System Plan at Exhibit 2B discuss Toronto Hydro's capital investment needs and, by extension, the appropriateness of the CIR option in greater detail.

A challenge for CIR applicants like Toronto Hydro is to reconcile their significantly large, multi-year investment commitments with a framework that concords with RRFE guidance. To this end, Toronto Hydro proposes that these needs be reconciled within a custom PCI framework that entrenches the OEB's inflation and productivity factors within a formulaic approach to adjusting distribution rates.

The following subsections discuss the retention of the inflation and productivity factors and the inclusion of the customized elements of the proposed PCI formula.

[2] RRFE Report at page 9.
[3] RRFE Report at page 14.

3.1. Inflation and Productivity Factors

In 2013, the OEB updated its standard rate adjustment parameters following a consultation process that explicitly considered:[5]

1) The development of a more Ontario-specific inflation factor;
2) The estimation of long-run Ontario electricity distribution total factor productivity ("TFP"); and,
3) The development and implementation of total cost benchmarking.

The OEB decided on a new methodology for the I-factor. The I-factor is based on a 30/70 weighting of labour and non-labour sub-indices and is updated annually. The labour sub-index is determined by changes in the average weekly earnings of Ontario workers, and the non-labour sub-index is determined by changes in the Canada Gross Domestic Product Implicit Price Index for final domestic demand.

Toronto Hydro proposes to use the OEB's I-factor in its custom PCI. As the value for the I-factor is updated annually, Toronto Hydro will incorporate the value into its custom PCI to appropriately adjust base distribution rates for the following year.

The productivity factor, one of the two X-factor components, was also updated. The productivity factor is intended to estimate the overall trend in the productivity of the electricity distribution industry in Ontario by measuring changes in TFP, defined by Pacific Economics Group as a "comprehensive measure of the extent to which firms convert inputs into outputs."[7] TFP can change over time for a number of reasons, such as change in technology, achievement in economies of scale and overall improvements in efficiency.

[5] EB-2010-0379, Report of the Board, Rate Setting Parameters and Benchmarking under the Renewed Regulatory Framework for Ontario Electricity Distributors (December 20, 2013) [the "OEB Rate Setting Parameters Report"].
[7] Pacific Economics Group (2013), Productivity and Benchmarking Research in Support of Incentive Rate Setting in Ontario, (corrected January 24, 2014) at page 12 [the "PEG Report"].

In its report, PEG used an indexing method to estimate TFP for the Ontario distribution sector based on data from the 2002 to 2012 period.[9] This sample excluded the experience of both Toronto Hydro and Hydro One because, as a result of their large size relative to the rest of the industry, PEG determined that they were exerting a disproportionate impact on industry TFP.[10] Toronto Hydro presumes that this principle would have held if one or both had outperformed the sector on TFP.

The result of PEG's analysis that excluded both utilities suggested that industry TFP over that period grew at an average annual rate of -0.33%. That is, TFP for sector actually declined over that period. As PEG noted, not only are negative productivity factors a "theoretical possibility", it cited multiple examples of negative productivity factors in other western democracies. The Australian experience in the early 2000s is of particular interest given that negative productivity factors occurred at a time when utilities "were undertaking extensive capital investment programs," which is the state that Toronto Hydro is currently operating in.

In alignment with PEG's recommendation, the OEB ultimately adopted a zero productivity factor as a matter of policy. In Toronto Hydro's view, any departure from the value produced by the methodology chosen to produce the productivity factor represents an implicit "stretch" to the sector. In this case, the sector is expected to achieve an additional 0.33 percentage points of productivity gains relative to the sector's overall trend in TFP. This is not an immaterial amount, particularly for a utility with the capital requirements of Toronto Hydro.

Nevertheless, Toronto Hydro notes that the OEB is very clear in its guidance to applicants that its productivity factor be part of a CIR rate framework. Accordingly,

[9] PEG suggests that a 10-year horizon is the minimum required for TFP Indexing.
[10] PEG Report, supra note 5 at page 4.

Toronto Hydro proposes to embed the OEB's productivity with its implicit incremental stretch factor unchanged within the proposed custom PCI. /C

3.2. Custom Stretch Factor

The second component of the X-factor is an explicit stretch factor. According to the OEB, "Stretch factors promote, recognize and reward distributors for efficiency improvements relative to the expected sector productivity trend."[8] Under the current methodology, which was updated most recently in 2013, utilities are assigned one of five stretch factors. This occurs on the basis of a comparison of the utility's total costs relative to their predicted total costs. The predicted total costs are determined using a total cost econometric model developed by PEG.[9]

As part of this application, Toronto Hydro is submitting alternative total cost benchmarking, the details of which can be found in the Power System Engineering's Econometric Benchmarking Report, at Exhibit 1B, Tab 2, Schedule 5 (the "PSE Report"). The alternative total cost benchmarking model prepared by PSE for Toronto Hydro is econometric in nature (similar to PEG's model) and includes an expanded data set. The results are statistically significant and relevant to the OEB's consideration of Toronto Hydro's performance.

Accordingly, Toronto Hydro submits that this is an appropriate basis for setting its stretch factor. As noted in the PSE Report, Toronto Hydro's forecasts of its total costs are within ten percent of its predicted total costs. Utilities within this demarcation point are assigned to Group III of the OEB's benchmarking cohorts, implying a stretch factor of 0.30%. Toronto Hydro therefore proposes that the stretch factor in the proposed custom PCI framework be set at 0.30%.

[8] OEB Rate Setting Parameters Report, *supra* note 3 at page 18.
[9] OEB Rate Setting Parameters Report, *supra* note 3 at page 19.

3.3. Custom Capital Factor

The premise of the inclusion of a custom capital factor ("CCF" or "C-factor") is to reconcile the OEB's guidance that the CIR framework is best suited for utilities with significant, multi-year capital investment requirements as it is clear that the standard 4th Generation IR framework is not.

The proposed C-factor is designed as an adjustment mechanism that is directly proportional to the degree of capital investment required by Toronto Hydro, as detailed in its DSP (Exhibit 2B). It is comprised of two sub-components that serve two primary functions:

- Reconcile Toronto Hydro's capital investment need in a price cap framework; and,
- Return to ratepayers the funding advantage provided for capital through the standard "I – X" increase.

The first sub-component, termed "C_n", is determined as the percent change in total revenue requirement that is attributable to changes in capital-related revenue requirement – that is, depreciation, return on equity, interest and PILs/taxes. Changes in capital-related revenue requirement are based on forecast changes in average annual rate base, associated depreciation and taxes. Tax rates and the cost of capital are maintained at their 2015 levels, consistent with the standard 4th Generation IR treatment.

For Toronto Hydro, C_n in 2016 would be determined on the following basis:

Table 1: Calculation of C_n ($ Millions)

Revenue Requirement Component	2015	2016
Interest	80.2	89.5
ROE	120.9	135.0
Depreciation	206.5	221.6
PILs/Taxes	24.0	14.7
Capital-related RR	**431.6**	**460.9**
OM&A	269.5	
Revenue Offsets	(46.1)	
Total RR	**655.0**	

/C

The change in forecast capital related revenue requirement from 2015 to 2016 is $29.3 million ($460.9 million minus $431.6 million). The total revenue requirement in 2015 is $655.0. C_n for 2016 is therefore:

/C

$$C_n = (460.9 – 431.6) / 655.0 = \mathbf{4.47\%}.$$

Calculating C_n for years beyond 2016 requires a forecast of total revenue requirement. Capital-related revenue requirement, as noted, is determined on a forecast basis. By contrast, OM&A and Revenue Offsets are assumed to increase by "I – X". A more detailed discussion of why this is the case can be found towards the end of this schedule.

Applying this method results in values for C_n that are summarized in Table 2 based on inputs summarized in Table 3. These values represent the amount by which base rates would need to be increased to fund Toronto Hydro's capital needs over the course of the rate term.

Table 2: Values of C_n for 2016 to 2019 (in percent)

	2016	2017	2018	2019
C_n	4.47	8.25	6.68	5.01

/C

Table 3: Inputs for the determination of C_n for 2016 to 2019

Revenue Requirement Component	2015	2016	2017	2018	2019
Interest	80.2	89.5	98.4	103.9	109.2
ROE	120.9	135.0	148.3	156.6	164.6
Depreciation	206.5	221.6	248.3	266.8	287.4
PILs/Taxes	24.0	14.7	22.6	40.3	46.5
Capital-related RR	**431.6**	**460.9**	**517.6**	**567.5**	**607.6**
OM&A	269.5	273.3	277.1	281.0	284.9
Revenue Offsets	(46.1)	(46.8)	(47.4)	(48.0)	(48.7)
Total RR	**665.0**	**687.5**	**747.4**	**800.5**	843.8

/C

With the inclusion of C_n in the custom PCI, Toronto Hydro would receive sufficient funding for its capital needs as presented in the DSP. However, the "I – X" increase retained in the custom PCI from the standard 4th Generation IR framework does provide some degree of incremental funding. Absent additional constraints, the custom PCI formula would risk over-funding relative to Toronto Hydro's capital need because a portion of the "I – X" increase could be committed to capital expenditures. Toronto Hydro proposes to remove this risk through an automatic distribution rate reduction captured in the C-factor to constrain the impact of C_n.

An efficient and principled approach is to reduce the C-factor by a capital-related proportion of "I – X". Toronto Hydro proposes that this "scaling" factor be determined

by the proportion of the total revenue requirement that is capital-related. Termed S_{cap}, this scaling factor is calculated in the following fashion:

$$S_{cap} = \text{(capital-related revenue requirement)} / \text{(total revenue requirement)}$$

Table 4 provides the information necessary for calculating S_{cap} for 2015.[10]

Table 4: Revenue Requirement Components for Determining S_{cap}

Revenue Requirement Component	2015
Interest	80.2
ROE	120.9
Depreciation	206.5
PILs/Taxes	24.0
Capital-related RR	**431.6**
OM&A	269.5
Revenue Offsets	(46.1)
Total RR	**655.0**

/C

In 2015, the capital-related revenue requirement is forecast to be $431.6 million and the total revenue requirement $655.0 million. S_{cap} for 2015 would therefore be:

/C

$$S_{cap} = 431.6 / 655.0 = 0.659 \ (65.9\%)$$

The same methodology for calculating S_{cap} is proposed for all years from 2016 to 2019.

[10] This particular example is for illustrative purposes only as the custom PCI, for which the term is required, does not apply until 2016. S_{cap} values for 2016 cannot be calculated at this time because S_{cap} is sensitive to changes in the inflation factor as determined annually by the OEB. Toronto Hydro proposes, for the purpose of determining its annual rates, to calculate S_{cap} using this methodology once the value of the inflation factor for the following year is determined by the OEB.

The above discussion sets out the variables that constitute Toronto Hydro's proposed custom PCI. The resulting PCI value for a given year would, in keeping with IRM principles, be applied to all distribution rates from the previous year to determine the following year's distribution rates.

To summarize, the custom PCI is determined in the following fashion:

$$PCI = I - X + C, \text{ or}$$

$$PCI = I - X + C_n - S_{cap} * (I - X)$$

Where,

- "I" is the OEB's inflation factor, determined annually
- "X" is the sum of:
  - The OEB's productivity factor of 0.0%
  - Toronto Hydro's custom stretch factor, set applying the OEB's methodology to Toronto Hydro's alternative benchmarking model
- "C" is difference of:
  - C_n, a reflection of Toronto Hydro's capital investment need
  - $S_{cap} * (I - X)$, an offsetting adjustment required to ensure that the C-factor provides funding only in excess of what is already provided for capital through "I – X"

While the custom PCI cannot be calculated until the OEB determines its inflation factor for a given year, it is possible to develop scenarios using the methodology detailed in this schedule and an assumed value for the I-factor.

Table 5 shows the components of the custom PCI based on an assumed I-factor of 1.7%, its value at the time of writing, and the corresponding value of the custom PCI. This is

the same I-factor that is used to calculate bill impacts, which can be found in Exhibit 8, Tab 7, Schedule 1. Again, this is for illustrative purposes only.

Table 5: Custom PCI Values Assuming An Inflation Factor Of 1.7% For Each Year

CUSTOM PCI COMPONENT (%)	2016	2017	2018	2019
I	1.7	1.7	1.7	1.7
X - productivity	0.0	0.0	0.0	0.0
X - custom stretch	-0.3	-0.3	-0.3	-0.3
C_n	4.47	8.25	6.68	5.01
S_{cap}	67.1	69.3	70.9	72.0
Custom PCI	**4.94**	**8.68**	**7.09**	**5.41**

/C

4. CONCLUSION

4.1. Policy Concordance

The manner in which the rate framework submitted as part of this CIR application concords with the OEB's guidance in the RRFE Report is fundamental to Toronto Hydro's development of this application. Toronto Hydro has deliberately chosen a framework that includes a standard rebasing year followed by four years of a custom PCI framework as the mechanism by which to have its distribution rates set over the course of the term. It has done so because, in Toronto Hydro's view, this represents an approach that is appropriately concordant with RRFE guidance. Where this proposed rate framework does not explicitly conform to that guidance, it is Toronto Hydro's view that its approach is reasonable and appropriate. One such example is the explicit inclusion of the OEB's inflation and productivity factors into the custom PCI formula, which goes further than the OEB's guidance to be "informed" by those analyses.

In considering its custom approach, Toronto Hydro was particularly concerned with the contents of Table 1 in the RRFE Report.[14] This table provides some of the clearest indications of the OEB's expectations for prospective applicants.

The remainder of this sub-section outlines how Toronto Hydro's proposed rate framework concords with the guidance provided in that table.

The proposed rate framework is comprehensive. Toronto Hydro proposes that the rate framework commence with a standard rebasing year to determine base distribution rates, followed by four years where a custom PCI governs incremental changes to those base rates. Base rates are determined by a base revenue requirement that relates to both capital and operating costs.

The proposed rate framework is informed by Toronto Hydro's forecasts. The rebasing year offers the opportunity to test capital and operating expenditures. The C-factor in the custom PCI is calculated based on a forecast of Toronto Hydro's capital-related revenue requirement during the remainder of the term, which can also be tested. This incorporates expectations of inflation for its capital costs, as set out in Exhibit 2A, Tab 6, Schedule 1.

The proposed rate framework is informed by the OEB's inflation and productivity analyses. The proposed rate framework is not only informed by, but firmly entrenches the OEB's productivity analyses through the inclusion of its inflation and productivity factors within the custom PCI formula. While not a requirement, Toronto Hydro believes this is to be a distinctive element of its proposed rate framework.

[14] RRFE Report at page 13.

The proposed rate framework is informed by benchmarking to assess the reasonableness of the distributor's forecasts. The custom PCI incorporates a custom stretch factor that applies the OEB's methodology of assigning stretch factors but that uses Toronto Hydro's alternative total cost benchmarking model, as set out in Exhibit 1B, Tab 2, Schedule 5.

The proposed rate framework includes a productivity and stretch factor. In Toronto Hydro's view, the inclusion of the OEB's productivity factor and a custom stretch factor into the custom PCI meets the OEB's expectations for the sharing of (financial) benefits.

The proposed rate framework covers the entirety of the application's five year term.

4.2. Implications for OM&A and Revenue Offsets

An intended implication of this custom PCI framework is the amount of funding that is as a matter of consequence provided for OM&A and Revenue Offsets. Tested in the standard rebasing fashion in 2015, the custom PCI provides incremental funding for OM&A and Revenue Offsets in the amount of only "I – X". Consider the entire custom PCI formula, with the C-factor in its constituent parts: **/C**

$$CPI = I - X + C_n - S_{cap}*(I - X)$$

By design, C_n reconciles Toronto Hydro's capital investment need, leaving the remaining terms to fund increases in OM&A and Revenue Offset. In simplified terms, that amount is:

$$(1 - S_{cap}) * (I - X)$$

This can be restated in another fashion, using S_{OMA} and S_{RO} to respectively represent the ratio of OM&A and Revenue Offsets to the total revenue requirement (recall this is identical to how S_{cap} was determined). Given that capital costs, OM&A and Revenue Offsets are the only three components of the total revenue requirement, the above formula can be restated as follows:

$$(1 - S_{cap}) * (I - X) =$$
$$(S_{OMA} + S_{RO}) * (I - X) =$$
$$S_{OMA} * (I - X) + S_{RO} * (I - X)$$

In other words, the custom PCI proposed by Toronto Hydro embeds the expectation that the components of rates attributable to OM&A and Revenue Offsets will continue to increase by only "I – X". If actual OM&A was to increase at a rate greater than this, or if Revenue Offsets were to stagnate, Toronto Hydro is at risk for under-recovery through the 2015 to 2019 period. Toronto Hydro is aware of this risk and, in response to the incentives created by its proposed custom PCI, expects to continue to seek efficiency and productivity improvements throughout the rate term.

5. OFF-RAMPS

Toronto Hydro proposes to apply the OEB's existing policy with respect to off-ramps. The RRFE Report indicates that each rate setting method includes a trigger mechanism with an annual return on equity dead band of plus or minus 300 basis points, at which point a regulatory review may be initiated.

6. SPECIFIC Z-FACTOR

One of the incremental challenges inherent in a five-year rates plan is the need to contend with prudent, material unexpected costs. As part of this application, and as explained in further detail throughout this application,[15] Toronto Hydro has proposed restrained/constrained OM&A and capital funding requests. The funding that Toronto Hydro seeks in this application is expected to enable the utility to carry out the work that it has detailed in these programs. That funding, by definition, is not sufficient to address the prudent costs of material events that occur outside the control of the utility and which have not been forecasted. Accordingly, Toronto Hydro proposes to incorporate within its rate framework the availability of Z-factor relief, which Toronto Hydro understands is available to CIR filers as part of the RRFE framework.

As detailed below, while Toronto Hydro expects that a request for relief would be exceptional, the utility has prepared a list of possible categories of specific events which it believes could occur, and where they occur, may necessitate additional funding during the term of the plan. The criteria that would apply to the consideration of any of these events would be the standard Z-factor criteria, most recently articulated by the OEB in its Decision on Enbridge Gas Distribution Inc.'s 2014 to 2018 Rate application.[16] To the extent the OEB has concerns with respect to the possible availability of Z-factor treatment in relation to any of the items set out below, Toronto Hydro asks the OEB to identify these concerns as part of this application.

6.1. Events with a one-time impact

One-time events that Toronto Hydro anticipates may give rise to a Z-factor application include:

- Extreme weather events such as storms;

[15] See for instance the Financial Planning Process (Exhibit 1C, Tab 3, Schedule 2), Overview of OM&A Expenditures (Exhibit 4A, Tab 1, Schedule 1) and Capital Expenditures Planning Process Overview (Exhibit 2B, Section E2).
[16] EB-2012-0459, Decision with Reasons (July 17, 2014) at pages 18-21.

- One-time investments made at the behest of government direction and outside of management's control, such as:
  - Smart Meter implementation;
  - Conservation and Demand Management;
  - Regional Planning; and,
- Any other one-time events that meet the Z-factor criteria.

6.2. Events with an ongoing impact

Material ongoing events that Toronto Hydro anticipates may give rise to a Z-factor application include:

- Changes to IESO market rules;
- Changes to OEB codes or policies, such as distributor rate design;
- Changes to income tax rates or laws;
- Changes to accounting frameworks or technical standards;
- Changes resulting from new or amended government legislation, regulation or policy, such as environmental laws;
- Ongoing investments made at the behest of government direction and outside of management's control; and,
- Any other ongoing events that meet the z-factor criteria.

In the interest of regulatory efficiency, Toronto Hydro proposes that any application for this treatment would compartmentalize the material impacts of the event, as opposed to undergoing a full regulatory review of the rate framework. For one-time events, Toronto Hydro would propose a targeted rate rider. For events with an ongoing impact, Toronto Hydro would propose an adjustment to the base revenue requirement if one was to occur in 2015, or else to the custom PCI.

CAPITAL INVESTMENT

1. INTRODUCTION

As described in Exhibit 1B, Tab 2, Schedule 3, Toronto Hydro has filed this rate-setting application under the Custom Incentive Rate-setting ("Custom IR" or "CIR") framework primarily due to the significant multi-year investment needs of Toronto's electrical distribution system. Toronto Hydro's 2015-2019 Distribution System Plan ("DSP")[1] captures, in detail, the capital requirements of the system. These investment commitments exceed historical levels, as demonstrated in the DSP and as further indicated in the Navigant Report (Appendix B to this Schedule).

Toronto Hydro's DSP reflects the utility's need for a sustained period of capital investment to replace and expand the City's aging distribution infrastructure. Toronto Hydro's infrastructure investment plans over the five year forecast period (2015-2019) are aligned to the longer-term objective of reaching a "steady-state" of annual investment that is intended to (1) enhance value for money over the service life of all distribution assets and (2), through a restrained and prudent approach to achieving "steady-state", provide greater predictability in customer bill impacts in the short and long-term. The steady-state concept is further explained in Section 2 of this schedule.

Toronto Hydro's proposed capital program:

I. represents a minimum level of appropriate investment given the distribution system's needs;
II. reflects customers' preferences;
III. will be delivered productively and efficiently; and
IV. ultimately delivers long-term value for ratepayers.

[1] Exhibit 2B

Each of these aspects of the evidence is summarized in Section 2 of this schedule, with reference to other, more detailed sections of the application where appropriate.

Section 3 of this schedule describes Toronto Hydro's presentation of its capital evidence in the form of the 2015-2019 DSP and the compliance of the DSP with the Chapter 5 Filing Requirements[2].

2. 2015-2019 CAPITAL PLAN OVERVIEW

I. Responding to System Needs

Toronto Hydro's most recent rate setting application was the 2012-2014 Incremental Capital Module ("ICM") application (EB-2012-0064), which was approved the by Ontario Energy Board ("OEB") and covered the years immediately preceding the 2015-2019 Custom IR application. Toronto Hydro identified its proposed capital programs in the DSP based on feedback from customers and by leveraging the same asset management tools and processes authorized by the OEB in EB-2012-0064[3]. Toronto Hydro's Asset Management Process – including its various components, decision tools and inputs and outputs – is discussed in detail in Section D3 of the DSP.

Continuity With Respect to the 2012-2014 IRM/ICM Application

With reference to the previous application, Toronto Hydro's proposed 2015-2019 DSP capital programs can be classified according to two general categories:

1) capital programs that are a direct continuation of activities described in one of the OEB-approved ICM segments, and
2) capital programs that are incremental to the ICM segments approved by the OEB.

[2] Filing Requirements for Electricity Distribution Rate applications (July 17, 2013) [the "Filing Requirements"].
[3] EB-2012-0064, Partial Decision and Order (April 2, 2013) at page 21.

The following tables summarize the proposed capital programs in the 2015-2019 DSP and their relationship to activities that were described in the 2012-2014 ICM application. The DSP programs listed in Table 1 are direct continuations of the activities featured in the ICM segments listed in the left column. The forecasted expenditures for the programs listed in Table 1 are comparable to those in the ICM period, with some programs tapering off or coming to an end within the 2015-2019 period, and other programs increasing marginally to address greater investment needs in the 2015-2019 period.

Table 1: DSP Capital Programs that are Continuations of OEB-Approved ICM Segments

Approved ICM Segment	DSP Program
B1 Underground Infrastructure	E6.1 Underground Circuit Renewal
B2 PILC Piece-outs and Leakers	E6.2 PILC Piece-outs and Leakers
B3 Handwell Replacement	E7.5 Handwell Upgrades
B4 Overhead Infrastructure	E6.4 Overhead Circuit Renewal
B5 Box Construction	E6.7 Box Construction Conversion
B6 Rear Lot	E6.6 Rear Lot Conversion
B7 Polymer SMD-20 Switches	E7.6 Polymer SMD-20 Switch Renewal
B8 SCADA-Mate R1 Switches	E6.8 SCADA-Mate R1 Switch Renewal
B9 Network Vaults and Roofs	E6.9 Network Vault Renewal
B10 Fibertop Network Units	E6.10 Network Unit Renewal[4]
B11 ATS and RPB	E6.11 Legacy Network Equipment Renewal
B12 Station Power Transformers	E6.14 Stations Power Transformer Renewal
B13-1 Municipal Substation Switchgear Replacement	E6.13 Stations Switchgear Renewal
B13-2 Transformer Station Switchgear Replacement	E6.13 Stations Switchgear Renewal

[4] E6.10 Network Unit Renewal includes fibertop units as well as an additional network unit type in need of renewal.

Approved ICM Segment		DSP Program
B14 Stations Circuit Breakers		E6.15 Circuit Breaker Renewal
B17 Copeland TS		E7.9 Stations Expansion[5]
B18 HONI Capital Contributions		E6.13 Stations Switchgear Renewal
		E7.9 Stations Expansion
B20 Metering		E5.1 Metering
B21 Externally Initiated Plant Relocations and Expansions		E5.3 Externally Initiated Plant Relocations and Expansions
C1 Operations Portfolio Capital	Customer Connections Capital	E5.2 Customer Connections
	Mitigating System Operating Constraints	E5.4 Load Demand
	Critical Stations Work	E6.17 Stations Ancillary Systems
		E6.18 Station Building Infrastructure
		E6.19 Stations DC Battery Renewal
	Reactive Capital	E6.20 Reactive Capital
	Worst Performing Feeder Capital	E6.21 Worst Performing Feeders
C2 Information Technology Capital		E8.4 IT Hardware Refresh
		E8.5 IT Software
C3 Fleet Capital		E8.1 Fleet and Equipment Services
C4 Buildings and Facilities Capital		E8.2 Facilities Management and Security

/C

The proposed capital programs in Table 2 are incremental to the approved OEB segments from the ICM application. Toronto Hydro added these programs to the 2015-2019 capital plan to accomplish one of three overarching objectives:

1) maintain responsiveness to public policy objectives and fulfil mandated service obligations (e.g., Generation Protection, Monitoring and Control);
2) address system and non-system renewal needs identified in the course of the utility's long-term planning review process (e.g., Underground Legacy

[5] Segment B17 was narrowly focused on the first phase of Copeland TS; E7.9 Stations Expansion includes carryover expenditures from Copeland TS Phase 1, new Copeland TS Phase 2 investments and other capacity expansion investments at the station level over the five year forecast period. /C

Infrastructure; Distribution System Communications Infrastructure; Voice Radio System Upgrade; ERP Implementation); or

3) achieve targeted system and operational objectives in light of evolving system conditions (e.g., Local Demand Response; Design Enhancement; Program Support) and opportunities to enhance customer value (e.g., Feeder Automation, Operating Centers Consolidation)

Table 2: Proposed DSP Capital Programs that are Incremental to the OEB Approved ICM Segments

Proposed DSP Program
E5.5 Generation Protection, Monitoring and Control
E6.3 Underground Legacy Infrastructure
E6.12 Network Circuit Reconfiguration
E6.16 Stations Control & Monitoring
E6.22 Distribution System Communications Infrastructure
E7.1 Contingency Enhancement
E7.2 Design Enhancement
E7.3 Feeder Automation
E7.4 Overhead Momentary Reduction
E7.7 Downtown Contingency
E7.8 Customer Owned Station Protection
E7.10 Local Demand Response
E7.11 Energy Storage Systems
E8.3 Operating Centers Consolidation
E8.6 ERP Implementation
E8.7 Voice Radio System Upgrade
E8.8 Program Support

Proposed Level of Spending

Figure 1 shows (i) the historical level of capital spending from 2006 to 2011, (ii) the

average of actual and forecasted spending over the three-year ICM period (2012-2014), and (iii) the proposed level of capital spending for each of the five years in the planning horizon.

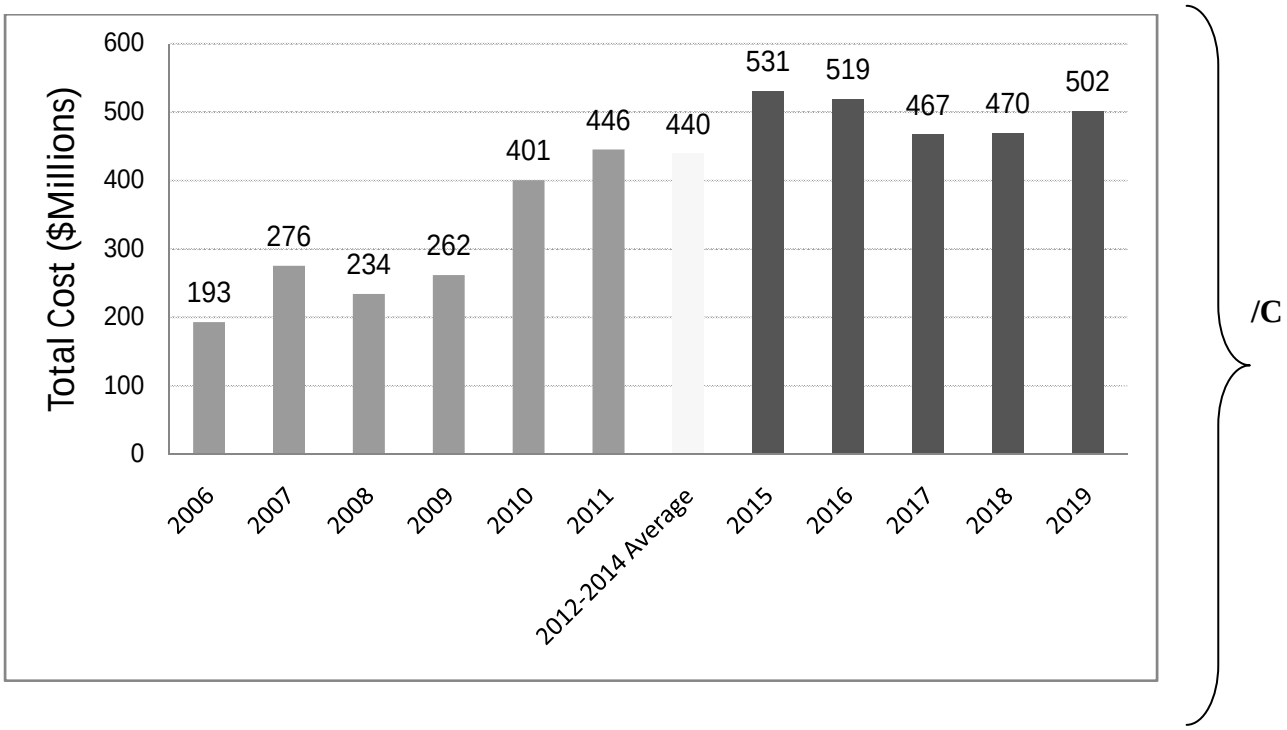

Figure 1: Historical and Forecast Capital Spending (2006 – 2019) ($Millions)

As shown above, the average annual level of investment for the proposed capital program is comparable to the level of spending during the utility's 2012-2014 IRM/ICM period. This level of investment is required primarily to address the large and growing backlog of end-of-life and obsolete assets, while also addressing critical system challenges and operational needs at a pace and in a manner that moderates rate increases and is consistent with customer preferences. As demonstrated in the DSP, and as validated in the Navigant Report (Appendix B of this Schedule), this level of spending is the minimum level of investment that is appropriate during the 2015-2019 period given the distribution system's needs. While the optimal level of capital investment exceeds the

work proposed in Toronto Hydro's DSP, the level of capital investment in this application balances the needs of the distribution system against a level of rate increases that customers accept.[6]

Distribution System Pressures

Toronto's distribution system faces a number of significant and evolving challenges that necessitate the proposed level of investment. These challenges include the following.

- Aging and Obsolete Assets: The foremost pressure driving distribution system investment commitments is the large and growing backlog of in-service assets that are operating beyond their expected useful lives. An estimated 26% of Toronto Hydro's existing distribution system asset base will be operating beyond end-of-life as of 2015. Assuming a run-to-failure approach (i.e., executing a capital expenditure plan with minimal proactive asset replacement), Toronto Hydro expects an additional 7% of the existing asset base to reach end-of-life by 2020. Without a sufficient proactive renewal program, the utility anticipates that reliability will deteriorate over the five-year CIR period, and the growing backlog of end-of-life assets will become more difficult to manage beyond 2019 without potentially unacceptable rate increases and execution challenges due limited resource availability.

  With respect to system renewal, Toronto Hydro's long-term asset management policy objective is to eventually arrive at an optimal percentage of assets operating beyond end-of-life in order to minimize the overall lifecycle costs of operating the system over time. This concept is discussed in Section IV of this schedule.

[6] For further discussion of Toronto Hydro's customer engagement program, please refer to the evidence at Exhibit 1B, Tab 2, Schedule 7 and the 2015-2019 DSP (Exhibit 2B).

The forecasted improvement in reliability associated with Toronto Hydro's proposed capital plan[7] is due in part to the ongoing renewal of aging and defective assets, but is also an expected outcome of a small number of targeted, high-value programs such as Feeder Automation[8] and Design Enhancement[9], which are incremental to the OEB-approved ICM segments and are expected to deliver significant improvements in system performance and operational efficiency for a level of annual investment that is relatively small compared to the typical renewal program. These cost-effective interventions allow Toronto Hydro to enhance customer value through system reliability and efficiency improvements while executing core renewal programs at a moderate pace.

x Economic Growth and Capacity Constraints: Toronto's distribution system continues to face utilization pressures related to economic growth and evolving system use. These pressures include existing and emerging capacity constraints in several areas throughout the system due to load and customer growth; an anticipated increase in large externally initiated plant relocation projects (e.g., Metrolinx light rail transit projects); and the expectation that connected distributed generation ("DG") capacity will more than triple over current levels during the five-year CIR period.

As explained in Exhibit 9, Tab 1, Toronto Hydro is requesting a minimal, below-forecast baseline amount of rates funding for externally initiated plant relocations work as part of the DSP, representing less than the utility's forecast annual spending on externally initiated projects. This below-forecast amount is accompanied by a variance account to capture annual differences from this base amount. The utility's expectation is that this approach will allow it to fund

[7] Exhibit 2B, Section E2.
[8] Exhibit 2B, Section E7.3.
[9] Exhibit 2B, Section E7.2.

necessary, non-discretionary work while, at the same time, holding ratepayers harmless from the potential that a material amount of the forecast third party work does not materialize, due to the unpredictable nature, costs, and timing of such projects.

- Critical Issues: Toronto Hydro also plans to address a number of critical distribution system issues that go beyond core renewal and capacity/utilization concerns. These include potential safety issues, system design deficiencies and reliability issues.

- Climate Change: An AECOM-Toronto Hydro report entitled Future Impacts of Climate Change on Toronto Hydro's Distribution System[10] concludes that weather and climate change can be expected to impact the reliability of the distribution system going forward, and that Toronto Hydro will be required to manage assets that may not have been designed for future climate conditions. Climate change forecasts anticipate worsening pressures such as increases in extreme maximum temperatures and increased intensity of rainfall events. A number of Toronto Hydro's planned capital programs are expected to enhance system performance and operational efficiency during major storm events and other adverse weather conditions.

- Utility Operations Needs: Toronto Hydro must also continue to maintain and enhance its non-distribution system assets to ensure the efficient and effective execution of the proposed capital program, maintenance activities and other business functions. In addition to the fleet, facilities and Information Technology ("IT") asset renewal investments, Toronto Hydro has identified several additional, one-time capital projects that are required during the forecast

[10] Exhibit 2B, E8.8, Appendix A.

period, including replacement of the obsolete enterprise resource planning ("ERP") system and the voice radio system.

Toronto Hydro's asset management process and the resulting 2015-2019 DSP balance these various system needs in a manner intended to maximize customer value while mitigating bill impacts during the forecast period and ensuring prudent and efficient progress toward the achievement of a more stable, predictable and balanced system state in the long-term.

Complete details and justification for all of the programs that address the aforementioned system and non-system investment needs are available in the DSP, Exhibit 2B, Sections E5 through E8. A discussion of the pacing of investment and its alignment to longer-term objectives is provided in part IV of this section.

II. Customer preferences and the DSP

As part of preparation for this rate filing, and to achieve alignment with the RRFE Report and associated specifications set-out in its Filing Requirements, Toronto Hydro set out to gather customer preferences with respect to the proposed 2015-2019 capital expenditure plan and its associated outcomes and bill impacts. Toronto Hydro worked with Innovative Research Group ("Innovative") – a firm known for their expertise in meaningful customer engagement in the energy and utilities sector – to identify customer preferences in all customer classes up to, but not including, the utility's very large user class. Toronto Hydro relied on its standard, year-round key account management programs for the largest users, as these customers generally have more complex and specific needs and concerns with respect to electricity distribution. A comprehensive discussion of these processes, how they were designed, and the results gathered can be found at Exhibit 1B, Tab 2, Schedule 7, including Innovative's final report. For a

detailed discussion of the alignment of Toronto Hydro's proposed DSP to the needs and preferences gathered through customer engagement, please refer to Exhibit 2B, Section E2.4.

In general, Toronto Hydro has taken a customer focused approach at every stage of preparing its DSP. The foremost example of this is Toronto Hydro's asset management process,[11] which relies extensively on outputs from the Feeder Investment Model ("FIM"). The FIM tool uses quantified customer interruption costs ("CICs") as one of several inputs when calculating the optimal replacement or maintenance time for an asset. This approach ensures that engineering investment decisions are inherently sensitive to customer value.

In terms of the overall capital expenditure plan, Toronto Hydro has also considered customer and regulator expectations with respect to acceptable bill impacts over the 2015-2019 period. The capital "ask" has been deliberately reduced to reflect these expectations. Alignment to these expectations was demonstrated through the Innovative customer engagement process, the results of which suggests that most customers (between 48% and 58%, depending on the class) are accepting of the rate increase based largely on the belief that Toronto Hydro's proposed capital plan is necessary to maintain the grid to a reasonable standard.

The level of restraint that Toronto Hydro's proposed plan represents versus actual system needs is discussed in part IV of this section.

III. The proposed capital program will be delivered productively and efficiently.

Toronto Hydro is committed to providing the OEB and customers with a transparent, meaningful view of the ways in which the utility works toward maximizing the efficiency and productivity of its capital work.

[11] Exhibit 2B, Section D.

Toronto Hydro has a long-standing productivity culture which has evolved over time in line with emerging operating challenges, changes in government policy and expectations underlying the regulatory regimes that govern the utility's operations. Toronto Hydro's framework of current and planned productivity processes and initiatives emphasize increasingly sophisticated performance measurement tools, a bottom-up approach to identifying new efficiency opportunities, and streamlining labour-intensive processes through technological improvements and rationalization of supporting infrastructure. For a comprehensive overview of the evidence that Toronto Hydro has filed this application to enable the OEB to evaluate the utility's ongoing efforts regarding efficiency and productivity improvements, please refer to Exhibit 1B, Tab 2, Schedule 5.

Performance Measurement in the DSP

With specific reference to the OEB's Chapter 5 Filing Requirements, Toronto Hydro has proposed a series of measures for monitoring and encouraging continuous improvement with respect to the execution of 2015-2019 capital expenditure plan in the DSP. These metrics are listed in Table 3 below.

The measures cover several dimensions of the utility's capital planning and implementation processes or pertain directly to the outcomes of such processes, motivated by customer needs, regulatory compliance obligations, or corporate efficiency objectives. Several of these measures are already in a mature state and will be tracked during the five-year planning horizon; others are in a relatively nascent state, to be developed and refined over the course of the CIR term as part of Toronto Hydro's commitment to productivity and continuous improvement.

Table 3: Proposed Performance Measures Framework[12]

Customer-Oriented Performance	Cost Efficiency/ Effectiveness of Planning and Implementation	Asset/System Operation Performance
1. System Average Interruption Duration Index (SAIDI) 2. System Average Interruption Frequency Index (SAIFI) 3. Customer Average Interruption Duration Index (CAIDI) 4. Feeders Experiencing Sustained Interruptions (FESI) 5. Momentary Average Interruption Frequency Index (MAIFI)	1. Distribution System Plan Implementation Progress 2. Planning Efficiency: Engineering, Design and Support Costs 3. Supply Chain Efficiency: Materials Handling On-Cost 4. Construction Efficiency: Internal vs. Contractor Cost Benchmarking 5. Construction Efficiency: Standard Asset Assembly Labour Input	1. Outages caused by defective equipment 2. Stations capacity availability

Execution Considerations and the Need for Flexible Capital Funding

Toronto Hydro expects that flexibility in project scheduling across the five-year term of this application will be a source of efficiency as the utility executes the proposed capital work in the DSP. This ability to shift projects between years and to increase or decrease the amount of spending in a program in any given year allows Toronto Hydro to execute the overall capital expenditure plan outlined in the DSP in the most cost-effective manner

[12] For more information, please refer to Exhibit 2B, Section C.

possible.

Due to a number of factors, executing capital work in Toronto is necessarily a complex and dynamic process. While executing a planned work program, external factors, such as work permit timing, weather, re-prioritization of jobs due to system needs, etc., will inevitably arise. In many of these situations, good utility practice and prudent work planning is best served by (a) specific projects within a capital program being substituted, on a like-for-like basis, with other projects; and (b) specific projects being added to, or deferred from, a given program. These numerous externalities mean that Toronto Hydro cannot plan with certainty of execution timing or costs in advance, and attempting to do so would actually be an imprudent use of time and ratepayer funds. Toronto Hydro has prepared a detailed overview of the practical execution challenges that the utility often faces during development and execution of its capital program. This overview can be found in Appendix A to this schedule ("Execution Challenges").

Despite its best efforts to anticipate and plan around these challenges, Toronto Hydro must be prepared to respond to circumstances "on the ground" in order to make the most efficient use of resources and ultimately deliver the best value for its customers. From a planning perspective, this means that the utility must be able to substitute, defer and add projects in the annual work program in a given year, to accommodate the operational realities that it encounters in the course of executing its work program.

Toronto Hydro's planning process attempts to mitigate these issues in various ways, but ultimately the execution of any given project can be changed by various external forces that cannot be predicted with certainty. Over time, these issues can generally be mitigated – some work can be advanced if not work must be delayed – but the forecast work for any given year may change depending on circumstances, and as a result the aggregate work in service in a given year may change.

While specific projects may change in scope, cost and timing during the CIR period, the utility has confidence that, over the course of the five-year planning horizon, the overall work program presented in the DSP can be executed as described. Prudence dictates that Toronto Hydro must retain the flexibility to execute an optimal mix of work in each given year. It is not possible to predict the specific work that will comprise Toronto Hydro's execution work program in 2019, but the utility can be certain that, over the five years of the application, this level of work, as set out in the DSP programs, is required.

IV. The proposed capital program ultimately delivers long-term value for customers

As discussed in part I of this section, the pace of investment during the 2015-2019 period is driven by system needs. The underlying need and establishment of pacing is described in detail in Toronto Hydro's asset management policy and processes[13] and in the capital expenditure plan.[14] At a high level, the long-term objective of Toronto Hydro's asset management policy is to achieve an optimal "steady-state", in which the number of assets that are past their economic end-of-life (explained below) is minimized. When the system is in that theoretical steady state, the total operating (or lifecycle) costs associated with the broader in-service asset population are minimized, meaning that customer value is maximized.

The concept of a steady state is based on Toronto Hydro's risk-based optimization approach to investment planning, which relies largely on use of the utility's Feeder Investment Model ("FIM") and other age and condition based information. Using these tools, Toronto Hydro determines the optimal asset renewal timing based on the economic end-of-life criteria for each asset. An asset reaches its economic end-of-life when the risk cost of continuing to operate the asset, which increases over time, becomes equal to or

[13] Exhibit 2B, Section D.
[14] Exhibit 2B, Section E.

greater than the cost of replacing the asset, which decreases over time. An asset management policy that strives to replace the broader population of assets at this "optimal intervention time" ensures that, on average, Toronto Hydro is minimizing the total costs of operating the system, thereby maximizing customer and utility value derived from the assets.

Theoretically, Toronto Hydro's risk based model defines the ideal "steady state" as the scenario where, on a system level, no assets are allowed to operate beyond their optimal intervention time, and all assets are replaced at exactly the optimal intervention time and no earlier (except those that inevitably fail prematurely). (Practically speaking, Toronto Hydro must group asset replacements into efficiently executable projects; therefore, the actual "steady state" will necessarily involve replacing a small percentage of assets before end-of-life and allowing a small percentage of assets to operate beyond end-of-life.)

As discussed in part I of this section, Toronto's distribution system currently features a high percentage of assets operating beyond end-of-life. Clearing this backlog and achieving "steady state" as quickly as possible is ideal for the utility and customers to the extent that it will minimize the duration that the distribution system is operating in an unbalanced state with higher than necessary aggregate lifecycle costs. However, in reality, clearing this backlog in one year (i.e., the economically ideal approach), or even over the duration of the five-year CIR period, would not be feasible as it would feature levels of investment that do not immediately align to Toronto Hydro's current resources and system constraints. For these reasons, Toronto Hydro's DSP is based on a paced execution strategy, which represents the minimum level of investment appropriate given system needs during the 2015-2019 period.

If Toronto Hydro were to continue at the proposed annual average pace of investment beyond 2019, the system is forecasted to reach steady state by approximately 2037. This paced approach has the advantage of moderate and predictable bill increases during the 2015-2019 period and alignment with Toronto Hydro's immediate execution capacity. The paced strategy also helps to ensure more predictable bill impacts and system performance beyond the achievement of steady-state, due to the more gradual or dispersed approach to clearing the backlog of end-of-life assets.

3. STRUCTURE AND COMPLIANCE OF TORONTO HYDRO'S DSP

Toronto Hydro has organized its 2015-2019 Distribution System Plan ("DSP")[15] in a manner consistent with Chapter 5 of the Filing Requirements. Toronto Hydro has worked to provide DSP content that aligns with the spirit of the RRFE Report, as expressed through the Chapter 5 Filing Requirements, and that allows the OEB to evaluate all aspects of the utility's detailed and integrated five-year capital plan within the context of this Customer IR application. Key features of the DSP include the following.

- The five major sections of Toronto Hydro's DSP adhere to the organizational structure outlined in sections 5.2 and 5.3 of Chapter 5. This includes:
  - Section A: DSP Overview
  - Section B: Coordinated Planning with Third Parties
  - Section C: Performance Measurement for Continuous Improvement
  - Section D: Asset Management (AM) Process
  - Section E: Capital Expenditure Plan

[15] Exhibit 2B.

- The contents of these chapters are substantial compliance with the various filing requirements listed throughout the applicable sections of Chapter 5.

- Toronto Hydro has organized its capital investments in accordance with the OEB's prescribed investment categories (System Access, System Service, System Renewal and General Plant) and has provided figures and analysis for historical and forecasted expenditures in these categories as well as for System Operating & Maintenance ("System O&M") expenditures.

- To address the OEB's incremental filing requirements for "Material Investments"[16], Toronto Hydro has further grouped investment activities within the investment categories into 46 capital programs, which are analogous, and in many cases identical, to the "segments" filed in the utility's 2012-2014 ICM application. Programs consist of investment activities or groups of discrete projects that are similar in nature and purpose and that share similar justifications and business case elements.

- Each capital program is further defined by a single 'trigger' driver and a number of secondary drivers. These drivers generally align to the example drivers provided by the OEB in Chapter 5.17 The trigger driver indicates the primary reason that a particular program must be carried out. However, in some cases, secondary drivers may be as or more consequential than the trigger driver (e.g., safety as a secondary driver).

- Each capital program contains detailed information that can be used to assess Toronto Hydro's investment plans in light of the OEB's specific evaluation criteria (i.e., Customer Value, Reliability, Efficiency, Safety, etc.). To aide in this

[16] Filing Requirements, Chapter 5 at section 5.4.5.2.
[17] Filing Requirements, Chapter 5 at section 5.1.1, Table 1.

evaluation, Toronto Hydro has provided summary tables of anticipated program benefits in the description of each program.

x Toronto Hydro has complied with specific requirements in Chapter 5 that are meant to promote integrated planning, including, for example:
  - a complete analysis of regional planning considerations and their effect on the DSP;
  - a system capability assessment for renewable energy generation;
  - details on System O&M expenditures and their relationship to capital investments;
  - forecasted smart grid development; and
  - identified sources of cost savings during the forecast period.

APPENDIX A: EXECUTION CHALLENGES

When executing its capital program Toronto Hydro must be prepared to respond to circumstances “on the ground” in order to make the most efficient use of resources and ultimately deliver the best value for its customers. From a planning point of view, this means that the utility must be able to substitute, defer and add projects in the annual work program in any given year to accommodate the operational realities that it experiences in the course of its work program.

This appendix describes aspects of Toronto Hydro’s service territory that add complexity to the execution of large capital projects.

1. WEATHER AND THE NATURAL ENVIRONMENT

A number of unpredictable work execution challenges arise due to severe weather and conditions that exist in the natural environment. These challenges are difficult to assess in advance of undertaking projects and planned work.

1.1. Weather

Unpredictable weather events have the potential to impact work execution in two ways. One is that extreme weather (e.g., very cold or very hot temperatures) over a prolonged period can cause projects to be delayed or cost. Second, severe weather such as extreme wind, ice, and rain events can cause wide-spread damage to Toronto Hydro’s distribution system and necessitate the redirection of crews from planned work to emergency storm restoration activities.

An example of a prolonged weather pattern that impacted Toronto Hydro’s ability to execute planned work was the cold experienced during the 2013-2014 winter. Due to

frost, snow, and ice, utilities are generally challenged to conduct civil and pole installation work during winter months. To manage this reality, Toronto Hydro conducts significant amounts of civil work in the lead up to winter and then does not schedule much civil work until winter conditions subside. Given that the 2013-2014 winter was particularly long and cold, resulting in frost settling deep into the ground, civil work was substantially delayed in 2014. The long winter not only impacted capital projects but also maintenance programs such as insulator washing that cannot be conducted in cold temperatures.

Examples of severe weather events causing damage to Toronto Hydro's distribution system occurred on October 29, 2013 (i.e., Hurricane Sandy) and December 21, 2014 (i.e., the 2013 Ice Storm). In response to the damage caused by these severe weather events, Toronto Hydro redirected all available crews, including crews working on planned projects and programs, to emergency storm restoration activities. In any given year, the amount of time and delay caused by severe weather can vary but can equate to weeks of construction time across all projects as evidenced in 2013, where planned work was delayed due to flooding in July, strong winds in August and October, and the ice storm in December. Some of the delays were overcome by working overtime at an increased cost to individual projects.

1.2. The Natural Environment

The natural environment can create challenges due to issues that may involve soil conditions, ground water, and vegetation. Prior to work execution, Toronto Hydro attempts to plan for the natural environment and mitigate associated risks. However, it is not uncommon for even the most prudently planned projects to be delayed due to challenges associated with the natural environment.

One set of challenges that are encountered are related to the soil conditions found on sites

where planned projects are being conducted. For example, it is not uncommon for Toronto Hydro to encounter shale while installing poles. When identified, shale must be removed using a jackhammer causing delays and increased costs. Toronto Hydro tries to mitigate the risk of unexpected shale using test pits prior to commencing work. These test pits require additional site visits and are costly. As a result, it is prudent for Toronto Hydro to only undertake such costs if there is a reason to believe that soil conditions are abnormal.

Another risk related to soil conditions is soil contamination. The removal and disposal of contaminated soil can be particularly costly and can delay projects if identified during work execution. An example of a where this occurred is the Strachan TS Civil Egress project. This project was required to construct cable chambers and underground conduits from Hydro One's Strachan TS to Manitoba Drive. When construction commenced, contaminated soil was discovered and the additional cost for soil testing, removal, and disposal was approximately $400,000.

A second set of challenges associated with the natural environment is excessive ground water. Although de-watering needs are anticipated for many projects including those that are undertaken close to Lake Ontario, these needs can significantly exceed estimates and contingencies. In some cases, de-watering specialists need to be called in during work execution as excessive and unanticipated water levels delay the project and increase costs. Further complications can arise if soil is contaminated and de-watering is required. Finally, Toronto Hydro may need to obtain a permit from the City of Toronto to pump water out and to release it in the City's sewer system. An example of excessive de-watering needs occurred during the civil construction work associated with the Copeland TS project. Some of the conduits and cable chambers being built as part of this project resulted in approximately $375,000 in additional costs for excessive de-watering.

Beyond the de-watering challenges described above, complications can also arise with de-watering that is required following heavy rains. For example, the heavy rain on July 9, 2013 and the flooding that ensued caused work at a number of Toronto Hydro's construction sites across the City to stop until de-watering could be completed. Project schedules as a result were generally delayed for approximately four days each.

A third set of challenges associated with the natural environment is related to vegetation, specifically trees. Many of Toronto Hydro's overhead and underground construction projects have the potential to negatively impact trees and as part of the design and estimating process, Toronto Hydro takes into consideration precautions to protect trees. These precautions are often conditions of obtaining permits and approvals from the City of Toronto. These conditions are enforced by City inspectors that may visit sites during construction. In many cases, precautions must be expanded upon or altered during work execution based on conditions that are identified at the time. For example, Toronto Hydro may need to dig deeper, alter trench routes, or construct unplanned tree tunnels during work execution to avoid damaging a tree. These requirements can and do result in delays and additional costs.

2. EXTERNAL STAKEHOLDERS

Work execution challenges often arise as a result of external stakeholder needs, preferences, requests, and actions. External stakeholders include the City of Toronto, Toronto Hydro's customers, Hydro One, and a wide variety of other organizations and individuals that have an interest in the work that Toronto Hydro undertakes. Challenges that are related to external stakeholders can greatly impact project and program schedules and costs as illustrated by the examples that follow.

2.1. The City of Toronto

A significant stakeholder in all work that Toronto Hydro undertakes is the City of Toronto. The vast majority of Toronto Hydro's assets are located on City road allowances and co-exist with City (e.g., water and sewer systems, roads, sidewalks) and other utility (e.g., telecommunications, gas lines) and non-utility (e.g., transit) infrastructure. To enable the efficient management of road allowances, the City has implemented a number of co-ordination, permitting, and approval processes that have the potential to influence work execution, schedules, and budgets.

An example of how the City's processes can impact work execution is road moratoria that are implemented following City road improvement projects.[1] Depending on the type of road (e.g., road, curb, sidewalk) improvement that the City undertakes, utilities such as Toronto Hydro will not be granted permits to conduct subsequent construction work for a period of three to ten years.

In situations where the City advances or provides short notice for road improvements, Toronto Hydro must re-prioritize work to ensure that projects that are planned in the short and medium terms are completed before a moratorium goes into place. A specific example of this is work that Toronto Hydro planned in the Hogg's Hollow area of Toronto. Plans were to initially execute the work in five sequential phases. When the City announced that it was moving forward with road improvement work, Toronto Hydro brought forward the execution of the fifth phase to avoid a road moratorium after 2013. Re-prioritizing projects in this manner can force the deferral of another project and has the potential to increase costs depending on whether the project must be undertaken by a different contractor or resource group.

[1] Moratoria are implemented by the City's Municipal Consent Requirements for the Installation of Plant Within City of Toronto Streets, pursuant to the City's authority over highways (public roads) under sections 32 and 33 of the City of Toronto Act, 2006, S.O. 2006, C. 11, Sched. A.

Another example is work that Toronto Hydro had to conduct as a result of a series of City projects (e.g., granite sidewalk retrofit; water main replacement) in the vicinity of Bay and Bloor Streets. During one project, Toronto Hydro was given only three months to complete its work and during another project, Toronto Hydro had to rebuild an overhead pole line during the Christmas season. Typically, work in this area is constrained as restrictions to only work certain hours of the day, to only occupy a certain length of street at a time, to minimize disruption to local business, and to eliminate work during rush hour are in place. Given the tight timelines imposed, Toronto Hydro had to obtain noise exemptions from City and crews had to work overtime resulting in costs that would not otherwise have been required. Another project on Asquith Avenue in the same vicinity needed to be delayed entirely and was only completed in 2014 as a result of City work in the area.

On many occasions, challenges that arise as a result of City requests do not result in delays or additional costs, but instead result in a need to advance costs from one year to the preceding year. One example is a voltage conversion project south of Bloor Street. Initially, Toronto Hydro had planned to finish the project by May 1, 2014 when the City asked for the project to be completed by March 31, 2014 due to a planned water main and sewer replacement project. To accommodate the City's request, Toronto Hydro started construction in the last quarter of 2013 and advanced more than $200,000 of expenditures into 2013. Another example is a project to place direct buried cable on Starview Lane and Rockbank Crescent in the Weston Road and Sheppard Avenue area. To avoid a scheduling conflict with other City's water main and sewer work, Toronto Hydro advanced an additional $250,000 into 2013.

2.2. Customers

A second set of stakeholders that can introduce unexpected challenges during work execution are customers and members of the public. Although Toronto Hydro undertakes

significant customer engagement activities (e.g., informational letters, town hall meetings, responses to requests for accommodation) before and during planned work, and although the vast majority of Toronto Hydro's customers are supportive and very reasonable when work is being undertaken in proximity to their homes and businesses, incidents and challenges do arise.

One example is the aforementioned set of projects at Bay and Bloor Streets in downtown Toronto. During one project, pedestrian control in the area became so challenging that Toronto Hydro had to increase the budgeted number of paid duty police officers from one to two. In addition, one of the buildings along the project route started renovations at the same time that Toronto Hydro's project was to be executed. The building's contractors installed scaffolds outside the building for two months and this prevented Toronto Hydro from commencing its project during this time.

2.3. Hydro One Networks

Toronto Hydro is supplied by Hydro One Networks Inc. ("HONI") and owns equipment at 34 transformer station sites that are owned by HONI. The equipment at station sites is tightly integrated and the two companies must closely coordinate planned work. At times, even the best efforts and plans cannot fully mitigate the risk that challenges will arise and delays will occur.

3. OPERATING ENVIRONMENT

Work execution challenges that are brought by the Operating Environment relate to issues that arise as a result of working within congested underground utility corridors that are shared with other service providers such as the City of Toronto's Water Division, natural gas and telecom companies. This includes past tenants or users of the space that now makes up the corridors. These challenges, as illustrated below, can greatly influence

Toronto Hydro's ability to execute work on schedule and on budget.

3.1. Aging Infrastructure

Challenges often arise due to the need to work around aging infrastructure that is often owned by third parties (or Toronto Hydro). One example of this is water and sewage lines. Around these lines, Toronto Hydro utilizes specialized excavation techniques such as vac-truck digging to mitigate the risk of damage. However, aging lines have at times broken open despite the use of these techniques and have caused water or sewage spills that delay projects and increase costs.

A particular example of the unexpected failure of water and sewage lines during the execution of a Toronto Hydro project occurred on Laird Drive in East York. As illustrated in Figure 1, a sewer line was uncovered during the project, the line began to leak as a result of a defective fitting. The fitting needed to be replaced and the line needed to be supported during the construction of the duct bank.

Figure 1: Sewage Line Uncovered During Duct Bank Construction

As part of the same project, a water line was also uncovered while constructing a new cable chamber. This water line began to leak and water migrated into the chamber as shown in Figure 2. These two issues caused several weeks of delays in the construction schedule of the Laird Drive project.

Figure 2: Water Line Leak Flooding Cable Chamber During Construction

Another particular example occurred where Toronto Hydro needed to construct a duct structure well below an old existing water main. This main can be seen at the bottom of the trench in Figure 3. During excavation, the water main broke. (Water can be seen running in the trench in Figure 3.) The main had to be repaired and supported by chains, which caused delays and additional costs in the project.

Figure 3: Water Main Leak at the Bottom of a Trench

Beyond aging water and sewer infrastructure, challenges also arise during work execution in the vicinity of telecommunication infrastructure and even Toronto Hydro's own infrastructure. For example, older telecom cables were buried directly into the ground without concrete encasings as found during a recent project on Toresdale Avenue in North York. Precautions to mitigate the risk of damage to in-service cables during the Toresdale Avenue project added to costs and, if damage had occurred, would have resulted in delays. Precautions must also be taken with Toronto Hydro's own infrastructure, which often must be supported and maintained in functional condition throughout a project. The following figures illustrate live cables being supported during construction projects.

Figure 4: In-Service cable being supported as a large cable chamber was re-constructed in the aforementioned Laird Drive project.

Figure 5: In-Service cables being supported during a vault re-build at Wellington and Emily Streets in downtown Toronto.

Figure 6: In-Service cables being supported during a vault re-build at 390 Bay Street in downtown Toronto.

The complexity of some of these work sites and the necessity to support at times aging and deteriorated assets can lead to issues, risks, delays in work schedules, and increased costs.

3.2. Undocumented Sites and Infrastructure

During work execution, it is not uncommon for Toronto Hydro to encounter sites and infrastructure that are not documented or difficult to anticipate. Some of these discoveries can be accommodated within the scope of a project. However, some are particularly unique and result in unavoidable delays and costs. Discoveries often cause

projects to be placed on hold as they necessitate investigations, project redesigns, and new permits.

One example of a unique discovery during work execution is an unregistered archaeological site that was found on Scenic Hill Court in Scarborough. The discovery was made during an underground duct construction project and resulted in a four-month delay in the project.

A second example of a unique discovery is an old undocumented gas pipe that was found during a system expansion project to supply new customer load. The project was replacing an overhead single circuit steel pole line with a new double circuit wood pole line. When an old cast iron pipe was discovered, pole installation was halted and a subsequent investigation revealed that the pipe was an abandoned gas main (see Figures 6 and 7 below). Enbridge was contacted and approval to break out the abandoned gas main at the proposed new wood pole locations obtained. The impact of the abandoned pipe, which included breaking out the pipe at 28 pole locations, resulted in approximately $120,000 of additional expenditures and a three-week delay.

Figure 7: Abandoned Gas Main Found During Pole Placement

EXECUTIVE SUMMARY

Navigant Consulting Ltd. (Navigant) was retained by Toronto Hydro-Electric System Limited (THESL) to conduct an independent review of THESL's Distribution System Plan (DSP), prepared to support distribution projects and programs that THESL plans to submit for approval under the OEB's Chapter 5 requirements for electricity transmission and distribution applications. The specific investment categories and business case segments that Navigant reviewed are listed in Table 1.

Table 1: DSP Capital Investments Reviewed by Navigant

Based on our review of THESL's DSP and the business cases it prepared to support its five-year spending plan (for simplicity, "the proposed investments"), Navigant has concluded the following:

1. THESL's DSP supports the OEB's four performance outcomes; customer focus, operational effectiveness, public policy responsiveness and financial performance as outlined in Chapter 5 of the OEB's Filing Requirements for Electricity Distribution Rate Applications (Chapter 5). Further, THESL's DSP addresses specific provisions set forth in applicable subsections of Chapter 5.
   - Where applicable, the proposed project plans provide information on customer engagement to identify customer preferences. THESL has taken steps to ensure that customer inputs were taken into consideration, and to ultimately provide economic efficiency, superior performance and cost-effectiveness for its customers.
   - THESL has provided descriptions of how its proposed assessment, management strategy and capital expenditure plans best maximize the opportunities for operational effectiveness and continual improvements for productivity and cost performance.

- Proposed projects are explained and rationalized as to how the capital expenditure plan is integrated with public policies (government mandates) where applicable.
- Each of the projects proposed offer justification for prudent capital expenditure and show they can be executed with financial viability and operational effectiveness. Furthermore, the project plans provide details of how these efficiencies can be sustained over the long term.

2. The proposed projects in each investment category of THESL's DSP are required and justified based on methods and criterion that reflect Chapter 5 objectives.
   - The DSP provides a clear and concise approach to asset management and planning, including the data bases and decision tools it used to prioritize and select capital projects that appear in its five year investment plan.
   - Business cases consistently apply methods outlined in DSP asset management processes, and the results of THESL's evaluation confirm that the solutions it proposes are the preferred alternative based on performance and economic criteria.
   - The proposed investments are consistent with solutions other similar utilities have or propose to implement; for example, utilities throughout North America are replacing obsolete air blast magnetic breakers, transformers and communications and control systems.
   - Several of the proposed projects reflect the intent of relevant sections of OEB Chapter 5, the Ontario Distribution System Code and Electrical Safety Authority (ESA) rules and regulations with respect to power system safety and reliability.

3. THESL's DSP and proposed projects prudently address key drivers such as condition, safety and growth in a responsible and efficient manner, and are consistent with other utility practices.
   - Each of the projects proposed in the four investment categories addresses important reliability, safety, and performance issues. Deferring these projects will degrade service reliability and quality of service to THESL customers.
   - Several of the safety related upgrades, including breaker and switchgear replacements, are issues that many other utilities have encountered and have proactively addressed or are addressing.
   - Many of the deficiencies THESL has identified and proposes to address were identified in Asset Condition Assessment (ACA) procedures and DSC mandated inspections, and should be addressed without unreasonable delay.

4. THESL's decision tools, planning criteria and design practices underpinning the business cases in the DSP are consistent with industry best practices.

   - THESL planning criteria with respect to equipment loading and distribution feeder design are consistent with other utilities, except in the downtown Toronto core, where feeder back-up is provided by intra-station ties instead of inter-station feeder ties.
   - Where differences in standards exist, they typically are due to constraints associated with operating energy delivery facilities in a major urban center, or because of unique equipment requirements due to higher operating voltages or subject to higher fault current levels.
   - The decision tools and processes cited above have been consistently applied in THESL's business cases, where projects are selected based on a thorough evaluation of reliability, safety, economic, environmental and other factors applicable to each investment category.

5. The methods and tools employed by THESL to evaluate and select the proposed projects are appropriate, and meet or exceed those employed by electric utilities in Ontario and other provinces. The business cases provide ample evidence that the projects are not only required, but have been thoroughly evaluated.

   - THESL has conducted extensive technical evaluation of the condition of the assets it proposes to upgrade or replace. The underlying reasons as to why the equipment or facilities proposed for renewal are deficient are clearly evident from the analyses THESL engineers and support staff have performed and documented in the business cases.
   - Proposed upgrades are based on rigorous and thorough condition assessment methods, using modern tools and methods. For example, power transformer and breaker replacements were selected, in large part, based on physical data from DGA records that confirms declining performance or potential for failure.
   - Project need and the evaluation of alternatives are based on similar asset management best practices and principles that leading utilities now employ, including optimizing the timing of renewal investments based on trade-off of cost and risk.

6. THESL's proposed projects are coordinated to ensure they will result in the maximum utilization and efficient use of equipment.

   - Project selection is based on sound asset management practices and principles that are consistent with those we have seen at other utilities that have adopted best practices and solutions. These include use of asset condition data and decision tools that ensure renewal investments optimize the timing of replacements or upgrades.
   - Several projects are complementary; that is, investments often are needed to ensure maximum efficiency and utilization of equipment, particularly those designed in consideration of area planning.

- Some assets are nearing maximum utilization and new facilities are needed to serve growing load and to ensure reliability is maintained. Downtown Toronto is one of the areas experiencing capacity constraints and increased risk of exposure to high impact events. For example, downtown station's capacity constraints will be addressed by a combination of new feeder ties, expanded station capacity and targeted CDM in the form of localized demand response.

- Some investments are needed to support City of Toronto initiatives, including major in-City roadway projects that will require major relocation of underground facilities and cables.

7. THESL's proposed aggregate capital spending of approximately $490 million annually over the five year period is reasonable and justified based on the information and analyses provided in THESL's DSP. There are potential undesirable consequences to system reliability, safety and performance if THESL does not proceed with the proposed projects.

   - THESL's proposed spending is the minimum needed to complete the continuation of ICM programs in 2015 and to maintain a reasonable balance between risks and costs over the five year rate period. The level of spending is higher than the prior five years, but is the minimum required to reduce the backlog of end-of-life asset replacement by 2037 and meet OEB Chapter 5 requirements.

   - The technical and economic analyses THESL has developed to support capital is rigorous and consistent with Chapter 5 guidelines for each of the four major spending categories.

   - Data and analyses presented in the business cases demonstrate that key distribution equipment and facilities are increasingly at risk of failure or are inadequate to reliably serve current and future load. System reliability and customer satisfaction are expected to decline in the absence of proposed investments as these risk factors increase and equipment performance declines.

   - THESL is proposing to responsibly address known safety and performance deficiencies that company personnel have identified, including structures, devices and facilities that place public and crew safety at risk. Similarly, the known deficiencies associated with primary distribution equipment should be addressed to reduce safety risk to THESL crews and minimize the potential for interruptions or longer restoration times for customers.

   - Without the proposed investments, THESL customers would likely see higher costs in the form of increased O&M, longer restoration time, and greater likelihood of collateral damage due to catastrophic equipment failures.

   - Timely completion of key major projects is needed to complement Hydro One renewal programs, and vice-versa, with sub-optimal performance and higher costs if these are not installed as THESL and Hydro One have proposed.

In summary, each of the proposed investment categories and business cases in THESL's DSP that Navigant reviewed is consistent with those currently or previously undertaken by many other urban utilities in Canada and the United States that Navigant has evaluated. Notably, we did not identify any projects or measures that are inconsistent in scope or need with programs implemented elsewhere. In Navigant's view, because of these reasons and the review and analysis presented in subsequent sections of our report, the proposed projects in THESL's DSP are reasonable and justified.

INTRODUCTION AND BACKGROUND

Background

Chapter 5 of the OEB's Filing Requirements for Electricity Transmission and Distribution Applications sets forth guidelines and objectives applicants must follow to support proposed capital investments.

THESL has prepared a Distribution System Plan (DSP) to support proposed investments for the years 2015 through 2019 based on requirements in Chapter 5. The DSP includes detailed business cases for each major project or program under which THESL seeks OEB approval.

Navigant's Scope of Work

Navigant was retained by THESL to conduct an independent review of its Distribution System Plan (DSP) and business cases that it prepared to support proposed capital investments from 2015 through 2019, inclusive.

Specifically, Navigant was asked to answer the following questions in its review:

1. Is THESL's Distribution System Plan (DSP) consistent with the guidelines, objectives and criteria set forth in Chapter 5 of the OEB's Filing Requirements for Electricity Distribution Rate Applications (Chapter 5)?
2. Does THESL's DSP and proposed investment plan satisfy the objectives set forth in Chapter 5?
3. Are the business cases that THESL presents in its DSP consistent with the requirements of Chapter 5?
4. Does each of THESL's business cases apply the methods, tools and criterion outlined in its DSP, and has THESL provided sufficient evidence to justify the proposed investments?
5. Are THESL's design and planning practices consistent with utility best practices?
6. Are the methods and tools employed by THESL to select proposed projects appropriate and sufficient to justify the investment?

Navigant conducted its independent review and assessment based solely on information and findings obtained from documents THESL prepared under five DSP document categories listed below. Navigant did not request nor did THESL advise as to content or suggest modifications to any of the findings or conclusions contained in this report.

1. Section A: Distribution System Plan Overview

2. Section B: Coordinated Planning with Third Parties

3. Section C: Performance Measures for Continuous Improvement

4. Section D: Asset Management Process

5. Section E: Capital Expenditure Plan (including Business Cases)

Section E includes detailed business plans based on the methods, criteria, and evaluation framework set forth in Sections A through D. These business cases are grouped according to four categories outlined in Chapter 5. Navigant's review includes a detailed assessment and evaluation of over 30 specific business cases, grouped according to the four OEB investment categories listed in Table 2.

Table 2: THESL Capital Investments Reviewed by Navigant

Navigant's Approach

For each investment category, Navigant reviewed the overall robustness of the business cases in terms of establishing that the projects are required and sufficiently justified to support each of the proposed investments. The criteria considered by Navigant in its review included, among other factors, the following:

1. Comprehensiveness of impact analysis including underlying logic, quantification of benefits wherever possible, and linkage back to a robust, systematic capital planning approach used by THESL.
2. Prioritization within the cases, as appropriate (e.g., why do the recommended units need to be replaced or upgraded?) and rationale for such prioritization.
3. Clarity regarding impact of the proposed investment relative to other capital investments or expenses (e.g., maintenance, do nothing, capitalized maintenance).

4. Robustness of analytical methods and technical support for establishing need and the impact on reliability and performance if the projects are not funded and implemented by THESL.
5. Identification of options considered and robust analysis of these options clearly showing the advantage of the preferred options.
6. Comparison with industry practices and standards as appropriate (e.g., asset economic end of life schedules).

Navigant also reviewed THESL's Feeder Investment Model (FIM) methodology and how it was applied to support each of the business cases in terms of consistency with industry practice and sound logical underpinning.

In the sections that follow, Navigant answers the six questions set out at the beginning of this section.

DISTRIBUTION SYSTEM PLAN OVERVIEW

In this section, Navigant addresses THESL's Distribution System Plan ("DSP" or the "Plan") with respect to consistency and compliance with the guidelines and objectives set out by the OEB. Specifically, our review of the DSP is intended to address the following question:

Is THESL's Distribution System Plan (DSP) consistent with the guidelines, objectives and criteria set forth in Chapter 5 of the OEB's Filing Requirements for Electricity Distribution Rate Applications (Chapter 5)?

Distribution System Plan Framework

Our review of THESL's DSP, including relevant chapters and sections contained in Sections A through E, confirms that the Plan meets each of the requirements set forth in Chapter 5. Navigant reviewed in detail THESL's DSP framework presented in Section A through D, and specific business cases in Section E, and has determined that THESL has developed a DSP with sufficient rigour and supporting analysis to justify the proposed levels of spending throughout the rate period. Additionally, Navigant has determined that the methods, tools, and system that THESL used to evaluate and justify proposed capital spending in its DSP meets or exceeds current utility practices. Our determination is based on comparable reviews Navigant has conducted in Ontario, the United Kingdom, the United States, and other provinces in Canada.

The basis for our conclusions and opinions regarding THESL's DSP is supported by the detailed review and assessment in sections that follow.

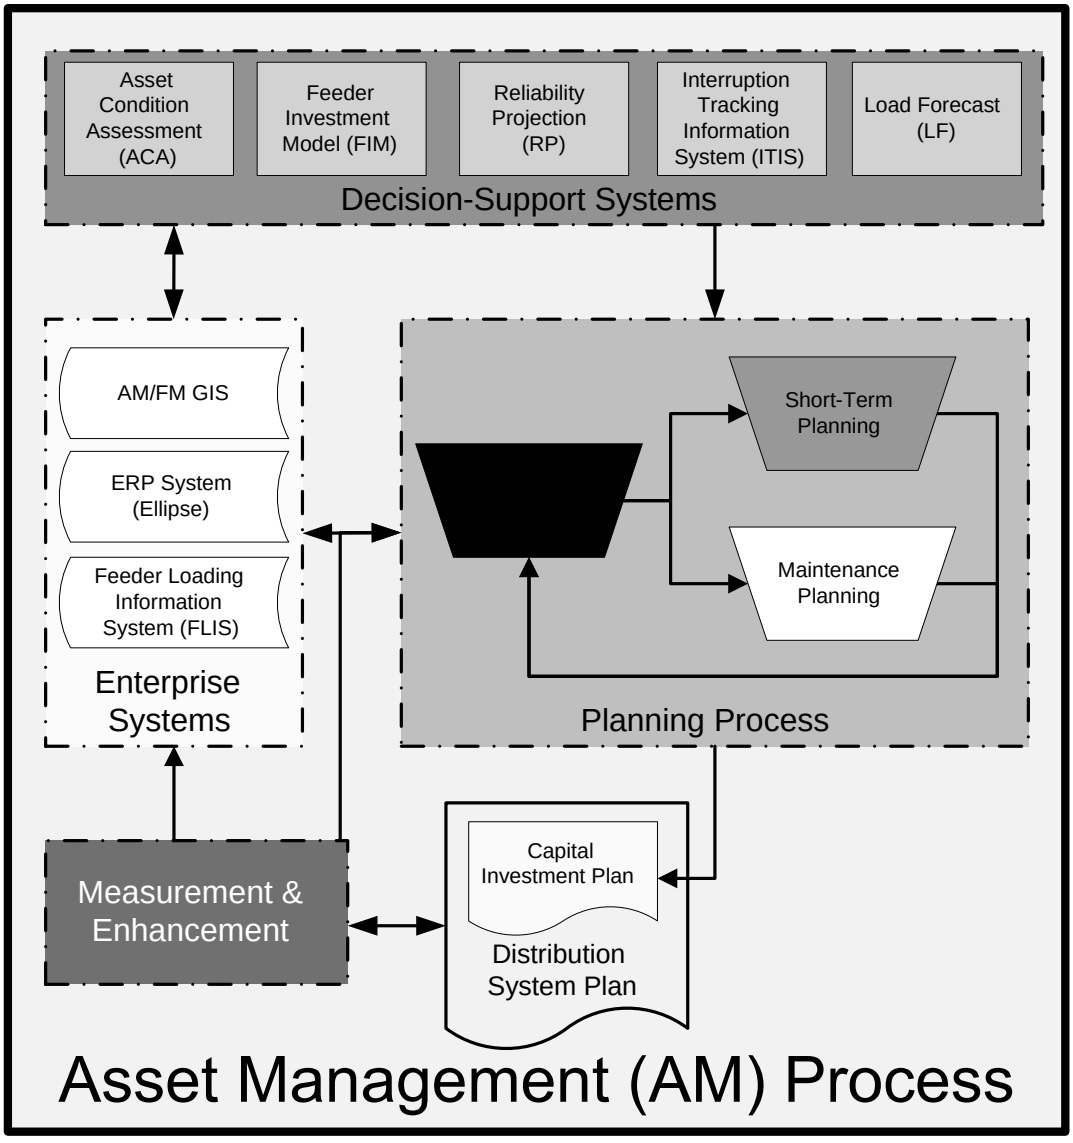
Overview

The following presents Navigant's general findings and opinions on the processes, tools and methods THESL developed and applied to support proposed capital spending throughout the five year rate period. Navigant's findings with respect to the above are based largely on the DSP overview and framework presented in Sections A through D, and application thereof to individual business cases in Section E. Our independent assessment seeks to make a determination as to the whether THESL's DSP is consistent with Chapter 5 guidelines and objectives, and to identify potential opportunities where new data or information could be incorporated into THESL's planning for greater optimization of proposed investments during the five year rate period.

Asset Management Plan

Section D of THESL's Application provides a concise overview of the processes, systems and methods it uses to manage its capital assets, and to meet an overarching objective of optimizing spending over the rate period to meet customer and performance objectives at acceptable cost and rates. THESL's AM objectives are set forth in the following excerpt, which

appears in Sections A.1.2 and D.1.1 of its filing documents. Navigant believes these objectives are consistent with the OEB's general requirements set forth in Chapter 5.



> Toronto Hydro's asset management objectives proactively identify, manage and mitigate deficiencies and risks to the electrical distribution system in order to (i) maximize value to the utility's customers, (ii) minimize or eliminate safety risks, and (iii) strike an optimal balance between required capital investment and risk costs associated with asset failure (Toronto Hydro refers to this balance as "steady state").

To maintain a desired balance in spending – THESL seeks to achieve spending equilibrium (i.e. "steady state" as described above) in a "paced" manner such that funds are spent at relatively consistent levels – the AM Plan outlines the approach THESL used to evaluate asset needs over the short-, mid-, and long-term to derive a level of spending that balances risk versus cost, consistent with Chapter 5 guidelines prescribed in Section 5.3.1. Figure 1 is a high-level process diagram THESL prepared to illustrate foundational elements of its AM plan, each of which Navigant has reviewed and analysed in forming its opinion on THESL's AM strategy, approach, and proposed spending plan.

Based on our prior review of THESL's previous ICM application and the current DSP, Navigant is able to confirm that THESL has developed a comprehensive Asset Management (AM) strategy that is based on key principles outlined in Chapter 5, and consistent with leading industry practices such as those outlined in British Publicly Available Standard (PAS) 55[1]. The strategies THESL's DSP has adopted are designed to identify renewal program requirements based on quantifiable data that accurately describe asset condition and risk. Our review indicates the information contained in the business cases include significant condition data based on measurements and root cause analysis, such as those performed for station transformers and overhead switches. THESL's DSP also highlights the associated risks if the investments are not undertaken. The EIM is one of the primary AM tools used to incorporate project economic value based on asset condition, risk factors and customer impacts.

[1] PAS 55 recently migrated to ISO 55001 & 2, which expands upon and incorporates most elements of PAS 55, but includes greater standardization requirements for auditing and certification; and separate segments on requirements and guidelines for application of asset management systems. The new standard has been adopted in the U.S., UK and Canada, among other nations.

Figure 1. THESL Asset Management Planning Process

Source: THESL Application, Section D: Figure D1.2.2 Asset Management Planning Process Overview

Decision Support Systems

Figure 1 includes five decision support systems or tools THESL relies on to evaluate project need and investment alternatives. Each of these systems links to AM databases to support the planning processes for selection of investments and formulation of the DSP. Our assessment of each of these systems and related processes follows.

Asset Condition Assessment (ACA)

The ACA is a critical element of THESL's AM processes for evaluating capital investment options, as it relies heavily on ACA data to support spending for asset renewal. The renewal

of assets that have deteriorated or are otherwise obsolete is based largely on application of ACA metrics for virtually all major equipment categories. THESL's use of ACA to determine the condition of distribution asset extends to the past decade, when it created asset records and a methodology to categorize the condition of its assets based on consistently applied testing, measurement and evaluation techniques. The results of a recent ACA audit indicate that many assets have deteriorated to a state where replacement, recondition or upgrade is warranted. To maintain spending at desired levels, THESL prioritized renewal projects by applying economic methods that incorporate risk and criticality; thereby enabling the selection of assets that demonstrate the highest level of need and justification.

In June 2014, THESL updated an ACA audit originally completed in 2007 and revised in 2012 by its independent consultant, Kinectrics, to include one new asset category (Network Protectors), and a series of other enhancements. The ACA processes and health indices now incorporate updated asset condition and failure data, enhanced equipment testing and inspection, and larger sample sizes.[2] The 2014 audit report presents asset condition data for 21 asset categories ranked by health indices on a scale of 1 through 5. The report also provides reasoning on how ACA data can be used for asset prioritization and ranking. It lists seven recommendations to further improve ACA processes, many of which THESL applied in this application, including data entered into Ellipse and used in BI (Business Intelligence) tool calculations[3]. THESL has provided information in its DSP that confirms it has or proposes to implement these recommendations.

The Kinectrics report confirmed a series of enhancements THESL has implemented since the prior audit, including changes in asset sample size and condition for each of the 21 categories included in the ACA. Results indicate relatively minor changes in asset condition for some of the 21 categories, but increased deterioration in others, such as station transformers and switchgear; Navigant views each of these as critical assets in terms of reliability, safety and customer satisfaction.

Navigant views the level of rigor and use of ACA data that THESL applies in its asset renewal selection process as consistent with industry best practices, supported by condition data and assessment methods that have evolved and continuously refined over time. In support of its DSP, THESL's ACA audit highlights those assets whose condition has remained relatively stable versus those that are experiencing accelerated deterioration. This information provides key input into decision tools, that THESL's distribution planners use to prioritize proposed renewal spending to assets that demonstrate greatest justification and need. It also indicates where asset upgrades or capitalized maintenance may be a more cost effective choice. In addition, THESL's incorporation of continuous improvement and monitoring of equipment performance, ACA data, and evaluation methods indicates it intends to update or revise

[2] Toronto Hydro Electric System Limited, 2014 Asset Condition Assessment Audit, Kinectrics Inc. Report No: K-418649-RA-R00, June 20, 2014.

[3] Specific recommendations appear in the Kinectrics report.

specific business case investments during the 2015 through 2019 rate period using the most current information available at the time of implementation of the investment. Navigant views THESL's approach as reasonable, as it will produce the greatest value to its customers for a given level of investment over the life of the asset.

Feeder Investment Model (FIM)

THESL uses a Feeder Investment Model (FIM) to evaluate the economic value of asset renewal capital investments options. FIM is a series of distribution simulation and analytical tools designed to predict asset performance and equipment loading under a range of operating conditions. The FIM incorporates key risk factors and life cycle economics to evaluate and justify project need and value, summarized in the following excerpts from Section D.3 – Asset Lifecycle Optimization Policies & Practices, which states that FIM is

> ". . . used as part of the Long-Term System Review Process to determine the asset renewal investment timing based upon the economic end of life criteria for each asset. It is through this approach that Toronto Hydro plans to eventually achieve a 'steady state" at the system level through the execution of its capital investment plan."

Where,

> ". . . 'steady state' represents an optimal balance between required capital investment and aggregate risk costs associated with the existing asset base, such that the total lifecycle cost of the broader asset population is minimized."

From the above statements and DSP process descriptions, THESL demonstrates that it has incorporated least-cost planning criteria and methods to support its investment strategy and proposed spending levels, which Navigant finds is consistent with OEB Chapter 5. Navigant also finds that FIM includes the capability to identify optimal investments for an appropriate range of performance, safety, operating efficiency and cost and performance factors. . . .

One of the key inputs is Value of Service (VOS), applied to net reliability gains achieved over the life of an asset or investment strategy to quantify a primary value driver for the investment. The use of VOS is consistent with Chapter 5 guidelines and practices that utilities in North America, the UK and elsewhere have applied. The assumptions for VOS components also are consistent with values applied by comparable utilities. THESL's predictive reliability impact analysis data, described below, is a key input for renewal and other project categories where VOS is a driver. The FIM model is applied to most renewal investments, in addition to other projects with a range of performance and cost trade-offs. The FIM model is used to determine the optimal timing of investments based on criteria that establish when an asset has reached end of life (in economic terms).[4] . . .

[4] Assets not evaluated using FIM are targeted for replacement based on estimates of useful remaining life.

THESL has consistently applied EIM to proposed renewal investments, which should result in least cost investment choices based on end of life economic evaluation criteria. The EIM results, coupled with other critical replacements THESL has identified, indicates up to a $2.5 billion backlog of assets exists for 2015 with another $1.55 billion for the remaining four years for a total of about $4 billion that is justified based on DSP economic end of life criterion. However, proposed spending for asset replacement over the five year rate period is much less, reflecting a desire to balance risk and cost via paced spending.[5] The validity of the levelized approach is supported by THESL's reliability metric projections, which indicate proposed spending will maintain or improve system performance up to 2019.

Reliability Projections (RP)

The RP is an important process and set of analyses THESL uses to predict the reliability benefits associated with proposed upgrades and renewal replacements, including the impact on reliability for reinforcement and replacement options.[6] This capability is important, as the accuracy of the RP is contingent upon ACA data and predictive methods that quantify reliability impacts over time, including accelerated degradation for "do nothing" or "run to failure" strategies.

Databases

THESL relies on several data bases, collectively referred to as its Enterprise system, for use in its planning process and decision support tools described above. It includes asset records and condition data contained in THESL's Ellipse data base, a system commonly used by utilities for tracking and recording of maintenance and performance data. Similarly, the AM/FM GIS contains diagrams and feeder attribute data needed for planning, design and construction of the distribution system. It also provides requisite links or inputs to GEAR, and plant record keeping systems. The reliability data base provides failure history and cause code information needed to assess risk factors and the extent to which candidate solutions will impact reliability, safety and performance. As noted in our ACA review, THESL reports that the accuracy and quantity of data stored has risen over the past several years, commensurate with increases in sample size and quantity of information collected.

Feeder loadings are continually read and downloaded from the SCADA system and captured in a Feeder Loading Information System (FLIS) to provide information distribution planners use to conduct short , and long term capacity studies. The data also ensure distribution simulation studies of feeder performance and operation are based on accurate loading data. This process is similar to those applied by most utilities to evaluate capacity alternatives and proposed spending.

[5] Replacement spending of up to $4 billion over five years also would create disproportionate and unacceptable rate increases.

[6] In the absence of proposed spending programs, reliability would degrade to a SAIFI of 1.99 and SAIDI of 1.50.

THESL's reliance on and accuracy of systems such as Ellipse, AM/FM/GIS, FLIS and reliability history is consistent with leading industry practices, as each provides critical input to decision and planning tools that the company relies on to determine assets that present the greatest risk and economic impact. The data also is used to prioritize and select investments among candidate options. The data also support processes such as current state analysis (CSA) for determination of such conditions as distribution reliability, performance history and remaining life of key equipment. Importantly, THESL has established processes to ensure data quality is maintained and used properly in its suites of tools and systems. Navigant views THESL suite of Enterprise data bases, type of data collected, and quality assurance processes to be consistent with current industry practices.[7]

Other Key Asset Management Metrics

Navigant also finds that THESL has appropriately used other key AM metrics to justify and support investments included in its AM plan and business cases. These additional AM metrics include distribution system attributes such as urban versus rural, underground versus overhead, temperate versus extreme weather and fast versus slow economic growth areas.

Capital Planning Process

THESL's capital planning process is designed to consider investments across three broadly defined investment categories, each reflecting a range of business drivers and planning horizons. Figure 2 presents these three categories, which includes two sub-categories for AM investments based on risk based versus useful life economic justification methods. Each investment category includes evaluation processes that determine when intervention is required to achieve an optimal balance of spending versus risk.

Figure 2.

Section E.2.1: Capex Planning Approach

[7] Navigant's review focused on the systems, procedures and application of Enterprise system data. However, Navigant did not conduct a review of data accuracy.

THESL's planning process includes recognition of DG interconnection and integration requirements. Specific upgrades and mitigation strategies are proposed to relieve constraints that currently limit the amount of DG that can be installed in various sections of Toronto.

Key Business Drivers

Table 3 presents the key value drivers THESL prepared and presented in Section 2A.2.1.1 Navigant reviewed these drivers and the analyses THESL presents in specific business cases and supporting sections and has determined that these drivers are consistent with Chapter 5 requirements and guidelines. THESL's asset management based approach to developing its DSP and proposed investment incorporates inputs and data for each relevant driver. The business cases prepared by THESL and reviewed by Navigant demonstrate that drivers listed in Table 3 also are consistently and appropriately evaluated to support proposed investments.

Table 3. Key Business Drivers by Asset Category

A key outcome of THESL's capital investment program is improved distribution system reliability performance (as measured by system reliability metrics). By 2019, THESL expects reliability as measured by outage (interruption) frequency and duration will improve:

- SAIFI (system average interruption frequency index): Reduce from 1.53 to 1.13
- SAIDI (system average interruption duration index): Reduce from 1.21 to 0.97

The above reductions represent a significant improvement in reliability. Although THESL seeks to balance investments over the five year rate period to balance costs versus risks, it also has instituted a reliability improvement program designed to lower (i.e. improve) these two metrics at low cost. In addition to targeted renewal programs that optimize spending based on reliability performance, THESL's reliability improvement program also includes low cost, smart grid investments such as feeder automation and equipment monitoring to achieve these gains. This strategy is consistent with leading practices utilities have implemented elsewhere in Canada, the UK and North America.

Load Forecast

THESL projects increases in peak demand at each of the 35 station busses serving 13kV and 27kV load. The forecast is based on known changes in building construction and population forecasts, which are continuously monitored for changes, including proposed load transfers that make best use of available station bus or transformation capacity among adjacent stations; particularly important at downtown stations where capacity upgrades are most costly. The forecast also incorporates CDM measures in the forecast, including targeted demand response to reduce peak demand in the relatively few peak load hours. These practices are consistent with or exceed industry practices, particularly with respect to incorporation of CDM in localized forecasts.

CDM and Distributed Generation

THESL's planning methodology includes "non wires" options as candidate solutions to meet capacity shortages caused by growing demand. Key among these is targeted CDM, designed to defer capacity additions on a cost effective basis. Programs THESL proposes are comparable to other programs Navigant has encountered or supported, such as Consolidated Edison Company of New York's Targeted T&D DSM program. Non wires solutions also are included in the Central Toronto Integrated Regional Resource Plan (IRRP), currently underway.

These measures include a comprehensive Demand Response program designed to reduce distribution peak demand in Section E.7.10 (Local Demand Response). The DR program THESL proposes is consistent with Chapter 5 guidelines that recommend applicants consider load control and efficiency as a means to defer distribution capacity investments at the station level, where the value of capacity upgrade deferrals often is high due to the complexity of design and high cost of major equipment components. Because of long lead times for planning and design of both station and local DR programs, THESL's targeted program is suitable for deferring station capacity over the mid to long term. For this application, the downtown Cecil station is targeted for deferral, as the cost of upgrades and criticality of the station makes it an ideal candidate for localized DR. THESL and its consultant, IDF, conducted a series of economic studies of both capacity and DR options under a range of tests using an external model (e.g., total resource costs, ratepayer, as opposed to Avoided Risk Cost

(ARC) or Cost of Ownership (COO) under its Business Case Evaluation (BCE), and the DR program produces favorable results in terms of cost effectiveness. The use of a set of tests other than BCE is appropriate given the nature and timing of DR programs, which are comparable to energy efficiency programs where use of such tests are common. Accordingly, Navigant finds that THESL's DR program meets this objective on a cost effective basis, as it will defer up to 9 MW of capacity by 2019.

Although limited to Cecil for this application, almost half of THESL's 35 major stations will require capacity upgrades by 2025. Navigant concludes that Localized DR programs ultimately will result in cost effective deferral of future capacity upgrades. Although not cited as a primary objective, Navigant notes that the Local DR program also relies on smart technology and communications, consistent with Chapter 5 smart grid objectives.

THESL's current projection of DG capacity additions by 2019 is 626 MW, about 200 of which is renewable energy sources. Table 1 summarizes these additions by type and year.

Table 4. DG Capacity Additions

Past and current studies reveal DG capacity is constrained at the transmission and distribution level. A major limiting factor is station equipment, typically breakers, that is not rated to accept the additional fault current contribution from DG. Reverse power flow on DESN power transformers is an additional constraint.

Because these constraints are evident at both the transmission and distribution level, HONI and THESL each have proposed several mitigation options to relieve these constraints. HONI expects to complete major equipment upgrades at Manby and Leaside (also referenced in THESL's 2012 ICM filing) in 2015 while THESL will implement upgrades coincident with DG capacity projections in Table 4.

Other THESL upgrades designed to relieve constraints include enhanced protection, real-time monitoring and control, and bus tie arrangements. The use of advanced monitoring and controls is needed to safely and reliably integrate large quantities of DG. These real-time systems rely on smart technology and communications, consistent with Chapter 5 objectives. These strategies are reviewed in greater detail in several of the business cases we reviewed.

Performance Reporting

THESL proposes to enhance performance measurement processes and monitoring to ensure continuous improvement of processes, data and methods used to support investments, and assure accountability of results. The concepts THESL has outlined are consistent with Chapter 5 guidelines and approaches implemented by other utilities.

THESL's Investment Plan

THESL proposes to spend approximately $490 million annually over the five-year rate period. Figure 3 presents total annual spending for each of THESL's DSP investment categories. Notably, about one-half of proposed spending is for asset renewal, reflecting a level of spending designed to gradually reduce the backlog of assets that have reached economic end-of-life without compromising reliability, safety or performance. The investment strategy appears warranted, as an accelerated approach to decrease the backlog would increase annual capital spend by about 60 percent, with attendant undesirable rate impacts. It also reflects a minimum level of investment needed to maintain distribution system performance, reliability, safety and performance at a level consistent with customer expectations and OEB Chapter 5 requirements.

Based on our review of THESL's AM-based planning processes and individual business cases, Navigant finds that the proposed five-year investment plan is justified and consistent with OEB Chapter 5 requirements. Further, performance monitoring and measurement procedures will help ensure that appropriate adjustments and refinements to specific investment plans can be made based on new information received during the five-year rate period.

Additional details and rationale supporting this finding is providing in subsequent sections and business case reviews.

Figure 3. Proposed 5-Year Investment Plan

BUSINESS CASE REVIEW

In the following, Navigant opines on the benefits of the proposed investments, with emphasis on the likely outcomes and benefits that will accrue to THESL customers from DSP investments. Our review seeks to answer the following questions regarding consistency with THESL's DSP framework and Chapter 5 requirements.

Does each of THESL's business cases apply the methods, tools and criterion outlined in its DSP, and has THESL provided sufficient evidence to justify the proposed investments?

Concurrent with its review of Sections A through D, Navigant conducted an independent review and assessment of business cases THESL prepared in Section E of the DSP. Navigant's assessment of THESL business cases, summarized in Appendix A, includes two key objectives:

1. Develop a thorough understanding of the specific business cases THESL prepared for each the four OEB investment categories outlined in its Chapter 5 filing requirements.

2. Determine the extent to which THESL adopted the principles and methods set forth in Sections A through D to specific business cases and Chapter 5 requirements and guidelines for the four investment categories.

Given these objectives, our review of THESL's business cases seeks to answer the following question:

Are the business cases that THESL presents in its DSP consistent with the requirements of Chapter 5?

THESL has prepared detailed business cases that thoroughly address why the investment is needed and includes several alternatives and solutions, including "do nothing" and "run to failure" options. It has consistently applied the methods and principles outlined in its DSP, consistent with OEB Chapter 5, to support the level of investment for each business case. THESL also demonstrates that it has evaluated and selected alternatives within each business case based on life cycle economic criterion. THESL's business case analyses also confirm the investments will provide value to its customers over the five year rate period and beyond. For these reasons, Navigant concludes that the investments THESL proposes are supported and justified by the business cases it has prepared.

Navigant review of THESL's business cases is presented in Appendix A for each of the four OEB investment categories.

CONSISTENCY WITH UTILITY PRACTICES AND STANDARDS

In this section, Navigant addresses the degree to which THESL's practices and proposed projects are consistent with those used and implemented by comparable utilities. It includes an assessment as to whether THESL's practices meet or exceed those of other utilities, and reasons why differences exist in some segments of the distribution system. Specifically, this section sets out Navigant's response to the following question:

Are THESL's design and planning practices consistent with utility best practices?

To support its review, Navigant compared THESL's planning criterion, and design and construction practices to other comparable utilities in Ontario and other provinces. We also reviewed a June 2014 report prepared by Power System Engineering (PSE) that evaluated design standards and practices covering four areas.[8]

Design Practices

The PSE report confirms the adequacy of THESL's design standards, succinctly summarized in the following excerpts from the study.

> The SDP[9] document was found by PSE and LHB to be thorough, well documented and consistent with what is seen in the industry throughout North America as best practices.
>
> Overall, the standards and specifications contained in the SDP would not be perceived as insufficient or excessive.

Navigant agrees with PSE's overall assessment. Navigant's concurrence with these statements is based on our review of the PSE report and a prior independent review of THESL's design standards and practices that Navigant completed for its 2012 IRM filing. For the 2012 IRM, Navigant conducted a survey to support its findings relating to design standards and practices covering the following. Navigant considered these criteria, where applicable, in developing findings and conclusions herein.

- Distribution design and planning criteria
- Equipment selection criteria
- Station and distribution line loading criteria and practices
- Line relocation policies and practices

[8] Standards Review Study, Power System Engineering, Inc. LHB, Inc., January 14, 2014.

[9] The SDP refers to THESL's Standard Design Practices (SDP) document, which documents Company Standards as applied to the design of the electric distribution system.

- Equipment replacement (renewal) criteria
- Overhead and underground distribution design and protection
- Physical infrastructure and renewal programs
- Safety-related upgrades and replacements

Planning Criteria and Methodology

THESL's approach to planning recognizes differences in methods applied to assets where criticality requires short-term action versus assets where long-term planning methods are appropriate. The type of economic evaluation also differs for business case evaluation, where Avoided Risk Cost is applied to replacement of assets and Cost of Ownership for new or non-like-for-like interventions.

Long-Term Planning

Over the longer term, THESL's planning criteria and methods, outlined in various sections of its DSP, consider a range of options, including "non-wires" strategies such as CDM and localized Demand Response as alternatives to new lines and stations. THESL's long-term capacity planning also recognizes integration requirements associated with renewable energy generation (REG) and other forms of distributed generation (DG) such as CHP. THESL's planning processes thus must consider factors such as increased fault current contribution and two-way power flows on distribution assets. Operational considerations such as intertie transfer constraints, enhanced protection and the need to monitor third party generation become more apparent and critical as REG and other DG capacity increases.

THESL also must consider differences in the fundamental design of the distribution system. The mostly overhead 27kV system serving areas outside the downtown core has greater flexibility due to multiple feeder ties between stations; whereas the mostly underground 13kV system serving Toronto's downtown core has few feeder ties and limited station back-up at the transmission level. THESL has taken steps to proactively address these issues, including joint planning with HONI on development of east-west 115kV transmission tie lines and the construction of the Bremner station (renamed Copeland), each of which will provide greater flexibility and capacity serving critical downtown core load. In the DSP, THESL expands on this design philosophy via enhanced contingency plans for the downtown core, with increased feeder ties needed for load growth and reliability. It also is applying non-wires solutions in the form of localized DR for the Cecil station as a cost-effective alternative to new station capacity.

Short-Term Planning

THESL short-term planning focuses on assets where degradation, safety, municipal projects and relocations, and customer requests require near-term action. For assets that are rapidly degrading or where safety concerns are evident, THESL has taken steps to remedy deficiencies, which includes replacements from the 2012 IRM that will be completed in 2015

(also see Continuation of IRM projects in Business Case Review section). Strategies include enhanced maintenance, both corrective and preventative, as an alternative to replacement or upgrade. Key among these programs is THESL pole inspection and mitigation, where ACA data is used to identify poles in need of remediation or replacements. ACA data and current state assessment (CSA) results also provides information from which THESL can make cost-effective choices to address performance issues or known deficiencies. Each of these practices is consistent with practices Navigant has encountered at other comparable utilities that have adopted best practices for short term investment planning.

Based on the above and our review of documents that outline THESL's approach to planning its assets, supported by business case reviews, Navigant confirms that THESL has appropriately considered a diverse range of options and strategies, consistent with OEB Chapter 5. Further, the economic criteria and methods used to evaluate and rank options is consistent with leading utility practices.

Consistency with Industry Best Practices

As noted in prior sections, THESL's proposed projects are consistent with measures undertaken at other utilities with comparable service areas and electric system configurations. The methods that THESL has employed to determine need and sequencing of renewal upgrades also is consistent with current utility practices. This is particularly evident for high cost replacements such as power transformers and station switchgear, where THESL has undertaken a high level of rigour and significant analysis to determine where the need for renewal is greatest.

The replacement of obsolete equipment and facilities that are deteriorated and pose reliability or safety risks, such as non-arc resistant switchgear, is common among utilities, as are some of the more salient, and equally compelling needs to replace defective porcelain and change out of gang operated overhead switches – each of these programs are underway at many other utilities in Canada and the U.S.

The upgrade of communications and SCADA is also consistent with common utility practice, as sound and reliable communications provided via redundancy is now an essential component of utility monitoring and control systems. The increased sophistication of these systems and introduction of Generation Protection Monitoring and Control program is needed to enable increased penetration of distributed generation.

In summary, Navigant views THESL practices and proposed investment programs to be in line with those undertaken by other utilities that have adopted best practices for renewal programs. Such actions assure that THESL's energy delivery system will continue to operate safely and reliably. Further, the proposed investment schedule will assure that renewal programs are implemented in a scheduled and orderly manner, both during the 2015 – 2019 and thereafter, until the renewal backlog is fully addressed by 2037.

Overall Findings

From our in depth review of THESL's DSP, policies and practices, specific business cases, and planning methods and criteria, and prior experience evaluating similar utilities, Navigant finds that THESL's planning practices are consistent with those employed by other utilities and the requirements set forth in relevant sections of OEB Chapter 5. Significantly, business plans in THESL's DSP consider a diverse set of options and selects the least cost options based on life cycle economic criteria.

Based on our review of THESL documents and extensive work with other electric utilities in Ontario and other provinces, Navigant finds that THESL's design practices also are consistent with Chapter 5 guidelines and prudent utility planning practices. Where differences exist, such as limited downtown feeder ties, higher fault current rating of some station equipment, these are due to the unique challenges and requirements associated with a major urban system; many of which are discussed in THESL's DSP and business cases and that will be addressed through THESL's proposed projects.

CONFORMANCE WITH OEB DISTRIBUTION SYSTEM PLAN REQUIREMENTS

In this section, Navigant opines on the degree to which THESL's DSP conforms and complies with the major objectives and guidelines outlined in Chapter 5. Specifically, this section sets out Navigant's response to the following question:

Does THESL's DSP and proposed investment plan satisfy the objectives set forth in Chapter 5?

Following a careful review of Chapter 5, Navigant has concluded that THESL's DSP meets the general and specific requirements set forth therein. Our findings are based on the degree to which THESL processes outlined in the DSP comply with Chapter 5, and the consistency of THESL's business plans with OEB guidelines. Our conclusions are supported by findings contained in the sections that follow.

OEB Investment Categories

THESL's CAPEX plan has been developed in a manner generally consistent with OEB asset capital investment categories; however, certain asset classes and investments span more than one category. THESL prepared the diagram that is replicated in Figure 4 to facilitate external review of its application, and is referenced herein as an aid in our assessment. It highlights the asset categories that are designated as material investments outlined in Section 5.4.5.2 of Chapter 5.

Figure 4. Mapping of THESL Investments to OEB Categories

Integrated Planning

Planning for the safe and reliable operation of an electricity distribution system requires the integration of a range of primary and secondary drivers to ensure needs are met in a cost effective manner. Inherent in this process is the recognition of drivers outside of the utility's direct control, such as transportation infrastructure improvements. It also recognizes the drivers jointly affecting other utilities; most relevant to THESL is joint planning with HONI where investments are made as a result of the respective needs of each utility.

Navigant has found that, through the policies and practices outlined in Sections A through D, and the detailed business cases in Section E, integrated planning has been consistently undertaken by THESL and it has been incorporated in virtually all aspects of its system. Several examples of comprehensive and proactive integrated planning are presented in our review, with key examples highlighted below.

- Load forecasts that recognize CDM and localized demand response for capacity planning
- System upgrades designed to enable safe and reliable integration of DG, consistent with provincial policy and Green Energy and Economy Act mandates
- Contingency planning of critical downtown load recognizing HONI transmission design and constraints
- Recognition of major transportation infrastructure and city expansion to guide the development of new or upgraded facilities to meet these needs
- Safety and reliability improvements designed to meet customer expectations and needs
- Balancing of risk versus of cost in developing a five year investment plan

These factors support Navigant's conclusion that THESL's DSP recognizes and consistently applies integrated planning principles and practices to support formation of its proposed investment plan. It incorporates principles and requirements in Section 5.0.3.1 (Integrated Planning) specifically and Section 5.2 (Distribution System Plan) generally, thereby ensuring compliance with OEB DSP objectives. Our review of individual business cases supports this finding, as many projects and programs include elements of several of the above drivers.

Long-Term Planning

THESL clearly has taken a long term approach for each of the investment categories outlined in Chapter 5 and addressed herein. The use of ACA and EIM determines the optimal timing of renewal replacement based on economic end of life criteria; which for many assets has been partially deferred to ensure an appropriate balance of risk and cost. THESL's paced investment plan for reducing the backlog of economically justified renewal and replacement goes well beyond 2019, with the backlog fully addressed by 2037.

System Service investments, especially more costly station upgrades, are made with consideration given to "non-wires" alternatives and rebalancing and transfer of distribution loads to ensure station and line capacity is used in the most efficient manner, consistent with OEB Section 5.4.2(b) and other relevant sections in Section 5.2. These initiatives are projected to result in the deferral of costly upgrades at critical downtown stations such as Cecil. Navigant views the multitude of options THESL considered in its planning process and strategy to maintain a paced spending profile for renewal projects as entirely consistent with Chapter 5 objectives specifically, and common industry practices in general.

Regional Considerations and Third Party Planning

THESL, as an embedded LDC, does not interconnect to or provide distribution supply to other LDCs – all points of supply are from HONI networks via direct connection to the transmission system or HONI stations. Hence, most regional planning considerations focus on HONI and the OPA. Navigant's review of THESL's DSP and knowledge of regional planning for the Greater Toronto Area (GTA) confirms regional issues have been incorporated into the DSP.[10] Foremost among these is the extensive joint planning efforts to address reliability of supply for downtown Toronto.[11] The development and expansion of HONI's 115kV transmission to create a new east-west tie was the result of extensive joint planning, including supply to the Copeland station in the 2012 IRM and the Downtown Contingency Plan in the DSP. Additionally, THESL has coordinated its plans to mitigate constraints limiting DG and renewable sources with HONI, as conditions such as fault current limitations exist on both systems (e.g. Leaside and Manby on HONI's system).

THSEL also is actively supporting the Central Toronto Integrated Regional Resource Plan (IRRP) to address alternatives for ensuring reliable, low-cost supply to Toronto, including non-wires alternatives. For these reasons and evidence of joint planning for City infrastructure projects and downtown development, Navigant concludes that THESL has demonstrated that it has proactively addressed regional issues in its DSP, consistent with Chapter 5 requirements. Our conclusion is supported by the cost-effective alternatives THESL evaluated and proposed in business cases from Section E5 of the DSP that Navigant reviewed in preparing this report.

[10] Navigant's involvement in prior GTA regional issues include business case review of the Copeland station for the 2012 ICM; review and assessment of THESL's GEA Plan; market potential assessment of DG with the OPA, and an assessment for enabling greater amounts of DG in Toronto in concert with HONI proposed upgrades, among other engagements addressing supply.

[11] For example, THESL demonstrates that it has coordinated station expansion and upgrades with third parties, including HONI and the Ontario Power Authority for upgrades considered in the ongoing OPA led IRRP planning process.

Smart Grid Development and Implementation

Although THESL does not include a spend category labeled Smart Grid, our review of its planning processes and specific business cases indicates the five year spending plan include many smart grid components and systems. Many smart grid initiatives are effectively embedded within projects and programs, such as enhanced monitoring of distributed generation to enable higher levels to be installed. Other smart grid investments such as automated switching and transfer schemes are categorized as reliability improvements. The use of smart technologies is proving to be particularly effective as a low cost method to improve reliability, a foundational aspect of SmartGrid deployed throughout North America and worldwide. Further, the build out of communications system provides requisite infrastructure to support a range of smart grid investments, including those that will enable higher penetration of DG throughout the distribution system. Each address specific OEB guidelines set forth in Section 5.0.3.4, including the use of smart technologies to "facilitate the integration of distributed generation and complex loads."

Integration of Renewable Energy Generation to THESL's Network

THESL fully complies with Chapter 5 requirements set forth in Section 5.4.3 (a) through (e), (System Capability Assessment for Renewable Generation), which directs applicants to provide information on the capability of the distribution system to accommodate REG capacity and integration constraints. Section E.3 of THESL's DSP includes a projection of renewable and other DG technology capacity to 2019 (626 MW total), and specific solutions and mitigation strategies to address constraints it has identified on its and HONI's system. These upgrades are consistent with those outlined in THESL's 2012 Green Energy Act plan and related studies it prepared over the past several years that addressed DG market potential, DG capacity limits and solutions to address integration constraints. THESL is also proposing implementation of monitoring and controls via its Generation Protection Monitoring and Control program. Navigant believes this is a vital and necessary project that reduces the likelihood of DG disrupting distribution performance or operations, thereby increasing THESL's DG integration capability. In addition, as discussed previously, THESL is undertaking joint planning and coordination with HONI to identify solutions to facilitate integration of REG that are best addressed at the transmission level.

Reliability and Performance

Almost 50 percent of THESL's proposed spending over the five year rate period is for renewal programs. Because of the backlog in economically justified renewal replacements and other critical infrastructure projects, THESL has relied on a risk based process and economic model (FIM) to identify the most critical upgrades to ensure reliability and performance does not degrade. The processes and methods THESL used to select up to $250 million of renewal investments annually are consistent with Section 5.4.5 (Justifying Capital Expenditures) of Chapter 5. The validity of the levelized approach is underscored by THESL's reliability

projections, as the proposed spending program will maintain or improve system performance metrics by 2019.

Performance Monitoring

THESL presents a performance monitoring and continuous plan designed to ensure the investments it proposes over its five year rate period produces efficiency, performance and customers satisfaction gains outlined in its DSP and business plans. It includes 12 measures over three categories that THESL proposes to monitor throughout the rate period (Figure 5). Foremost among these is Customer Oriented Performance that THESL will track and measure using IEEE reliability and performance metrics.

Figure 5. THESL Performance Measures

THESL also proposes to track DSP progress via internal and external benchmarking for key supply, construction and design performance metrics. THESL will track operational performance via two metrics, outage from defective equipment and station capacity; charts in the DSP confirm increased utilization of station capacity. THESL also proposes to continue to track customer satisfaction through periodic surveys to gauge customer views on a series of performance and cost issues. These surveys also are used to provide guidance to THESL to ensure program spending, to the extent practicable, is directed to areas of greatest concern of interest to its customers. Based on THESL's proposed monitoring and tracking of key metrics, Navigant concludes the plan, consistently tracked, should yield continuous improvements in each performance category listed in Figure 5.

Customer Value

Customer value is repeatedly underscored throughout THESL's DSP by the significant emphasis on ensuring and improving reliability performance, taking numerous proactive steps to improve system safety, and realizing operational and investment efficiency synergies whenever possible. Utilizing ACA data and the FIM as tools for informing sensible and cost efficient system investments maximize customer value and represent best practice in investment planning. The implementation of tracking continuous improvement measures for reliability should enhance customer value throughout the rate period, which THESL will verify by periodic surveys. Consistent with Chapter 5 requirements, consideration of both current and future customer value is present in THESL's planned investments that in many cases may enable future modernization projects not yet directly contemplated in this plan (e.g. development and modernization of distribution communication infrastructure will support future smart grid opportunities).

SUMMARY ASSESSMENT

The section addresses the methods and tools THESL employed to evaluate projects, and the level of rigour applied to justify project need. Specifically, with respect to THESL's proposed projects, Navigant critically reviewed the approach THESL undertook to justify each project, summarized in the following question:

Are the methods and tools employed by THESL to select proposed projects appropriate and sufficient to justify the investment?

Technical Need

For all business cases Navigant reviewed, THESL provided factual or empirical evidence that amply demonstrate why the proposed projects are needed, consistent with guidelines set forth in Chapter 5. The methodology, engineering principles, assumptions, and level of rigour used by THESL are broadly consistent with those used by leading utilities. Foremost among these is the use of sophisticated tools and tests to determine the condition of equipment, and to predict the areas of the system at greatest risk. For example, the condition and need for replacement of station transformers is based on dissolved gas analysis (DGA) performed by reputable firms, coupled with the exposure to customers if such devices were to fail. Similarly, the replacement of station class breakers, switchgear and overhead, gang operated switches is based on thorough research and tests performed by THESL personnel that confirm that some of the devices installed on THESL's system are defective, with attendant reliability and safety exposure.

THESL uses a comprehensive series of distribution simulation and analytical tools to accurately predict asset performance and equipment loading under a range of operating conditions. These include the FIM for renewal spending, which incorporates risk factors and life cycle economics to evaluate project need and value. The upgrade of remote terminal units (RTU) also is critical as several devices are no longer capable of reliably providing continuous status data to system operators. Navigant has witnessed the degradation of RTU functionality at many other utilities, which have adopted similar replacement strategies.

Economic Value

Navigant has determined that the economic value of the five year investment plan to THESL customers is consistent with OEB Chapter 5 requirements and leading industry practices. This finding is supported by the rigour and application of economic methods THESL used to develop its capital spending plan. Navigant views THESL's proposed level of spending over the five year rate period as the minimum needed to ensure distribution reliability, safety and customer satisfaction. THESL has developed and implemented economic models designed to optimize investments based on risk versus cost trade offs. Although THESL does not propose spending levels that are supported by economic end of life criterion – this would result in capital spending at 60 percent above proposed levels it has developed a spending strategy to

meet Chapter 5 requirements at an acceptable level of risk. Navigant's review of THESL's methodology presented in its DSP, and its application of these methods to business cases we reviewed, confirm the projects and programs THESL proposed are justified based on life cycle economic value.

Smart Grid and Renewable Generation

THESL proposes a series of investments designed to reliably integrate up to 626 MW of DG capacity that it expects to be added to its distribution system through 2019, including over 200 MW of renewable generation. THESL prepared a DG capacity forecast, and includes in its DSP a series of investments to proactively address constraints and violations caused by the addition of DG resources. These include upgrades such as communications, monitoring and controls that Navigant believes are essential to reliably integrate large amounts of DG. THESL has also coordinated its investigation of impacts and mitigation options with HONI. Accordingly, we conclude that THESL's DSP meets or exceeds the requirements set forth in OEB Chapter 5 and are consistent with leading industry practices.

Environmental Factors

THESL proposes programs that address environmental factors at the system and distribution level. At the system level, THESL has proposed upgrades and system that will enable greater amounts of DG capacity, including environmentally favourable renewable generation. At the distribution level, THESL proposes replacement of critical infrastructure and equipment that pose local environmental hazards. Our review of the DSP and individual business plans indicates that the upgrades and replacements THESL proposes also will produce the value in terms of reasonable efforts to mitigate or reduce environmental impacts. Further, by focusing on assets with the highest risk, THESL has taken a responsible approach to addressing infrastructure and equipment with potential environmental impacts.

Overall Assessment of the THESL's DSP and Five-Year Capital Investment Plan

Our review and assessment of THESL's DSP indicates the methods it has applied to develop its capital investment program are consistent with other urban utilities in Canada and the United States where Navigant has conducted a similar evaluation. Notably, we did not identify any projects or measures that are inconsistent in scope or need prescribed in OEB Chapter 5. In Navigant's view, because of these reasons and the analysis presented in prior sections of our report, THESL's DSP, and the business cases and proposed projects therein, are reasonable and justified.

Further, THESL's proposed five year capital spending plan of approximately $490 million annually is justified based on Navigant's review of the evidence and facts THESL presents in its DSP that we relied upon to conduct our independent review and evaluation.

Our conclusion is based on the following key findings:

- THESL's proposed spending is the minimum needed to complete the continuation of IRM programs in 2015 and to maintain a reasonable balance between risks and costs over the five year rate period. The level of spending is higher than the prior five years, but is the minimum required to reduce the backlog of end of life asset replacement by 2037 and meet OEB Chapter 5 requirements.
- The technical and economic analyses THESL has undertaken to support the capital investment plan is rigorous and consistent with Chapter 5 guidelines for each of the four major spending categories.
- THESL's has consistently applied technical and economic evaluation methods to support individual business cases; and proposed spending for each business case is justified by the facts, evidence and analysis Navigant evaluated for its review.

APPENDIX A: BUSINESS CASE REVIEWS

Concurrent with its review of Sections A through D, Navigant conducted an independent review and assessment of business cases THESL prepared in Section E of the DSP. Navigant's review of these business cases is presented below.

System Access

2014 ICM Continuation Programs

Metering

THESL's investment in its metering program is designed to achieve mandatory service obligations as outlined by the IESO (for wholesale metering) and the Gas & Electricity Inspection Act (for revenue metering). THESL's DSP outlines the work involved in the program, including meter removal for verification testing; there is a further breakdown of assets proposed for replacement by customer class. THESL quotes the relevant OEB amendment to the Distribution System code (DSC) which impacts a portion of its metering upgrade program. For the suite metering segment of its business case, THESL cites the Energy Consumer Protection Act (ECPA) as a standard mandating these installations. The total capital required for the program is $77.3 million. Annual capital expenditures and unit replacement schedules are presented, with annual costs averaging $17 million with most spending concentrated at the beginning of the program.

Compliance with statutory provisions and regulatory requirements are the primary drivers for THESL's metering program. Asset management is governed by identified standards (specifically Sections 9, 11, and 12 of the Electricity and Gas Inspection Act) which are expanded upon extensively and summarized in Table 19.

The benefits of the metering program are highlighted in THESL's business case, primarily improvements to customer service. For example, large building operators' dependence on metering data to manage electrical plants is cited, as well as the number of customers (9,500) that will benefit from the replacements. THESL also states that interval metering upgrades will allow for more efficient outage verification and a reduction in SAIDI, consistent with customer benefits cited by other utilities.

The business case lists timelines for the program and the start dates of the sub programs. It also list factors contributing to year to year variances in spending, including data processing deferment and dependence on HONI for scheduling wholesale revenue metering changes. THESL also summarizes program risks, such as delays in HONI work and methods for mitigation (i.e. scheduling work closely with HONI for proper allocation of resources). THESL highlights the consequences of changing its current approach for meter reads; for example, manual reading of meters would require "immense resources" compared to upgrading

metering to smart synch meters. THESL's program is unique in that due to regulatory mandates, there are no alternatives for the majority of THESL's proposed work plan. Accordingly, this requirement obviates the need to perform economic feasibility analyses. THESL provides further justification in its business case by separately listing all of the individual standards and regulations that the program work must comply with in Table 19.

Customer Connections

THESL's customer connections program is driven by its obligation to connect to new buildings on its distribution lines or for an occupant that requests connection. The work includes installation of overhead or underground supply lines, service poles, cable chambers, transformers, commercial meters and other connection tasks. Expansion work is sometimes necessary, and may include upgrades such as new circuits or civil infrastructure enhancements. THESL's forecasted total cost forecast from 2015 to 2019 is $260 million, with $70 million offset by customer contributions.

THESL's business case indicates the primary justification and program benefit is customer value. THESL states that the investment will provide, and continue to maintain, distribution service to customers, particularly during a period of time of when it expects increasing numbers of high rise developments, consistent with growth projections in the City's GDP. THESL compares the rate of development of high rise buildings in Toronto to other large cities to support a view that connection work in Toronto is likely to be comparable to or exceed that of other large cities.

Regarding the pacing of its program, THESL cites the timelines of individual connection work mandated by the Electricity Act and CoS. THESL forecast connection requests through development of a historical baseline, and then incorporated economic growth factors, development factors, and large construction projects to augment the baseline. This method is typically used in developing load forecasts and is consistent with what has been provided by similar utilities. THESL describes cross program efficiency initiatives in prior connection projects, citing cases where expansion for future load was integrated into task work. Risks in program execution are highlighted, including variations in the forecasted demand impacting timelines.

Externally Initiated Plant Relocation & Expansion

Investment in this program is for government mandates that require Toronto Hydro to work in conjunction with public entities to facilitate public development projects. This includes like for like replacement of some assets during relocations or upgrade of service to provide safe and reliable service. Some requests are mandated by Public Service Works on Highways. THESL estimates it will be able to recover 30 percent of construction costs from projects associated with the road authority, while all other agencies cover 100 percent of THESL's relocation cost. An example of the latter is the ELRT, with program costs of about $220 million from 2015-2019, averaging about $40 million annually.

THESL's report thoroughly supports paced program spending, citing major projects between 2015-2019, such as the MTO Bridge Rehabilitation, GO Transit Electrification, Eglinton Light Rail Transit, and other Metrolinx LRT projects. THESL notes that since investments are highly dependent on external agencies, high variability in required funds is likely and largely beyond THESL's control. For this reason, Toronto Hydro requests OEB authorize funding for a base rate sufficient to fund the sub-forecasted base amount; a variance account is also requested to cover additional costs that are difficult to predict.

The report also identifies opportunities to upgrade system assets instead of like-for-like replacement for externally initiated relocations. THESL's DSP provides a description and review of how potential efficiencies in the upgrade process are evaluated. This review provides evidence that Toronto Hydro selects work plans to consider associated work when carrying out "non-discretionary capital projects" (i.e. to directly address EB-2012-0064, as discussed in the report).

Load Demand

THESL investment in the Load Demand program funds three activities on its 13.8kV and 27.6kV distribution system: load transfers, feeder upgrades and equipment upgrades. These upgrades and modifications will alleviate operational constraints associated with available connection capacity. THESL evaluated stations forecasted to be overloaded in the 2015 through 2019 late period, and proposes to proactively transfer load off of these station buses to reduce reactive work and resultant less efficient system configurations. THESL's program includes upgrades to 18 stations at a cost of $63.14 million. Average annual expenditures are approximately $15 million, with program costs increasing throughout the five-year investment period.

Program benefits include enhanced customer value, expressed as the difference in cost of ownership between existing and renewed assets for the first year of the program ($24.21 million), a common metric used as evidence to support the investment. This value, along with a positive first-year NPV ($12.31 million), indicates that the program is prudent investment. Additional qualitative benefits include enhanced reliability, safety, and efficiency (i.e. reduction in restoration time, reduction in asset failure risk, and increased operational freedom). The primary driver is customer service requests. THESL's interpretation of DSC 3.3.1, in which the distributor is obligated to plan and build the system for reasonable forecast load growth, and improve the system for relieving system capacity constraints" provides additional rationale to support proposed investments. Other drivers, such as reliability, also reference DSC operational mandates with regards to the planned program work.

The business case conveys sound underlying support for pacing program investments. For example, the number of proposed developments in the process of obtaining permits is a significant factor driving the need for increased investment in load transfers and station upgrades. THESL demonstrates that based on historical timelines, substantial connection work will be needed between 2015 and 2019. As evidence, THESL provides service territory maps

overlaid with proposed connected load to illustrate concentrated load requests necessitating specific station upgrades. The lower amount of spending in 2015 is due to the City's construction moratorium for the Pan Am games. Other program expenditures are based on individual project ranking criteria, including area capacity to connect new customers, the ability to continue operations under single contingency conditions, and area reliability; each are consistent with utility prioritization approaches for asset replacement or upgrade. Finally, THESL includes funding for temporary upgrades to ensuring system operability is maintained until future upgrades have been evaluated and completed.

The business case evaluates investment alternatives, including upgrading station capacity through expansion or the construction of new stations. These options were eliminated in favour of equipment upgrades due to long lead times, potentially exposing the system to degraded reliability until work is completed. THESL includes asset replacement for each sub-project.

Generation Protection, Monitoring and Control

THESL's Generation Protections, Monitoring and Control (GPMC) program aims to enhance and enable protection schemes, and increase visibility via the monitoring and control of distributed generation (DG). This program includes high speed protective relays at station buses with short circuit constraints, bus tie reactors that minimize the short circuit at station busses, and monitoring and control equipment to provide greater visibility and provide distribution operators with proactive controls to prevent risky conditions such as islanding. The program is expected to cost approximately $15.5 million over the next 5 years. The program also supports HONI's ongoing efforts to alleviate constraints at the transmission level, as protection systems will be installed at Leslie, Basin and Wiltshire TS with a bus tie reactor at Richview TS. Related program benefits associated with enabling greater DG capacity include greater customer value, reliability, safety, efficiency, and meeting public policy and environmental goals.

Given significant projected increases in DG capacity in its service territory, THESL's business case amply justifies the investment by citing field crew safety, reliability impacts and potential deterioration of distribution assets due to high fault currents. THESL forecasts that 626 MW of new DG capacity is likely to come on line over the next 5 years for FIT, CHP and other DG. Its staggered plan to install the advanced protection, monitoring and control devices is in line with expected DG capacity additions between 2015 and 2019. The program includes anti-islanding to reduce risk for field crews during restoration. Enhanced protection and monitoring capability also enables distribution operators to better manage thermal loads via load transfers. The NPV cost for the GPMC program is about $18 million

THESL evaluated alternatives such as major system upgrades and deemed these too expensive and largely dependent on HONI to perform the work with scheduled timeframes outside the five-year window. Navigant views THESL's GPMC program as less costly and providing tangible benefits within a desired timeframe. Tables and graphs THESL used to evaluate

program need and benefits support the business case, although details on the process THESL used to select technologies is limited – additional details on cost for selected technologies would further strengthen the business case.

System Renewal

2014 ICM Continuation Programs

THESL provided significant evidence in its 2012 ICM filing to justify and support proposed renewal expenditures for programs continuing into 2015. Navigant reviewed much of this evidence for its independent evaluation of the ICM filing. Navigant also reviewed the updated business cases THESL prepared for the DSP and the technical and economic methods used to justify these projects. Based on its review, Navigant finds that each of the renewal program investments continue to be justified based on need and life cycle economics. We did not see any major changes in assumptions, costs or economic results that would justify deferring or eliminating completion of these programs as part of the ICM filing.

Reactive Capital

Reactive capital is necessary to ensure THESL retains the ability to reliably serve its customers and quickly respond to service interruptions or hazardous system conditions. Exact budget requirements for a reactive capital program are difficult to predict. THESL justifies its business case based on past experience, inventory of asset condition (via a Defective Equipment Tracking System), and tracking corrective work request needs. THESL estimates reactive capital spending over the 2015 to 2019 late period at $165.5 million, a figure inclusive of the offset expected from planned non-reactive asset replacements.

The business case justifies the renewal program budget in light of THESL's to ongoing obligation to maintain system reliability, quickly correct hazardous system conditions, address imminent or likely asset failures, and restore service resulting from defective, failing assets and unplanned contingencies including natural disasters and foreign interference. Reactive capital also is required to facilitate planned modernization and system growth by ensuing resources needed to support planned operational investments are available for those activities. THESL expects reactive capital requirements to increase based on a growing trend of equipment reaching or exceeding EUL, with 26 percent of distribution system expected to be beyond their EUL by 2015. While the overall reactive budget is reasonable in light of expected increases in asset failure due to larger shares of system equipment exceeding EUL, among other factors, asset condition may be a more useful and clear metric than asset EUL and is described but not as clearly and quantitatively summarized as asset age in this business case.

Creating a reactive capital budget based on expected future asset failure and historical failure data is consistent with standard utility practice. The program is required to ensure the continued safe operation of the distribution system, maintaining crew and public safety, mitigation of environmental hazards, and proactive response to actual or potential

contingency events. Though financial analysis is not performed for alternative scenarios, including "do nothing" options, Navigant recognizes both the need and level of investment THESL presents in its business case.

Underground Legacy Infrastructure

THESL's Underground Legacy Infrastructure (UGL) renewal program is designed to upgrade system components that present challenges on multiple fronts including system maintenance, operational efficiency, crew and public safety, and delivery of customer value through reliable and efficient service. In its business case, THESL supports the replacement of several assets between 2015 and 2019 including:

1. Sachsenwerk switch and fuse units
2. Specific equipment in the Thorncliffe Park distribution area
3. Transclosures
4. Powerlite switches
5. Vault step transformers
6. Cable chamber covers (i.e. "manhole" covers)

The program is expected to cost $27.39 million over the five year rate period, and includes replacement of the above listed assets at various locations across THESL's service territory.

THESL's business case for replacement of these UGL assets covers a range of factors unique to individual assets, though primary drivers across all categories include obsolescence of equipment design and/or configuration, increased failure probability in light of equipment condition and age, and safety concerns for both the public and THESL crews resulting from failing and outdated equipment or equipment in poor condition. Navigant agrees that continued operation of aging and non-standard assets experiencing intermittent failures, particularly with regard to the Sachsenwerk switch and fuse units, Powerlite switches, and certain transclosures, presents operational challenges, safety hazards, and inefficiencies as reactive replacement or repair may require custom engineered solutions and workarounds that lead to longer customer outage times. Further, certain UGL assets (e.g. Powerlite switches) are no longer manufactured, making continued operation impractical without OEM support or an adequate supply of replacement parts. Others, such as in the case of Sachsenwerk switches, are of an outdated design prone to flash over hazards.

Potential safety hazards exist for other UGL assets as well. Traditional unsecured chamber covers present a danger to the public/THESL crews in the event of an underground explosion (24 incidents of dislodged covers have occurred in the past 17 years), and corroded transclosures beyond their EUL (representing the majority of the system) present hazards to THESL crews as transformers are degraded by the elements. Reliability of transclosure units following replacement also is enhanced, as THESL seeks to convert radially fed units to a

looped system with open ties. THESL also proposes to replace or decommission vault step transformers installed between the late 1950s through the early 1980s in a wide array of sizes (both in kVa and voltage). The program is justified, as THESL no longer provides multiple service voltages, and it no longer stocks replacement transformers due to the small number of installed units. Decommissioning will improve reliability by reducing the potential for equipment failure and by removing non-standard equipment no longer in stock and that is challenging to replace.

Navigant notes that THESL's plan to upgrade UG infrastructure in the Thorncliffe Park distribution area includes replacement of newer vintage assets (compared to other UGL assets); it includes the replacement of live and six-way SF6 switches installed by the former East York Hydro. These switches, permanently sealed after manufacture, have a rated EUL of only 20 years, and are deemed "effectively failed" after leaking sufficient levels of SF6 insulating gas. THESL does not stock replacements as these switches are no longer manufactured and are used in a small segment of its service territory. Replacement solves a series of challenges and brings greater uniformity to system design, avoids possible near-term failures (as experienced by other similar vintage SF6 switches), and reduces equipment exposure to flooding and corrosion by reconfiguring equipment to be pad-mounted. Notably, the Thorncliffe Park area has experienced flooded vaults resulting in damaged UG equipment despite THESL's use of sump pumps. This reduced automatic transfer switching (ATS) capability of SF6 switches, which have higher failure rates due to flooding and that require frequent maintenance.

Based on the quantification of these risks and constraints, THESL estimates the cost of ownership of existing legacy infrastructure (COE) is greater than the cost of ownership of new assets of a standard design (CON). Total CON, inclusive of additional quantifiable benefits, risks and program cost, is expected to yield a positive NPV of $1.46 million in the first year.

THESL's business case for replacing UGL assets is justified by a host of safety, reliability, and customer value concerns: improving system architecture and uniformity offers THESL greater flexibility for optimal network management, both by crews (via safe/efficient use of engineering resources) and remotely (i.e. smart grid); and replacement CRD/CLD and pad-mounted switches can be retrofitted to enable remote operability. THESL's ranking and prioritization of equipment replacements is clearly outlined, both in methodology and expected installation sequence. THESL's analysis evaluates asset condition, load served, upstream effects, and coordination with other program work balanced to ensure equipment replacements enhance customer value by delivering service reliably and efficiently.

Network Unit Renewal

Network units (NUs) are a critical element of THESL's downtown secondary distribution network. These devices contain several components including a network protector, a primary disconnect and grounding switch, and a network transformer. These units are essential, as they isolate faults from separate feeders within the network, which protects network

equipment, and provide uninterrupted service to downtown load. Many of THESL's NUs are beyond or approaching EUL, and, particularly for "fibertop" units, an outdated design that risk service disruption and increased risk of vault fires. All NUs scheduled for replacement are susceptible to damage and corrosion from flooding, and replacement with submersible units will mitigate these impacts. THESL estimates total program costs over the 2015 through 2019 rate period at $34.38 million. First year program cost versus avoided risk cost is $7.11 million NPV.

THESL's business case justifies the NU renewal program based on safety, reliability, and customer value. Further value is realized via the replacement of submersible equipment that will be less susceptible to corrosion and flood damage, and improved visibility of vault conditions through remote load monitoring (i.e. via use of smart grid technology). Existing network unit equipment includes "fibertop" and "semi-dust-type" units that are not water tight and in many cases experience significant corrosion and rust following years of exposure to flooding. Fibertop units have an outdated design that increases the risk of phase tracking, which can instigate costly and dangerous vault fires with attendant risk to the public and THESL crews. Some units also are connected to the secondary grid using asbestos-insulated, lead cables that also pose significant hazards in the event of a vault fire. THESL's proposed replacement of fibertops with submersible units virtually eliminates tracking risk, as use of a raised secondary busbar reduces accumulation of salts and debris. Some older units also may leak oil, which poses an environmental hazard and higher risk of failure.

THESL's proactive replacement of network units that are both of inadequate design, susceptible to flooding damage, and pose increasing risk of failure is consistent with industry practices. THESL has prioritized replacements by focusing on fibertop units most prone to failure, followed by replacement of units in the poor condition and those most likely to encounter flooding. Though not fully detailed in the business case, a feeder investment model (FIM) is used to balance asset condition and customer impact to determine optimal intervention time and replacement prioritization. Annual forecasted capital expenditures are provided with approximately 500 units replaced annually.

Distribution System Communication Infrastructure

THESL's existing communications infrastructure is becoming increasingly difficult to maintain and expand, with reliability bottlenecks that are inconsistent with current design practices. THESL's renewal program addresses key communication infrastructure constraints and deficiencies, several with synergies to other renewal programs. THESL's supervisory control and data acquisition (SCADA) system is critical for optimal distribution system (DS) management, as it enables controllers to respond quickly to changing system conditions and manage contingency events. Proposed communications and control infrastructure will significantly reduce outage times. THESL estimates outage time increases from 30 minutes to three hours without proper SCADA functionality. THESL estimates program costs of $16 million over the 2015 to 2019 rate period, with all work scheduled to be completed by the end of 2017. Placing and prioritization of the work is based on the dependency of individual

communication components as well as the dependency of other programs on the communication infrastructure.

Consistent with other renewal programs, THESL's business case justifies the investment based on improved reliability, operational efficiency, and enhanced customer value, achieved by limiting outage duration via optimized system control. The program includes three primary investments: 1) DS communication technology upgrade; 2) DS fiber optic plant replacement/expansion; and 3) SCADA wireless infrastructure. For its current DS communication technology, THESL relies on an outmoded 1980's vintage synchronous optical network (SONET) system that has produced 90 communication outages over the last five years. The system is no longer supported by the manufacturer, is compatible with only one remote terminal unit (RTU) system, and limits benefits achieved by other programs such as station control and monitoring, and station switchgear renewal. Navigant agrees that it is neither cost effective nor prudent to continue to investing in and utilizing the outdated SONET system, as this system is non-standard and incompatible with future expansion.

Fiber optic plant replacement and expansion, the second major investment category, creates reliability exposure and an expansion bottlenecks, both in design and ownership structure. Currently, 75 percent of all fiber optic cable is jointly owned by THESL and Cogeco Data Services (CDS). This arrangement limits THESL's ability to optimally route cables and eliminate single points of failure, resulting in potential SCADA outages. Targeting areas prone to failure, THESL plans to reduce dependency on CDS through gradual migration to a fully-diverse THESL owned fiber optic plant, while also expanding its reach.

Wireless SCADA infrastructure, the third primary investment area, is currently dependent on five separate wireless technologies, three of which are now functionally obsolete. Over 1,100 vault or overhead RTUs now rely on communications from this equipment, and system operations are further complicated by a lack of manufacturer support for outdated models. Also, THESL cites a potential cyber security risk by operating an outdated and unencrypted wireless communications system, one that will be minimized thorough investment in new equipment.

THESL's justification for proposed investment for the upgrade of this critical communications infrastructure is consistent with practices Navigant has encountered with other utilities. We also acknowledge that it is necessary to further enable smart grid management, and to fully realize benefits and opportunities presented by other planned system investments. In summary, THESL proposed investments will significantly modernize and improve the security of THESL's distribution communications network.

Station Building Infrastructure

THESL's proposed investment in its Station Building Infrastructure program is driven by the failing building components identified through a civil assessment on Toronto Hydro station buildings. The assessment included observations of water infiltration, moisture ingress,

structural integrity, rodent infestation, building security, and other hazards, each of which are targeted for upgrade. Failure to address structural degradation could negatively impact safety and reliability. For some buildings, maintenance is recommended instead of replacement to save cost and reduce lead time. Total proposed program cost from 2015 to 2019 is $11.25 million for 11 stations; on average, about $2.5 million annually.

The value of THESL's program is presented in terms of avoided estimated risk cost (ARC), estimated at $0.65 million. In maintenance based programs where assets are primarily repaired versus replaced, demonstrating positive ARC is typically sufficient evidence to demonstrate the investment is prudent, and in lieu of financial metrics such as difference in Cost of Ownership. The proactive nature of the maintenance work is justified through planning and labour management efficiencies that will be recognized through advanced notice. In addition, although standard maintenance is carried out, the level of investment that is recommended is such that standard maintenance can be performed without failure risk.

The civil assessment details several criteria required for station buildings to be deemed at risk including age, foundation deterioration, flood risk, and potential for high risk to customers under failure. These criteria imply a careful assessment of asset operability, beyond asset age, which provides convincing evidence for the proposed investment. Furthermore, THESL provides both the number of customers and the amount of load served by targeted stations serve to illustrate the impact of failures on continuity of service.

Navigant views THESL's approach to prioritize program work as sound. This finding is supported by our review of engineering notes and cost estimates from the civil assessment, the complexity of the proposed work, and sequence of stations proposed for upgrade. THESL also cites potential risks and challenges in scheduling the work, including Hydro One restrictions to THESL station work, extensive coordination for de-energization and load transfer, and potential permitting delays from the City of Toronto; each of which are factored into the program schedule.

Circuit Breaker Renewal

THESL's Circuit Breaker Renewal program is designed to replace aging oil circuit breakers that are nearing the end of or are currently beyond their useful service life, and that pose unnecessarily significant safety, reliability, and environmental risks in the event of failure. THESL intends to replace breakers in tandem with the replacement of similar vintage electromechanical (EM) feeder protection relays with modern microprocessor units to enable future feeder automation and other smart grid functionality. THESL's decision to simultaneously replace EM relays comes as a lesson learned after two outage events of previously replaced circuit breakers revealed end of life relays were defective that had to be replaced reactively at higher cost. This approach will reduce reliability risk, improve operational efficiencies, and result in lower cost compared to reactive replacement. Figure 16 presents the age profile of THESL's circuit breakers.

THESL's program is expected to cost $9.13 million over the 2015 to 2019 rate period. It includes the replacement of 135 oil circuit breakers with vacuum units equipped with microprocessor relays. In 2015, THESL expects 46 stand alone oil circuit breakers to remain in service, with 42 located at 27.6kV outdoor transformer stations across North York, and four in 13.8kV municipal substations in the Scarborough area.

Figure 6. Circuit Breaker Age Profile in 2015 (EUL = 45 Years)

The business case for the circuit breaker renewal program is well justified. Oil circuit breakers present both operational challenge and risk that can be mitigated at a very low cost relative to the total renewal budget and estimated risks. Operational challenges include the difficulty of finding suitable replacement parts and increased maintenance costs versus vacuum breakers. Further, safety and environmental concerns in the event of catastrophic failure are daunting. In the event of such a failure these units have the potential to cause significant/explosive fire, while emitting flying debris, and, in some cases, the release of PCBs at a concentration in excess of 50ppm. In contrast, vacuum units have fewer moving parts, require less maintenance, and do not contain oil that imposes additional risk. THESL proposes to systematically replace these circuit breakers over five years, and has prioritized renewal replacement schedules first by asset condition and age, and second by load and customers served.

Navigant views THESL's proposed replacement of oil based circuit breakers (OCBs) as an important investment in reliability, customer value, safety, and environmental protection. Navigant is aware that numerous other electric utilities also are replacing OCBs, and THESL has presented a logical sequence for upgrading these assets based on their likelihood to fail (age and condition), and the severity of impacts from a failure (customers affected and load served). THESL's business case includes a table and graphic that indicates the quantity of circuit breakers to be replaced annually and transformer stations where these replacements are scheduled.

OH Circuit Renewal

THESL's Overhead Circuit Renewal program is designed to replace assets that are nearing the end of their useful service lives or which have degraded to a stage where replacement is justified. Specific asset classes in the program include wood and concrete poles, single and gang operated overhead switches, CSP transformers, animal guards and porcelain insulators. The program will cost approximately $39 million over 5 years, which includes about $10 million in 2015 for SCADA Mate switch replacements that THESL included in its 2012 Incremental Capital Model (ICM) rate filing. Annual spending averages between $25 and $30 million. Most of these assets are located on THESL's 27kV overhead distribution lines outside the downtown core, but include lower voltage 4kV and 13kV connected to 27kV lines or unit substations.

THESL's business case justifies the renewal program based on a combination of factors, including obsolescence for certain manual overhead switches, crew safety for devices such as SCADA Mates switches, public safety for pole replacements, and reliability associated with each of the individual asset replacement categories. Tables that present historical reliability trends for each equipment type are included to support expected reliability benefits. The program also includes the conversion of 4kV and 13kV lines and equipment to operate at 13kV or 27kV, both to increase line capacity and to replace deteriorated equipment. Each of these programs and the justification used to support these investments is common for utilities in Ontario and throughout North America. An NPV analysis is performed for specific projects over 5 years and the first year avoided risk for the combined programs is about $39 million.

Each of the programs and the methods THESL used to justify the proposed investments is consistent with practices Navigant has applied and encountered with other electric utilities. The detailed list of individual project business cases, such as those presented for individual feeders, is beyond what some utilities use to support replacement programs covering a wide range of investments. The business case also describes the ranking and selection criteria for each equipment category. The replacement of critical assets such as wood poles whose condition has deteriorated beyond acceptable limits is an important component of renewal programs that regulatory bodies now require from electric utility distribution systems. We note that the business case does not include tables that summarize the quantity of equipment THESL proposes to replace versus the total population of each asset class. For example, utilities often will present pole replacements based on scheduled inspections, with test results, and condition. These additional summary tables would provide further support and justification.

Network Circuit Reconfiguration

THESL's Network Circuit Reconfiguration program is comprised of two initiatives: (1) enhance secondary network grid flexibility, and (2) expansion and upgrades of its 600V network distribution, which includes conversion of grid to spot networks. The first proposes increased power transfers from new high voltage station feeders and connecting transformers

(Figure 7 illustrates THESL's secondary network design). This portion of the work is also identified as a necessary prerequisite to the Downtown Contingency work described in the System Service section.

Figure 7. THESL Network Configuration

The second initiative is to introduce a 600Y/347V network to supplement existing lower voltage 4.33Y/250V and 2.16Y/125V network equipment. The higher voltage system will prevent functional obsolescence of the secondary distribution network, as 4.33Y/250V equipment is obsolete and difficult to acquire, while the 2.16Y/125V grid, while suitable for smaller buildings, is not preferable for use in all buildings due to internal voltage drop. Finally, some existing 600Y/347V network equipment has been identified as hazardous, and is also up for replacement.

The objective of THESL's program is to minimize customer interruption, improve planning and operational flexibility, enhance the ability of the network to operate under extreme events,

and prevent the secondary network distribution system from becoming functionally obsolete. To meet this objective, THESL proposes to replace four transformer and eight switchgear line ups, and add eight network underground transformers. The total cost of the program between 2015 and 2019 is estimated at $9.14 million. THESL expects the program to continue beyond 2019. The average cost of the program is about $2.3 million, which begins in 2016.

THESL indicates customer value is confirmed by an analysis that produces a positive first year NPV of $0.77 million, with a cost of ownership of $3.08 million. THESL also cites reliability, safety and efficiency benefits to further support the program. THESL's analysis includes a 66 percent reduction in load interruption during second contingency events, the elimination of hazardous Sachsenwerk switch/fuse units, and the elimination of special operation procedures associated with the new configuration. THESL states the primary program driver is functional obsolescence, supplemented by the necessity to expand or convert the secondary network to a mixed network configuration, with expansion of 600V connections for new large buildings and customers. THESL supports safety concerns with Sachsenwerk switches by describing failure events that have occurred. The replacement of these switches is further detailed in the UG Legacy Infrastructure business case.

THESL's pacing of the program is reasonably justified and in line with common utility practice. THESL plans to stagger rollout to ensure staff training and safe work procedures are developed. Furthermore, individual sites are planned based on operational restrictions that allow distribution operators to take feeders out of service in certain areas. THESL identifies the portions of the program that will be completed in the short, versus long, term. The risks associated with downtown underground work are listed along with mitigating options, such as scheduling construction work outside of the switching restrictions periods in the summer. The cost of ownership of the status quo system configuration is assessed and quantified in terms of the number of outage hours and associated avoided costs ($1.81 million) resulting from the proposed reconfiguration, for a net difference is shown to be $0.77 million.

Stations DC Battery Renewal

This program is designed to proactively replace station DC battery systems that control and operate station circuit breakers. THESL's proposed battery system replacements vary in capacity from 50Ah to 400Ah that will be installed between 2015 and 2019. The variation in battery sizes are due to the diverse requirements of the stations such as load requirement, different alarm systems, emergency lights, SCADA protection systems, and RTUs. THESL estimates total program cost at approximately $3.1 million, with annual spending of approximately $700K per year beginning in 2016. The proposed program aims to replace 67 battery systems at an average rate of 14 per year.

The useful life of existing DC battery systems is about ten years, and 27 percent of THESL's 194 battery systems are expected to be beyond their useful life by 2015, with an additional 33 percent expected to reach end of life by 2020. THESL's business case justifies the renewal program citing operational issues such as the increased potential for failed batteries to cause

lengthy outage and safety of workers when performing manual switching activities, and potential risk of exposure to acid and fumes from old batteries, and operational efficiency. In addition, the proposed program is consistent with Transmission System Code requirements.

Navigant views methods THESL used to justify the proposed investment to be consistent with industry practices. THESL conducted an extensive analysis of battery performance and presented graphs and tables summarizing the age of batteries that failed over 2011-2013 and the percentage of the battery population approaching end of life. It also includes a detailed assessment of the 167 battery systems that THESL identified for replacement. THESL is also considering the replacement of vented lead-acid (VLA) batteries with Valve-regulated lead-acid (VRLA) batteries that do not release chemical fumes to further reducing safety risk. THESL also evaluated run-to-failure versus planned replacement, with the latter yielding an avoided risk cost of $5.10 million for the year of 2015.

Station Ancillary Systems

Station ancillary systems ensure that THESL's stations function normally with minimal disruption to operations. THESL's program is designed to maintain the integrity of systems such as air compressors, fire alarms, heating and lighting, batteries and chargers, station service power supply, sump pumps, and fire barriers or fire suppression systems. The estimated investment for this program is approximately $2.29 million between 2015 and 2019. The assets that will be replaced under this program are listed in Table 5.

Table 5. Assets to be Replaced by Asset Class

Assets (units)	2015	2016	2017	2018	2019	Total
Air Compressors	4			2		6
Station Service Power Supply		1				1
Fire Alarm System			2	1	2	5
Fire Barrier/Suppression System	1	2				3

Assets targeted for upgrade are rated from 4.16kV and 13.8kV for air compressors to 230kV for fire barrier/suppression around transmission transformers.

THESL's business case is justified based on the criticality of the ancillary systems required for reliable distribution operations. THESL estimates over 100,000 customers are at risk of extended outages if the proposed station ancillary system program investment is not undertaken. Tables and graphs presented in the business case clearly illustrate the escalating number of repairs proportional to the increasing age profile of these assets. The primary driver for this program is the risk of failure resulting in extended customer outages and failure of station assets. The secondary drivers for this program are functional obsolescence and safety of crews and customers at or near the station. An NPV analysis performed for this program produces a net benefit of about $1.53 million.

The methods THESL used to justify the business case provide an objective view of each asset in THESL's ancillary systems. It includes an analysis of the current situation, and the prioritization and ranking of required upgrades by asset type. The business case provides analysis of alternative options with associated costs. The alternative option to replacing the ancillary services is the status quo option. Given the risk to customer outages and safety risks, THESL has decided the replacement of ancillary systems is the preferred option. The business case covers the overall program cost; additional details about individual asset replacement cost would provide further support and justification.

Worst Performing Feeder

THESL's worst performing feeder (WPF) renewal program is designed to improve the performance of feeders that, on average, experience the highest number of customer interruptions as measured by THESL reliability metrics. Asset replacements executed under the WPF program typically include replacement of legacy or worn components or outdated designs that pose a higher risk of service disruption or, in some cases, safety hazards. THESL uses a metric of seven interruptions per 12 month period (FESI-7[12] status) to classify and identify worst performing feeders, with plans to address feeders exceeding or trending toward FESI-7 status. Most feeders classified as worst performers are 27kV overhead lines outside the downtown core. Proposed spending is projected at $8.5 million between 2015 and 2019.

THESL's targeted investment for worst performing feeders is justified as it is expected to improve system reliability at low cost. Economic value and improved customer service is achieved by targeting equipment or conditions known to produce the highest level of interruptions. Many, if not most major utilities have implemented similar programs as they often produce very favourable NPV as measured by value of service (VOS) metrics. Typical components THESL proposes to replace or upgrade include uninsulated secondaries and services (replaced with insulated conductors to mitigate the impact of temporary faults), metal switch brackets (replaced with non-conductive brackets), defective glass/porcelain insulator (replaced with polymer insulators to reduce tracking or flashover risk), and certain underground assets such as transformers and cable segments with repeat failure histories. Proactive measures include insulator shielding to prevent animal contact, such as the installation of animal guards on transformer bushings and conductor leads, a common utility practice.

Targeting worst performing feeders is a standard practice that Navigant has recommended or encountered with numerous electric utilities. THESL's prioritization of feeders selected for mitigation is based on identifying those experiencing the highest number of sustained interruptions over a 12 month period, and that can be addressed at reasonable cost. Notably,

[12] THESL utilizes the acronym FESI-7 to refer to feeders experiencing sustained interruption seven or more times in a 12 month period.

1

1

THESL recalibrated its WPF program in 2012 to focus on short term mitigation options that yield immediate reliability benefits, with demonstrable success over the past few years.

1

System Service

Station Expansion

THESL proposes to upgrade several major stations during the five year period, many in the downtown area where building activity and growth are driving the need for increases in station capacity and connections capability. The other major driver is fault current constraints on station equipment that both THESL and HONI propose to address via breaker, switchgear and associated equipment replacement and upgrades. The relief of fault current constraints is a key requirement to enable greater DG capacity in the City of Toronto. THESL's station plan includes approximately $50 million in 2015 to complete the first phase of the Copeland station that is currently under construction and previously approved in THESL's 2012 IRM. Work at Copeland has been delayed to a combination of harsh winter weather and challenging site conditions associated with a high complex underground station. The need for Copeland was fully supported in THESL's 2013 IRM, in which Navigant provided evidence to justify need and proposed capital spending. Total program cost for stations over the five year late period is $182 million, with annual costs ranging from a low of $22 million in 2018 to a high of $51 million in 2015; the latter mostly to complete work at Copeland.

The methods THESL used to justify the proposed station project is consistent with leading practices Navigant has applied and encountered with other electric utilities. THESL's business cases emphasize use of CDM measures to permanently reduce peak demand enabling it to defer capacity upgrades, where possible. As noted in other business cases Navigant reviewed, CDM in the form of local demand response is proposed to defer capacity upgrades at Cecil. The business case also demonstrates station capacity is utilized to the extent practicable, accomplished via increased use of load transfer and greater use of feeder ties. Station upgrades in the downtown core are planned based on composite loadings and projected growth at several stations, recognizing the need to balance loadings to maximize the capability of each station to the extent possible.

THESL's business case clearly describes factors and assumptions supporting the ranking and selection process for each station project, including potential outcomes if proposed projects are not completed. These include new feeder positions such as the two needed at Bathurst to accommodate a large customer request. THESL also demonstrates that it has coordinated station expansion and upgrades with third parties, including HONI and the Ontario Power Authority for upgrades considered in the ongoing OPA led IRRP planning process. THESL is active in the IRRP working group committees, which issued a recommendation to increase transformation capacity and the Manby area. For the reasons cited above, Navigant finds that THESL's proposed station expansion plan is justified, as it has comprehensively considered

both expansion and non-expansion options and demonstrates that it has sought to maximize the utilization and capability of existing assets.

Station Control and Monitoring

Remote Terminal Units (RTUs), SCADA systems and pilot wire configurations are systems that THESL relies on to clear and manage faults. Due to aging hardware and lack of new communication capabilities, station relays many not be able to clear all faults and could be susceptible to cyber attacks. The Station Control and Monitoring program is designed to upgrade or replace station RTUs and pilot wire protection systems that have reached their end of useful life. The program is also designed to install SCADA at stations where none exists and that can utilize remote monitoring capabilities of RTU and pilot wire systems. The program is expected to cost approximately $5.05 million between 2015 and 2019. Average spending is $1 to $1.5 million per year starting in 2016 with very little upgrade planned for 2015. When the difference in cost of ownership is compared to the associated program costs, the Station Control & Monitoring program produces an NPV of $0.02 million.

THESL's business case justifies need by identifying RTU and pilot wire systems that are at the end of their useful lives. Given the capabilities of newer RTUs, communication systems and pilot wire systems, additional efficiencies and benefits are anticipated, particularly installing SCADA systems in stations where none exist. Supporting plots and tables indicate that customer hours interrupted (CHI) is nearly double for stations without SCADA capability. The primary driver for this program is functional obsolescence, with additional benefits focusing on labour and maintenance cost efficiency and a power distribution system with greater resilience from cyber attacks.

Each of THESL's program initiatives and methods used to justify spending are consistent with Navigant's experience with other utilities. THESL provides examples of prior outages caused by the failure of RTUs or pilot wire system to further justify the need and value. The business case also describes the ranking and prioritization criteria, which considers other system renewal programs in its evaluation. Since this program requires station outages for the work to be performed, THESL also considered program risks and appropriate mitigation measures to limit outage exposure. Like other business cases, THESL's evaluation of alternatives includes status quo (do nothing) versus the RTU, communication system and pilot wire upgrades it has proposed.

Feeder Automation

THESL's Feeder Automation (FA) program includes installation and refurbishment of SCADA switches with software upgrades to enable autonomous tie transfer for unaffected feeder segments during interruptions. THESL's directive for its Feeder Automation program is to reduce outage times through decreasing the resources and effort necessary to restore service following an interruption. The upgraded system will detect and automatically isolate faults, thereby reducing isolation times from between 30 minutes and 3 hours depending on the

existing setup. THESL is proposing feeder upgrades in both the Downtown and Horseshoe areas of its distribution system, where it will automate 640 switches on 130 feeders. The total cost of the program is projected to be $54.1 million from 2015-2019, with average annual cost of about $10 million.

THESL provides compelling evidence in terms of increased reliability to justify the FA program, citing improvements in outage metrics such as number of customer interruptions (CI), customer hours interrupted (CHI), and SAIDI/SAIFI. THESL compared current reliability metrics to the projected system state following automation, and determined that it can achieve an approximate 50 percent improvement in these metrics. Based on THESL's method of analyzing the number of feeder trunk lines that will benefit by automation, improved fault location and isolation times, and reductions in CI and CHI achieved by prior automation projects, THESL's DSP goals appear reasonable. The project produces a positive difference in the cost of ownership of $102.74M and NPV of $91.6M for the first year of the project.

THESL relies on past experience with feeder automation in the Horseshoe area and standardized utility practice to extend feeder automation to the Downtown system (first of its kind deployment in downtown area). The process THESL used to sub prioritize work appears justified, as it includes trunk outage data, and consultation with operations staff and systems planning approaches to identify the best opportunities given the loadings and geography of downtown lines. THESL also evaluated project risk, including potential for rapid load increases, integrity of the communication infrastructure, and premature asset failure. The report provides mitigating planning techniques which are reasonable, including monitoring load forecasts and connection requests, review of radio design, and reactive replacement of failed switching devices to enable the FA program.

THESL present program alternatives, including a status quo option, remote, manual switching control, along with the proposed option. The COO and NPV for these options are derived, and the proposed option offers significant benefit over other alternatives.

Contingency Enhancement

The Contingency Enhancement program includes several investments to improve response time during outages, achieved by re-routing power via feeder ties to restore affected customers. The program will improve customer service by reducing customer outage hours. Total program cost is $66.1 million from 2015 to 2019, excluding capital expenditures from previous years, as projects were undertaken as part of asset renewal or plant upgrades prior to 2015. Assets scheduled for replacement include primary cable, underground transformers, poles, overhead transformers, and overhead switches. Average annual spending is approximately $10 million, with the greatest spending occurring in the last year of the program.

THESL justifies the Contingency Enhancement by highlighting reliability, system efficiency, and safety improvements. THESL notes in its business case that fewer crews will be deployed

in outage scenarios to operate tie switches; as more tie transfer switches are installed, potentially dangerous manual switching also will be reduced. THESL determined that in the first year the program will produce a positive NPV of $49.82 million, with a difference in cost of ownership between existing and renewed assets of $59.19 million. The capacity of some conductors will be upgraded, as maximum peak loading during transfers on could exceed maximum ratings. THESL has structured the program pace to coincide with system renewal projects, so that replacement efficiencies are realized.

THESL's business case includes a description of each feeder tie project, along with costs, justification, and assets to be replaced in the sub projects. The Cost of Ownership in terms of asset risk and non asset risk is significant higher than program costs, and the NPV for the first year activities is much larger than the proposed net spend. Given these data, Navigant finds THESL's proposed contingency enhancements to be a cost effective approach to improving reliability and increasing operating flexibility.

Overhead Momentary Reduction

THESL's proposed overhead momentary reduction program is designed to reduce the number of customers impacted by momentary interruptions caused by temporary or permanent line faults. On longer feeders, the number of customers interrupted by permanent faults can be high, and these can be reduced via installation of line reclosers. Use of line reclosers is relatively new for THESL, and the primary focus of the program is to improve distribution performance and enhance customer satisfaction by reducing the quantity of customers impacted by momentary interruptions. THESL proposes to focus spending during the first two years to evaluate options and identify the best locations for installing line reclosers on its 13.8kV and 27.6kV distribution system. Thereafter, THESL proposes to install eight per year starting in 2017. The total cost of the program over five years is estimated at $1.92 million.

Customer service disruptions, even momentary, can be a major inconvenience to customers, and some result in material economic losses. Navigant's experience confirms that customers are increasingly impacted by momentary disruptions due to use of digital electronics susceptible to drop out. Momentary disruptions [13] account for 54 percent of interruptions on THESL's distribution system, and are of particular concern to customers that require uninterrupted supply for sensitive equipment. Installation of reclosers on main line sections can reduce the number of customers affected by momentary and sustained disruptions by eliminating station breaker operation that otherwise would occur absent the recloser. In addition to enhanced customer satisfaction, use of reclosers also improves THESL crew and general public safety. By isolating faults automatically quickly (through improved protection coordination), hazards can be isolated faster (e.g. high impedance faults such as overhead lines on roadway pavement). Manual switching by crews also is reduced as reclosers can be operated remotely by distribution operators via SCADA communications links. Operational

[13] Defined as an interruption with a duration of less than one minute.

efficiencies are also achieved by reducing the time required by field crews to patrol and isolate faults.

Navigant finds that THESL's proposed use of reclosers to reduce the number of customers impacted by momentary interruptions is justified, as use of these devices is a cost-effective approach to improve distribution reliability and performance, and it is common among utilities throughout North America. THESL's NPV estimate of $5.76 million demonstrates the program produces significant value for a relatively small investment, and that will enhance customer value by providing more reliable and efficient service.

Design Enhancement

THESL's design enhancement program focuses on two primary areas of improvement: (1) improved fuse protection and coordination and (2) installation of tree wire on 27.6kV overhead lines. These investments are proposed to improve distribution reliability via low cost enhancements. The total cost of the program is $7.3 million over the five-year rate period. THESL selected feeders for improved fusing based on known fusing deficiencies and where installation of fuses currently is limited by high fault current (i.e., exceeds 14ok maximum rating). In addition, THESL will install fuses where none currently exist, mostly on three-phase laterals integral to trunk lines.

THESL proposes to install tree wire or insulated overhead conductor in areas most susceptible to tree-related outages. Tree wire (insulated conductor) is most effective in areas where trees cause temporary interruptions; insulated wire will prevent line trips for self-clearing faults, and some permanent faults such as small branches lying on the line that are later removed by field crews. THESL will select distribution lines for fusing (install correct fuse sizes or improved coordination) or insulated conductor based on studies that are most susceptible to interruption due to fuse deficiencies or a high number of tree-related interruptions.

The primary benefits of these two initiatives is improved reliability, achieved by reducing the number of customer interrupted due to absence of fuses, undersized fuses or miscoordination; or by reducing the number of sustained faults via replacement of bare conductor with insulated conductor. The program NPV of $5.2 million is very favourable compared to the level of investment. Navigant finds THESL's proposed design enhancements to be prudent, as these are common reliability improvements it has seen elsewhere and demonstrate positive economic value.

Energy Storage Systems

The goal of THESL's Energy Storage Systems (ESS) program is to install 24 ESS's for a total installed capacity of 4.4MW and energy output of 10MWh. The program is designed to improve system efficiency, reliability, power quality, distributed generation enablement and electric vehicle enablement. The function of the ESS's is to provide load relief and shave peak load to reduce strain on system assets. THESL has divided the proposed investments into

centralized forms (Compressed Air Energy storage and Lithium ion batteries) and decentralized forms (solely lithium ion batteries) of ESS. The centralized devices can deliver 400 kW over 3 hours to municipal substations, whereas the decentralized devices can deliver 100-200kW of grid support/local support for 1-2.5 hours at strategic locations within the system. It is expected that the ESS program will cost $10.82 million from 2015-2019 with an average annual cost of about $2.0 million.

THESL scopes program benefits in terms of OEB goals, such as the enablement of DG and renewable generation. Expected reliability improvements are comparable to goals established by other utilities, such as increased voltage support, decreased harmonics, and uninterrupted service. The primary driver for the program is efficiency, as ESS is argued to increase the utility and lifespan of existing distribution assets while managing the variability of distribution system load, thus improving service and distribution capacity. The secondary drivers of improving reliability and power quality also contribute to the narrative of THESL targeting proactive improvement of its system assets.

The timing and pacing of the program is methodical, with planning work occurring in the first year, and a steady ramping of annual installations occurring for the remainder of the program. THESL's historical experience from ESS pilots that occurred in 2014 ensures that preferred sites (i.e. overloaded stations, feeders with reliability issues, areas with historical power quality complaints, areas with high DG penetration, etc.) are chosen for installation. The process outlined in THESL's execution plan is similar to utility practices for handling DG connection; with system evaluation, technology selection, site selection, design, procurement and commissioning playing large roles.

THESL addresses program risks, including limited technical expertise, load transfer constraints, and labour availability. Mitigation techniques appear reasonable, as THESL commits to advanced planning, training, and coordination between lines of business. THESL cites a third party study performed by Sandia National Laboratories to determine the cost of ownership for recommended ESS technologies. THESL's methodology for converting Sandia's findings to a quantitative first year benefit appears sound. THESL's justification of GSES work in 2015 is well outlined and complies with the OEB mandate of accommodating connection of DG to distribution systems.

Local Demand Response

The goal of THESL's Local Demand Response (Local DR) program is to encourage a shift in electricity consumption from peak to off peak periods, to delay system expansion until a permanent means to address load growth becomes financially prudent. THESL's program is designed to operate in conjunction with its Stations Expansion program, targeting load served by Cecil TS. Cecil TS is geographically confined so as to restrict physical expansion, and the load profile for the station transformers exhibits short duration peaks, which suggests DR as an alternative to capacity upgrades. THESL's program will cost $4.02M from 2015 to 2019, with an average cost of just under $1 million annually.

The primary driver for this program is relief of capacity constraints at Cecil TS, which THESL expects to be overloaded by 2020. Navigant views load growth projections as reasonable for this area of the city, and supported by the increasing trend in customer connections to Cecil TS. The business plan describes THESL's decision making process for mitigating capacity constraints; first, load transfer to adjacent buses is considered, and failing this, load transfer to surrounding stations. It is argued that load transfer may not feasible due to lack of station interties and existing station capacity limits. Physical expansion of Cecil TS is also considered. THESL's justification of switchgear additions as the only feasible expansion option to relieve capacity constraints is supported by evidence it presents. Even for switchgear replacement, extensive coordination with Hydro One would result in long lead times and lower short-term reliability in the short term.

THESL cites the positive results from the economic analysis performed for the project, operational issues associated with options for relieving capacity constraints at Cecil TS, and the ability to use proposed local DR for future work to justify the investment. THESL's selection of Cecil TS amongst other candidate stations is justified by a combination of factors, including year of required load relief, implementation time, physical restrictions, asset condition, cost of investment, and DR potential. THESL's business case provides an analysis of risks and alternatives, while an external consultant, ICF International, developed a financial model that incorporates cost-effectiveness tests to evaluate the potential financial impacts.

Customer-Owned Station Protection

Customer-owned substations are used by commercial and industrial customers of THESL that have significant power usage. These substations contain overhead steel structures and electrical assets like transformers that connect to THESL's larger distribution network. The Customer-Owned Substation Protection (COSP) program is designed to improve the protection mechanism at customer-owned substation and utility-owned protection mechanism installed upstream from the customer-owned substation. The program investment is estimated at $4.04 million over the 5-year period from 2015 to 2019. THESL estimates about 630 devices to be installed at 210 customer-owned substations on the overhead 13kV and 27kV in the Horseshoe and Downtown networks. The program cost and estimated devices are subject to change based on the outcome of the audit phase proposed in this program.

The business case for this program is justified given the primary driver is reliability and the failure of customer-owned equipment has caused nearly 17 interruptions per year. The failure of customer-owned substation is due to equipment not meeting the required standards or THESL-owned protection devices are absent altogether. The secondary drivers are safety of field crew that may have to perform work on rusted metal structures and poorly maintained transformers. The supporting details such as pictures, graphs and outage analysis in the business case exhibits a clear picture of the aged and under-maintained infrastructure that has caused service interruptions. The proposed protection mechanism is in line with the industry standards and good utility practice.

THESL has conducted an assessment of 10% of the total population (about 214 customer owned substations) and has found 21 of 185 visited customer owned substations in the Horseshoe area with equipment beyond its useful life and numerous substations with missing upstream protection devices. This type of analysis is consistent with utility operations that Navigant has seen. As required by such a program, THESL has proposed a two phase approach to executing this program. According to the business case THESL will conduct an audit phase followed by an implementation phase. Table 6 illustrates the outcome of the audit phase that is ongoing. Prioritization of the required work has been done based on priority for overhead lines susceptible to faults caused by trees and animals, number of interruptions, condition of equipment and protection coordination. THESL has considered the status quo option to perform system repairs and upgrades reactively which would result in considerable reliability concerns and has hence decided to adopt the proposed plan which is well justified.

Table 6. Customer-Owned Stations

Downtown Contingency

The Downtown Contingency program will install inter station feeder ties in the downtown 13.8 kV network in order to change the network configuration from a dual radial distribution design to an open loop design. (Figure 8)

Figure 8. Dual Radial Dx Design (current) & Inter-station Feeder-Ties Design (Proposed)

THESL is planning for 6 separate projects which will cost a total of $3.36 million from 2015, 2019. The business case quantifies the number of assets scheduled for replacement by this

work, which include underground switches, overhead switches, underground cable, and overhead conductor.

Customer Value is justified by THESL through quantifying the expected service restoration time during contingency events (8.2 hours currently, versus 1 hour after upgrades, on average). Reliability improvements are further quantified in Figure E7.7.8 which details downtown contingency outages from August 2003 to July 2013 (a 10 year window which covers the previous 5 years of system activity). This chart also summarizes CMO, CHI, CI, and outage duration, and forecasts the improvements in these metrics after system upgrades (consistent with other utilities' practices in quantifying outage data). Furthermore, the first year of activities of the program will represent a difference in cost of ownership of $3.07 million and an NPV of $2.33 million, which is in line with overall spending. THESL's pacing of the discussed project work is justified in the context of 3rd party utility constraints (HONI) and construction moratoriums (Pan Am Games), which demonstrates coordination with regional planning. Advanced planning with HONI is specified in the Program Risks section as a mitigating technique. Project prioritization is ranked first with respect to Historical Outage data, and second with respect to execution complexity, which is consistent with reviewed utility practice.

There is a thorough analysis of the alternatives to this program. The financial feasibility of the status quo alternative is compared against the proposed program, wherein the NPV of the proposal is found to be more financially prudent. However, although a third program alternative is provided, a financial analysis was not performed as a part of its assessment. When considering multiple alternatives, utilities generally attempt to discount the financial feasibility of each to strengthen the investment proposition.

General Plant

Information Technology

THESL's IT refresh programs are designed to replace and maintain assets relating to the software and hardware components to support ongoing operations. These components are required in order for THESL to efficiently execute required tasks such as preparing customer bills and dispatching crews to respond to outages. The IT Hardware Refresh program addresses the renewal and maintenance specifically for hardware assets. Software assets are specifically addressed in a separate business case (IT Software Upgrades, Enhancements and Analytics Program). Specific asset classes in this program include endpoint assets (such as desktops, laptops, tablets, printers and plotters) and core backend infrastructure assets (such as servers, disk arrays, network and telephony assets, and ancillary items). The IT Hardware Refresh program will cost approximately $37 million over 5 years, which includes $28 million of core backend infrastructure assets and $9 million of endpoint assets. Annual spending averages are expected to be approximately $7.4 million per year, with 2018 as the year with the highest spend at $10 million. This is primarily driven by the maintenance and capital investment required for disk and flash storage assets.

The primary driver for the program is system maintenance, which is justified by the necessity to periodically refresh IT infrastructure to mitigate risk associated with aging assets. If investment is not granted, the risks as outlined in the report may be:

1. Business continuity – obsolete hardware can result in core process interruption
2. Cyber security – security updates and patches could be impaired
3. Inability to pursue operational efficiency – obsolete hardware might act as a bottleneck for new program development
4. Lost opportunity cost – inability to plan for a uniform update can lead to system operation inefficiencies

Toronto Hydro also significantly details the stages of its IT asset lifecycle, and provides reasonable evidence for the benefits of constant failure rate operation. Navigant notes that supporting evidence in the form of industry standards for IT hardware replacement scheduling would be useful to further justify timelines. The report provides a breakdown of the types of assets up for replacement, and justifies the increased spending rates in 2018 as necessary in order to avoid deferral of storage asset replacement beyond their planned lifecycle. The priority of the replacements is such that the largest impact due to asset failure is mitigated first.

The regulations and standards cited ensure that THESL is replacing its current fleet with IT hardware that is industry accepted, and forwards OEB goals such as cyber security and Smart Grid development. Adherence to internal policy also ensures the program in line with Toronto Hydro's historical strategy towards IT hardware. The report assesses the alternatives to the approach the program is proposing, such as the run to failure option, and outsourcing device management. Due to risks involved with reactive replacement of assets, such as lack of planning causing poor integration of devices and high operational expenditure, run to failure is generally discounted, which demonstrates THESL's commitment to proactive asset management in this late filing. Furthermore, Toronto Hydro justifies internal replacement of its assets through decreased cyber security risks, mitigation of system lag/latency, and the flexibility to modify hardware asset maintenance without needing to communicate with external vendors.

Facilities Management & Security

THESL's facilities management and security plan is designed to make infrastructure improvements to specialized facilities that perform unique functions. These improvements include changes and enhancements to building security, mechanical, electrical, civil and architectural areas at 500 Commissioners, 14 Carlton, 160 Eglinton and several THESL stations. It is important to note that the security aspect of station facilities covered under this program will be coordinated with other improvements covered by Stations Building Infrastructure Renewal program. Total program cost is estimated to be $28.8 million between 2015 and 2019.

Most of the investment ($22.9 million) is proposed in the 2015 through 2016 time frame. High level items covered by this program include:

- Security – Locking hardware, card readers, fencing/gates, lighting, and intercom systems
- Mechanical – Plumbing, heating, air conditioning, and elevators
- Electrical – power distribution system, building automation system (BAS) and the fire and security monitoring systems
- Civil – Interior and exterior coverings, surfaces of the buildings, access ways, walk ways and windows
- Architectural – foundation and building envelope, roof and building masonry

THESL's business case justifies the upgrade based on security related incidents like theft, forced entry, vandalism, trespass, injury and safety. Pictures and associated details provide reasonable evidence to the deteriorating conditions in mechanical, electrical and architectural areas. The primary objective of this program is to maintain critical facilities that support efficient operations, replace assets that are at end of life, and to move toward alignment with NERC security standards. Secondary drivers include health and safety of employees and a reduction of failure risk that could affect reliability.

Methods THESL used to justify this program are in line with the processes applied and encountered at other utilities. THESL clearly articulates the facilities included in the program, the current state analysis of each facility, expected improvements, and the cost of each improvement. THESL's evaluation of alternatives clearly suggests the activities planned for this program are superior compared to the status quo option or repairing facilities reactively. Detailed cost analysis of the first year of investment provides additional justification.

Voice Radio System

THESL's Voice Radio System Upgrade Program is designed to replace voice communications equipment that field crews and external contractors use to communicate with control room personnel. THESL has accelerated the program to be completed between 2015 and 2016 due to the aging communication equipment and lack of vendor support. THESL expects the program to cost about $20 million over two years. The assets to be replaced in this program include the Data network, associated facilities; and backend equipment such as antennas, gateways, base stations; and front end equipment such as dispatch consoles. Spending is front loaded with $15 million of the investment proposed for 2015 and $5 million in 2016.

THESL justifies the program by citing two key facts: First, most communication hardware has been in service past the expected lifespan and second, vendor support contract expiring in 2016 with no future plans to support the existing communication hardware, the business is

justifies the renewal program. The voice communication infrastructure is critical to THESL's core distribution operations as it enables field crews to report injuries, emergencies and operations feedback. The tables and graphs clearly show an increase in component failure and proportional increases in repair costs. The limitations with the current system and dead zones within Toronto are preventing some communications, which affects THESL's core distribution functions.

In its business case, THESL evaluated other options such as,

1. Maintaining the existing system beyond 2016 on a "best effort" basis
2. Migrate to a contracted radio service
3. Replace the existing analog system with new digital radio system TETRA
4. Upgrade the existing analog system to digital radio system P25

THESL cites Option 4 as the preferred alternative, as it requires minimum investments and lower risk in safety, vendor and operational categories. THESL's evaluation and justification is in line with practices seen by Navigant at other utilities and with other programs within THESL.

Fleet and Equipment

The Fleet and Equipment services program is intended to replace THESL's aging fleet of vehicles in a timely manner to avoid expensive repairs and benefit from related efficiencies. There are a total of 660 units from various classes of vehicles and trailers that include cars, backhoes, minivans, among other equipment. The program is expected to cost about $18 million between 2015 and 2019. Annual spending averages about $3.5million, which includes vehicle replacements and equipment such as GPS trackers and associated services. The fleet replacement lead times vary from 3 to 12 months depending on the type and required vehicle equipment.

THESL's fleet replacement program is driven primarily by system maintenance and capital investment support with safety, reliability and business operations efficiency as secondary drivers. Analysis of vehicle life cycle costs, maintenance cost and reliability with age and odometer over 2008 to 2012 clearly presents rising maintenance costs with decreased reliability as the average age of the fleet exceeds 16 years and approximately 150K kilometers. THESL is considering the replacement of GPS/Telemetry systems as a part of this program. Year 2015 is the final year of the support contract for these systems, and replacement is justified because newer systems with enhanced features are available at lower cost due to technological advancements.

The methods THESL uses to justify the program are consistent with practices at other utilities. Various vehicle classes and related replacement criteria has been considered, and options such as "run to failure", "status quo" and "managed fleet replacement" were explored. The benefits of managed fleet replacement outweigh the risk and demerits of the other two options.

Program Support

Program Support investments include a study of customer interruption cost (CIC) and a climate adaptation study. Through surveys of various customer classes, the CIC study will provide THESL with better information on localized outage costs for customers. The primary benefit of the CIC study is the incorporation of the resulting data into the Feeder Investment Model (FIM). The climate adaptation study will improve system resiliency with regards to weather related risk, thus reducing the frequency and duration of outages caused by these events. Program Support will cost $1.7 million between 2015 and 2019 with all of the spending occurring in 2015 and 2016. The climate adaptation studies will cost $0.5 million annually, while the CIC study will be executed in 2015 and cost $0.7 million.

The most significant driver for the program is the need to support system maintenance programs through a robust knowledge of climatic impact on assets and cost of localized outages caused by asset failure. This program is framed by THESL in terms of a mechanism to improve its numerous capital investments in asset renewal for this rebasing. The report makes use of recent singular events, and historical impacts that Major Event Days have had on SAIDI and SAIFI metrics, and to quantify the necessity for climatic asset resiliency. In addition, the report summarizes the findings of studies conducted by other electrical utilities.

The report provides sound justification for the pacing of the program. The desire to incorporate the results of this program to enhance business cases for other investments is restated and is reasonable justification towards completing the CIC survey and climate adaptation studies early in the 2015-2019 rate period. THESL proposes to minimize cost by opening the studies to competitive vendor bidding. To reduce risk, THESL proposes to restrict the pool of vendors to those that have previously completed similar studies in conjunction with other electrical utilities.

RIDER to Navigant Consulting Ltd. Report Titled:

INDEPENDENT ASSESSMENT OF TORONTO HYDRO BUSINESS CASES

Ontario Energy Board EB-2014-0116.

The following summarizes Navigant's review and assessment of updates for certain projects included in Toronto Hydro, Electric System Limited's (THESL) July 31, 2014 Custom Incentive Rate-setting (Custom IR) application for 2015 – 2019 Electric Distribution Rates and Charges before the Ontario Energy Board (OEB) under EB-2014-0116. The findings and conclusions presented in our report are based on our independent assessment of THESL's Distribution System Plan (DSP), the Schedule of Exhibits accompanying the DSP and all updated business cases for programs that THESL now seeks authorization from the OEB, and which Navigant originally evaluated in its July 29, 2014 report titled "Independent Assessment of Toronto Hydro's Distribution System Plan and Business Cases" (Exhibit 1B, Tab 02, Schedule 4, Appendix B) submitted in EB-2014-0116).

The 2014 Evidence Update includes a supplemental exhibit (E.8.3) titled "Operating Centres Consolidation Program", which requests additional capital funds of $52.2 million over 2015, 2019. Navigant completed a post-filing and independent review and assessment of THESL's business case presented in E.8.3, which is attached to this rider as Attachment A. Thus, the findings and conclusions presented below are intended to amend and supplement those contained in our July 29, 2014 report with respect to the business cases and exhibits reviewed by Navigant in the 2014 Evidence Update, in addition to new evidence provided in E.8.3 justifying the consolidation of THESL operating centres.

Navigant's independent review of the Custom IR project revisions contained in THESL's September 2014 Evidence Update resulted in a determination that the conclusions we reached in our July 29, 2014 assessment have not changed. Among other findings, the total capital funds THESL now requests for 2015 – 2019 are virtually the same as the amounts that appear in our July 29, 2014 report, i.e. slightly less than $500 million annually.

Most important, THESL's justification for each project, including costs versus expected benefits, has not materially changed. Notably, findings in our July 29, 2014 report were not premised on specific dates or times when specific projects and jobs should be completed. Rather, our report highlights on page 9 that: "Navigant reviewed in detail

THESL's DSP framework presented in Section A through D, and specific business cases in Section E, and has determined that THESL has developed a DSP with sufficient rigour and supporting analysis to justify the proposed levels of spending throughout the rate period [emphasis added]."[11] The adjustments that THESL proposes are entirely consistent with this statement.

Given these facts, Navigant has no reason to change any of the key findings, conclusions or any of the findings presented in its July 29, 2014 report with respect to the business cases and exhibits reviewed by Navigant in THESL's September 2014 Evidence Update.[11] With respect to the Operating Centres Consolidation Program, Navigant finds the proposed investments and activities associated with the reduction or relocation of THESL operating centres is warranted and will produce net economic, reliability and customer service benefits to its ratepayers.

Attachment 1A

Operating Centres Consolidation Program

THESL proposes to continue to invest in its Operating Centres Consolidation Program (OCCP) that it initiated prior to the Custom IR filing. The OCCP for 2015 through 2019 includes $52.2 million of investments to fund the reduction and relocation of four operating centres at several locations. This is in addition to amounts that have been or will be spent in 2014 and prior years. Two of the operating centres ("OC") are owned by THESL and will be sold. The other two operating centres are leased facilities that are set to expire within the 2015 through 2019 rate period. Staff, equipment and work activities from these four centres will be transferred to three existing THESL operating centres or vacant properties owned by THESL. All funds will be used for upgrading or purchasing of equipment for use in closing of the operating centres, termination of leases, transfer of staff and equipment, and the purchase of new equipment. None of the funds will be used for facilities or equipment for the delivery of electricity to THESL customers.

The following illustration highlights the location of operating centres that will be closed and the locations of existing THESL operating centres or properties that will be expanded or built to accommodate the relocations.

THESL proposes to implement the OCCP over 4 phases, the first involving the closure and sale of 5800 Yonge, with most staff, equipment and related operating functions transferred to 500 Commissioners Street. (THESL has a 99 year lease for 500 Commissions.) Yonge Street currently houses THESL's Data Centre, the Call Centre and Control Centre. The Commissioners Street facility has sufficient space to accommodate the additional staff and activities, and will include enhancements to communications, infrastructure and security features needed for each of the three above operating functions. It includes use of highly reliable fiber optics communication systems and uninterruptible power supply at Commissioners Street for critical Control and Call Centre functions. Approximately 300 employees will transfer from 5800 Yonge to 500 Commissioners.

The second and third phases involve constructing new OC's at 7151 Milner (currently a vacant building) and 741 Rexdale due to termination of leases at nearby OC's at 6011 Milner and 161 Monogram. The existing OC's are used primarily as crew work centres for maintenance and construction, and are needed to serve northeastern and northwestern sections of THESL's service territory, respectively. The new OC's will provide assurance of property tenure and provide greater efficiency in building utilization and work activities. The new OC's will include more efficient space utilization and modern office facilities and equipment.

The fourth and final phase involves the permanent closure and relocation of THESL personnel, mostly restoration crews ("System Response"), from 28 Underwriters to other OC's, including the new OC's at Rexdale and Milner. The property will be completely vacated and sold. THESL expects that the de,centralization of System Response functions will reduce travel times for crews to response to emergencies or service interruptions.

The OCCP is expected to provide benefits to THESL customers in terms of reduced cost, better reliability and improved customer service. Among these benefits is improved efficiency and asset utilization. The consolidation is expected to reduce total THESL OC square footage from 4.21 to 2.61 million, or 43%, thereby improving utilization of existing and new facilities. The sale of the 8.11 acre Yonge Street property is expected to provide direct economic benefits to ratepayers via reduced taxes, lower maintenance and proceeds from the sale of property located in a desirable, high growth area. The transfer of restoration personnel from 28 Underwriters to other OC's is expected to improve reliability as crews will require shorter travel time from the dispersed work locations to restore service. Downside risk is low as THESL owns or occupies each of the three properties where staff and operating activities will be relocated.

1

Navigant's experience and review of THESL's OCCP confirms the proposed consolidation is consistent with utility practices throughout North America. The reasons and analysis THESL performed to support the OCCP demonstrates that it is a better choice when compared to continuation of existing leases and facilities ("Base Case") or "Do Nothing" options. Specifically, the OCCP will provide net economic, reliability and customer service benefits to THESL's customers, and reduces the risk of higher long-term costs associated with currently leased properties when compared to other options. As a result of these findings, Navigant has determined that THESL's funding request for the OCCP is justified and warranted.

EFFICIENCY, PRODUCTIVITY AND CONTINUOUS IMPROVEMENT

1. INTRODUCTION

The purpose of this schedule is to provide an overview of the evidence that that Toronto Hydro has filed this application to enable the Ontario Energy Board ("OEB") to evaluate the utility's ongoing efforts to achieve sustained improvements in efficiency and productivity.

In response to the OEB's Guidance in the RRFE Report,[1] Toronto Hydro has filed evidence detailing the utility's past, present and future productivity accomplishments, including continuous improvement as part of the utility's proposed custom rate-setting index. This evidence presents an evaluation of the utility's productivity levels, confirms the reasonableness of the utility's application through empirical benchmarking analysis, and explains how Toronto Hydro is appropriately incented to continue seeking further efficiency and productivity gains during the 2015 – 2019 rate period.

Toronto Hydro has a long-standing productivity culture which has evolved over time in line with emerging operating challenges, changes in government policy and expectations underlying the regulatory regimes that govern the utility's operations. Toronto Hydro's framework of current and planned productivity processes and initiatives are in alignment with the spirit of the RRFE Report. These processes and initiatives emphasize increasingly sophisticated performance measurement tools, bottom-up approach to identifying new efficiency opportunities, as well as streamlining labour-intensive processes through technological improvements and rationalization of supporting infrastructure.

[1] Report of the Board "Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach" (October 18, 2012) [the "RRFE Report"].

Consistent with the OEB's guidance in the RRFE Report (as briefly summarized below and discussed in more detail in Exhibit 1B, Tab 2, Schedule 2) the remainder of this schedule addresses the utility's productivity and efficiency levels and the culture of continuous improvement. The evidence is presented in two sections:

(i) the Past and Present, detailing the utility's accomplishments up to and including its 2015 Test Year; and

(ii) the Future, discussing the utility's plans for continued improvement of productivity and efficiency, together with the tools and processes needed for the utility to deliver the desired outcomes.

2. OEB GUIDANCE ON PRODUCTIVITY, EFFICIENCY AND CONTINUOUS IMPROVEMENT FOR THE DISTRIBUTORS FILING CUSTOM IR APPLICATIONS

The OEB's RRFE Report indicates the OEB's expectation that Custom Incentive Rate-Setting ("Custom IR" or "CIR") applications will enable "an assessment of the adequacy of past and future productivity levels."[2] Elsewhere in the RRFE Report, the OEB states that it expects to use benchmarking evidence "to assess the reasonableness of the distributor's forecasts."[3]

Toronto Hydro has endeavoured to address, and submits that it has effectively addressed, the OEB's guidance in the RRFE Report through information contained in, and appended to, this schedule. In particular, the utility's productivity evidence showcases,

(i) the long-standing nature of Toronto Hydro's culture of productivity;

(ii) the reasonableness of the utility's current and forecasted costs in light of its atypical operating conditions; and

[2] RRFE Report, supra note 1 at page 70.
[3] RRFE Report, supra note 1 at page 13.

(iii) the sufficiency of productivity and efficiency incentives embedded within the Toronto Hydro's proposed CIR ratemaking framework and capital efficiency performance measures underlying the utility's Distribution System Plan ("DSP).

2.1. Past and Present Productivity Initiatives

The adequacy, scale, scope of Toronto Hydro's productivity levels, together with its past and present productivity culture is subdivided into three general components:

1) Past Accomplishments – Case Studies and Cultural Evolution;
2) Empirical Evaluation – Econometric Benchmarking Study;
3) Ratemaking Incentives –The Effect of the IRM Framework

2.1.1. Past Accomplishments – Case Studies and Cultural Evolution

To showcase the range, nature and evolution of Toronto Hydro's past productivity accomplishments the utility has filed, at Appendix A to this schedule, a review of past productivity initiatives implemented by the utility between 1998 and 2011, inclusively. The review uses a narrative structure (with high-level quantification) to showcase the evolution of Toronto Hydro productivity culture since the utility's amalgamation.

As further discussed in Appendix A, Toronto Hydro's productivity was in large part shaped by the amalgamation of six neighbouring municipal electric utilities with distinct operating practices, unique asset bases and long-standing management philosophies. Following amalgamation, Toronto Hydro was dedicated to streamlining and rationalizing the legacy tools, processes, assets and workforce, while working towards creating a unified operating model supported by a common corporate philosophy.

As the utility matured and the operating practices became progressively harmonized, the focus shifted to enhancing its capabilities to plan for and implement comprehensive and

sustainable longer-term staffing and asset management strategies, along with expanding its ability to operate the distribution system in a reliable and coordinated manner. Critically, the systems and processes put in place during the 2004-2006 timeframe facilitated Toronto Hydro's ability to accommodate the increase in the volume of the utility's capital program starting in 2007. Among the key initiatives that drove productivity and efficiency improvements were the implementation of the Outage Management and Distribution Management Systems ("OMS" and "DMS", respectively), the adoption of the reliability-centered maintenance framework, and job description harmonization.

More recently, Toronto Hydro's productivity-enabling activities were primarily focused on supporting the utility's growing capital investment program and facilitating improvements to its customer service offerings. The specific initiatives included the adoption of new asset management tools and procedures, implementation of comprehensive health and safety management practices, outsourcing of capital work execution, and the introduction of a new Customer Care and Billing ("CC&B") system. Throughout this period, the utility also focused on maximizing the value of output from its internal labour force through such programs as performance and attendance management, the employee health and safety management system ("EHSMS"), and enhanced field supervision practices.

2.1.1.1. Asset Management Productivity Evolution

Among other examples of continuous improvement showcased within the Past Productivity Review is the evolution of Toronto Hydro's asset management practices and tools. Having inherited six distinct distribution systems with varying asset types, vintages and configurations, Toronto Hydro made significant progress in standardizing its asset base and implementing progressively more sophisticated asset management tools and processes.

The utility's initial challenge, at the outset of its amalgamated existence, was to develop and implement a consistent framework of asset nomenclature across all six legacy distribution territories. This was a complex and labour-intensive process, the outcome of which was to simplify and streamline the execution of field work. Toronto Hydro also consolidated and systematized all of its asset records into a comprehensive Geospatially Enabled Asset Registry ("GEAR") application, which remains a fundamental asset management and design application used by Toronto Hydro's engineers and technicians. Using Geographical Information System ("GIS") technology, GEAR has streamlined the utility's asset management and planning procedures, allowing Toronto Hydro to support the growing capital program.

The standardization of asset nomenclature and records also enabled Toronto Hydro to adopt the Reliability-Centered Maintenance ("RCM") approach for its distribution plant maintenance activities. This approach, first adopted in the airline industry, has allowed Toronto Hydro to schedule and prioritize its maintenance activities on the basis of highest probability and the impact of failure, contrary to past approaches that were largely reactive, or planned maintenance activities on the basis of equipment manufacturer specifications. In a similar manner, the implementation of the Worst Performing Feeder ("WPF") program and tracking of the supporting Feeders Experiencing Sustained Interruptions ("FESI") measure enabled the utility to effectively and efficiently target the most vulnerable parts of its system, driving performance improvements through targeted reliability-driven investments[4].

The utility further improved its asset analytical capabilities by implementing the Feeder Investment Model ("FIM"). The FIM application allows the utility to determine the optimal intervention times for the replacement or refurbishment of its distribution plant

[4] For more information about the WPF program and FESI measure, refer to the utility's Distribution System Plan at Exhibit 2B, Sections C.2.2 and E.6.21

on the basis of interruption costs and other risk-based considerations. This helps to identify the areas where capital investments provide the highest value for Toronto Hydro and its customers at a given time.

2.1.2. Empirical Evaluation – Econometric Benchmarking Study

To further support the appropriateness of Toronto Hydro's productivity/efficiency levels and provide the OEB with an objective evaluation of the reasonableness of the utility's 2015-2019 rate request,[5] Toronto Hydro has filed, as Appendix B to this schedule, a Custom Econometric Benchmarking Study prepared by Power System Engineering Inc. (the "PSE Report"), based on empirical analysis of total cost levels and reliability of all Ontario distributors and 85 utilities from the United States.

In addition to the OEB's guidance in the RRFE Report with respect to the use of benchmarking in evaluation of custom IR applications, in commissioning this study, Toronto Hydro was also guided by the OEB's commentary in Toronto Hydro's 2012 - 2014 rate application (EB-2011-0144), in which the OEB stated that it is "always open to applicants to bring forth alternative benchmarking evidence which incorporates comparators from other jurisdictions if the distributor believes those comparisons are more relevant."[6]

As further detailed in the appended PSE Report, Toronto Hydro believes that broadening the sample of analyzed utilities, while maintaining the presence of Ontario data points and the core methodology endorsed by the OEB, allows Toronto Hydro to strike a balance between maintaining relevance to the Ontario economic and regulatory context,

[5] Nicole Stewart, Missing in Action: Absenteeism Trends in Canadian Organizations (Ottawa: Conference Board of Canada, 2013), online: Sun Life Financial <http://www.sunlife.ca/static/canada/Sponsor/All%20Group%20Benefits/Focus%20Update/2013/Special%20Edition%20-%20Sept.%2023%20-%20%20Sun%20Life%20co-sponsors%20major%20new%20Conference%20Board%20of/MissinginAction_SUN%20LIFE_EN.pdf>.

[6] EB-2011-0144, Decision with Reasons and Order on the Preliminary Issue (January 5, 2012) at page 17.

and exploring the effect of additional business conditions that distinguish Toronto Hydro's operations from other Ontario local distribution companies ("LDCs").[7]

Based on its econometric benchmarking analysis, the PSE Report concludes that Toronto Hydro's past costs, as well as its 2015-2019 cost levels proposed in this application are lower than the reasonable levels of spending predicted by the econometric efficiency model. Toronto Hydro submits that these findings support the sufficiency of Toronto Hydro's past cost performance and confirm the efficiency and reasonableness of the forecasted costs underlying this application. The Utility attributes the results of this assessment at least in part to the benefits of productivity initiatives described in the Past Productivity Review (Appendix A to this schedule) and those detailed elsewhere in this application.

In addition to examining the total cost efficiency levels, the PSE Report undertakes an econometric benchmarking analysis of Toronto Hydro's reliability levels. Similar to the econometric cost benchmarking exercise, the PSE Report determines the expected System Average Interruption Duration Index ("SAIDI") and System Average Interruption Frequency Index ("SAIFI") levels for Toronto Hydro based on an examination of the business conditions that affect the utility's reliability performance. The sample of observed utilities comes from a combination of Ontario distributors and utilities in the United States.[8] As discussed in more detail in the appended PSE Report and Exhibit 2B, Section E2 discussing the utility's reliability performance, Toronto Hydro's historical and projected outage duration (SAIDI) performance is better than expected by benchmarking analysis, while its historical outage frequency (SAIFI) results are poorer than predicted by the econometric model. In discussing these results of this analysis, PSE observes that

[7] The PSE Report provides additional discussion of the technical, economic, demographic and topographic factors underlying Toronto Hydro's decision to expand the study's sample to include a subset of U.S. utilities, including PSE's commentary on these factors.
[8] The samples of observed U.S. utilities differs between the Total Cost and the reliability benchmarking studies due to the availability of public information that was necessary to conduct both studies.

above-average SAIDI results speak to the quality of Toronto Hydro's operations, which allow the utility to detect and quickly address the outages occurring on its system. As to the utility's below-average past SAIFI results, PSE largely attributes them to the current age and condition of Toronto Hydro's distribution plant. Consistent with the nature and volume of Toronto Hydro's proposed 2015-2019 capital investment program, the utility's SAIFI projections are expected to converge towards the benchmark over the five-year CIR period.

The PSE Report utilizes the translogarithmic (or translog) method of statistical modelling to evaluate Toronto Hydro's efficiency on a total cost basis, using a set of key business conditions derived through analysis of a comprehensive sample of electric utilities from Ontario and the United States. The translog methodology used by PSE is substantially similar to the approach employed by the OEB's own productivity consultant, Pacific Economics Group ("PEG"), for the purposes of placing Ontario's distributors into five efficiency cohorts and assigning the corresponding annual stretch factor values.[9]

Among the custom elements distinguishing the PSE model from the PEG approach used by the OEB is an extended sample of electric utilities, with data from a full sample of Ontario LDCs complemented by a set of 85 utilities from the United States, a number of which are comparable to Toronto Hydro in size, share with the utility a number of key business conditions that are largely absent across the Ontario electricity distribution sector.[10] In addition, the PSE benchmarking model leverages the inclusion of additional data points, thereby expanding upon the scope of key business conditions used to derive the predicted efficient cost levels for all utilities examined.

[9] Pacific Economics Group (2013), Productivity and Benchmarking Research in Support of Incentive Rate Setting in Ontario, (corrected January 24, 2014) at page 12 [the "PEG Report"].
[10] See PSE Report (Appendix B) for a comprehensive discussion of the business conditions that Toronto Hydro shares with many of the U.S. utilities included in the sample, which, in PSE's assessment are largely absent from the Ontario distribution landscape.

Chief among the additional business conditions is the "Presence of a Large Urban Core," a variable that cannot be derived from the Ontario-only sample, where Toronto Hydro is an outlier in terms of its size and the density of its urban service territory. A distinct feature of Toronto Hydro's urban downtown system is an asset-intensive downtown underground secondary distribution network, which provides increased reliability to Toronto Hydro's customers in the downtown core. These customers include critical loads such as hospitals, major bank headquarters, and the Toronto Stock Exchange. The downtown secondary network, which in PSE's assessment significantly influences the utility's total operating and capital costs, is unique in its span and configuration among the Ontario utilities. At the same time, similar secondary network configurations are relatively commonplace among the U.S. utilities serving major urban centres such as New York, Chicago, Baltimore, San Francisco, and Washington DC, all of which are included in the expanded sample set used by PSE.

Beyond the downtown secondary networks, as confirmed by PSE's cost analysis, serving large and densely populated downtown cores involves significant incremental capital expenses, all of which are largely uncommon to other Ontario's distributors given the age and configuration of their systems. Factoring the effect of this business condition into the benchmarking model enables PSE to assess the efficiency of Toronto Hydro's operations in a more comprehensive manner, by comparing it to other utilities that are exposed to similar cost drivers. The cost consequences of serving a dense urban-metropolitan era are further examined in the appendix to the PSE report. This appendix contains an engineering study that concludes that serving a dense urban area requires significantly more capital infrastructure (and thus a higher capital cost per kW) than supplying less dense suburban and medium-density areas that are more typical in Ontario's distribution landscape.[11]

[11] The referenced engineering study appended to the PSE Report does, however, find that it is similarly more expensive to serve sparsely populated rural areas.

Furthermore, the appendix to the PSE Report includes a comprehensive description of other business conditions that are largely absent from other Ontario distributors' service territories. Among these atypical business conditions are:

- Spatial restrictions for underground and overhead corridors;
- Excavation challenges due to the lake proximity and unmapped legacy infrastructure;
- Large-scale and frequent plant relocations driven by third-party requests;
- Vertical city growth and incremental costs of serving high-rise buildings;
- Heavy traffic congestion and municipally driven road work restrictions;
- Mature and dense tree canopy adjacent to or within utility corridors;
- Specialized skill requirements for work on legacy assets (pilc, box construction);
- Physical and economic topography (rivers, ravines, major highways and railroad corridors);
- High customer mobility, and large proportion of low-income customers;
- Safety costs of confined space work and the presence of controlled substances in the plant; and
- High commercial real estate prices.

Toronto Hydro's assessment is that the cumulative effect[12] of these and other related business conditions has a significant impact on the utility's operating and capital costs – an impact that is beyond the typical levels expected from Toronto Hydro based on its customer count, load or energy throughput. By expanding the number of model observations to include the U.S. utilities serving territories characterized by a wide variety of conditions, the cumulative effect of these atypical business variables can be better accounted for. Moreover, in the combined Ontario-U.S. dataset, Toronto Hydro is

[12] Toronto Hydro understands that most of these business conditions exist to varying degrees in the service territories of other Ontario distributors. However, the utility believes that the aggregate effect of the scope and magnitude of these operating characteristics within its service territory has a significant influence on its costs, above the levels experienced by other Ontario distributors.

approaching the sample average in terms of customer size, total expenditures, load and energy throughput unlike the OEB Ontario-only model where the utility is a clear outlier.

The OEB acknowledged the outlier status of Toronto Hydro in the Ontario context, by excluding results of the utility's historical Total Factor Productivity ("TFP") assessment from the calculation of the Productivity Factor for rate-setting under the 4th Generation Incentive Rate-Setting ("4th Generation IR") regime.[13] The variability in the scale of operation and costs of observed utilities in PSE's combined dataset makes it possible to produce benchmark cost models that evaluate Toronto Hydro's performance in a rigorous manner, and allow PSE to account for the effect of business conditions not present elsewhere in Ontario (e.g., large urban core).

2.1.3. Ratemaking Incentives – the IRM Framework

Toronto Hydro's base rates have been set using a cost of service in accordance with the OEB's 3rd Generation Incentive Rate-Setting Price Cap Index ("PCI") mechanism since 2011, when the utility underwent its last rebasing proceeding (EB-2010-0142). In ensuring that its operating costs conformed to the funding levels provided by the PCI framework over the 2012-2014 period, the utility took a number of cost-saving steps to enhance the efficiency and promote sustainability of its operations, including:

- Conducting a Restructuring Program in 2012, which reduced the utility's headcount by approximately 200 full-time unionized and non-union employees;[14]
- Improving efficiency of its supply chain and warehousing operations by introducing a new Warehouse Management System, outsourcing a portion of warehousing operations and automating low-value activities;[15]

[13] EB-2010-0379, Report of the Board, Rate Setting Parameters and Benchmarking under the Renewed Regulatory Framework for Ontario's Electricity Distributors (December 4, 2013) at page 14.
[14] Exhibit 4A, Tab 4.
[15] Exhibit 4A, Tab 2, Schedule 12.

- Reducing administrative burden and improving service quality by outsourcing the management of 100+ facilities contracts to a single Facilities Management Organization;[16]
- Taking steps to rationalize the size of the utility's vehicle fleet and reducing the associated expenditures through a combination of outsourcing and process streamlining;[17]
- Improving the efficiency and scalability of its information technology operations by virtualizing the majority of the utility's servers and standardizing and streamlining the governance of all key IT processes;[18]
- Driving down injury frequency and avoiding the associated costs by implementing industry-leading health and safety standards and investing in safety awareness;[19]
- Introducing a new Customer Care and Billing ("CC&B") system and broadening the scope of available online self-service tools, including move processing, electronic billing etc, which improved service levels and had a positive impact on the utility's working capital requirements;[20]
- Other initiatives described throughout this application.

2.2. Future Productivity and Toronto Hydro's Productivity Culture

The utility's evidence in support of the productivity incentives built into the proposed Custom IR rate framework and the reasonableness of the utility's forecasted expenditures over the 2015-2019 horizon is based on:

1) Structural Elements of the CIR Framework;
2) Empirical Evaluation of the 2015-2019 Expenditure Forecasts;
3) Productivity Culture over the CIR Timeframe.

[16] Exhibit 4A, Tab 2, Schedule 11.
[17] Exhibit 4A, Tab 2, Schedule 10.
[18] Exhibit 4A, Tab 2, Schedule 16.
[19] Exhibit 4A, Tab 2, Schedule 14.
[20] Exhibit 4A, Tab 2, Schedule 13; Exhibit 2A, Tab 3.

2.2.1. Structural Elements of the CIR Framework

Toronto Hydro's proposed Custom IR framework contains two key elements that are expected to incent the utility to seek further efficiency and productivity improvements over the 2015-2019 timeframe. These elements are:

(a) The Custom Rate-Setting Index; and

(b) Distribution System Plan (DSP) Capital Efficiency Measures.

2.2.1.1. The Custom Rate-Setting Index

Toronto Hydro's proposed 2015-2019 rate framework entails a custom index, whereby the portion of the utility's Operations, Maintenance & Administration (OM&A) expenditures built into the 2015 base rates will increase on the basis of the OEB's Price Cap Index ("PCI") in 2016-2019 (i.e., years 2-5 of the CIR plan), while the funding for capital expenditures during this time will be provided through a Custom Capital Factor ("CCF" or "C-Factor").[21]

More specifically, the utility's OM&A expenditures built into 2015 base rates, will increase by the value determined through application of the OEB's long-standing I-X formula, where the value of both Inflation ("I") and Productivity and Stretch Factors (collectively "X") will be set by the OEB on an annual basis consistent with the traditional 4th Generation IR rate-setting policies. As a part of its annual update process, Toronto Hydro will apply to the OEB to adjust its base rates on the basis of updated I and X values along with the custom value of the C-factor.

As described in more detail in Exhibit 1B, Tab 2, Schedule 3, Toronto Hydro seeks a 0.3% stretch factor based on the findings of PSE Report, which indicate that Toronto Hydro's total cost are within +/- 10% of its model-predicted levels, and thereby

[21] See Exhibit 1B, Tab 2, Schedule 3 for more information about the proposed rate framework.

correspond to a Medium Efficiency Cohort (0.3% stretch factor) based on the OEB's 4th Generation IR methodology.

The Productivity Factor and Stretch Factor values built into the rate-setting mechanism facilitate the sharing of benefits from efficiency/productivity gains with customers on an ongoing basis. Toronto Hydro notes that that PEG's 2013 empirical research of Ontario distribution industry's Total Factor Productivity (TFP) trends commissioned by the OEB for the purposes of setting the Productivity and Stretch Factor values for the 4th Generation IR framework initially supported a negative (-0.3%) productivity factor[22], based on the Ontario distribution sector's historical (2002-2012) productivity trends. Moreover, PEG's findings in support of a negative productivity factor excluded the TFP performance results of Toronto Hydro and Hydro One Networks (which were also negative) on the basis that these utilities are industry outliers. The OEB has ultimately determined that the value of the Productivity Factor for the 4th Generation IR regime should be 0%. Considering the cumulative effect of the OEB-determined 0% Productivity Factor, the proposed 0.3% Stretch Factor, and the actual empirical results of the industry TFP performance which could warrant a negative productivity factor, the cumulative effect of incentives built into Toronto Hydro's proposed Custom IR index is effectively greater than the 0.3% value of X factor, and is likely in the range of 1% or higher. Toronto Hydro submits that this effective value of the X factor applied to the utility's OM&A expenditures constitutes a sufficient incentive for the 2015-2019 CIR rate period, especially in light of the amount of productivity efficiency gains achieved in the preceding years, as confirmed by PSE.

The elements of the PCI framework embedded within the proposed Custom IR index effectively guarantee the OEB and Toronto Hydro customers the achievement of an

[22] Pacific Economics Group (PEG), "Productivity And Benchmarking Research In Support Of Incentive Rate Setting In Ontario: Final Report to the Ontario Energy Board" 21 November 2013, p.5.

outcome of future cost efficiencies through formulaic increases of the utility's operational expenditures capped at a level significantly below inflation. Accordingly, and in light of the requested five-year rate term, Toronto Hydro submits that the proposed rate framework builds in a sufficient amount of long-term incentives to drive continuous improvement with respect to the utility's efficiency and productivity levels.

2.2.1.2. DSP Capital Efficiency Metrics

The second component of productivity and efficiency built into Toronto Hydro's Custom IR framework are the performance measures proposed as part of the utility's Distribution System Plan ("DSP")[23]. These measures relate to the efficiency and cost effectiveness of the DSP planning and implementation, in accordance with section 5.2.3 of the Chapter 5 Filing Requirements.

The proposed measures allow the utility to closely monitor, and take actions (where warranted and/or possible) to ensure continuous improvement in the efficiency of execution of key operating tasks that ultimately form part of total capital costs and future in-service additions. The activities captured by these measures relate to the capitalized costs of supply chain and warehousing operations, as well as capitalized costs of engineering, design and related administrative functions. Toronto Hydro believes that the optimal means of driving efficiency of its capital program involves reducing the input costs of activities that are ultimately capitalized.

In addition to the above-noted measures, Toronto Hydro's DSP performance measurement framework contains two new measures of capital implementation efficiency: (i) Annual Contractor vs. Internal Construction Costs benchmarking exercise, and (ii) a nascent project aimed at developing a comprehensive framework of construction labour input costs for planned capital projects executed by the utility's

[23] Exhibit 2B, Section C.

internal crews, which is expected to improve and simplify the processes currently in use. While the former measure enables the utility to conduct annual comparisons of its internal construction efficiency relative to the costs of identical work provided by contractors competing on the open market, the latter measure is aimed at developing a comprehensive activity-based costing framework that underlies operations of industry leaders.[24] By refining and developing these performance measurement tools over the next five years, Toronto Hydro expects to enhance its ability to obtain detailed insights as to the nature and scale of work execution challenges faced by its construction crews, and to develop appropriate tools and measures to mitigate these challenges, thus facilitating further capital efficiency and productivity improvements.

In addition to the performance measurement framework, and as further detailed in Toronto Hydro's Supply Chain OM&A program,[25] the utility continues to work on strategic materials sourcing, vendor management and automation of low-value tasks associated with management of materials and implements supporting its capital program. In a similar manner, the anticipated improvements of the utility's capital planning tools and applications, such as the proposed FIM enhancements,[26] are expected to facilitate productivity and continuous improvement of the utility's capital planning processes. In addition to the incentives provided through the capital productivity performance measurement framework discussed above, this is expected to enable Toronto Hydro to measure and, where feasible, control the costs of capital assets that it puts in service.

2.2.2. Empirical Evaluation of the 2015-2019 Expenditure Forecasts

In respect of productivity/efficiency incentives and a re-affirmation of the reasonableness of the utility's 2015-2019 total expenditure forecasts, Toronto Hydro refers to the Total

[24] For further discussion of activity-based costing please see the "Continuous Improvement" subsection of this schedule, which details the lessons learned by Toronto Hydro by examining the operations of leading North American distributors, whose operating environments are similar to the utility's.
[25] Exhibit 4A, Tab 3, Schedule 12.
[26] Exhibit 2B, Section A.

Cost Econometric Benchmarking Study prepared by PSE and appended to this Schedule as Appendix B (the "PSE Report"). As discussed above, the PSE Report examines and confirms the efficiencies associated with the utility's expenditure levels leading up to and including the 2015 Test Year. The PSE Report also applies empirical benchmarking practices to assess the reasonableness of Toronto Hydro's cost forecasts over the 2015-2019 Custom IR rate period. Similar to the conclusions regarding the utility's past expenditures and the 2015 Test Year, PSE finds that Toronto Hydro's 2016-2019 forecasted expenditures are reasonable when compared to average results predicted by the efficiency model; the utility's cost forecasts for each out-year are below the levels predicted by the econometric analysis.

Toronto Hydro believes that the approach adopted by PSE is the optimal means of conducting a forward-looking benchmarking assessment of future costs in the Ontario and broader North American context, where five-year utility business plans are typically not published due to commercial sensitivity or the lack of normative frameworks requiring such publications. Toronto Hydro submits that the approach used by PSE constitutes a reasonable estimate of the utility's future efficiency and productivity levels, as contemplated by the OEB in the RRFE Report.

2.2.3. Productivity Culture over the CIR Timeframe

Toronto Hydro employs a number of tools, processes and approaches to facilitate the culture of continuous improvement and achievement of further efficiency and productivity gains for the benefit of the utility and its customers. Among other things, Toronto Hydro seeks to create an environment that enables employees to perform their work efficiently, incorporates corporate goals into the daily actions of front-line staff, provides effective performance feedback, and creates a support structure for implementing continuous improvement ideas.

The remainder of this section presents a summary of Toronto Hydro's activities, currently in place or contemplated during the CIR period, as they relate to a culture of productivity. The activities are separated according to their underlying objectives according to the four general areas:

(a) Executing on projects with big savings potential;
(b) Creating a right environment for employees to perform their work productively;
(c) Translating corporate goals into daily actions for the front-line staff; and
(d) Creating a support structure for implementing continuous improvement ideas.

2.2.3.1. Executing on Projects with Big Savings Potential

Toronto Hydro expects to proceed with four initiatives:

- Upgrade of the Utility's Enterprise Resource Planning ("ERP") capability;
- Operating Centres Consolidation Program ("OCCP");
- Fleet Management Initiative;
- Standard Asset Assemblies Framework.

ERP Implementation

As detailed in Toronto Hydro's DSP,[27] Toronto Hydro's proposed ERP implementation is driven primarily by the need to upgrade Toronto Hydro's functionally obsolete Ellipse application, along with a number of other key IT applications that support the utility's key business processes. Beyond facilitating information technology service reliability and enabling sufficient technical support for upgrades for the Legacy Systems, Toronto Hydro views the ERP upgrade as an opportunity to streamline and automate a number of key asset management, human resources and financial processes that currently require a significant amount of manual effort or complex workarounds due to the lack of necessary IT functionalities. Accordingly, by implementing the upgraded ERP capability over the

[27] Exhibit 2B, E8.6

2015-2019 timeframe, Toronto Hydro expects to improve the execution efficiency of a number of critical processes supporting its operations.

Operating Centres Consolidation Program

Toronto Hydro's Operational Centres Consolidation Program ("OCCP")[28] aims to secure tenure for Toronto Hydro in the northwest and northeast areas of the City while delivering benefits to ratepayers. Under the program, Toronto Hydro would vacate four facilities, two of which it currently owns, and relocate staff, equipment and operations to three facilities already owned by Toronto Hydro to achieve efficiencies and improve space utilization. The two surplus Toronto Hydro-owned facilities would be sold and the net after-tax gains on sale and related tax savings arising would be credited to ratepayers through rate riders.

Fleet Management Initiative

The Fleet Management Strategy is an ongoing project that is already yielding efficiencies at Toronto Hydro. The project's aim is to rationalize the size of the utility's vehicle fleet and attain further operating efficiencies through competitive procurement of servicing functions, and leveraging GPS capabilities to optimize maintenance cycles. By the end of 2014, the utility expects to have removed 86 vehicles from its fleet from the time of the program's inception in 2011, which amounts to a 12% reduction. Further reductions are expected as the utility continues phasing its vehicle sharing program, which is currently in a pilot stage. For more information on the vehicle sharing program please refer to Fleet and Equipment Services OM&A program.[29]

[28] Exhibit 2B, E8.2
[29] Exhibit 4A, Tab 2, Schedule 10.

Standard Asset Assemblies Framework

As discussed above, and further detailed in the utility's DSP[30], the Asset Assemblies Framework (an undertaking that is currently in the early stages), aims to develop an enhanced framework of standard labour hour inputs for construction of a standard unit of Toronto Hydro's distribution plant. The framework is also expected to include standard adjustment factors to account for project-specific circumstances (e.g., installation in a ravine), as well as allocations for "non-work" time, such as regular breaks, set-up/takedown etc. Ease of performance tracking by crew leaders and supervisors is expected to be enabled through the development of a user-friendly application installed at handheld devices issued to staff. To ensure alignment between field conditions and performance expectations as well as drive continuous improvement, the input unit values would be periodically updated on the basis of field results.

While the framework is in the early stages and will undergo further testing and development during the 2015-2019 CIR timeframe, Toronto Hydro expects that it will provide the utility with key insights that will enable the optimization of construction practices, and in turn, lead to efficiency gains. As further discussed below, the implementation of standard asset assemblies is one of several key initiatives that Toronto Hydro identified during its recent outreach effort to several large U.S. utilities whose operating conditions are similar to those of Toronto Hydro, and whose operating practices are seen as industry-leading.

Over the 2015-2019 timeframe, Toronto Hydro plans to investigate opportunities for additional large initiatives that have value propositions and the potential for significant efficiency and productivity gains. As discussed earlier in this schedule, the incentive elements built into the utility's proposed custom rate framework are expected to incent

[30] Exhibit 2B, Section C.

Toronto Hydro to seek out and realize further productivity improvements during the CIR period.

2.2.3.2. Creating a Right Environment for Employees to Perform Their Work Productively

At the core of this strategy lies Toronto Hydro's corporate commitment to employee health and safety, supported by a comprehensive framework of safety rules, audits and education/awareness programs. Beyond facilitating employee welfare and job satisfaction, Toronto Hydro believes that a corporate focus on employee health and safety leads to significant financial benefits. For example, the utility estimates that a lifetime cost of a permanent shoulder injury to a frontline worker is approximately $1 million, comprised of rehabilitation and accommodation costs, lost productive time, insurance premiums and other components. As discussed in more detail in the utility's Human Resource and Safety OM&A evidence,[31] permanent shoulder injuries have been relatively commonplace at Toronto Hydro prior to the introduction of the current health and safety framework. The last permanent shoulder injury at Toronto Hydro occurred in 2011.

A related area of Toronto Hydro's productivity culture focus is employee attendance, as paid lost time due to absences, injuries or illnesses provides no value to the employer or ratepayers. A 2013 Conference Board of Canada study estimates that absenteeism costs Canada's economy $16.6 billion. Having put in place a comprehensive attendance management program starting in 2007, Toronto Hydro achieved a 45% reduction in absenteeism rates between 2008 and 2013, which ranks significantly below the municipal, provincial, and national averages according to the 2013 Conference Board of Canada study.[32] Toronto Hydro will continue its attendance management program over

[31] Exhibit 4A, Tab 2, Schedule 14.
[32] The Conference Board Of Canada, "Missing in Action: Absenteeism Trends in Canadian Organizations", Briefing, September 2013;

the 2015-2019 CIR timeframe to drive sustained improvements for the benefit of the utility and its ratepayers.

Toronto Hydro also continues to leverage technological advancements in order to create optimal work surroundings and drive employee productivity. Toronto Hydro has upgraded employee work stations by replacing standard desktop computers with laptops, which employees can take home or bring along to internal or external meetings. All laptops are equipped with software, which allows Toronto Hydro's employees to access all corporate applications and databases offsite via a secure connection. In addition, all of Toronto Hydro's work centres are also Wi-Fi enabled to allow the employees easy access to any required applications from anywhere in the buildings. These strategic hardware and software upgrades enable Toronto Hydro employees to perform their duties from home, while commuting, or under any other circumstances that require employees to be away from their primary work locations. In addition to facilitating productivity, this capability assists the utility's personnel in maintaining a healthy work-life balance, which improves job satisfaction and further incents productivity.

In a similar manner, Toronto Hydro is in the process of equipping all of its service vehicles with mobile laptops and GPS capabilities, which facilitates the execution of administrative tasks in the field, provides employees access to required applications and resources, and allows dispatchers to quickly locate a crew in the proximity of a reported incident. In addition, and as further described in the following section, mobile capability allows Toronto Hydro to implement new short-interval performance measurement systems, which allow the utility to quickly identify problem issues and incent its field employees to achieve performance improvements. Presently, mobile capability is

---

http://www.sunlife.ca/static/canada/Sponsor/All%20Group%20Benefits/Focus%20Update/2013/Special%20Edition%20-%20Sept.%2023%20-%20%20Sun%20Life%20co-sponsors%20major%20new%20Conference%20Board%20of/MissinginAction_SUN%20LIFE_EN.pdf

installed on all service vehicles that respond to system outages. The utility plans to equip the remainder of its service vehicles with mobile technology over the CIR period.

In addition to continuously evaluating its internal practices for improvement opportunities, Toronto Hydro also considers productivity/efficiency ideas in the practices of utility sector leaders. In 2012, Toronto Hydro conducted several visits to major U.S. electric utilities in an effort to identify and adopt the most successful productivity and performance management practices. The utilities that Toronto Hydro visited were Baltimore Gas and Electric ("BG&E") in Maryland and Commonwealth Edison ("ComEd") in Chicago. Toronto Hydro is in the process of implementing several of the work practices observed during these visits, including:

- short-interval performance controls for System Response Crews (discussed below);
- changes to temperature and infrared criteria for safe entry limits into confined spaces;
- outsourcing the traffic management set-up activities for roadway work; and
- implementing a standard Asset Assessment labour input methodology.

Each of the above-mentioned practices is in various stages of development and implementation and is expected to generate productivity and performance improvements. Toronto Hydro will continue seek and implement additional industry best practices by maintaining dialogue with industry peers in the context of various industry associations and other issue-specific engagements.

2.2.3.3 Translating Corporate Goals into Daily Actions for the Front-line Staff

Key Performance Indicators

Toronto Hydro maintains a comprehensive framework of Key Performance Indicators ("KPIs") that is integrated with the utility's performance pay program and is a part of a Balanced Corporate Scorecard. The KPI framework is structured in a way to create a direct link between the individual performance expectations of each Toronto Hydro employee and the corporate performance goals for each year. Such a structure allows the utility to foster accountability and continuous improvement at every level of corporate structure.

System Response Crew Performance Monitoring

In addition to corporate-wide performance measurement, Toronto Hydro continues to implement an increasing number of sophisticated program-specific performance measurement systems, which monitor employee achievement of key operational outcomes relevant to their particular area of responsibility. One such performance measurement system has been implemented in 2013 to enable more advanced tracking of the utility's responses to Police, Fire and Ambulance ("PFA") calls. Pursuant to the conditions of its distribution licence, Toronto Hydro is required to respond to 90% of all PFA calls within one hour from receiving the call. While Toronto Hydro has historically maintained its compliance with the OEB standard, the utility obtained the idea for a more advanced tracking system from one of its U.S. utility peers.

To ensure measurement accuracy, Toronto Hydro utilizes the GPS capability installed on all of its service vehicles to gauge each system response crew's success in meeting the internal benchmark. The summary of daily activities is electronically summarized in a user-friendly dashboard, which enables in-depth performance analysis at the next day's crew meetings with supervisors and managers. Performance trends are also reviewed at

monthly meetings, where employees are provided an opportunity to suggest practice improvements. Since this initiative has been put in place, Toronto Hydro's PFA performance rate has improved by approximately 20%, when adjusting for Major Event Days. Continuous tracking of performance statistics also allows Toronto Hydro to periodically increase the internal standards, thus driving continuous improvement in service levels and efficiency. Over the IRM period, Toronto Hydro plans to investigate opportunities for extrapolation of the PFA response tracking methodology to other areas of utility's operations, such as regular maintenance activities.

Other Activity-Based Performance Measurement

Toronto Hydro employs activity-based performance measurement across a number of its other operational programs, including:

- First Call Resolution and Average Call Duration stats for its contact centre employees;
- On Time and in Full ("OTIF") order fulfillment rate for it warehouse operations;
- Order completion rate for the utility's materials and supplies vendors;
- Service request resolution metrics for the IT program staff;
- Internal request response timelines for the Legal program staff;
- Order to Operate ("OTO") execution rates for the Control Centre employees;
- Office time spent by crew supervisors;
- Maintenance attainment rates for the utility's fleet; and
- Other activity-specific measures and metrics.

Performance Measurement over the 2015-2019 Timeframe

Over the 2015-2019 timeframe Toronto Hydro plans to continue expanding the scope and sophistication of its performance management and evaluation undertakings. Among the key areas of focus over the five-year period includes the investigation, piloting and introduction of the previously described Asset Assemblies Framework discussed earlier

in this document. Other initiatives targeting increasingly precise and sophisticated measurement of specific activities will also be considered.

2.2.3.4. Creating a Support Structure for Implementing Continuous Improvement Ideas

The utility places a significant value on the ideas generated by employees, and has put in place a number of formal channels for the identification and discussion of these ideas. The main means of soliciting productivity-enhancing feedback are meetings between Toronto Hydro employees and members of the management team that occur across the utility at regularly scheduled intervals. Toronto Hydro encourages its employees to provide open feedback on the operating practices they use in the field, including ways to improve the safety or efficiency of work execution. Toronto Hydro plans to put into place other tools for grassroots productivity initiatives identification. Among them are plans to conduct a survey across the utility's operations to address potential productivity opportunities during the CIR term. Initiatives that receive support and have potential to affect multiple programs may be further refined and considered for implementation.

The benchmarking analysis uses historical cost and reliability data from a dataset comprised of multiple utilities to create a model; this model relates cost and reliability to certain variables. The PRGHO LV WKHQ XVHG WR SUHGLFW (benchmarked) cost and reliability. In past stretch factor research, the Board has used an Ontario-only dataset to create the econometric model. In the present report, PSE DXJPHQWHG WKH %RDUG¶V 2QWDULR EHQ data from U.S. investor-owned utilities. Thus the general approach of our benchmarking analysis is as follows:

1. PSE assembled the historical costs of all utilities in the dataset, along with the variables that affect cost, such as customer levels, weather, wage levels, density, etc.
2. Using the historical data, PSE estimated an econometric model that expresses the relationship between the variables and cost.
3. For each utility in the sample, we can WKHQ SURGXFH ³EHQFKPDUN´ YDO +\GUR¶V FDVH WKHVH EHQFKPDUNV represent the costs we would expect for an average-performing utility with the number of customers, weather, wage levels, density, percent undergrounding, etc. faced by Toronto Hydro.
4. We then compare the costs that are expected (predicted) for Toronto Hydro by the model WR 7RURQWR +\GUR¶V historical and projected costs, which allows us to: (1) evaluate the historical performance, and (2) determine whether forecasted costs are reasonable.

We used D VLPLODU SURFHVV WR DQDO\]H 7RURQWR +\GUR¶V SDV general strategy is the same whether using a U.S.-only dataset, or a combined Ontario/U.S. dataset.

1.2 7KH 1HHG IRU D &RPELQHG 8 'DWDVHW

In the November 2013 Board Report, the Board recognized that certain distributors may have ³H[WHQXDWLQJ FLUFXPVWDQFHV´ [5] The summary for why different treatment is needed in the present case is that the unique size and urban characteristics of Toronto H\GUR¶V VHUYLFH make it an outlier among Ontario distributors. For a suitable benchmarking analysis, using a dataset that includes U.S. utilities is necessary. A brief summary RI 7RURQWR +\GUR¶V RXWOLHU VWDWXV and why PSE believes WKLV VI Toronto Hydro is a candidate for a different treatment in regards to its benchmarking evaluation and stretch factor assignment is found in Section 6.

To see why Toronto Hydro is an outlier, consider that the number of customers served is generally recognized as the leading driver of cost for electric distribution utilities. In terms of customers served, Toronto Hydro is practically without peers in the Ontario industry. Perhaps Hydro One Networks could be considered a peer in terms of sheer number of customers served, yet it has operating circumstances vastly different than those found in the Toronto area. The next

[5] See page 22 of the November 2013 Board Report.

largest distributor in terms of customers served, Powerstream Inc., has fewer than half the number of electric customers of Toronto Hydro.

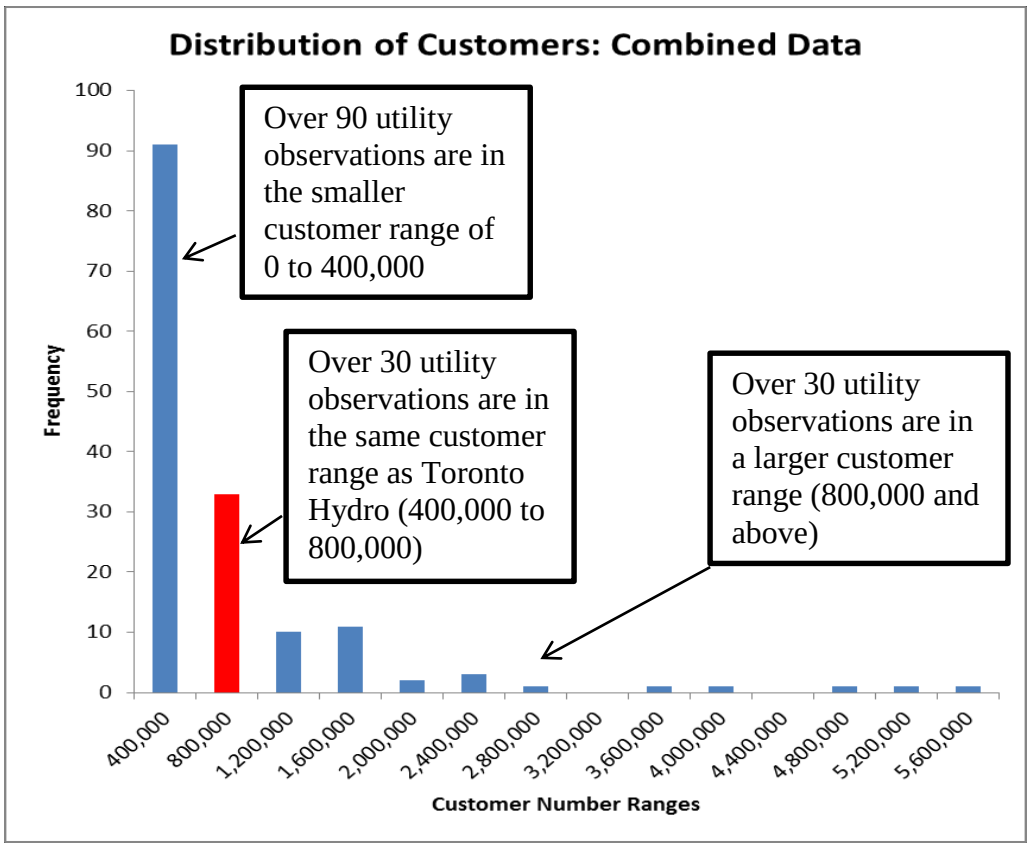

Figure 1 illustrates the vast differences between Toronto Hydro and the rest of the Ontario distributors, in terms of number of customers served. Related to this difference is the fact that Toronto Hydro also serves a large urban core (the Toronto area). Serving a large urban core presents unique cost challenges that are discussed further in another PSE report attached as an Appendix to this report entitled, [illegible].

Figure 1 Distribution of Customers: Ontario Dataset

After adding U.S. utilities to the Ontario dataset, Toronto Hydro ceases to be an outlier in terms of the number of customers. Figure 2 illustrates how in the combined Ontario/U.S. dataset, there are many utilities with more customers than Toronto Hydro, and many with fewer. When conducting econometric benchmarking, having a data sample with variable values that encompass those of the studied utility is essential to the accuracy of the exercise.

Figure 2 Distribution of Customers: Combined Dataset

1.3 7RWDO &RVW %HQFKPDUN)LQGL

As stated earlier, the RRF requests distributors include benchmarking of revenue forecasts in their Custom IR applications. In the November 2013 Board Report, the Board cites total cost econometric benchmarking as its preferred method for setting stretch factors.

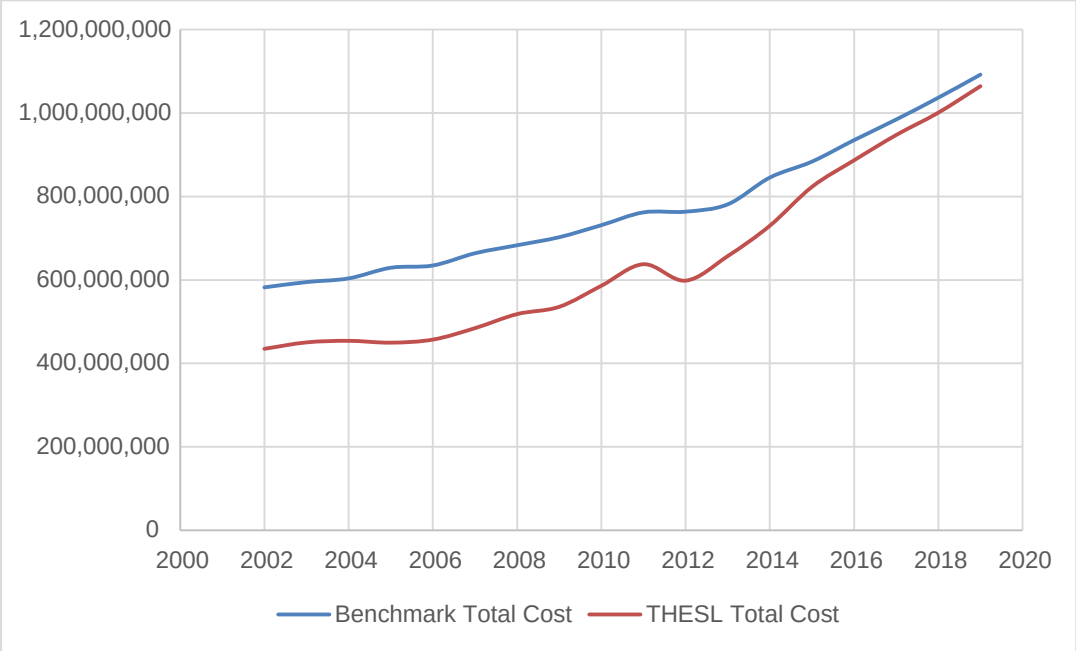
3((EHOLHYHV WKH %RDUG¶V SUHIHUHQFH IRU WRWDO FRVW approach when benchmarking cost levels. Total costs are defined as the sum of (1) OM&A expenses, and (2) the depreciation and opportunity costs of capital. This is quite similar to how revenue requirements are calculated, and so total costs are somewhat analogous to the distribution portion of revenue requirements.[6] Partial cost benchmarking approaches, such as OM&A benchmarking, exclude large swaths of cost, which can skew performance evaluations.

PSE also endorses econometric benchmarking because of its increased accuracy relative to peer group approaches. The econometric benchmarking method contains the ability to statistically test included variables and results, includes a relatively large number of variables that enter the analysis, and does not require the researcher to choose a peer group or exclude large portions of

[6] Total costs are not exactly analogous to revenue requirements, however, because of the generalizations needed to offer a fair analysis between utilities with varying depreciation rates, rate of returns, historical capital addition patterns, and cost definitions.

the available data.

PSE used a total cost econometric benchmarking model to benchmark 7 R U R Q W R + \ G UlR ¶V K L V V costs, and its projected total costs during the Custom IR period (2015 to 2019). PSE first derived an econometric model from the historical dataset. Using that model and its parameter values, we then calculated total cost benchmarks. For past years, we used historical variables to calculate the benchmarks. For 2014 to 2019 benchmarks, we used Toronto Hydro projections for the variables that enter the model. This process serves as a E H Q F K P D U N H Y D O X D W I R U Projected I W K H F F total costs.



Our total cost econometric benchmarking results indicate the following findings.

1. The historical total cost levels of Toronto Hydro are below benchmark expectations at a 90% confidence level when using a dataset that includes both Ontario and U.S. utilities.

2. The projected total cost levels during the Custom IR period remain below the benchmark predictions, although they do converge towards benchmark expectations, and the statistically E H O R Z H [S H F W D W L R Q Vno longer appropriate at a 90% confidence level.

The following graph illustrates the historical and projected benchmarked costs and company costs for Toronto Hydro using a dataset comprised of 156 distributors from Ontario and the U.S.

Figure 3 Historical and Projected Total Costs vs. Benchmarked Costs

PSE also conducted benchmarking research using a U.S.-only dataset, which indicates similar findings to the combined dataset. Both samples show Toronto Hydro has been below its total cost benchmark values, and this persists through the projected years, albeit with a convergence towards benchmark costs. Further details and results for the U.S.-only dataset, along with the

combined Ontario-U.S. dataset, are provided in later sections.

1.4 5HOLDELOLW\ %HQFKPDUN)LQG

In addition to total cost benchmarking, PSE conducted econometric reliability benchmarking of 7RURQWR +\GUR¶V V\VWHP DYHUDJH LQWHUUXSWLRQ IUHTXH LQWHUUXSWLRQ GXUDWLRQ LQGLFHV that necessitate a combined U.S. and Ontario sample when performing total cost benchmarking for Toronto Hydro also apply to benchmarking its reliability. Thus, we use a reliability dataset comprised of both Ontario and U.S. utilities WR EHQFKPDUN 7RURQWR +\GUR¶V 6$,), DQG 6$,',

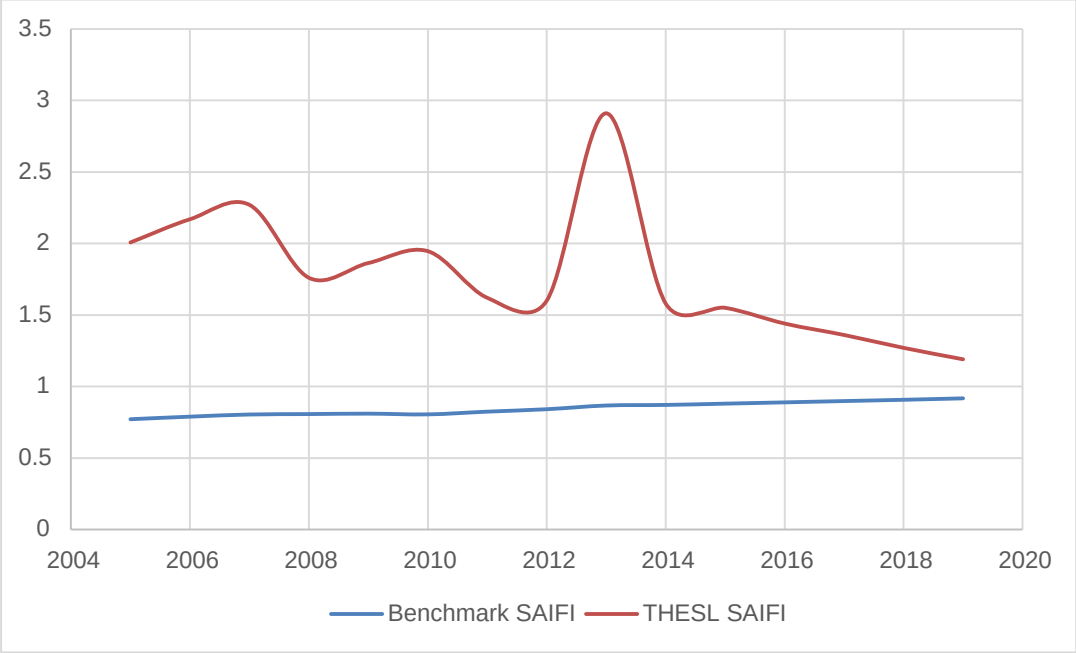
When Ontario distributors report SAIFI and SAIDI to the Board, they include all outages regardless of the cause and concentration of interruptions. In many jurisdictions throughout North America, on the other hand, utilities report SAIFI and SAIDI on a weather-normalized EDVLV 7KH\ GR WKLV E\ H[FOXGLQJ PDMRU HYHQW GD\V 30('V which permits them to gauge reliability performance during normal operating conditions. In order to compare reliability performance on an equal footing, PSE used data from U.S. utilities that include all outages in their reliability metrics, regardless of the concentration of outages in a given time period.[7]

Furthermore, Ontario distributors report indexes based on a definition of ³sustained outage´ as lasting at least 1 minute. In the US, some distributors define a ³sustained outage´ as lasting at least 1 minute, while others define it as lasting at least 5 minutes.[8] We tested for this difference in the econometric modelling by including a variable for the ³sustained´ definition. We found it to have a negative correlation with SAIFI (i.e., one minute definition ³VXVWDLQHG raises the expected SAIFI metric) and a positive correlation with SAIDI (i.e., one minute GHILQLWLRQ´ lowers the expected SAIDI metric). The inclusion of the variable did QRW PHDQLQJIXOO\ FKDQJH ,7 5 and it also reduced the size of the U.S. sample, because some utilities do not disclose their sustained outage definition. For these reasons, we left out the ³sustained´ variable from the final models.

PSE gathered Ontario distributor ¶data for WKH UHOLDELOLW\ LQGH[HV IURP WK We gathered U.S. data on XWLOLWLHV¶ non-normalized reliability indexes and their sustained outage definitions from publicly-available regulatory filings.

3(¶V UHOLDELOLW\ EHQFKPDUNLQJ analysis indicates the following findings.

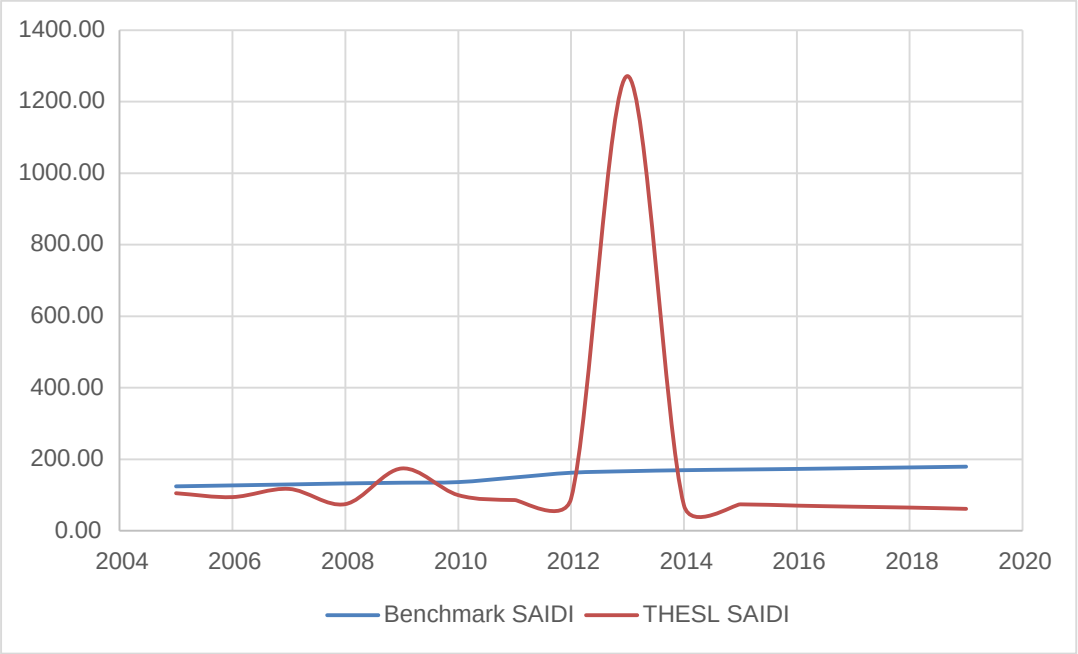
1. Historical SAIFI metrics for Toronto Hydro are higher than the benchmark values.
2. Projected SAIFI metrics converge towards the benchmark values through 2019.
3. Historical SAIDI metrics for Toronto Hydro are lower than the benchmark values.



[7] The disadvantage of using indexes that include all outages is that the volatility in the indexes will be quite large, making confidence intervals larger than in (1) total cost benchmarking, and/or (2) cases where the reliability metrics excluded extreme storms.

[8] 6RPH 8 6 GLVWULEXWRUV GRQ¶W GLVFORVH WKHLU VXVWDLQHG RXWDJH

4. Projected SAIDI metrics for Toronto Hydro continue to be lower than the benchmark values.



The following graph illustrates the historical and projected SAIFI values for Toronto Hydro [2] benchmarks and actual/projected values, using a dataset comprised of 116 Ontario and U.S. distributors. The large one-\HDU LQFUHDVH LQ WKH FRPSDQ\¶V 6$,), Z weather event that occurred in December of that year.

Figure 5 Historical and Projected SAIDI vs. Benchmarked SAIDI

PSE also conducted benchmarking research using a U.S.-only dataset for both reliability indexes. Results were again similar to the combined model, with SAIFI metrics for Toronto Hydro being higher than benchmarks, yet converging in the forecasted years, and SAIDI metrics being below benchmark values in the projected time period. Further details and results for that dataset, along with details about the combined dataset, are provided in Chapters 4 and 5.

1.5 (YDOXDWLRQ RI 7RURQWR +\GUR¶V $SSOLFDWLRQ

The JUDSKV EHORZ LOOXVWUDWH KRZ 7RURQWR +\GUR¶V historical total cost and reliability performances relate. Our results indicate that the company is missing its SAIFI benchmark value by a large margin (see yellow dot in Figure 6), while beating its SAIDI and total cost benchmarks (yellow dot in Figure 7). While more research would be necessary to ascertain Toronto Hydro ¶V customers ¶ exact preferences for how reliability should balance against higher rates, it seems reasonable that a large metropolitan city such as Toronto should at least strive to be at the benchmark value for the number of outages its system causes its customers. Outages are caused when the distribution system fails. A possible cause of WKH FRPSDQ\¶V KLJK R levels is the aged system infrastructure. In order to address SAIFI, system investments may be needed.[9]

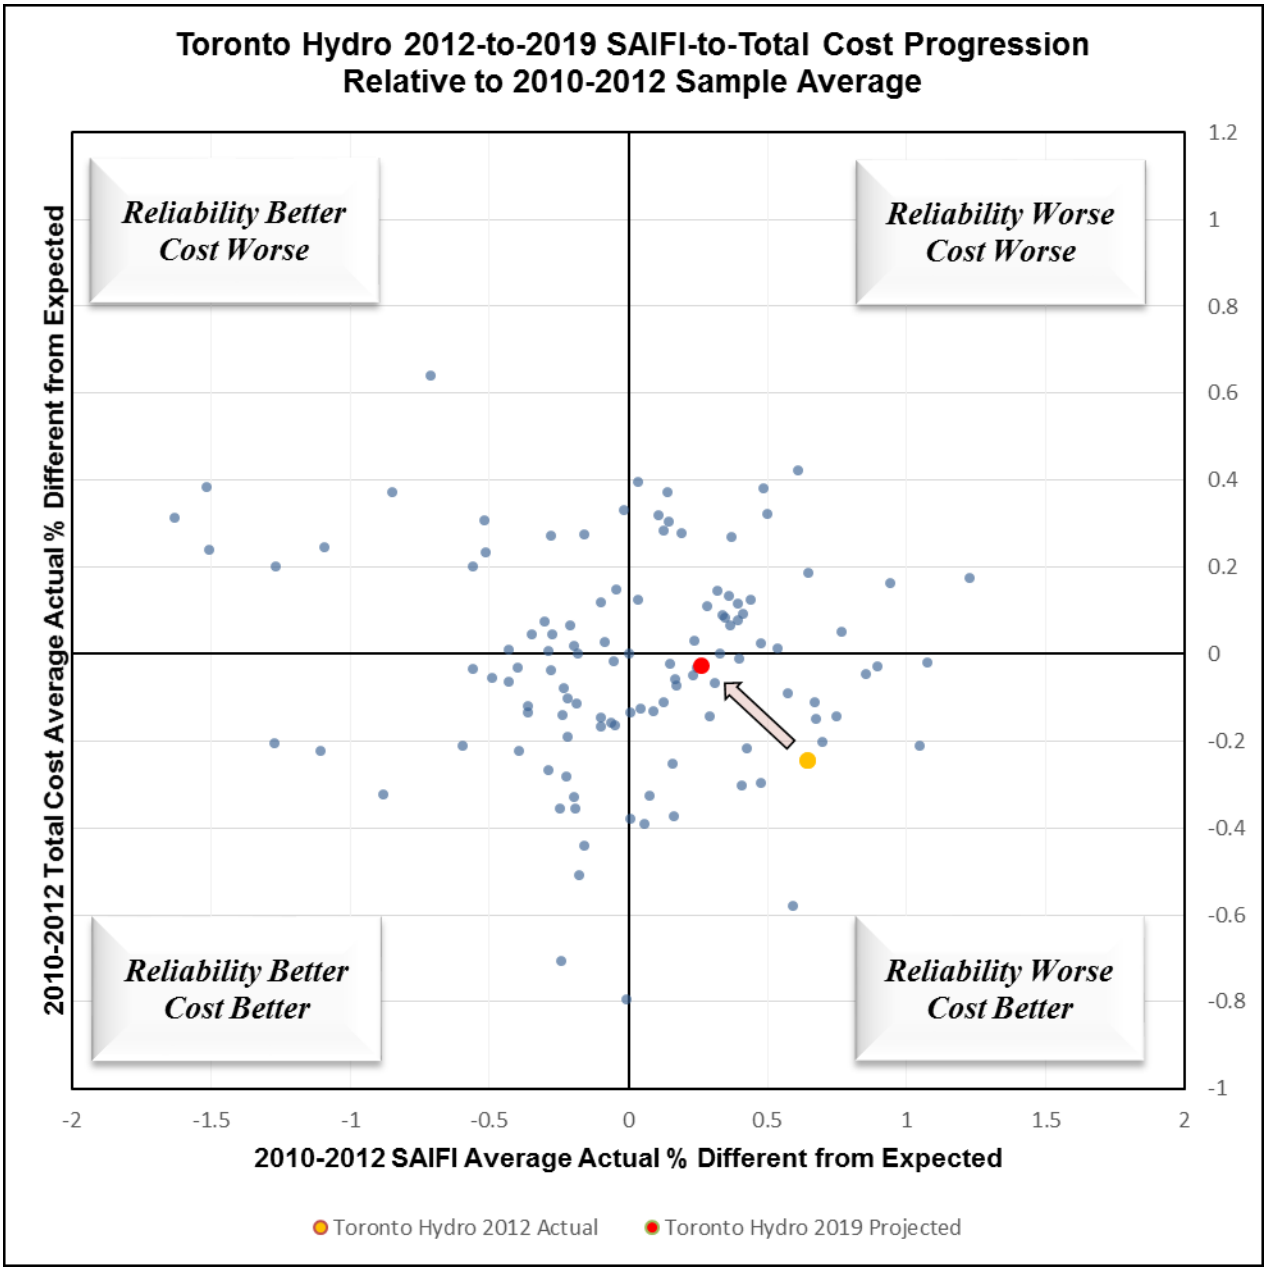
From a benchmark perspective, the projections to 2019 show that Toronto Hydro ¶V spending

[9] 7KLV GRHV QRW LPSO\ WKDW 7RURQWR +\GUR¶V FDSLWDO VSHQGLQJ SURJ It is our understanding that there are a number of other considerations, such as public and employee safety. +RZHYHU UHOLDELOLW\ LV D ODUJH SRUWLRQ RI WKH UDWLRQDOH DQG L readily lends itself to be benchmarked and evaluated.

IRUHFDVWV ZLOO FRQYHUJH WKH FRPSDQ\¶V 6$,), DQG WRWDO the benchmark expectations (red dot in Figure 6). SAIDI is projected to remain at a very strong level. Based on the projections, the projected spending will result in a utility more aligned with its externally-derived benchmark values from both a total cost and SAIFI perspective.

Figure 6 illustrates the convergence of SAIFI-to-total cost towards the benchmark values in the forecast period (the projected value gets closer to the center).

Figure 6 Toronto Hydro 2012-to-2019 SAIFI-to-Total Cost Progression Relative to 2010-2012 Sample Average



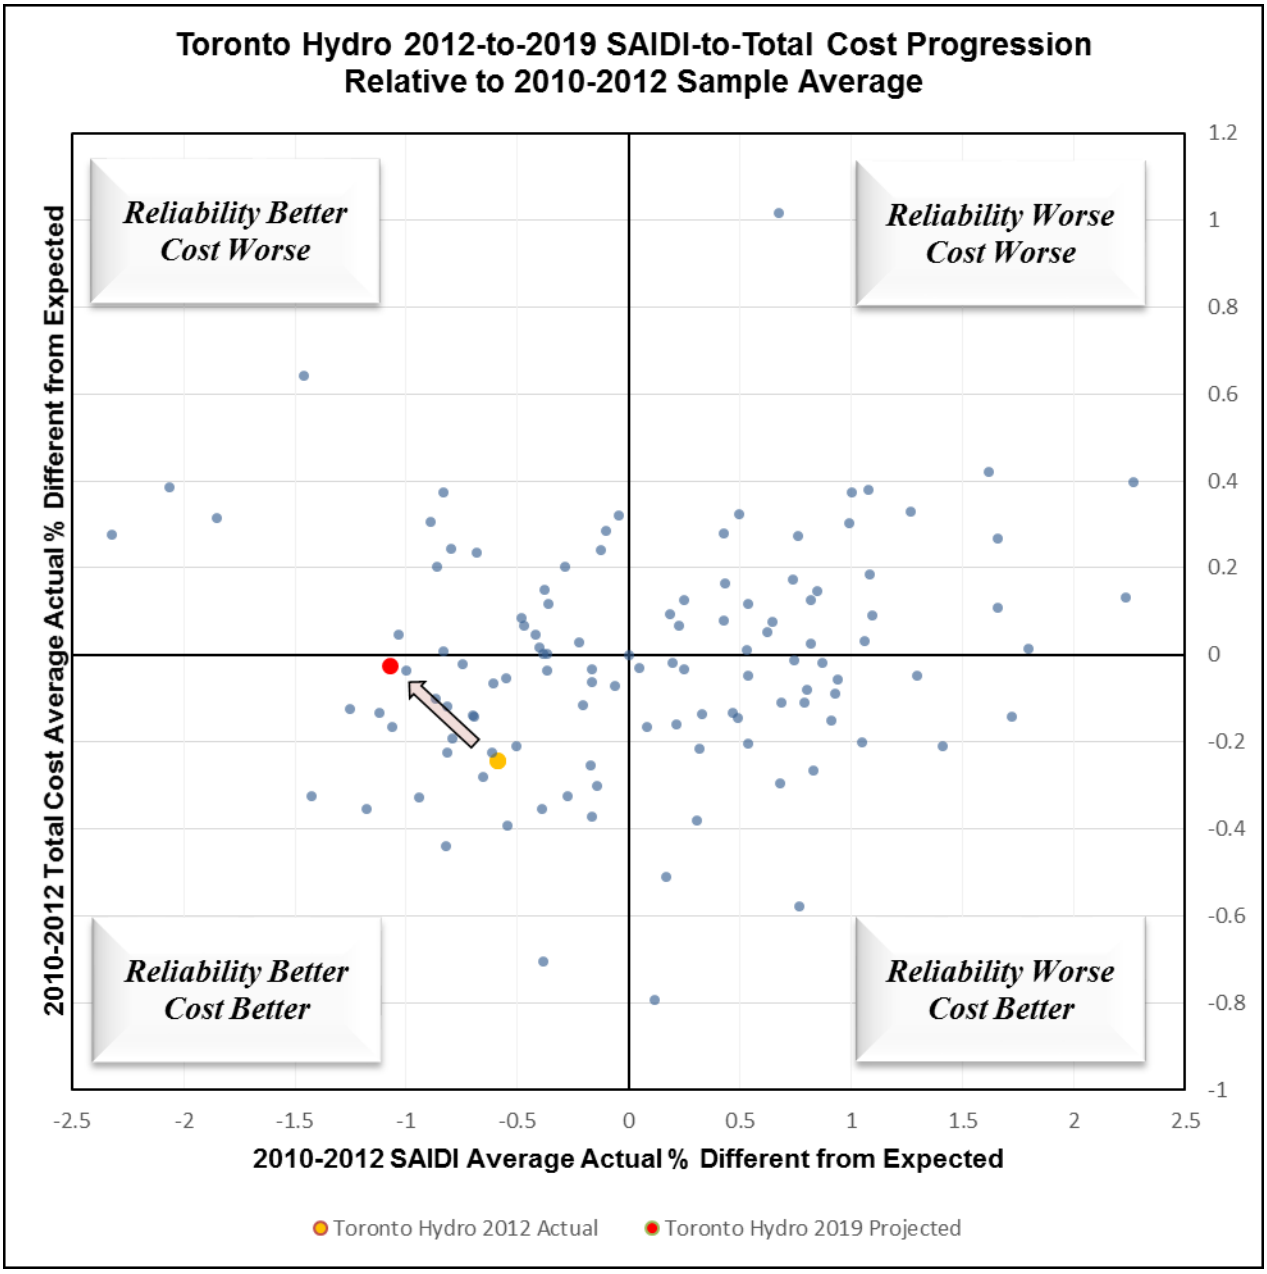


Figure 7 L O O X V W U D W H V W K H F X U U H Q W D Q G S U R M H F W H G S R V L W L
The company is currently better than the model expectations in both of these categories, and remains that way through 2019.

Figure 7 Toronto Hydro 2012-to-2019 SAIDI-to-Total Cost Progression Relative to 2010-2012 Sample Average

I Q 3 6 (¶ V R St Li Qe ar Q ly p o ssible that poor SAIFI performance is a symptom of the condition of the distribution network. On this basis, increased capital spending should address SAIFI metrics through upgrading the distribution network and decreasing the number of times it fails. While poor SAIFI performance tends to be an indicator of old and failing infrastructure, and thus provides a rationale for increased capital spending, strong SAIDI (and CAIDI) performance is an indicator that the company identifies and swiftly responds to outages when

they occur. Thus, SAIDI performance tends to be more related to OM&A spending, whereas SAIFI performance is related more to capital spending.

36(¶V EHQFKPDUN UHVHDUFK OHDGV XV WR WKH IROORZL
Custom IR proposal:

1. Toronto Hydro is entering the Custom IR period with strong recent cost performance (i.e., costs are below the expected values), with its average 2010 to 2012 total costs being estimated at 21.5% below benchmark values using the combined dataset results.[10]

2. This strong cost performance persists to 2015, although with some moderation. Toronto +\GUR¶Vtotal cost level forecast is estimated to be 7.1% below benchmark values, and is, in our opinion, reasonable from a benchmarking perspective.

3. 7RURQWR Custom IR period (2015 through 2019) total cost level projections remain below benchmark expectations. By 2019, the company is estimated to still be below benchmark values by 2.6 %DVHG RQ WKLV WKH projections Q\¶V &X are, in our opinion, reasonable from a benchmarking perspective.

4. Total costs are projected to be well within the 0.3% stretch factor range of plus/minus 10% set in the November 2013 Board Report. In terms of ranking, in the combined total cost rankings based on historical performance, Toronto Hydro is 30th out of the 156 Ontario/U.S. utilities. If Ontario distributors are isolated in the rankings, for the combined model, Toronto Hydro is ranked 15th out of the 71 distributors. Based on these findings, reducing the stretch factor from 0.6% to 0.3% seems LQ OLQH ZLWK WKH % LQWHQWLRQ RI DVVLJQLQJ D VWUHWFK IDFWRU WR benchmark evaluations.

5. 7RURQWR +\GUR¶V FDSLWDO LQIUDVWUXFWXUH expected VHHPV number of outages. 7KH FRPSDQ\¶V 2010-2012 SAIFI is 73% above benchmark expectations. This implies Toronto Hydro customers experience 73% more outages then our models predict. The SAIFI projections, assuming full funding, move the company towards the benchmark SAIFI value, reducing the number of outages experienced by customers 7KXV WKH FRPSDQ\¶V SODQ WR LQFUHDVH LV FDSLWD in our opinion, reasonable from a benchmarking perspective.

6. 7RURQWR +\GUR¶V outages, measured by SAIDI, is quite strong and is projected to continue to be strong. 7KH FRPSDQ\¶V 2010-2012 average is 48% below benchmark expectations. This implies that Toronto Hydro customers experience 48%

[10] In this section, we discuss only the results for the combined dataset. The U.S.-only results are similar, although they indicate Toronto Hydro is even further below its benchmark values than when using the combined dataset (i.e. when using the U.S.-RQO\ GDWDVHW 7RURQWR +\GUR¶V costs are higher, thus its performance more impressive).

fewer outage minutes than our models predict. % \ W K H F R P S D Q \ ¶ V 6 $, ' ,
projected to be nearly 84% below benchmark expectations.

0HWKRGV 9DULDEOH 'HILQL

The data for both the Ontario and U.S. utilities used in the study were acquired from publicly available data sources. There are 71 Ontario and 85 U.S. utilities in the combined sample, and 85 U.S. utilities plus Toronto Hydro in the U.S.-only sample. The data in each sample span the years 2002 to 2012.[11] The large number of observations in each sample is more than sufficient for the creation of statistically robust econometric models.

2.1 2QWDULR D'QG 86 6RXUFHV DQG 9
'HILQLWLRQV

The only Ontario utility serving a larger customer base than Toronto Hydro is Hydro One Networks. The next largest Ontario distributor is less than half the size of Toronto Hydro (when measured by the number of retail customers served). Furthermore, Toronto Hydro is the only Ontario distributor that serves a highly dense urban core, which provides substantial cost challenges that cannot be captured by an Ontario-only dataset. More information on the cost impacts of serving a metropolitan urban core can be found in a report located in the Appendix of this report W L W O H G [3] & D S L W D O 5 H T X L U H P H Q W V . R I 6 H U Y L Q J ' H Y H O R

Given the fact that Toronto Hydro is an extreme outlier in the Ontario data, augmenting the Ontario dataset with U.S. observations should increase the accuracy of the Toronto Hydro result. This statement is not meant to imply, however, that an Ontario-only benchmarking dataset is inaccurate for the vast majority of Ontario distributors. Most of the Ontario distributors have output levels and business condition variables that are encompassed by the Ontario-only dataset, making the evaluation an appropriate one in those cases. Section 6 provides a more detailed discussion of the reasons for the inclusion of data from U.S. utilities in the benchmarking of Toronto Hydro.

The utilities included in the combined sample, and the number of retail customers served in 2011, are provided in the following table. The Ontario distributors are shaded in green.

The output variables used in the total cost econometric benchmarking research are:

- Retail customers, and
- Peak demand.

The business condition variables used in the combined total cost econometric benchmarking research are:

- Regional input prices,
- Percent residential deliveries,
- Percent electric customers (out of total gas and electric customers),
- A binary variable for urban population above one million,
- Percent electric distribution in total electric gross plant, and
- Customers per distribution line mile.

Additional variables included in the U.S.-only total cost model are:[12]

- Percent forestation,
- Elevation standard deviation, and
- Percent plant underground.

Both OM&A and total costs used in the benchmarking models for the U.S. distributors are derived using FERC Form 1 filing data.[13] U.S. electric utilities are required to file FERC Form 1

[12] The U.S.-only model uses all the other variables used for the combined model, except for customers per distribution line mile. This variable was dropped due to it not being statistically significant and/or plausibly signed.

[13] All FERC form data was down O R D G H G E \ 3 6 (I U R P 6 1 / (Q H U J \ ¶ V G D W D E D V H W R R O

data annually, which includes operation and maintenance expenses broken down into specific cost categories (e.g. distribution, transmission, generation, customer billing, administrative and general). Form 1s also include plant in service and accumulated depreciation information that is used in constructing capital costs.

The historical calculations for U.S. utilities capital costs follow the procedures implemented by Pacific Economics Group ("PEG") in their benchmarking and productivity research found in Case EB-2010-0379 4th Generation Incentive Regulation". This was done in order to match the capital cost calculations used in Ontario with those used for the U.S. sample. Ontario's OM&A cost and total costs are computed based on the same information available in the Board's 4th Generation Incentive Regulation data. The capital costs for Ontario distributors use the same values and procedures implemented by PEG in the 4th Generation IR proceeding.

For U.S. utilities, the output variables are calculated from FERC Form 1s and Platts UDI directories.[14] The output data for Ontario utilities comes from the Board's fourth generation incentive regulation data. We note that the PEG model used in their 4th Generation Incentive Regulation research also included kilowatt hours delivered as an output variable. This variable, however, did not come in plausibly signed and statistically significant in our models. PSE believes that energy delivered will have minimal to no impact on distribution total costs. Distribution capital and OM&A costs are ordinarily driven by the number of customers served and the peak demand the system needs to be built to serve. For these reasons, we excluded kilowatt hours delivered from the models.

Input prices are divided into two categories: capital and OM&A. The capital input price calculation is discussed in detail in the following section. The OM&A input price captures the regional market price level that each sampled company encounters when procuring OM&A inputs, such as employees or materials and services. There are two components used to construct the OM&A input price. These are labour and non-labour.

The labour component is calculated by taking wage levels of numerous job occupations and weighting them based on the U.S. Bureau of Labor Statistics' occupation weights in the Electric Power Generation, Transmission, and Distribution Industry. The BLS has estimates for wage levels for each job occupation by city and metropolitan area. For Ontario distributors, we gathered job occupation wage estimates from Statistics Canada, mapped each distributor to the most appropriate observation, translated job occupations to match their U.S. counterparts and then weighted the job occupation wages by the BLS estimates. This provides consistency from the U.S. and Ontario samples regarding labour input prices and also puts the input price index in terms of each country's currency. Labour prices for U.S. utilities using BLS employment cost indexes for the utility sector and escalated Ontario prices using the Ontario average weekly earnings estimates.

The non-labour component of the OM&A input price uses the gross domestic product price index (GDP-PI) for U.S. The Ontario non-labour component uses the same GDP-PI in each

[14] We gathered data from annual editions of Platts UDI Directory starting in 2003 through 2013.

year, but adjusted for the purchasing power parity (PPP) index. This translates the non-labour input price component into Canadian dollars. To construct the overall OM&A input price we weighted each index using a 70% labour and a 30% non-labour rate. This was the same weighting used by PEG in their benchmarking research.

The ³UHVLGHQWLDO percentage of sales volume´ variable is also calculated based on data from)(5&)RUP IRU 8 6 XWLOLWLHV 4th Generation Incentive Regulation Data for Ontario utilities. The percentage of residential volume compared to total volume is a proxy for the variance in electricity loads. Commercial and industrial customer loads tend to be more level across hours of the day. As the proportion of residential volume increases, distribution systems tend to increase their system peaks and load variability. This results in higher volatility in the loads served by the system.

The variable that measures the percentage of electric customers out of total gas and electric customers is derived from both the FERC Form 1 and the FERC Form 2. The FERC Form 2 data includes the number of gas customers served by a natural gas distributor. This variable measures the economies of scope available from serving both electric and gas customers. All Ontario electric distributors distribute only electricity, and have values of 100 percent for this variable.

Toronto Hydro serves the urban core of Toronto, Ontario. Serving a densely populated urban core presents challenges that are not present in suburban or rural settings. The urban core YDULDEOH XVHG LQ WKH WRWDO FRVW EHQFKPDUNLQJ PRGHO variable provides key information on the added costs of serving electricity to a highly urban area. All utilities are given a value of zero unless they serve the urban core of a city whose population is above one million (U.S. cities are designated by the 2010 U.S. census). Toronto Hydro is the only Ontario utility that serves an urban core of this magnitude. For more information on the cost LPSDFWV RI VHUYLQJ KLJKO\ GHQVH PHWURSROLWDQ DUHDV located in the Appendix of this report entitled, ³&DSLWDO 5HTXLUHPHQWV IRU 6HUYLQJ 'HY

The percentage of electric distribution plant in total distribution plant measures the available economies of scope that result from being a vertically integrated utility, as opposed to a distribution-only utility. We expect distribution unit costs to be lower for utilities that also have transmission and generation activities. For U.S. utilities, data for this variable is found from the XWLOLWLHV¶)(5&)RUP V $OO WKH 2QWDULR XWLOLWLHV DU Form 1. All Ontario utilities have a value of 100 percent for this variable.

The customer density variable measures how many retail customers are served per length of line. 7KH FXVWRPHU GDWD LV WKH VDPH GDWD WKDW LV XVHG IR OLQH´ GDWD IRU ERWK 8 6 and Canadian utilities. Data for various editions of *Electrical World's* *Directory of Electric Producers and Distributors*. This variable measures the challenges of serving rural areas and having customers spread across a large service territory. The lower the customer density, the higher the expected costs. Again, for more information on the cost impacts of serving a lower density and rural area please refer to the report found in the Appendix.

The percentage of forestation variable is based on GIS (geographic information system) forestation maps. Such maps are matched with the areas served by each utility to create the variable. We would expect that the higher the level of forestation, the higher OM&A costs

required for right-of-way clearing and service restoration activities. GIS variable data is available for all sampled U.S. utilities and only available for a subset of the Ontario distributors. For this reason the variable is only included in the U.S.-only sample.[15]

The elevation standard deviation variable is computed using GIS maps of elevation in each utility¶ service territory. The variability of elevation levels poses both construction and maintenance challenges for local delivery systems. We capture this difficulty by computing the standard deviation of the elevation levels obtained from GIS maps. As stated in the last paragraph, GIS variable data is available for all sampled U.S. utilities and only available for a subset of the Ontario distributors. For this reason the variable is only included in the U.S.-only sample.[16]

The percentage of electric distribution plant that is underground can raise the capital cost of distribution delivery, but lowers maintenance (and hence OM&A) expenses. Data for this variable comes from FERC Form 1 filings for U.S. utilities and is not available for Ontario distributors.[17] For this reason, the variable is only included in the U.S.-only sample.

7KH YDULDEOHV DQG WKH DYHUDJH YDOXHV IRU WKH 8 6 V
provided in the following table. These are the averages for 2010-2012.

[15] We did, however, find very similar total cost results to the combined model when including the subset of Ontario distributors that did have GIS data available.

[16] See prior footnote.

[17] Ontario distributors do report on the kilometers of underground and overhead line. However, they do not report the plant in service breakdowns that would enable us to construct this variable for the entire Ontario sample.

Table 2 Variables in the Total Cost Benchmarking Study: 2010-2012 Averages

Variable	Units	U.S. Sample Average	Ontario Sample Average	Combined Sample Averages	Toronto Hydro Average
Total Power Delivery Cost	Dollars ('000)*	671,994	50,735	389,241	607,375

7KLV UHSRUW HYDOXDWHV 7RURQWR +\GUR¶V FDSLWDO FR
36(¶V PHDVXUH RI FDSLWDO FRVW LV EDVHG RQ D VHUYLF

This approach has a sound basis in economic theory, and is the same method chosen by PEG in their 4th Generation IR research.[18] It allows for a clear-cut and standardized way to account for differences between utilities with respect to historical plant additions. The service price approach also has ample precedent in government-sponsored cost research. It is used by the Bureau of Labor Statistics of the U.S. Department of Labor in computing multi-factor productivity indexes for the U.S. private business sector and for several subsectors, including the utility services industry.

Based on this approach, the cost of capital in each period *t* is the product of indices of the capital service price and capital quantity in place at the end of the prior period. The formula for this is given by:

$$CK_t = WKS_t \tilde{X} XK_{t-1}$$

Here, in each period *t*, CK_t is the cost of capital, WKS_t is the capital service price index, and XK_{t-1} is the capital quantity index value at the start of the period.

The capital quantity index is constructed using inflation-adjusted data on the value of net utility plant in a benchmark year, and on gross plant additions in subsequent years. It also uses an assumption about service lives. For the sake of consistency, we use either 1989 or 2002 as the benchmark year in the current study for Ontario sampled utilities, EDVHG RQ 3(*¶V SULRU GH their benchmarking work. We use 1989 for all U.S. sampled utilities. Based on the benchmark year, D ³WULDQJXODWHG ZHLJKWHG DYHUDJH´ LV XVHG WR FDOFXODWH WKH FDSLWDO stock in either 1989 or 6XEVHTXHQW \HDUV XVH WKH SUHYLRXV \HDU¶V FDSLWDO minus depreciation. For consistency, the plant DGGLWLRQV KDYH EHHQ FDOFXODWHG methodology found in their 4th Generation IR research. This method is used both for the Ontario and U.S. distributors. The formulas for the capital quantity index in 1989 and in subsequent years are provided below.

$$:-_{5=<=}^{Ü} L \frac{0\,A\,P2\,H=_{5=<=}^{Ü} P}{6\,9\,\#_{5=<=}^{Ü}}$$

$$:-_{ç}^{Ü} L :-_{ç?\,5}^{Ü} Û@E\frac{\#\,@_{ç}^{Ü}@}{9-\#_{ç}^{Ü}}$$

$$\#\,@_{ç@}L :)\,NK\,O2\,0H=_{ç}JP)\,NK\,O2\,0H=_{ç,}P; E\,ä\,r\,wÛ)\,NK\,O2\,0H=_{ç,}P$$

Under the service price approach employed in this study, capital cost has two components: opportunity cost and depreciation. The capital service price index is thus given by the formula:

[18] See Hall and Jorgensen (1967) for a seminal discussion of the use of service price methods for measuring capital cost.

9 - 5 ç L N Ç Û9 - # ç? 5 E @ Ç Û9 - # ç

Here, r_t L V W K H D O O R Z H G U D W H R I U H W X U Q E D V H G R Q W K H % R D U annual value is also used in the capital service price computation for the U.S utilities in the dataset. Setting the same rate of return for all distributors provides consistency in determining the capital costs, so that decisions by regulators do not enter into the benchmark evaluation, which is attempting to assess the performance of the utility itself. The parameter d_t is the economic depreciation rate. We use the same value as PEG did, 4.59%, for this parameter in the study.

The variable that the capital service price components have in common is WKA_t. This is an index of the price of capital assets used in power distribution. We compute this index using data on differences in the cost of constructing utility plant between regions, and within regions over time. In particular for U.S. distributors, we use the Handy-Whitman indexes for total power distribution plant, which vary over time and across six geographic regions. For Ontario distributors we use the annual Electric Utility Construction Price Index (³EUCPI ´).

We determine the relative levels of utility plant asset prices for 2012 by using the City Cost Indexes for electrical work in RS 0 H D Q 1 H Z Y *Heavy Construction Cost Data*.[19] These indexes measure differences among cities in the cost of labour needed to install electrical equipment and differences in equipment prices. The construction service categories covered are raceways; conductors and grounding; boxes and wiring devices; motors, starters, boards, and switches; transformers and bus ducts; lighting; electric utilities; and power distribution. The level of the asset price index for each utility is the simple average of the RS Means index values for cities in the service territory. This same source is used for both U.S. and Ontario distributors. The index is already adjusted for currency differences between the two countries.

[19] RS Means (2011).

2.3 (FRQRPHWULF 0HWKRG

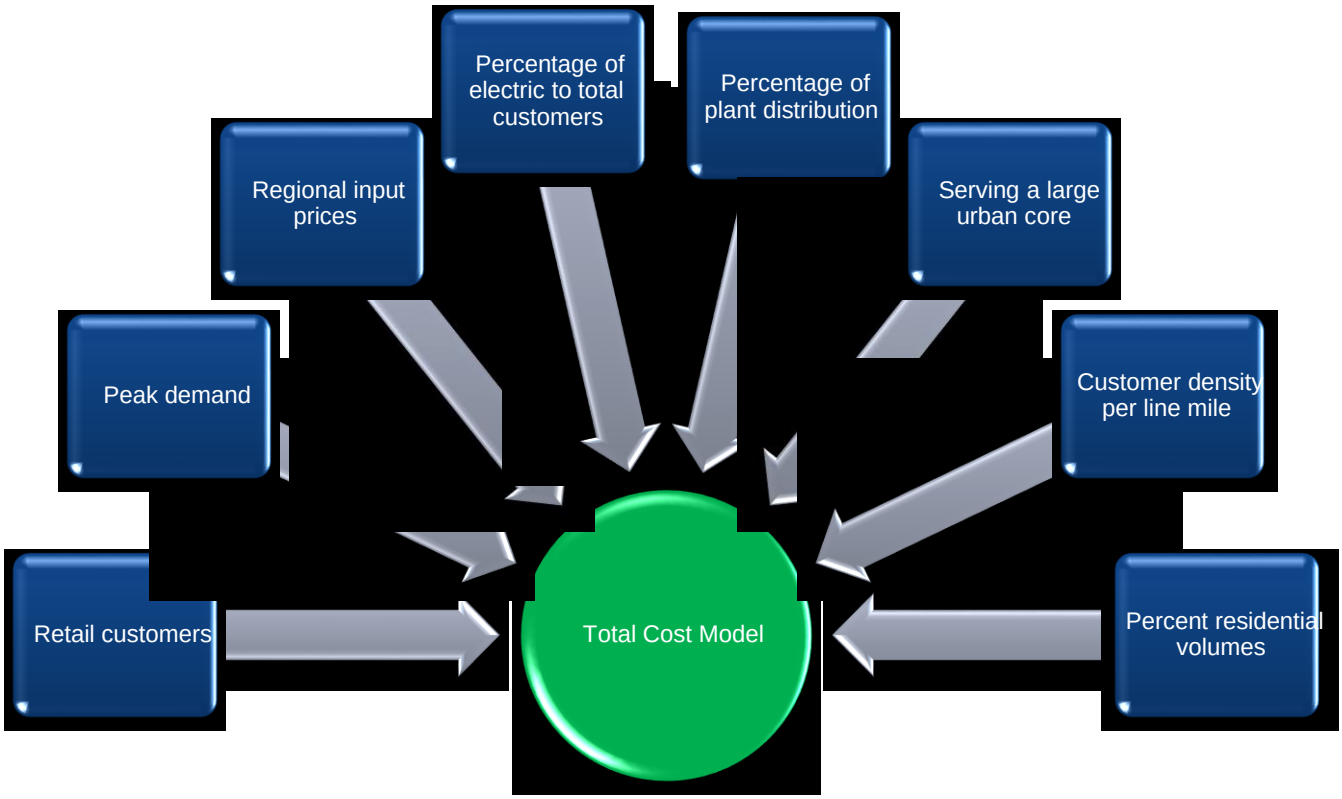
The benchmarking approach used in this report is the econometric approach. PSE believes this is the most accurate and fair method to use when comparing utility cost and reliability levels. It is also the same method preferred by the Board in the November 2013 Board Report. This method is absolutely essential to use when a utility does not have a large number of very similar peers, which is certainly the case for Toronto Hydro.[20]

The econometric DSSURDFK H[SOLFLWO\ DGMXVWV IRU GLIIHUHQFHV power distribution industry, simple rate or reliability index comparisons do not provide appropriate benchmarks when evaluating performance. Uncontrollable factors influence attainable levels of total costs; such factors include geographical size, level of forestation, consumer density, regional wage levels, mix of consumer classes, or serving an urban core. Therefore, more sophisticated tools that normalize for specific influencing factors must be employed to accurately assess performance. With this concept in mind, PSE has developed econometric benchmarking models that take into account factors that have proven to be statistically influential on distribution utility costs and reliability indexes.

The econometric benchmarking approach relies on comparisons between observed data values to the predicted values obtained from regressions. The researcher determines an appropriate functional form for the relationship between the studied metric and factors that influence it, and develops appropriate econometric methods for obtaining good parameter estimates of the VSHFLILHG PRGHO ,Q WKLV UHSRUW WKH VWHIXQFWLRQDO IRUP 7WK HW³UW function is well established in academic literature and provides a high level of flexibility in estimating costs. This is also the same functional form preferred by the Board in the 4th Generation IR proceeding.

Cost predictions for each firm are obtained by inserting company-specific variable values into the estimated equation. Performance is defined as the percentage difference of the observed data to the predicted value of the data, as shown below.

$$2\,A\,N\,B\,K\,N?IA\text{Æ}LJ\check{Z}\,\bullet l\frac{1>O\,A\,N\,K\,F\,A\,?\%PKA\&P=P=}{2\,N\,A\,@\,E\,?\%PKA\&P=P=}p$$



NOTE: 7KH WHUP ³OQ´ DERYH GHQRWHV WKH QDWXUDO O calculation for log arithmetically calculating percentage differences. It is typically used by both PSE and PEG to display benchmark scores.

[20] Even for utilities with a number of very similar peers, we would still advocate for using the econometric benchmarking method, because of the added variable information the model can account for and the extra information the approach can offer.

2.3.1 Variables Used

The variables included in the combined total cost analysis are shown in the figure below.

Figure 8 Variables in Econometric Cost Models

A diverse dataset which includes utilities with varying operational conditions is necessary to determine the influence on costs and reliability resulting from those conditions. There are many U.S. utilities which are either larger or smaller than Toronto Hydro, and Toronto Hydro falls well within the range of most variables. This is in contrast to an Ontario-only dataset, where Toronto Hydro tends to be an extreme outlier due to its size and urban characteristics. Due to this outlier status within the Ontario dataset, PSE considers the combined and U.S.-only benchmarking results to be more robust in revealing the cost and reliability performance of the company, relative to an Ontario-only sample.

The specification used in the cost models includes three types of variables: outputs, input prices, and business condition variables. Outputs are defined DV WKH 3ZRUN´ WKDW WKH XWL defined two variables as outputs: the number of retail customers served and peak demand.

The input prices are defined as the external market price for operation, maintenance, and administration (OM&A) expenses and capital service costs. The market prices for labour and capital will vary depending on the geographic location of each sampled utility. The business condition variables are the other service territory characteristics that statistically influence total cost levels. Examples of business condition variables are customer density, percentage of electric customers in total customers, percentage of forestation, etc.

2.3.2 Estimation Procedure and Translog Cost Function

As a starting point, we assume that the relationship between a XWLOLW\¶V FRVW WKDW DIIHFW LW FDOOHG ³FRVW GULYHUV´ FDQ EH TXDQWLILHG LQ IXQFWLRQ FDOOHG D ³FRVW IXQFWLRQ´ DOORZV 36(WR VSHFLI explained by relevant independent or explanatory variables and associated parameters; the latter capture the effect of the independent variables on cost. Such a cost function is estimated using econometric techniques that rest on certain fundamental assumptions.

$V LPSOLHG E\ WKH WHUP ³LQGHSHQGHQW´ RQH RI WKHVH DV used in the model are factors that are outside the control of utility decision-makers. For instance, the wage paid to labour is driven by market conditions in the service territory and is largely RXWVLGH WKH FRQWURO RI D ILUP¶V PDQDJHUV 2QH WKH RWK ZLWKLQ PDQDJHPHQW¶V FRQWURO DQG WKXV FDQQRW VHUYH

In general, cost is assumed to be a function of input prices, the output produced by the firm, and RWKHU LQGHSHQGHQW YDULDEOHV WKDW DIIHFW FRVW EXW function specified in this manner can capture a reasonable level of cost variability, it does not explain all the elements that affect cost. Therefore, the function includes a random noise term to account for such idiosyncratic factors.

The following equation provides an example of a simple cost function:

$$C = E_0 + E_1 * Y + E_2 * P + \varepsilon$$

In this equation, the terms C, Y, and P denote cost, output, and input prices, respectively. The E terms denote model parameters that capture the magnitude and sign of the effect of the explanatory variables on cost, and the error term captures random noise. The latter is assumed to be independent of the explanatory variables.

The data used to estimate this cost relationship can be from a single firm with multiple time observations (time series data), from many firms observed at a single time period (cross-sectional data), or from many firms with multiple time observations (cross-sectional time-series or panel data). The estimation procedure used to estimate model parameters is affected by the type of data used to estimate the model. In our present study, we have a panel dataset with cost data from multiple firms with observations starting in 2002 and extending to 2012. Additionally, we LQFOXGHG 7RURQWR +\GUR¶V cost projections through 2019, allowing us to also benchmark those forecasts ³RXW RI VDPSOH´ WR WHVW WKH model that is based on historical data and apply the estimated coefficients and projected independent variable values for Toronto Hydro to calculate a predicted benchmark value. This predicted benchmark value is then compared to Toronto +\GUR¶V SURMHFWHG WRWDO FRVW DPRXQW

A cost function can be specified as a single equation or a system of equations to get parameter estimates. A single equation model is specified as noted above. A system of equations results from applying economic theory that permits the derivation of cost share equations that are estimated along with the cost function to obtain more precise parameter estimates. The estimation procedure used for the total cost studies incorporates a system of equations that are

based on the cost shares of OM&A and capital costs. This produces more precise estimates and benchmark results. The reliability benchmarking exercise uses a single equation model only.

2.3.2.1 Statistical Tests

The precision of parameter estimates is an important dimension of the cost estimation exercise. It identifies business condition variables that have a statistically significant effect on cost. In particular, standard errors of parameter estimates, which measure the precision with which a parameter is estimated, are used to construct a test of a relevant hypothesis. The hypothesis to be WHVWHG LV ³WKH H[SODQDWRU\ YDULDEOH LQ TXHVWLRQ KDV procedure is called the *t*-test. A variable is statistically significant if this hypothesis is rejected at a pre-specified level of confidence. We use a 90 percent confidence threshold in our research.

A cost model with plausibly signed and statistically significant parameter estimates is ultimately used to assess the cost pHUIRUPDQFH RI HDFK ILUP LQ WKH VDPSOH %\ ³ that its sign (positive/negative) accords with our intuitive understanding of the relationship EHWZHHQ WKDW SDUDPHWHU DQG WKH YDULDEOH)RU H[DPSO number of customers served increases (a positive sign for the customer parameter).

A cost model with estimated parameters is fitted with the business conditions of each utility to generate cost benchmarks, against which actual cost is evaluated. A cost benchmark reflects the performance of an average utility facing the business conditions of the utility whose values are used to generate the benchmark.

,I D JLYHQ XWLOLW\¶V DFWXDO FRVW LV EHORZ WKH EHQFKP average ² it spent less than did a hypothetical utility (with the same particular characteristics) would be expected to spend. If its actual cost is above the benchmark cost, its cost performance is worse than average. A statistical test of a cost efficiency hypothesis, based on the *t*-test, can also be constructed to identify whether the cost performance identified by the above exercise is statistically significantly different from average.

2.3.2.2 Model Specification

A translog function is selected for the total cost model estimated in this study. The translog cost function was the same functional form chosen by PEG in their 4th Generation Incentive Regulation benchmarking research and the same one preferred by the Board in the November 2013 Board Report. Its general form, after suppressing time and firm subscripts, is given by:

$$\ln C = D_0 + \sum_i D_i \ln Y_i + \sum_j E_j \ln W_j + \sum_h J_h \ln Z_h + \frac{1}{2}\left[\sum_i \sum_k D_{ik} \ln Y_i \ln Y_k + \sum_j \sum_n E_{jn} \ln W_j \ln W_n\right] + \sum_i \sum_j D_{ij} \ln Y_i \ln W_j + D_t t + H$$

In this specification, Ds and Es are model parameters, and H is the random noise term. In addition, Y_i quantifies output, W_j input prices, Z_h other business condition variables, and *t* is a

time trend term. This form has been widely used in cost function research.[21] A major advantage is its flexibility, which permits it to provide a good approximation for the wide range of functional forms that the data can reflect.[22]

We also note several theoretical assumptions that aid in model specification and estimation. Among these is the idea that if all input prices rise, cost also rises proportionally. This is known as linear homogeneity, and it allows the restriction that the sum of input price parameters equals one. An additional restriction is symmetry in the parameters of the price interaction terms. In addition, we use 6KHSKHUG¶V OHPPD WR GHULYH FRVW VKDUH HTXDV the cost function. The general form of the cost share equation for input *j* is given by:

$$S_j = E_j \sum_i D_{ij} \ln Y_i \sum_n E_{jn} \ln W_n X_j$$

For the reliability models, we also specify quadratic models that include first-order explanatory terms and their squared counterparts. These models are specified as single equation models. The following presents the general form the reliability models take. Both the SAIDI and the SAIFI models are constructed in the same manner. We illustrate the basic form of the SAIDI model below.

$$SAIDI_j = E_0 \sum_i D_t \ln X_i \sum_i E_{ii} \ln X_i * \ln X_i D_t t F$$

2.3.2.3 Estimation Approach

One of the reasons for joint estimation of cost and cost share model parameters is that there is contemporaneous correlation between the error terms in these systems of equations. Such correlation allows the use of a system of regression equations that result in more efficient (precise) estimates. In this study, the systems estimator we use is Feasible Generalized Least Squares (³FGLS´).

In particular, PSE uses an iterative FGLS procedure that estimates the unknown error matrix consistently.[23] The estimates we compute are equivalent to Maximum Likelihood Estimates (³MLEs´).[24] Our estimates thus possess all the desirable properties of MLEs, which include consistency and efficiency. Since the cost share equations by definition must sum to one at every observation, one cost share equation is redundant and is dropped. This does not pose a problem, since yet another property of the MLE procedure is that it is invariant to any such parameterization. Hence, the choice of which equation to drop will not affect the resulting estimates.

The single equation model is estimated using generalized least squares (GLS) in order to correct

for cross-sectional heteroskedasticity and autocorrelation. The parameter estimates that result from this procedure are both consistent and efficient.

2.4 %HQFKPDUN)XWXUH<HDUV

The same econometric model and its associated parameter values that are estimated using historical data (DQG XVHG WR GHYHORS 7RURQWR) are also used to FDOFXODWH WKH FRPSDQ\¶V EHQFKPDUN YDOXHV. These parameter values are combined with projected variable values to calculate the expected total costs (or reliability) of Toronto Hydro in the future years of the Custom IR period.[25]

As a hypothetical and illustrative example of this procedure, assume we have a simple econometric model that only includes a constant and the number of customers as independent variables when predicting total cost levels. Using the historical sample data from 2002-2012, we estimate this simple model and find an equation that indicates:

Costs = 100 + (10*N)

where N is the number of customers served.[26] In this simplified case, the historical benchmarks would be calculated by inserting the actual number of customers for each year for the studied XWLOLW\ $VVXPH LQ 7RURQWR was 1,000, Toronto Hydro benchmark costs for 2002 would then equal 100 + (10*1,000), or $10,100. If by 2012, Toronto +\GUR¶V FXVWRPHU FRXQWV LQFUHDVH WR WKHQ LWV (10*2,000), or $20,100.

This same procedure is used for developing the future year benchmarks, but instead of using actual customer number estimates, we use company projections of those variables. So if the company projects the number of customers at 2,500 in 2015, the 2015 benchmark is 100 + (10*2,500), or $25,100.

This procedure assumes that future total costs will be influenced by the independent variables in the same way that historical costs have been estimated to be influenced by the independent variables. Absent robust projected costs from a large sample of utilities, PSE is of the opinion that using the historical relationships between variables found to be statistically significant in the models is the best and most straightforward way of benchmarking future total cost levels.

PSE was provided OM&A expense, plant addition, reliability, customer counts, and line length projections from Toronto Hydro.[27] We were also provided peak demand projections, but these

[25] 2014 is also a future year for this analysis.

[26] Again this is a hypothetical, simplified model only for illustrative purposes.

[27] We were only provided OM&A expenses for the year 2015. We then escalated this amount in each year for 2016, 2017, 2018, and 2019 using the I-X formula of projected inflation of 1.7% minus a 0.3% stretch factor.

were projections of non-coincident peaks at the substation level.[28] We then adjusted the non-coincident peak demand estimates based on the historical ratio of the coincident peak demand of the Toronto Hydro system and the sum of the non-coincident substation peak demands.

Input prices need to also be projected into the future years. For the labour and non-labour components of the OM&A input price, PSE used price forecasts of the GDP-IPI and Ontario weekly average earnings from the Conference Board of Canada (Spring 2014 forecasts). The forecasts only go to 2018, so for the 2019 observation we used the 2018 growth rate and applied that same growth rate to 2019. We used the average annual 40-year growth rate in the EUCPI for the capital construction cost estimates.[29]

The rate of return for the entire period is set at the 2014 Board-calculated weighted average cost of capital of 6.56%. This assumes that interest rates and returns will stay constant from 2014 to 2019. PSE believes this assumption is a fairly conservative one, as interest rates are probably more likely to increase, rather than decrease in the next five years.

Other projected variables that enter the models include percent residential, urban core, electric customers in gas and electric operations, electric distribution in total electric gross plant, percent forestation, elevation standard deviation, and the percent plant that is underground. Since these variables are not likely to meaningfully change, they were set at their most recently available historical value for the future years. The wind variable and lightning variables were set at the average of the values from the historical period.

[28] By non-coincident we mean the projected peak values were for the annual peaks of those specific substations and not the demand coincident, or at the same time as, the system as a whole.

[29] Forty years is the assumed service life of capital when calculating the triangularized weighted average of capital in the benchmark year. This long period also enables the smoothing out of interest rate impacts.

3 7RWDO &RVW %HQFKPDUNLQ

This section provides the total cost benchmarking results for both the combined dataset (includes both Ontario and U.S. distributors) and the U.S.-only dataset (includes only U.S. utilities plus Toronto Hydro). We begin with the combined sample results.

3.1 (FRQRPHWULF 5HVXOWV IRU W 'DWDVHW

The estimates from the total cost model based on combined data are presented in Table 4. We note that the cost function parameter estimates are plausibly signed and have reasonable magnitudes. The first order terms of all variables have the theoretically expected signs and are statistically significant.

UD	0.007	3.614		Sample Period:	2002-2012	
DT	-0.149	-11.850		Number of Observations	1650	

Total cost increases with higher capital prices and output quantities. At the sample mean, a 1% increase in the number of customers and peak demand are estimated to raise cost by 0.97% and 0.11%, respectively. The number of customers served is clearly the dominant output-related cost driver, which is an expected result for an electric distribution total cost model. Input prices also will increase total costs. Holding the effect of all other variables constant, we find that a 1% increase in the price of capital raises cost by 0.54%. This is higher than the elasticity of the price of the OM&A input, which is about 0.46%. Based on linear homogeneity, the OM&A input price estimate is predetermined to be one minus the capital price estimate. The estimates reflect the capital intensiveness of the power distribution business.

The business condition coefficients are also signed as our hypothesis would suggest. Utilities serving largely rural areas experience greater challenges relative to their suburban counterparts.

Cost is also higher for utilities that serve an urban core, which is defined as serving a city with a population of at least one million. Unit capital costs tend to decrease as customer density increases (i.e., rural areas will cost more to serve than suburban areas), but will then begin to increase as the area transitions from a suburban setting to an urban or metropolitan setting. This QRQOLQHDU UHODWLRQVKLS´ FRVW VWUXFWXUH LV UXUDO XQLW FRVWV lower, and urban core unit costs increase again) is supported by an engineering design study found in the Appendix of this report.[30]

The density variable, therefore, adjusts for serving a rural service area, whereas the urban YDULDEOH DGMXVWV IRU VHUYLQJ D ODUJH XUEDQ FRUH $V negative and is statistically significant, which reflects the economies achieved from serving more customers per a given line length. The urban variable is positive and statistically significant, reflecting the added costs and difficulties of serving a large urban area.

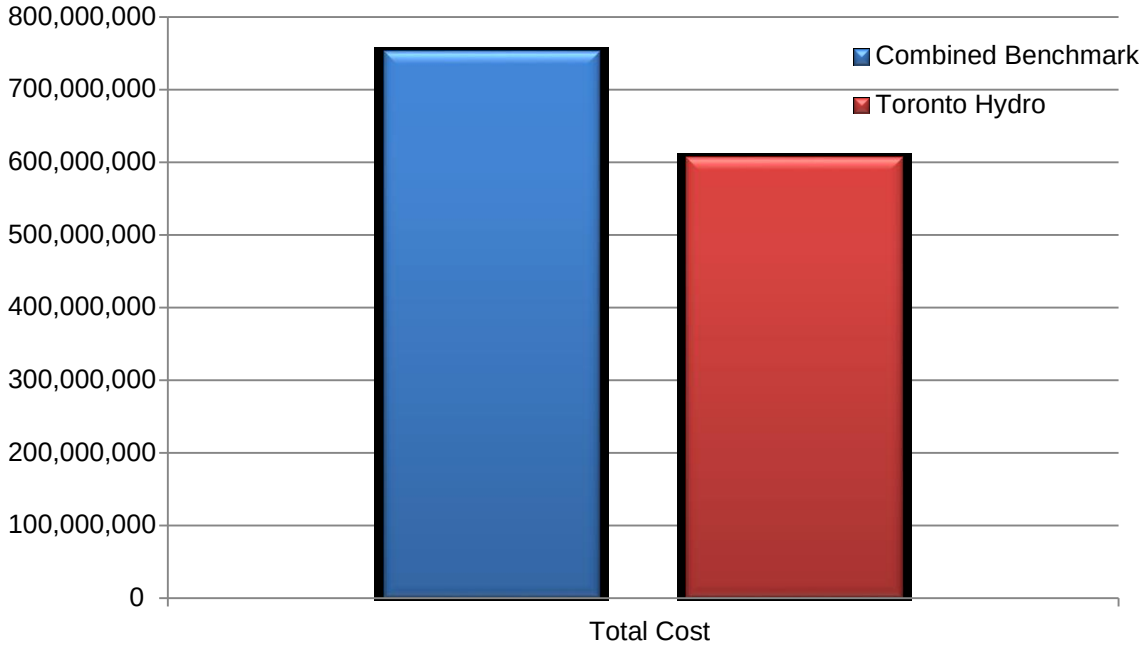
The remaining coefficients are positive, reflecting: (1) the economies obtained from diversification, in the case of utilities that serve gas customers, (2) economies of scope, in the case of utilities that are vertically integrated and, (3) economies from serving more of a non-residential load. In particular, the higher percentage of electric customers (out of total electric and gas customers), the higher the cost, due to lack of economies of diversification. The higher the percent of electric distribution plant in total electric plant, the higher the cost. This indicates that vertically integrated utilities enjoy economies of scope that are not available to distribution-only utilities. Finally, the higher the percentage of residential deliveries (out of total power deli Y H U L H V W K H P R U H - [illegible] times.

The estimate of the trend variable parameter is 0.3%. This suggests a modest upward shift in cost over time. This econometric trend indicates a modest negative productivity trend for the combined U.S. and Ontario electric distribution industry.

The next table presents the Toronto Hydro benchmark results from the combined total cost model for an average of the 2010 to 2012 years.

Table 5 Average 2010-2012 Toronto Hydro Combined Sample Total Cost Benchmark Results

Year	Actual	Predicted		% Difference	P-Value
Average 2010-2012	607,374,528	752,360,858		-21.5%	0.082



Actual cost is below the predicted or benchmark value by about 21.5 percent. This is a statistically significant difference with a 90 percent degree of confidence, and shows that when benchmarked relative to the power distributors of Ontario and the U.S., Toronto Hydro has a statistically significantly superior total cost performance.[31]

[30] 7KH UHSRUW LV WLWOHG ³&DSLWDO 5HTXLUHPHQWV RI 6HUYLQJ 'HYHORS

[31] The 90 percent confidence level assumes a one-tailed rather than a two-tailed test and is the same one used by

Put into dollar terms, the 2010-2012 average total costs of Toronto Hydro were expected to be $752.4 million, but were actually $607.4 million. This is $145.0 million per year below the benchmark expectation over the 2010-2012 period. This result is illustrated in the figure below.

Figure 9 2010-2012 Combined Sample: Benchmarked Total Costs vs. Actual Costs (3-Year Average)

The following table breaks down the historical and forecast year benchmark and company total costs from 2002 to 2014 and then during the Custom IR period of 2015 to 2019. During the historical period Toronto Hydro has consistently been below its expected benchmark levels. In the second column, the percent below benchmark is illustrated. Notice that prior to 2007 the company was consistently near 30% below benchmark expectations. This is suggestive that the F R P S D Q \ ¶ V was in need of investment. PCE	0.132	4.793		Sample Period:	2002-2012	
PRV	0.039	2.604		Number of Observations	880	

We note that cost is higher the higher the output quantities. At the sample mean, a 1% increase in the number of customers is estimated to raise cost by 0.73%. A one percent hike in peak demand is estimated to increase cost by 0.22%. As in the combined model, the number of customers served is clearly the dominant output-related cost driver.

The coefficients on the additional variables were also plausible. Utilities that serve an urban core with 1 million or more residents have higher costs than suburban utilities. Cost is also higher for utilities that only serve electric customers relative to those that serve both gas and electric customers. In addition, a utility that serves a more residential load, as measured by higher values

of percent deliveries that are residential, has greater cost relative to one that serves a more commercial and industrial load.

Further, the greater the percentage of the electric plant that is distribution-related, reflecting a lesser degree of vertical integration, the higher the OM&A cost incurred by the utility. On the other hand, undergrounding distribution capital lowers cost. Finally, greater variability in elevation and the higher the percentage of forestation of a service territory result in higher cost. The estimate of the trend variable parameter is 0.3%. This suggests a modest upward shift in cost over time (i.e., negative productivity). The estimates on all of the first order variable terms are statistically significant at the 90 percent confidence level. We present the benchmark results from the model in Table 8.

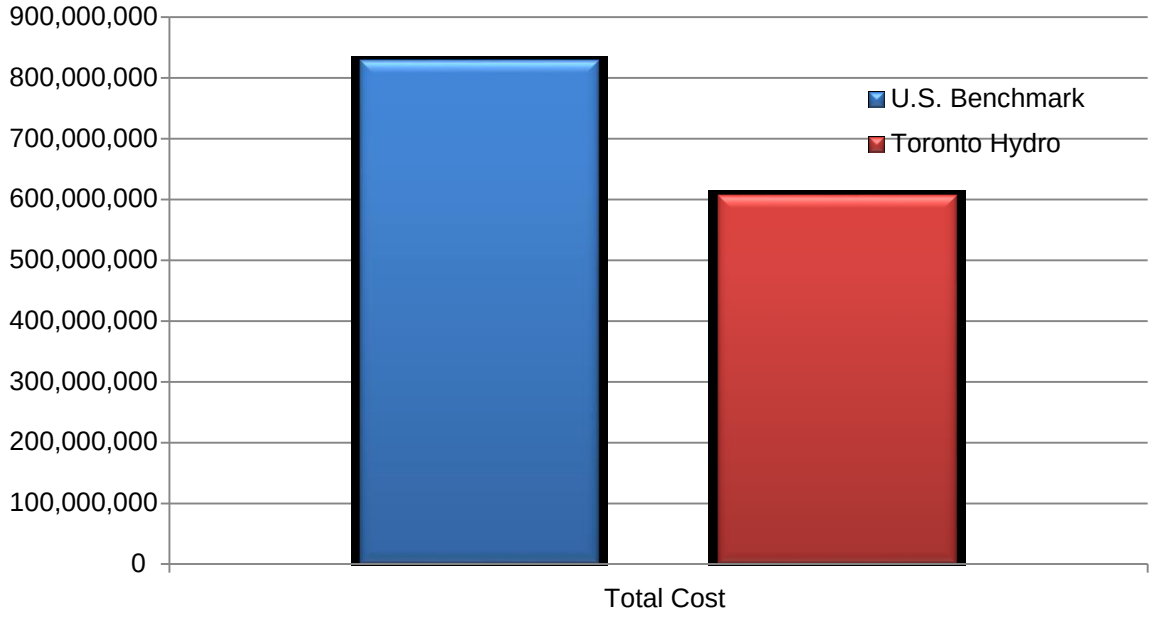

Table 8 2010-2012 Average Toronto Hydro U.S. Total Cost Benchmark Results

Year	Actual	Predicted		% Difference	P-Value

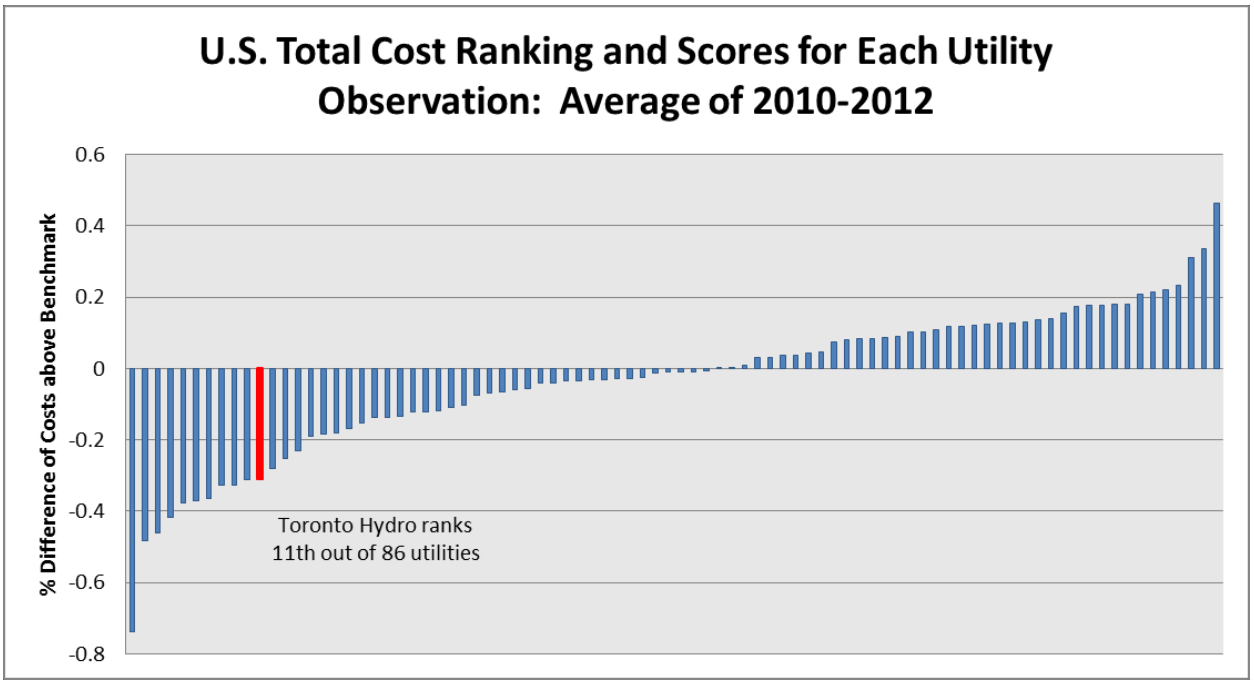
: H Q R W H W K D W 7 R U R Q W R \ G U R ¶ V W K H U H Average cost performance is good. Actual cost is below the predicted or benchmark value by about 31%. This performance score is statistically significant at least at the 90% confidence level and shows that when benchmarked relative to the power distributors of the U.S., Toronto Hydro is a superior total cost performer.

Put into dollar terms, the 2010-2012 average total costs of Toronto Hydro were expected to be $828.7 million. The actual observed costs are 31 percent below this mark. This is an annual difference of $221.3 million. This result is illustrated in the graph below.

Figure 12 2010-2012 U.S.-Only Sample: Benchmarked Total Costs vs. Actual Costs (3-Year Average)

The next table breaks down the benchmark total costs and company total costs from 2002 to 2019. During the historical period (2002-2013), Toronto Hydro has consistently been below its expected benchmark levels. Its actual total cost is expected to remain below the benchmark in the Custom IR forecast years, though, to a lesser extent than in the historical years. A similar pattern is found for the U.S. benchmark results as was seen in the combined results. Prior to 2008, total costs were about 40% below benchmark expectations. After capital investments increased, by 2013, the benchmark scores moderated to 25% below expectations (which is still a low cost level). Similar to the combined results, this illustrates the movement to upgrade the capital infrastructure on the system lowered TFP growth.

Table 9 2002-2019 U.S.-Only Sample Benchmark Total Costs vs. Historical and Projected



Year	Percent Below U.S. Total Cost Econometric Benchmark	Total Cost Econometric Benchmark, $M	Actual Total Cost THESL, $M

Nearly all jurisdictions that require reporting of reliability indicators include the metrics of 6$,', 6$,), DQG &XVWRPHU $YHUDJH ,QWHUUXSWLRQ 'XUDWLRQ [32] SAIDI measures the average duration of sustained interruptions per utility customer. SAIFI is a gauge of the average frequency of sustained interruptions per customer. CAIDI evaluates the average duration time per sustained interruption. SAIDI is thus the product of SAIFI and CAIDI.

$$\text{SAIDI} = \frac{\Sigma_i \text{Minutes Customer } 'i' \text{ is without Service}}{\text{Total Number of Customers on System}}$$

$$\text{SAIFI} = \frac{\Sigma_i \text{Frequency Customer } 'i' \text{ is without Service}}{\text{Total Number of Customers on System}}$$

$$\text{CAIDI} = \frac{\text{SAIDI}}{\text{SAIFI}}$$

Several jurisdictions exclude extraordinary events from reliability statistics, with the goal of increasing historical comparability. The bulk of excluded events stem from major storms. These severe storms vary in number and intensity from year to year. MED definitions are determined by each regulatory commission. Definitions vary by state; some use the IEEE standard 1366-2003 to determine what constitutes a MED.[33] Other states have customized definitions. For example, for some states, if 10 percent of a ut L O L W \¶ V F X V W R P H U V H [S H U L H Q F H D Q than a 24-hour period, a MED has occurred. States are gradually shifting towards the IEEE standard; however, considerable differences across states remain. The reliability benchmarking models we developed use the following variables:

- Density (customers per line mile);
- The number of retail customers;
- Percent plant that is distribution (out of total electricity plant);
- Forestation;
- The standard deviation of elevation in the service territory;
- The number of retail customers served
- Whether a utility serves an urban core with 1 million or more residents;
- The level of wind and lightning within a given service territory; and
- A time trend.

The sources for all the variables (except for the measures of weather) are detailed in Section 2.1 since they are also used in the total cost research. The variables used to construct the wind and lightning values are collected from National Climatic Data Center (³NCDC ´) of the National Oceanic and Atmospheric Administration (³NOAA ´).[35]

We constructed the wind variable using hourly weather station data for each service territory within the sample. In each hour, we subtracted the recorded wind speed by ten knots. If the wind speed was at or below ten knots, we set the value equal to zero. Similar to how cooling and heating degrees are calculated, we determined the level of wind speed above the 10 knot threshold in each hour for each service territory and summed up that value for each year.

The lightning variable measures the total number of strikes in each utility ¶ service territory. Both the wind and lightning variables are calculated at a county-by-county level for the U.S. distributors. Wind data for the Ontario sample is generated using the closest weather station observation to each distributor. Lightning data is not available for Ontario distributors; Toronto Hydro was assigned the lightning value of Rochester Gas & Electric, which serves on the New York side of Lake Ontario.

$V LQ WKH FDVH RI WRWDO FRVW ZH EHQFKPDUN 7RURQWR +\ (made up of U.S. and Ontario utilities), and a U.S.-only sample. The former includes 46 U.S. and 70 Ontario utilities, while the latter includes 46 U.S. utilities and Toronto Hydro. The data for the U.S. utilities in each sample spans the years 2002 to 2012. In each sample, some utilities have GDWD DYDLODEOH IURP WKH HDUO\ more limited data available. The OH R W K H data for the Ontario utilities spans the years 2005 to 2012. 7KLV VHFWLRQ RIIHUV EDFNJURXQG LQIRUPDWLRQ RQ 36(explains how the benchmarks were calculated. The parameter estimates and benchmarking results for both the SAIFI and SAIDI models are provided in Section 5.

36(¶V PHWKRG RI HFRQRPHWULF PRGHOLQJ is to use sampled data from the past to form a mathematical model. The model accepts inputs (operating conditions, service territory data, etc.) and produces an expected reliability index for each observation. By using the model, given a set of operating conditions, PSE can estimate an ³expected´ or benchmark reliability level for each utility in each year.

The variables included in the econometric model for SAIDI and SAIFI are shown in the figure below.[36]

Figure 14 Variables in Econometric Reliability Models

7 K L V W H F K Q L T X H D-0-DRSZO HIR U F3RPSDULVRQV DQG WKHUHIRU accurate assessment of performance relative to simply making industry comparisons of SAIDI and SAIFI.

5 5HOLDELOLW\ %HQFKPDUNLQ

Four econometric models were developed which measure reliability metrics which include all outages: a combined sample model and a U.S.-only sample model for SAIDI, and a combined and U.S.-only sample model for SAIFI. The explanatory variables in the models include:

- The forestation le Y H O V L Q H D F K X W L O L W \¶ V V H U Y L F H W H U U L W R U
- Customer density (measured by the number of retail customers divided by distribution line miles),
- Sum of wind knots above ten in each hour of the year,
- The percentage of underground plant in total distribution plant,
- Whether a utility serves an urban core with more than 1 million residents,
- The number of retail customers,
- Lightning, and
- Variability in elevation within the service territory.

The models also include a time trend variable. The trend variable examines how reliability data

[36] The illustration shows all the variables used in both the combined and U.S.-only models. Not all of the variables are in both models.

has changed over time.

SAIDI and SAIFI are modeled using a quadratic functional form, where model variables include logged first order and square terms. The number of customers is logged but not squared, and is included to control for scale effect. The urban core dummy is neither logged nor squared, because it is a binary variable. This form allows us to adjust for non-linearity in variables in determining reliability levels.

Each model includes utilities with varying time-series lengths covering the years 2002 to 2012.[37] This type of dataset requires an estimation procedure that accounts for the cross-sectional time-series ³panel´ nature of the data. We use a feasible generalized least sq X D U H V ³) * / 6´ estimator that corrects for cross-sectional heterogeneity and addresses the panel form of the data. The estimator accomplishes this by correcting for group-wise (utility-by-utility) heteroskedasticy, and results in parameter estimates that are more accurate, consistent, and precise than methods that do not correct for group-wise heteroskedasticy.

The results from the SAIDI models based on the combined and U.S.-only datasets are presented in the following two tables.

Table 11 Combined Sample SAIDI Econometric Model Coefficients

Variable	Coefficient Estimate	T-Stat
Constant	5.251	79.880
Customers (Y)	0.127	9.840
Customer Density (D)	-0.764	-15.237
Urban (U)	-0.025	-5.206
D*D	0.238	1.930
Trend	0.018	2.019

Table 12 U.S.-Only SAIDI Econometric Model Coefficients

Variable	Coefficient Estimate	T-Stat
Constant	5.405	64.025
Customers (Y)	0.025	0.703
Wind (W)	0.168	1.842
Customer Density (D)	-0.173	-2.115
% Forestation (F)	0.517	4.701
W*W	0.157	1.068
D*D	-2.116	-6.751

[37] Utilities in the States began reporting reliability metrics at different times.

F*F	-0.244	-0.861
Trend	0.048	4.485

All first order parameter estimates, except the number of customers, have the expected signs and are statistically significant.[38] Utilities that serve more densely populated and highly urban service territories have shorter outage durations per customer. On the other hand, utilities that serve more forested and windy service territories have longer outage durations per customer.

The SAIFI models are similarly based on a quadratic specification. The results are presented in the tables below.

Table 13 Combined Sample SAIFI Econometric Model Coefficients

Variable	Coefficient Estimate	T-Stat
Constant	0.299	8.802
Customers (Y)	0.014	1.585
Customer Density (D)	-0.159	-5.522
Wind (W)	0.061	2.124
% Plant Distribution (DS)	0.101	3.452
Urban (U)	-0.031	-7.144
D*D	0.301	3.585
W*W	0.087	3.488
DS*DS	0.033	0.948
Trend	0.012	2.714

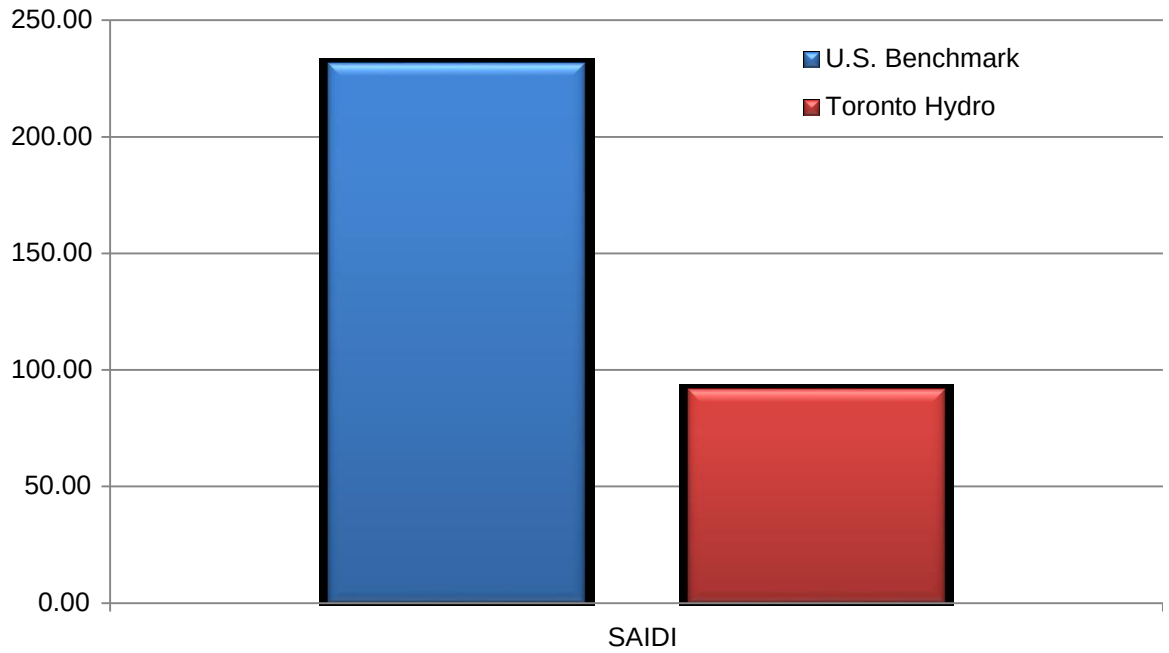
Table 14 U.S.-Only SAIFI Econometric Model Coefficients

Variable	Coefficient Estimate	T-Stat
Constant	0.423	9.932
Customers (Y)	-0.027	-1.780
Customer Density (D)	-0.154	-4.645
% Forestation (F)	0.241	5.234
Elevation (E)	0.109	4.414
Lightning (L)	0.217	9.862
D*D	-0.970	-8.907
F*F	0.211	1.797

[38] We kept the number of customers in the model because it is basically acting as a quadratic variable that is measuring scale economies. The reason it is considered a quadratic variable is because the left-hand side variable is defined as the number of outage minutes divided by the number of customers.

E*E	0.035	1.848
L*L	0.061	4.116
Trend	0.008	1.808

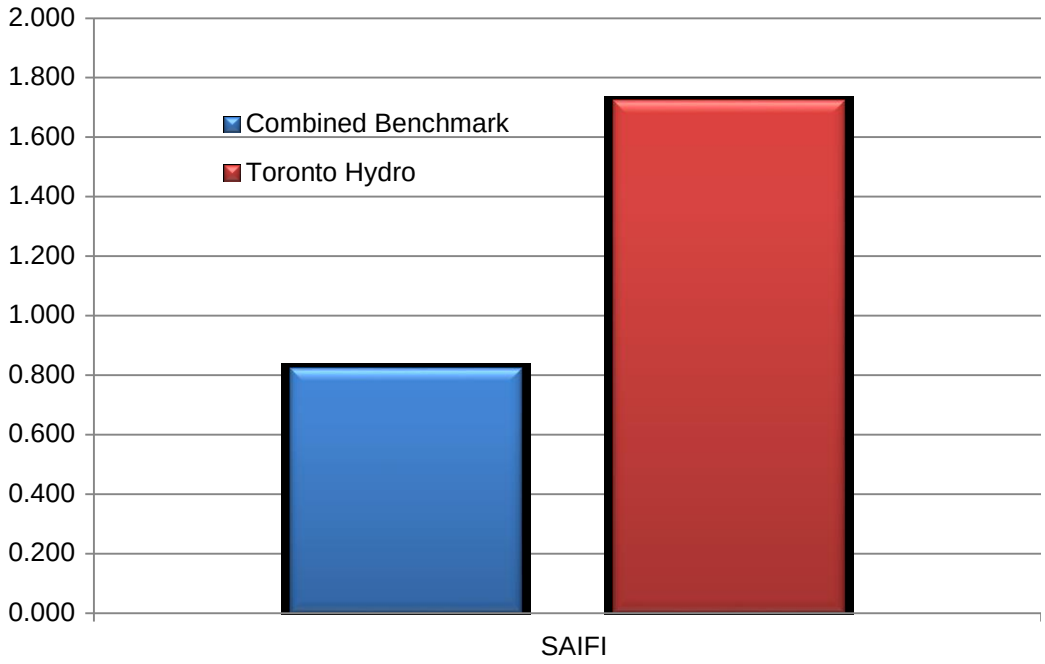
Utilities with more densely populated and highly urban service territories experience fewer outage frequencies per customer. Conversely, utilities with service territories that experience more lightning, windier conditions, and are more forested have more frequent outages per customer. In addition, those whose service territory elevation levels are more variable also experience more frequent outages per customer. Finally, utilities that have more distribution plant (as a percent of all electric plant) also have higher outage frequencies per customer.



5.1 &RPELQHG 6DPSOH (FRQRPHWULF 5HVXOWV

:H ILQG WKDW 7RURQWR +\GUR¶V 2012 average SAIDI is 48 percent below the benchmark value when using the combined sample. This result is not, however, statistically significant at the 90 percent confidence level.

2XU UHVHDUFK RQ 7RURQWR +\GUR¶V 2012 average SAIFI indicates that the reliability level in the combined dataset model is 73.4 percent above the benchmark value. This implies worse than average SAIFI performance, and is statistically significant at a 90 percent confidence level.

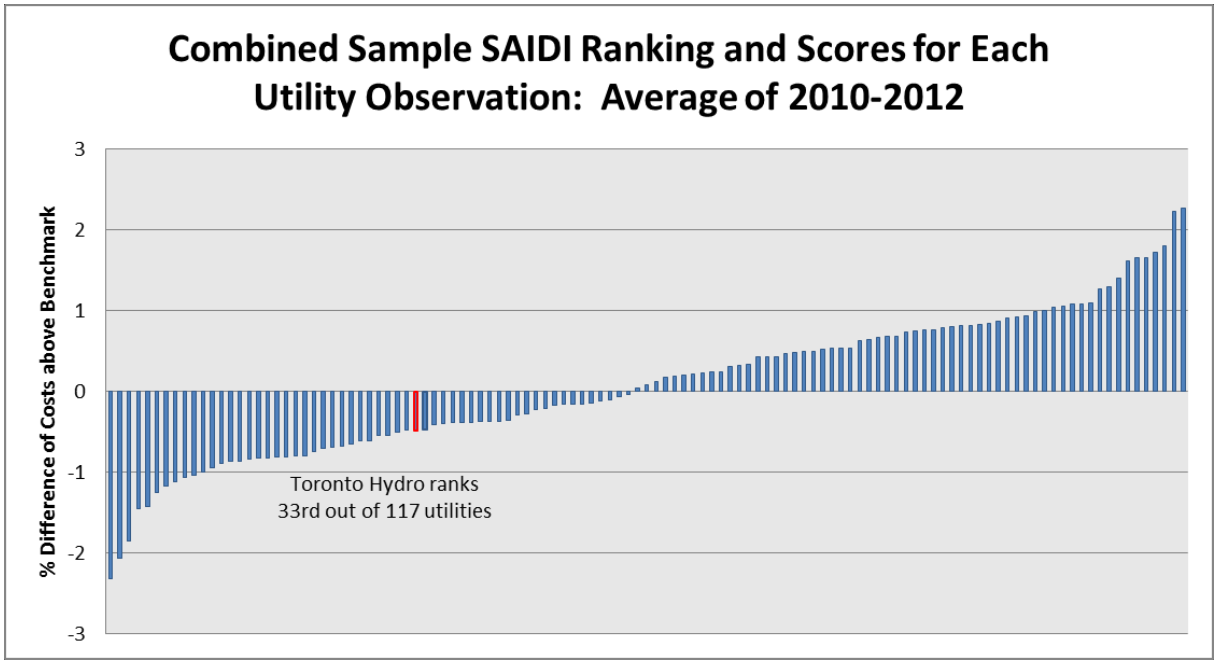


The benchmark comparisons for SAIDI are summarized in the following graph.

Figure 15 2010-2012 Combined Sample: Benchmarked SAIDI vs. Actual SAIDI (3-year Average)

The benchmark comparisons for SAIFI are summarized in the following graph.

Figure 16 2010-2012 Combined Sample: Benchmarked SAIFI vs. Actual SAIFI (3-Year Average)



The year-by-year breakdowns for both SAIDI and SAIFI are provided in the following table. This table provides both the actual reliability values for Toronto Hydro, along with the econometric benchmark value. Notice that Toronto Hydro has consistently been below its benchmark values for SAIDI, and consistently above its benchmark values in regards to SAIFI. 7KLV LV WKH FDVH LQ WKH KLVWRULFDO DQG IRUHFDVW \HDUV, its high SAIFI metrics will converge towards the benchmark value during the forecasted time period, although still remain higher than benchmark values. The Custom IR period is shaded in green.

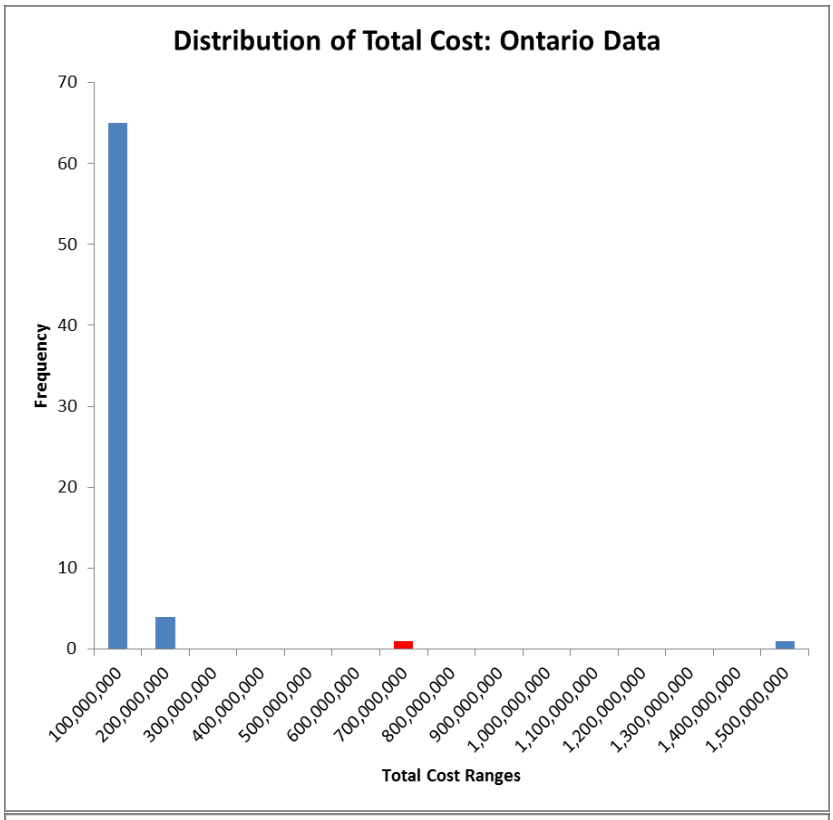
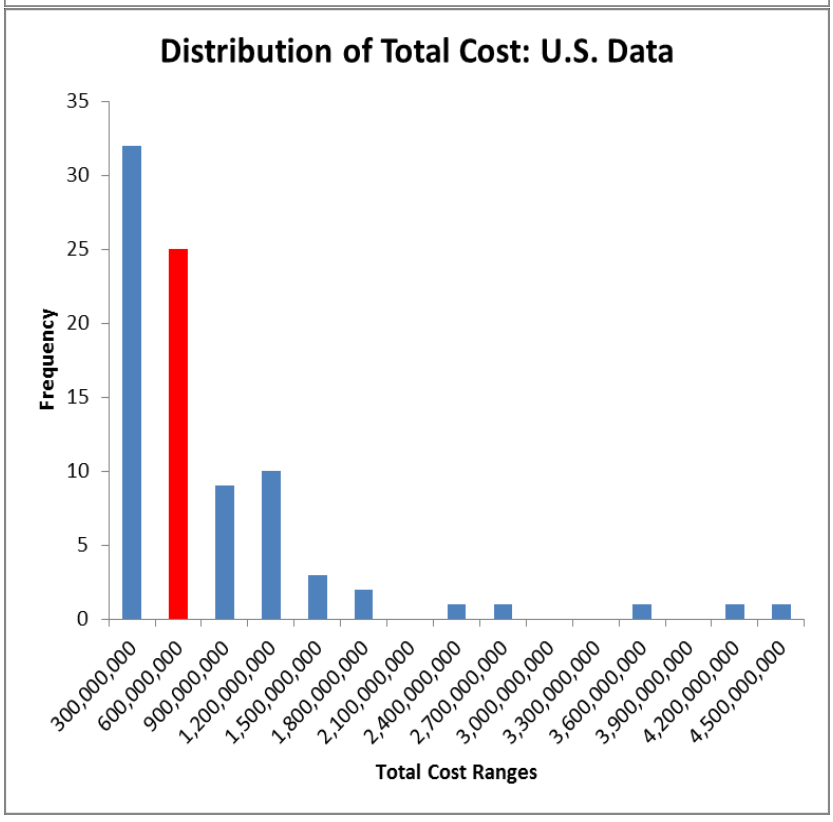
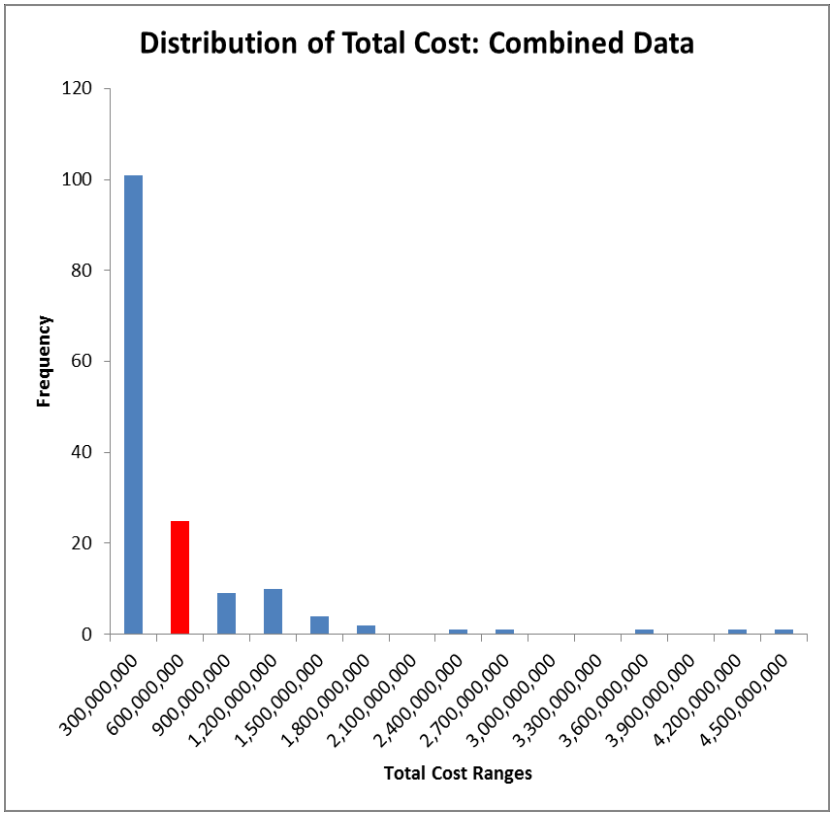
6 ,PSRUWDQFH RI 8 6IRU'D %HQFKPDUNLQJ 7RURQWR +\GUR



The benchmarking exercise evaluates utility performance relative to a given sample, which produces a benchmark value for each utility in the sample. The benchmark value is generated XVLQJ WKH VSHFLILF XWLOLW\¶V LQGHSHQGHQW YDULDEOH Y relative to the sample. 7KXV 7RURQWR +\GUR¶V EHQFKPDUN YDOXHV UH H[SHFW IURP DQ DYHUDJH XWLOLW\ ZLWK 7RURQWR +\GUR¶V V If the average efficiency embodied in the benchmark value is generated using firms that are very dissimilar than the utility being benchmarked (i.e., the benchmarked utility is an outlier), then its performance evaluation has a high chance of being inaccurate.



PSE authored a separate report that attempts to quantify the capital cost challenges of serving different types of developed areas.[39] In that report, PSE explains why unit capital costs will tend to decrease as customer density increases (i.e., rural areas will cost more to serve than suburban) but will then begin to increase as the developed area transitions from a suburban setting to urban or metropolitan settings.



We examine the distribution of total cost data in the Ontario, U.S. and combined samples using average values of the variable over the last three years. As the figures below illustrate, Toronto +\GUR¶V W KHUHH \HDU average total cost (flagged in red) is one of two extreme outliers in the distribution of Ontario distributors with regard to total cost. (The company on the far right in the 2QWDULR VDPSOH LV +\GUR 2QH 2Q WKH RWKHU KDQG 7RUR ranges of the total cost distribution in the U.S. and combined dataset (i.e., there are numerous utilities with lower costs, and numerous utilities with higher total costs).

cost performance against only Ontario utilities is unlikely to produce a fair assessment. Even when accounting for the external conditions that affect its performance, the model used to generate the benchmark will embody performance based on utilities whose scale of operation is FRPSOHWHO\ XQOLNH 7RURQWR +\GUR¶V

The estimation procedure is designed to fit the data through the mean of model variables. As a result, parameter estimates are most accurate for those utilities with operating conditions that vary within a reasonable range of the mean of model variables 7KH IXUWKHU D XWLOLW conditions are from the mean, especially if there are minimal sample observations nearby, the less accurate the cost benchmark based on the model. Also, if only one utility faces a certain external condition (e.g. serving a large urban core), it is impossible to incorporate the effect of that condition in the benchmark analysis.

No other distributor within Ontario comes close to serving an urban center like Toronto. Therefore, any model based on the Ontario dataset is unable to capture the added costs of serving an urban core. This is in contrast to models based on the U.S. and combined datasets, which reflect the conditions of several utilities that serve a densely populated urban center. Furthermore, the U.S. and combined datasets reflect operating conditions that encompass and ³surround´ WKRVH RI 7RURQWR +\GUR¶V

In addition, due to the variation and extensiveness of the utilities represented, the U.S. and combined datasets make it possible to identify the effect of several relevant business condition variables with greater precision. They also permit the inclusion of business conditions in the model such as percent forestation, urban core, and the standard deviation of elevation within each service territory.

7 &RQFOXVLRQV

This report develops a framework for evaluating 7RURQWR +\GUR¶V 2015-2019 Custom IR application. The parameters of this framework are set by considering three important questions: : K D W L V 7 R U R Q W R +\GUR¶V electric distribution cost performance, relative to the combined dataset and the U.S.-only dataset " : K D W L V W K H liability performance, relative to the combined dataset and the U.S.-only dataset? (3) Are the projected spending and reliability levels during the Custom IR period reasonable from a benchmarking perspective?

4XHVWLRQ : K D W L V 7 R U R Q W R +\GUR¶V total electric distribution cost performance, relative to the combined dataset and the U.S.-only dataset?

1 ,QWURGXFWLRQ

Electric distribution utilities operate in a capital intensive industry. There are significant costs for materials and labor associated with the installation of overhead and underground distribution lines, transformers, substations, and other associated facilities. These costs need to be depreciated over many years to ease the financial impact on electric rates. In addition to being capable of having a long life, distribution facilities must be designed and constructed in a safe and reliable manner while balancing a level of efficiency.

One important component that drives the cost of electric distribution infrastructure installations is the environment in which the facilities must be constructed. Several things may vary based on the surrounding environment, including design and construction standards utilized, equipment installed, and supporting civil infrastructure required. For example, it is typical in most rural and suburban areas for underground cable to be trenched or plowed, either directly or in conduit. This is possible because these areas contain relatively ample unsurfaced corridors that are available for utilities to install and maintain their facilities. In urban areas, underground cable is typically installed in concrete encased duct banks due to limited utility corridors and complications associated with congestion. Although there are significant cost differences between installing underground cable directly and within concrete encased duct banks, there is typically a correlation between the two based on the amount of customers served and the associated load. However, at a certain point, infrastructure costs rise at a faster rate than the associated number of customers and load needed to balance the costs.

A factor that affects the efficiency of an electric distribution utility is the capital cost of infrastructure, which may vary based on the service territory environment in which the utility serves and constructs facilities. Simply comparing the total plant value or incremental plant value year over year against the energy and/or demand the utility delivers does not provide a true representation. Rather, the cost effectiveness of distribution infrastructure for the environment in which it is installed needs to be factored into the evaluation.

The purpose of this report is to demonstrate how serving different developed environments impacts the effectiveness of capital requirements for a distribution utility. Specifically, the report closely looks at WKH VHUYLFH WHUULWRU\ RI 7RURQWR +\GUR (O
+\GUR´ DQG RWKHU QHDUE\.GHYHORSHG HQYLURQPHQWV

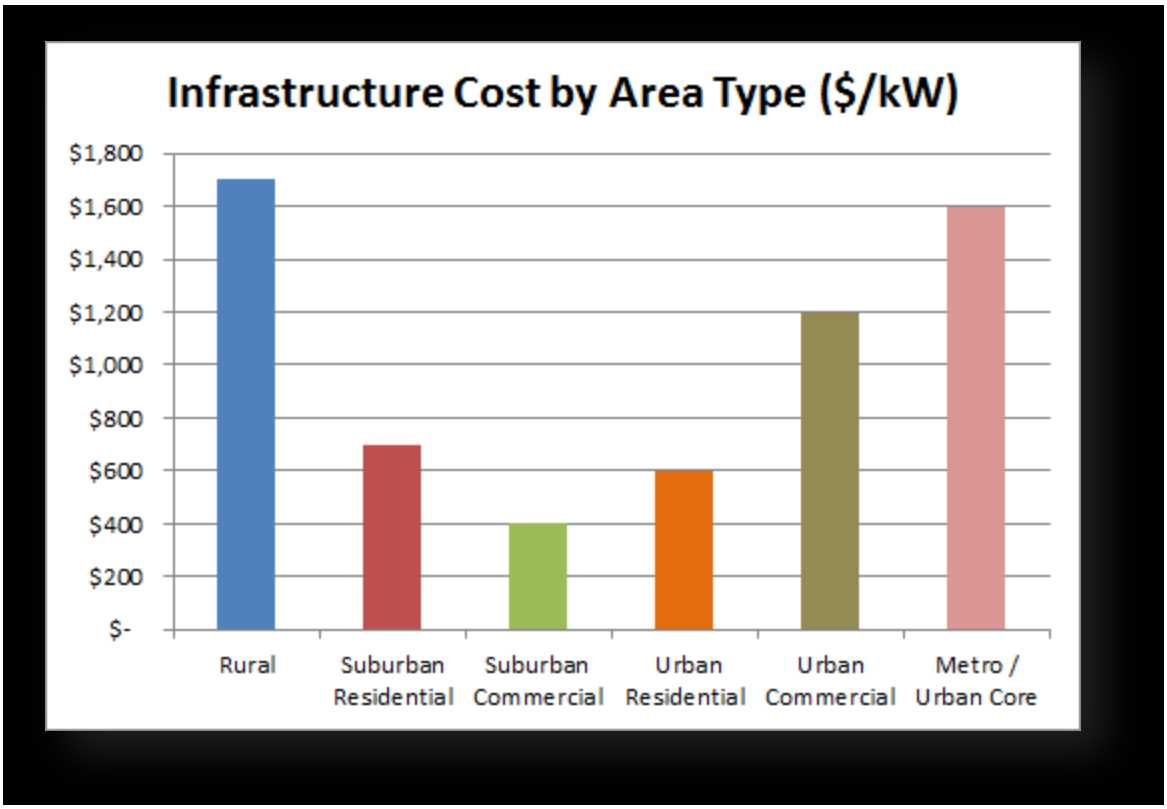

Figure 1-1 Infrastructure Cost by Area Type

Figure 1-1 illustrates the results of research and analysis completed by Power System Engineering [3 3 6 (.´ Suburban residential, suburban commercial, and urban residential areas resulted in the lowest electric distribution infrastructure cost in relation to the load level served when compared to other environments. Conversely, rural, urban commercial, and metro/urban core environments require a higher cost of electric distribution infrastructure in relation to the load level served. Factors driving these results include the density of load over which infrastructure costs can be spread, as well as the magnitude and complexity of the infrastructure required to serve the load within the given environment. Toronto Hydro ¶ service territory comprises mainly of urban residential, urban commercial, and metro/urban core areas.

2 7RURQWR6+\GURHOHFWULFV\VWHP

Toronto Hydro is the largest municipal electrical distribution company in Canada, serving approximately 733,000 customers in the city of Toronto. Comparatively speaking, the service territory is very unique from other distributors in Ontario due to its significant population density. The evolution of the city and its supporting infrastructure is common to other major cities found in the United States.

2.1 &LW\ RI 7RURQWR

In 1834, Toronto became a civic incorporation. Mostly occupied by British and Irish immigrants at the time, Toronto's population grew between 1831 and 1891. By the 1900s, more immigrants arrived from continental Europe, including Jews, Italians, and Ukrainians, followed by Germans, Poles, Hungarians, Slavs, Greeks, and Portuguese. By the 1920s, new suburban municipalities were appearing due to an overflowing city center of approximately 500,000 people. $IWHU :RUOG :DU ,, 7RURQWR¶V HFRQRP\ ERRPHG DQG WKH FLW\ JUHZ RYHU 1,000,000 by 1951. In the 1970s and 1980s, migrants from West India, South Asia and East Asia arrived. Present-day Toronto is made up of the former municipalities of Toronto, North York, Scarborough, York, Etobicoke, and East York, all of which merged into a six-municipality configuration in 1967. In 1998, the six municipalities were amalgamated into a single municipality, or the present-GD\ &LW\ RI 7RURQWR &XUUHQWO\ 7RURQWR LV WKH ILIWK PXQLFLSDOLW\ DQG 1RUWK $PHULFD¶V IRXUWK ODUJHVW FLW\ $FFRUGLQJ WR GDWD UHSRUWHG E\ WKH municipal government, the population of the City of Toronto was approximately 2.8 million in 2012, while the census metropolitan area population of the Toronto area was approximately 5.5 million in 2011.

Toronto is located on a shore plain of a harbor of Lake Ontario. The core downtown area of Toronto still resides along this shore line, while the rest of the city extends east, west, and north of the harbor. The city is intersected by three rivers and numerous tributaries, including the Humber River, the Don River, and the Rouge River, which have created densely forested ravines. The ravines have affected the original grid plan, and are noticeable on Finch Avenue, Leslie Street, Lawrence Avenue, and St. Clair Avenue. The ravines are useful for drainage of the FLW\¶V VWRUP VHZHU V\VWHP EXW RIWHQ H[SHULHQFH IORRGLQJ GXULQJ SHULRGV RI KHDY\ UDLQ

The City of Toronto was originally developed according to a small-town plot with a plain grid of straight streets. The straight grid pattern was extended as the city grew, but in 1834, uncoordinated private developments replaced the grid pattern. By the 1840s, the cityscape began to take shape. King Street was a main commercial east-west pathway, while Yonge Street served as the main north-south route. During the early 1900s, skyscrapers were being built and industry grew around Yonge Street, King Street, Queen Street, and Bay Street. A picture of present-day downtown Toronto is provided below.

Figure 2-1 Image of Downtown Toronto

7RGD\ 7RURQWR¶V FRUH GRZQWRZQ DUHD FRQVLVWV PRVWO condominiums. In the heart of downtown, the surrounding landscape is almost completely paved, with little to no grassy boulevards, medians, or curbs. Moving away from the city center, housing and business can be classified as urban. The inner suburbs, close to downtown, feature mostly single-family homes and apartment buildings that range in size. Due to population density, duplexes are common, and stand-alone houses are built closely together with limited yard space. Urban commercial areas have similarly closely positioned structures, and range in height. Designated green spaces or parks, some which are quite large, are located throughout 7RURQWR¶V GRZQWRZQ DQG XUEDQ DUHDV)XUWKHU IURP traditionally suburban, with larger single-family homes and more individual yard space. Suburban commercial areas have more space between buildings, and structures are mostly two to four stories tall. In rural areas surrounding Toronto, housing and commercial operations are widely spread apart, often separated by large farm fields. Homes are mostly large, single-family homes with extensive green space. Properties may be located at the ends of long driveways and not directly next to neighboring properties.

Downtown Toronto has many interesting and noteworthy structures. These include the original Fort York complex (rebuilt 1813-15), the Grange, a gentry mansion built around 1817, St Lawrence Hall (1850), originally a public building containing a hall and shops, Osgoode Hall (rebuilt 1857-60), headquarters of the Law Society of Upper Canada, University College (1859), the Ontario Parliament Buildings (1892), the City Hall (designed 1890, completed 1899), the Royal Alexandra Theatre (1907) and Union Station (opened 1927). Later eras have largely produced more and bigger office buildings, hotels and shopping centers. However, some newer buildings, like the new City Hall (1965) and Roy Thomson Hall (1982) are noteworthy structures.

An example of the sheer magnitude of construction in the core downtown area is the First Canadian Place building, located at the corner of King Street and Bay Street. This 72 story office tower offers approximately 2.7 million square feet of office and retail space and is the

operational head office of the Bank of Montreal. At 978 feet tall, the structure is known as & D Q D G D ¶ V W D O O H V W E X V L Q H V V B X L O G L Q J L Q W K H V X P P H U R I 2 0 H and records a daily pedestrian traffic of 83,000 people. A picture is provided below.

Figure 2-2 Image of First Canadian Place

Today, T R U R Q W R ¶ V largest industries are financial services, real estate, and wholesale and retail trade. Several head banking offices are located in Toronto. In addition, Canadian insurance and investment companies are centrally based in the city, as well as the Toronto Stock Exchange. The core downtown area is also home to many Canadian head offices of industrial, resource, and retail corporations, and of American or multinational companies. Today, there are approximately 90,000 businesses in the City of Toronto, and about 196,000 businesses in the Toronto region. The city's workforce is chiefly based in professional, clerical, manufacturing, retail and service work, in that order. Toronto struggled with the effects of the Free Trade

Agreement with the U.S., as well as with the recession of the early 1990s and the global financial crisis of 2008, resulting in high unemployment. The economy has slowly improved. As of June 2014, Tor R Q W R ¶ V X Q H P S O R \ P % H Q W U D W H Z D V

Buses, trucks and cars use Highway 401, a multi-lane crosstown throughway, and Highway 400, now the prime route north. Automobile routes such as the Gardiner Expressway along the southern edge of downtown, or the Don Valley Parkway running north, bear heavy loads. Traffic congestion can be extreme during peak travel times. In a recent study released by TomTom, Toronto was ranked as the second worst city in Canada for traffic congestion. However, the City has successfully maintained its public streetcar, bus and subway systems. According to 2013 data 7 R U R Q W R ¶ V L L L Transit network averaged approximately 900,000 passenger trips each weekday, operating four lines and 69 stations. The Government of Ontario also operates a rail and bus transit system called GO Transit in the Greater Toronto Area, which transports over 250,000 passengers every weekday.

Toronto has underground infrastructure for fresh water distribution, as well as for natural gas distribution. Much of the electrical infrastructure is also located underground due to limited aboveground space. Toronto is so densely populated and saturated that its local landfills reached capacity and municipal waste had to be shipped elsewhere. Due to the extremely tall buildings located in the core downtown area, radio towers have been built still higher in order to accurately transmit signals.

2.2 3RSXODWLRQ RI 7RURQWR DQG

According to population and dwelling account information collected by the Government of Canada[1], the total population of Ontario in 2011 was 12,851,821. Of this total population, the city of Toronto is categorized as a large urban area with a population of over 5 million, or nearly 40% R I 2 Q W D U L R ¶ V total population. The next largest urban area is the Ontario part of Ottawa-Gantineau metropolitan area with a total Ontario population of 697,267, followed by Hamilton with 670,580 residents and Kitchener with 444,681 residents. The other 11 cities classified as large urban areas have between 100,000 and 370,000 residents according to 2011 data. The remainder of Ontario is comprised of 19 medium cities and 239 small cities. Figure 2-3, shown below, is a graph with data points demonstrating population density, or the number of people per square kilometer, for the large urban and medium cities in Ontario. Toronto has a population density of 2931 people per square kilometer.

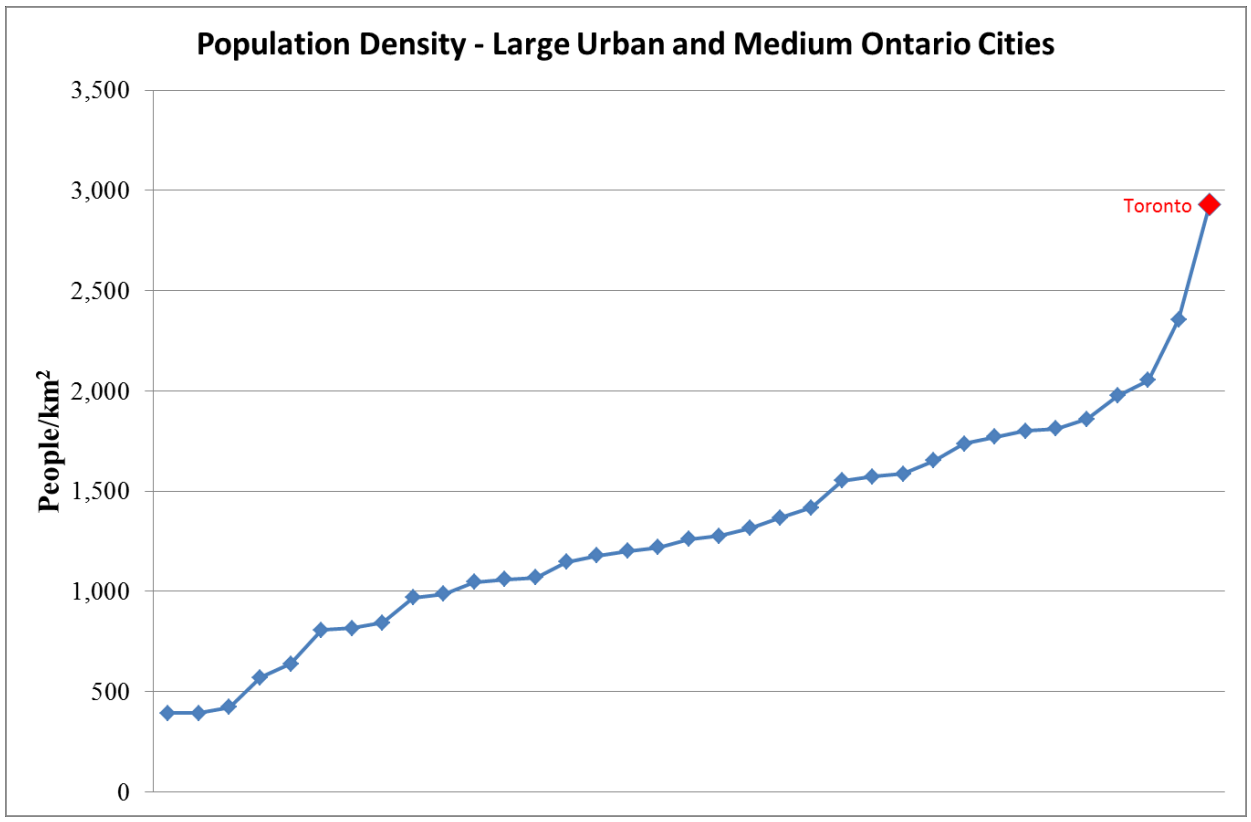

Figure 2-3 Ontario Metro Area Population of Large Urban and Medium Cities

2.3 8QLTXH 2SH&URDQWGLQWLRQV

There are many unique operating conditions that apply to a highly dense urban area. For the purposes of this report, the city of Toronto will be referenced in accordance with the effect these conditions have on Toronto Hydro Electric System Limited.

7RURQWR¶V FRUH GRZQWRZQ DUHD FRQVLVWV RI FORVHO\ S commercial properties and apartments and condominiums. The extreme urban density experienced in the city of Toronto creates a variety of unique assets or factors that affect Toronto Hydro¶V DELOLW\ WR HIIHFWLYHO\ DQG HIILFLHQWO\ VHUYH LW customers.

Toronto Hydro operates a unique and dated downtown underground system, which features a network of secondary-YROWDJH FDEOHV 7KH QHWZRUN¶V FRQILJXUDW RU ³*ULG 1HWZRUN´ GHSHQGLQJ RQ WKH WLPH RI FRQVWUXI downtown service for a high rise building is provided from a vault with two transformers, each FRQQHFWHG WR WZR GLIIHUHQW IHHGHUV 2WKHU EXLOGLQJV due to the large industrial load in the downtown area, Toronto Hydro installs and maintains additional regulating and safety devices, such as transfer trips. This network contains many redundancies to buildings throughout the downtown area and is not typically used in new construction, but is maintained by Toronto Hydro to fulfill expectations of reliability.

'XH WR WKH FLW\¶V DJH WKH RsUdonHrQ of legacy systeQ IUDVWU configurations that correspond with the surges of growth Toronto has experienced in past decades. In addition to the secondary network and complex vault configurations, as described above, Toronto Hydro¶V V\VWHP includes rear-lot construction, overhead box construction, and Paper Insulated Lead Cable (PILC) cable. All of these distinguishing characteristics require additional skills and costs to maintain and operate compared to utilities that do not serve dense urban and city environments.

Many buildings in Toronto have been built to the edge of the lot line which leaves no room for burying electrical equipment. This requires Toronto Hydro to pull network and connection cables to stations with available capacity that are further away. It also means that as the population grows and shifts, Toronto Hydro will need to build new stations or modify existing stations to accommodate additional breaker positions. Finally, as new high rise buildings are constructed in the limited space of the downtown core area, unconventional connection arrangements must be applied, which increases connection and expansion costs per customer.

Many overhead structures in Toronto Hydro¶V WHUULWRU\ LQFOXGH DQ RXWGD design, which is being replaced over time with a more modern structure. There are limitations for working near or with box construction, including safety concerns and the need for special training due to the large number of closely positioned live circuits. In residential communities, rear-lot facilities have become difficult to maintain over the years as a result of limited access for utility equipment. Bucket trucks cannot be used and insulated protective equipment must be in place before for work can be completed safely.

Along with the Ontario EPA regulations for working around and disposing of lead, additional regulations for PILC increase costs due to additional administrative staff, certification of vehicles, and safety training for field workers.

Furthermore, Toronto Hydro crews have physical limitations to contend with, such as equipment located in confined spaces, minimal road or sidewalk space available, and infrastructure installed under roadways. When working in a confined space, legislative requirements state that a dedicated observer must be present, so Toronto Hydro often needs to dispatch crews with multiple workers in order to be compliant. Limited sidewalk and road space causes issues with staging materials and fitting new infrastructure into existing corridors. Underground infrastructure is often located in the middle of roadways, which translates to safety concerns, as well as the need for assistance with traffic control and a schedule for working during non-critical hours. In addition, the city experiences heavy traffic congestion, which can impact the response time that a crew is able to arrive at a job site to complete a repair. These factors increase the need for staff and the difficulty of completing work safely and quickly.

Because it is an older city, Toronto has a mature urban setting, which means there may be excavation challenges when performing underground work, such as abandoned infrastructure that iV QRW PDUNHG RQ WKH FLW\¶V UHFRUGV DORQJ ZLWK RW must be preserved and worked around. In addition, Toronto Hydro utilizes a special communications infrastructure to support communications between field staff and the control room, and to enable collection of Smart Meter Data. Toronto Hydro has an extensive two-way radio system, as well as 10 communications antennae located on top of high rise towers to ensure

reliable radio communications. In addition, due to the number of multi-story buildings, more wireless collectors are needed for Smart Meter Data Collection and SCADA communication.

3 6HUYLFH 7HUULWRU\ (QYLUR

To answer the question of how different types of service territory environments affect the level of required infrastructure and associated capital, six areas have been identified within Ontario of varying customer densities and types. These areas are not all within the same service territory of a single electric distribution provider. Rather they were identified by their characteristics and evaluated on an individual basis. These six areas will be referred to as the following for the purposes of this report:

- Area 1 ±Rural
- Area 2 ±Suburban Residential
- Area 3 ±Suburban Commercial
- Area 4 ±Urban Residential
- Area 5 ±Urban Commercial
- Area 6 ±Metro / Urban Core

All locations were analyzed using Google Earth and PSE internal ESRI GIS maps. The land mass of these six areas ranged from approximately 0.28 to 4.13 square kilometers and were within 50 kilometers from each other. Exhibit I illustrates the general location of each area, the proximity of the locations to each other, and the land mass for each location by square kilometer.

With the exception of the urban commercial area, the class of customers and associated proprieties were identified for each area. For residential properties, Google Earth was used to identify the number of single-family or multi-family homes. For commercial properties, a general category was established (such as office, retail, etc.) and total floor space was estimated for each building.

The following provides a summary of each area, including a description of the assessment that was completed and a screenshot image from Google Earth.

3.1 $UHD±5XUDO

The selected rural area (Area 1) is located approximately 40 km north-northwest of downtown Toronto. The area is classified by PSE as a low density area primarily consisting of farm land, farm operation buildings, single-family homes, and recreational areas. The land mass of the area was measured at 4.13 square kilometers. An aerial image of Area 1 is shown in Figure 3-1.

Figure 3-1 Rural Area

8QGHU 36(¶V DVVHVVPHQW single-family homes were identified, as well as two dairy operations, two livestock operations, and seven distinguishable farmed fields (six of which appeared to be crops and one of which appeared to be a tree farm). In addition, one golf course and one commercial landscaping business were found in the area. Single-family homes were designated as such based on what appeared to be a private residence, as opposed to buildings related to farm operations, such as barns or storage sheds. In the identification of a dairy, livestock, or crop farm, buildings used for farm operations were not individually identified, but these types of buildings were found on these properties.

3.2 $UHD±6XEXUEDQ 5HVLGHQWLDO

The selected suburban residential area (Area 2) is located approximately 24 km north of downtown Toronto. The area is classified by PSE as a saturated and moderately dense residential area consisting of mostly single-family homes. Buildings with commercial or retail functions and other properties of interest were also identified. The land mass of the area was measured at 1.36 square kilometers. An aerial image of Area 2 is shown in Figure 3-2.

Figure 3-2 Suburban Residential Area

8QGHU 36(¶V DVVHVVPHQW Over [illegible] single-family homes were identified, many of which have sizable private green space. In addition, a strip mall with a combination of retail and commercial businesses was identified in the northwest corner of the selected area. The identifiable businesses included four food retail operations, one bank, one dentist, and one pharmacy. In addition, the reviewed area included one elementary school located in the center of the area, and one community center, located in the northeast corner of the area. The community center includes a large building, a baseball diamond, a soccer field, and several tennis courts.

3.3 $UHD±6XEXUEDQ &RPPHUFLDO

The selected suburban commercial area (Area 3) is located approximately 24 km north of downtown Toronto. The area is classified by PSE as a moderately dense commercial area consisting of mostly commercial office space, as well as some retail operations, such as restaurants or small stores. The majority of the buildings in this area ranged from two to four stories. The land mass of the area was measured at 1.04 square kilometers. An aerial image of Area 3 is shown in Figure 3-3.

Figure 3-3 Suburban Commercial Area

8QGHU 36(¶V DVVHVVPHQW of commercial properties were identified. The property with the largest floor space is estimated to be 29,260 square meters, while the property with the smallest floor space is estimated to be 1,390 square meters. The total commercial floor space within the area is estimated to be 491,450 square meters.

3.4 $UHD±8UEDQ 5HVLGHQWLDO

The selected urban residential area (Area 4) is located approximately 3 km north-northwest of downtown Toronto. The area is classified by PSE as a highly dense residential area consisting of single-family homes, apartments and condominiums, and retail operations, like restaurants and small stores. The majority of the properties in this area consisted of single-family homes, nearly all of which were side-by-side two-story duplex construction with two single-family homes located in one structure. The land mass of the area was measured at 0.39 square kilometers. An aerial image of Area 4 is shown in Figure 3-4.

Figure 3-4 Urban Residential Area

8QGHU assessment, approximately 1000 single-family homes and 250 individual apartment or condominium units were identified. Also present in the area were approximately 75 small businesses, including approximately 25 restaurants and 50 retail storefronts. In addition, the area included several churches, two schools, and one medical clinic.

3.5 $UHD±8UEDQ &RPPHUFLDO

The selected urban commercial area (Area 5) is located approximately 2 km north-northeast of downtown Toronto. The area is classified by PSE as a highly dense commercial area consisting of mostly commercial office space. The land mass of the area was measured at 0.32 square kilometers. An aerial image of Area 5 is shown in Figure 3-5.

Figure 3-5 Urban Commercial Area

3.6 $UHD±0HWUR 8UEDQ &RUH

The selected metropolitan/core downtown urban area (Area 6) is located directly in the heart of downtown Toronto. The area is classified by PSE as a highly dense, mostly commercial area consisting of skyscrapers that serve as office towers, apartments and condominiums, hotels, and retail operations, including restaurants and large and small stores. The structures in this area range from 2 to 72 stories. The land mass of the area was measured at 0.28 square kilometers. An aerial image of Area 6 is shown in Figure 3-6.

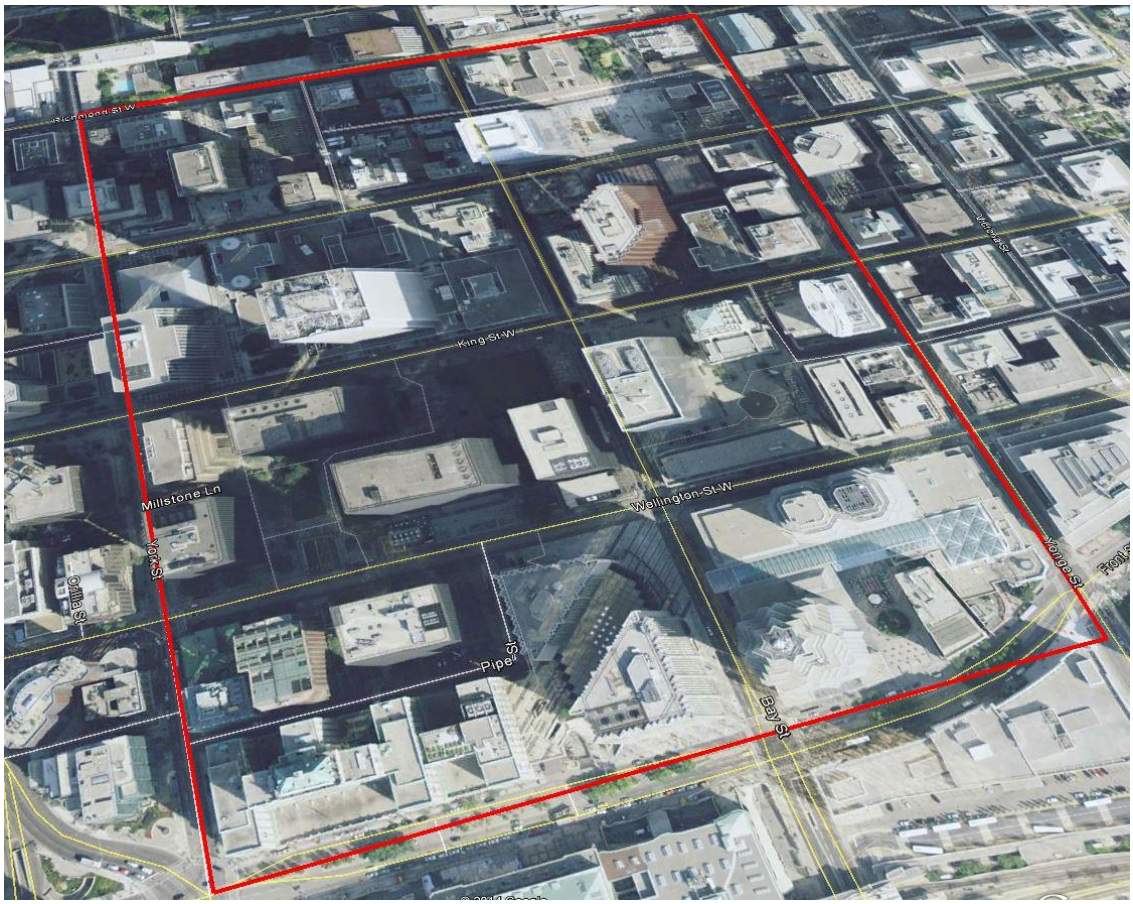

Figure 3-6 Core Downtown Area

8QGHU 36(¶V DVVHVVPHQW DSSURDFK, properties were identified. The property with the largest floor space is estimated to be 251,000 square meters, while the property with the smallest floor space is estimated to be 670 square meters. Approximately 75% of the properties in the area were 10 stories or taller. The total commercial and residential floor space within the area is estimated to be 2,500,000 square meters.

4 /RDG 'HQVLW\

For each of the studied areas, PSE estimated the coincident peak load based on a combination of factors. These factors included:

- Type of customers (ex. single-family home, retail, office space, medical, etc.)
- Quantity of each customer type
- Enclosed floor space of each customer type

Being that Toronto Hydro ¶V VHUYLFH WHUULWRU\ FRYHUV $UHDV DQG provided estimated coincident peaks for the corresponding areas to be used as a comparison.

4.1 $UHD± 5XUDO

There were a total of 41 services estimated within Area 1. The customer types included residential single family, farm ± livestock, farm ± dairy, farm ± crop, and commercial ± landscaping. The total non-coincident demand for the area was estimated at 850 kW. Applying a coincident factor for each customer type, the coincident peak demand was estimated at 582 kW. Table 4-1 VKRZV D VXPPDU\ RI 36(¶V HVWLPDWH

As previously mentioned $UHD LV ZLWKLQ 7RURQWR +\GURV VHUYLFH DWH 3 6 (¶V HVWLPDWH Toronto Hydro also established an estimated coincident peak load for the same area. This estimate was reported at 77,800 kVA. Assuming a 90% power factor, this equates to 70,020 kW, ZKLFK LV ZLWKLQ RI 3 6 (¶V HVWLPDWH

5 &DSLWDO &RVWV

A combination of developed electrical design plans by PSE and actual installations identified by Toronto Hydro were used to identify required electric distribution infrastructure to serve each of the six areas. The PSE design plans included routing overhead and underground distribution lines, placing transformers to serve the residences or businesses, and running secondary service drops to homes and other buildings located in each area. Based on the design and actual installations, a cost estimate was created by breaking down the electric distribution infrastructure into the quantity of individual poles, switches, duct banks, vaults, conductors, and transformers needed to supply electricity to the area.

Following the quantification of infrastructure facilities for each area, replacement cost estimates were established. These estimates were also based on a combination of construction cost data developed and maintained by PSE, as well as actual unit construction contract costs provided by Toronto Hydro.

5.1 $UHD±5XUDO

For design of the Rural area, it was assumed that the area will be served by an overhead three-phase main line and single-phase tap lines. Residences and farms located close to the road would be served by overhead line and those with long driveways would be served by underground line fed off of the overhead line. Both overhead and pad-mounted transformers were used in the design. The minimum size of transformer used was 25 kVA and approximately one transformer would serve each residence or farm. The design utilizes a combination of overhead and underground infrastructure. The total estimated cost of a replacement installation is estimated at $963,995. A breakdown of major infrastructure components and costs are shown in Table 5-1.

5.6 $UHD±0HWURSROLWDQ&RUH

For design of the Core Downtown / High Density Urban area, it was assumed that the area will be served by underground, large conductor, three-phase lines. The underground conductors would be run in multi-duct banks and the equipment would be located in underground vaults. Taps would be made to the main lines through the use of switches and then routed through the downtown area. Extensive use of network protectors was included in the Core Downtown design to ensure very reliable service. All the transformers used in the design were vault type and were sized to serve the load level assumed. The costs associated with this area are significantly higher than the other five areas due to the difficulty in constructing and operating in such a congested area. The design utilizes almost entirely underground infrastructure. The total estimated cost of a replacement installation is estimated at $105,901,695. A breakdown of major infrastructure components and costs are shown in Table 5-6.

6 5HVXOWV

In reviewing the estimated coincident peak load, land mass, required electric infrastructure, and capital cost of the infrastructure for each area, a number of observations can be made. These observations include the demand density, infrastructure cost density, and infrastructure cost effectiveness.

The demand density is the amount of coincident demand within a unit of land mass. In the case of this analysis, kW per square kilometer was used. As shown in Table 6-1, the range greatly varies from 141 kW per square kilometer for the studied rural area, to 22,470 kW per square kilometer for the urban residential area, to 238,140 kW per square kilometer for the metro/urban core area.

Table 6-1 Demand Density Table

	Rural	Suburban Residential	Suburban Commercial	Urban Residential	Urban Commercial	Metro / Urban Core
Demand Density (kW/km^2)	141	3,656	12,395	22,470	68,185	238,140

The results are also illustrated in Figure 6-1. Excluding the rural area, the demand density from one area to the next increases by a factor of 1.8 to 3.5.

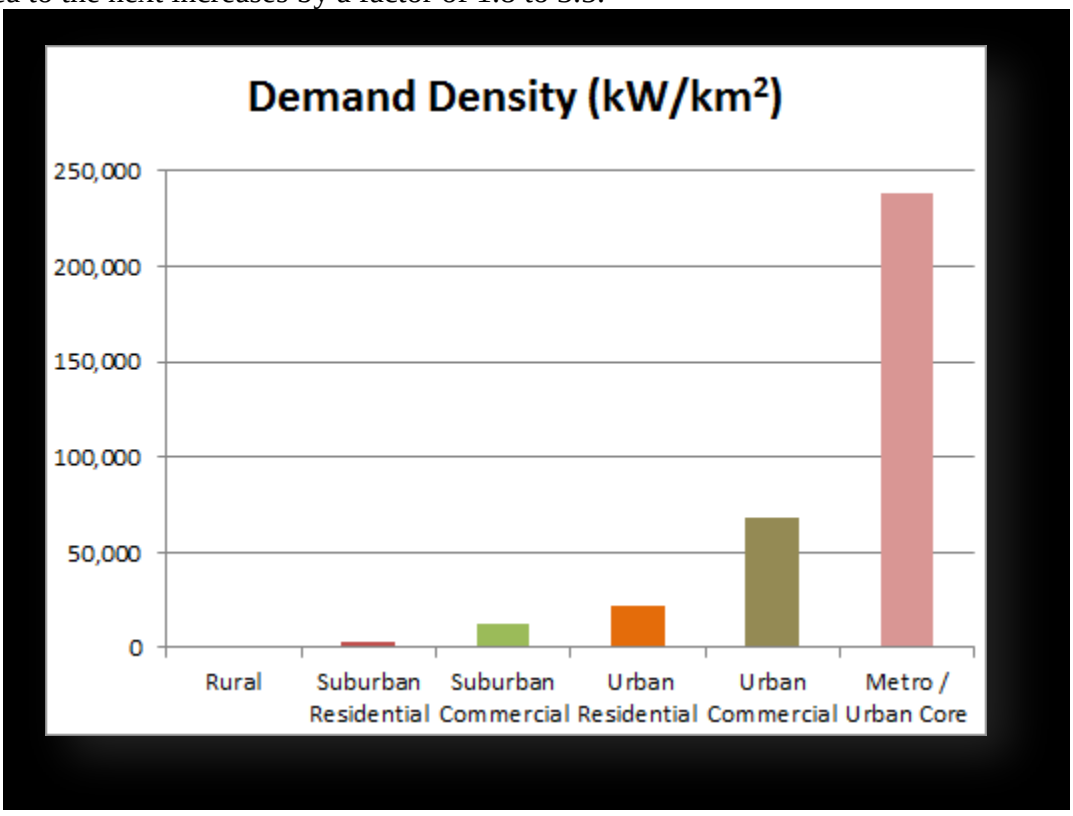

Figure 6-1 Demand Density

The infrastructure cost density, or plant cost density, is the amount of required infrastructure cost within a unit of land mass. In the case of this analysis, dollars per square kilometer was used. As shown in Table 6-2, the range greatly varies from $233,000 per square kilometer for the studied rural area to $12,690,000 per square kilometer for the urban residential area to $372,762,000 per square kilometer for the metro/urban core area.

Table 6-2 Infrastructure Cost Density

	Rural	Suburban Residential	Suburban Commercial	Urban Residential	Urban Commercial	Metro / Urban Core
Plant Cost Density ($1,000/km^2)	$ 233	$ 2,612	$ 5,445	$ 12,690	$ 78,826	$ 372,762

The results are also illustrated in Figure 6-2. Excluding the rural area, the infrastructure cost density from one area to the next increases by a factor of 1.7 to 6.2.

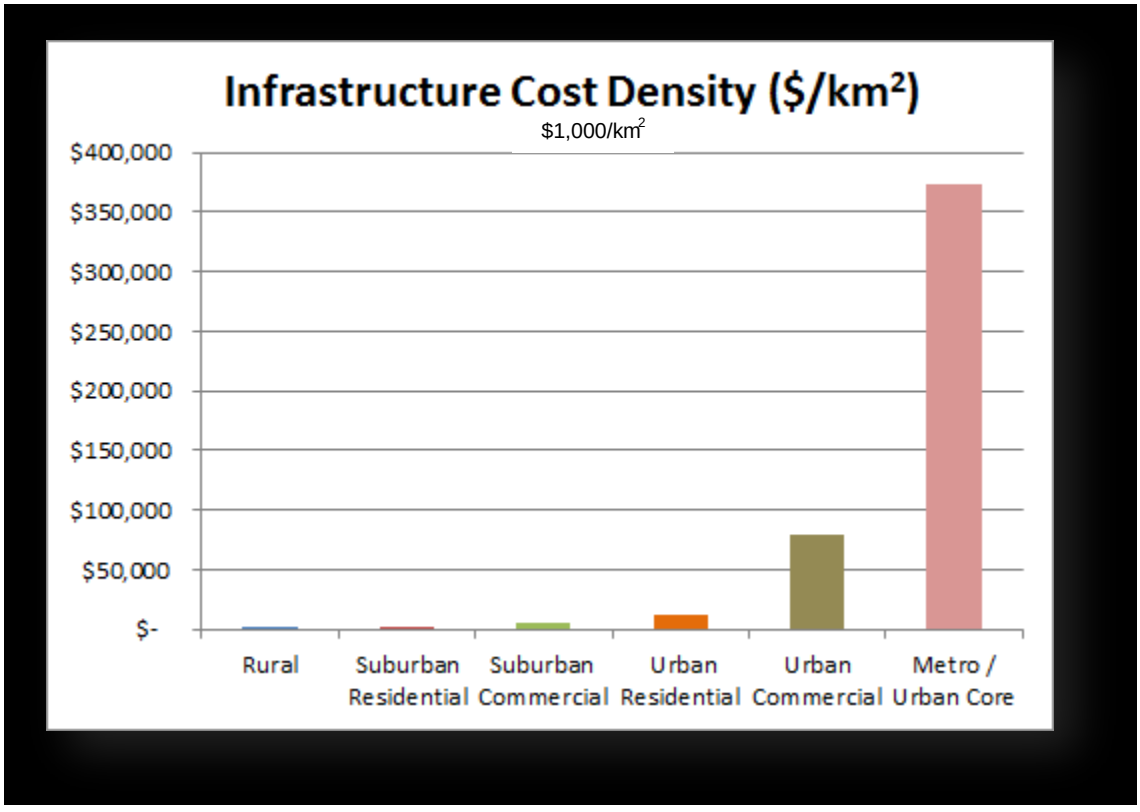

Figure 6-2 Infrastructure Cost Density

The infrastructure cost effectiveness is the cost of infrastructure required to serve a unit of coincident demand. In the case of this analysis, dollars per kW was used. As shown in Table 6-3, the range varies from $1,700 per kW for the studied rural area, to $600 per kW for the urban residential area to $1,600 per kW for the metro/urban core area.

Table 6-3 Infrastructure Cost by Area Type Table

	Rural	Suburban Residential	Suburban Commercial	Urban Residential	Urban Commercial	Metro / Urban Core
Plant Cost/Demand ($/kW)	$ 1,700	$ 700	$ 400	$ 600	$ 1,200	$ 1,600

The results are also illustrated in Figure 6-3. The infrastructure cost effectiveness from one area to the next increases or decreases by a factor of 1.3 to 2.3.

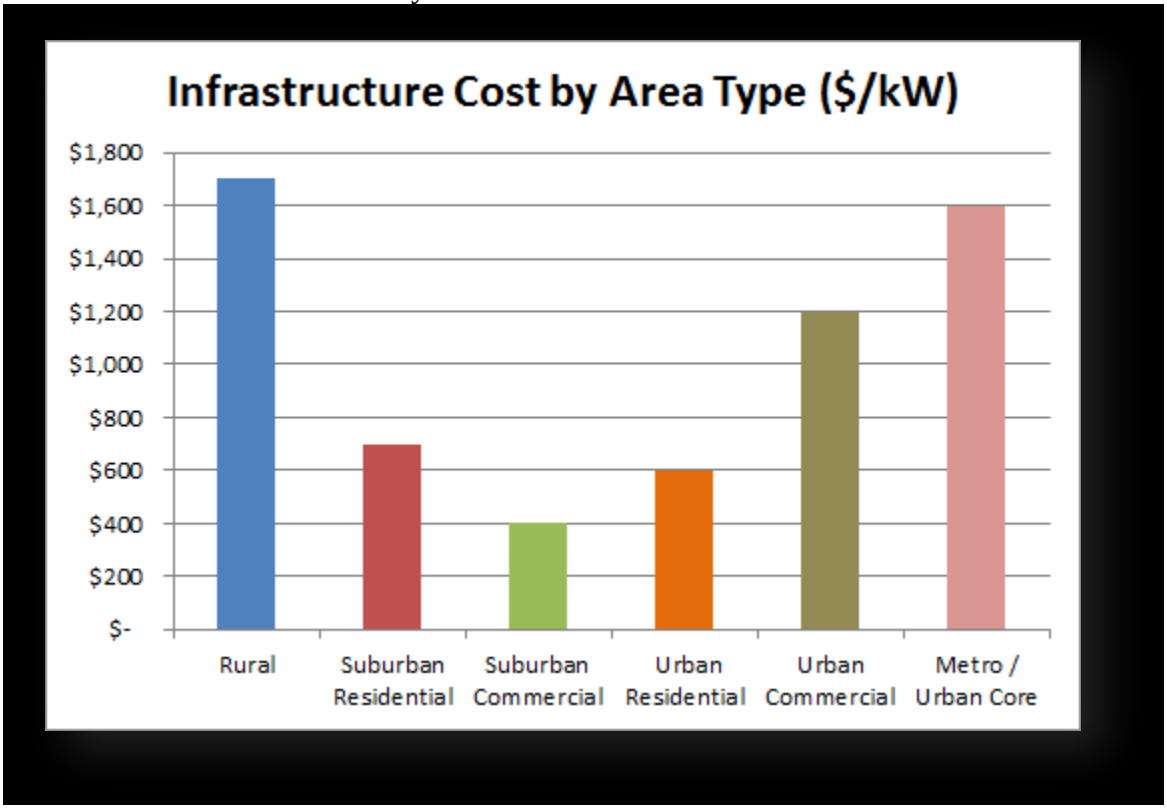

Figure 6-3 Infrastructure Cost by Area Type

It can be easily seen that the cost effectiveness of required infrastructure for the six areas studied does not result in an upward or downward trend as demand density increases. Rather, the cost effectiveness represents a U-shape where rural and metro/urban core areas are the least cost effective in terms of required infrastructure to serve the loads within the given environments. Conversely, suburban residential, suburban commercial, and urban residential areas are the most cost effective environments to serve.

In conclusion, the results of this report demonstrate that higher infrastructure costs per kW load served should be expected from a utility when serving a metro/urban core area. As demonstrated by the graphs above, both demand density and infrastructure cost density are extremely high in a metro/urban core service territory in comparison to all other types of service territories. The physical limitations for a utility operating within a highly dense, saturated downtown environment increase the costs associated with maintaining and installing electrical infrastructure to the extent that serving a core downtown area is almost as inefficient as serving a rural area. :LWKRXW VDFULILFLQJ D XWLOLW\¶V HIILFLHQF\ WR GRZQWRZQ FXVWRPHUV, LQ SUR efficiency is simply limited by the operating conditions a utility faces in this type of environment. While a utility should still fulfill all expectations of efficiency, regardless of service territory, these expectations should be reflective of the developed environment served.

2. PEG and PSE Reliability Benchmarks

PEG states that PEG and PSE agree that THESL's 3(*'V ILQGLQJV GLIIHU VRPHZKDW IURP WKRVH RI 36(¶V EHORZ H[SHFWHG OHYHO 3(* also below benchmarks, but not as far below as PSE found. However, the results seemingly differ because in the PEG Report, PEG was referring to the more dated time period of 2009-2011, and in the PSE September Report, we used the most recent time period of 2010-2012, it has THESL at 49% below SAIDI benchmark values, as compared to the 48% below in the PSE September Report. Both PSE and PEG find that THESL's SAIDI is projected to be 100% below benchmark values by 2019.

The fact that PEG's results are nearly identical to PSE's is slightly obscured by modifying the graph that PSE provided in its September Report, comparing THESL's actual SAIDI values to benchmarks (see Figure 1 in PSE's September Report). PEG's calculated SAIDI benchmarks (green line) PSE's September Report. Figure 1 below shows the three values and THESL's actual and projected SAIDI results (red line). Figure 1 below shows the three values and illustrates why there is little difference in benchmarks.

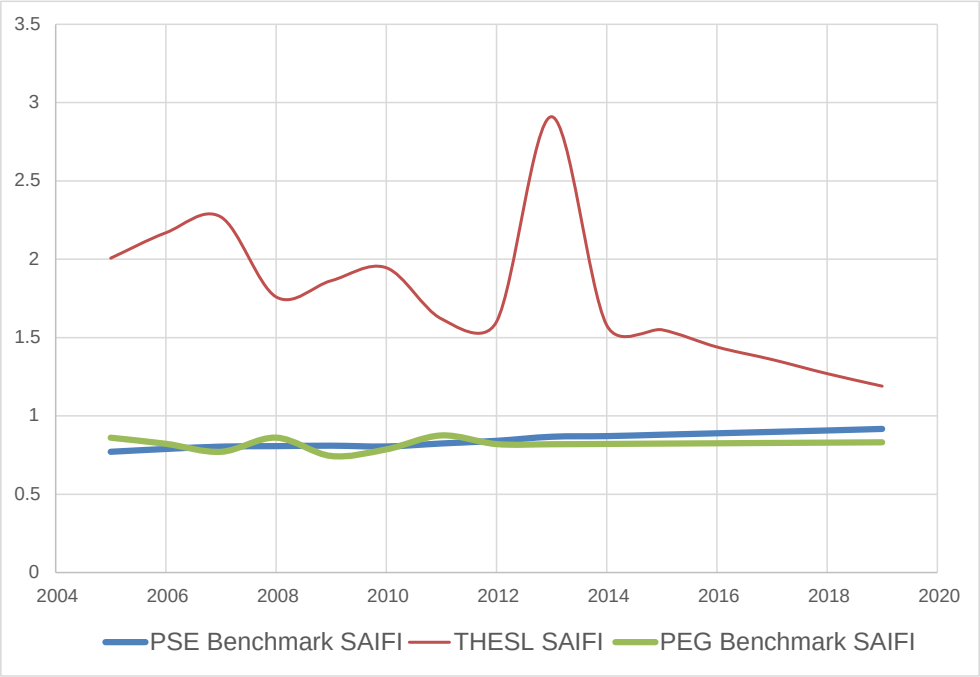

Figure 1 SAIDI: PSE, PEG, and Actual

As PSE has already noted, PEG has arrived at nearly identical benchmarks. In Figure 2 below, PSE has added PEG's benchmarks (green line) to PSE's graph of THESL's actual/projected results (red line). Notice again how similar the PEG and PSE reliability results are.

[1] Page 5 of the PEG Report.

Figure 2 SAIFI: PSE, PEG, and Actual

'HVSLWH 3(*¶V FRQWHQWLRQ WR WKH FRQWUDU\ WKHUH LV 3(*¶V 6$,', EHQFKPDUN 6$,', those in PSE's Exhibit No. 6 (DQG the only difference arises from the different time periods being compared. The PEG Report focused on the reliability performance scores in the past (2009-2011) rather than using the Custom IR projections to formulate conclusions. Although PEG has conducted this analysis, the PEG Report did not display the future reliability projections (THESL is projected to improve in this area). 7KLV LV LQFRQVLVWHQW ZLWK 3(*¶V total costs, where PEG¶V FRQFOXVLRQV ZHUH EDVHG RQ 7+(6/¶V UHVXOW

PEG notes that it made a numb HU RI UHOLDELOLW\ GDWD VHW UHYLVLRQV based on whether the data could be verified with the source document, or whether the value aligned ZLWK WKH FXUUHQW GRFXPHQW 3(* VWDWHV RQ SDJH [3] RI LWV RPLVVLRQV ´ 3(*¶V exaggerated. The adjustments PEG made WR 36(¶V UHOLDELOLW are minor revisions. PSE made a good faith effort to gather data from hundreds of sources scattered around the internet over the course of many years. PEG made minor changes that did not have a PHDQLQJIXO LPSDFW RQ WKH UHVXOWV 7KH 36(* WKDW WKH this fact.

The consistency in 7+(6/¶V UHVXOWV is notable, given that two separate experts used different data sets, time periods, and models to derive them. While PSE is unconvinced WKDW 3(*¶V included variables should have replaced those in PS(¶V 6HSWHPEHU issue is of little WKH consequence in this case, given the extreme similarity of results.[2] The similar results should provide the Board with a high level of confidence in the reliability benchmarking provided by PSE in this proceeding.

[2] PEG inserted cooling degree days, heating degree days, undergrounding, and precipitation into the models and took out percent forestation, customer density, wind, and the number of customers from the PSE models.

3 7RWDO &RVW 5HVXOWV DQG 0RGHO

As the experience of incentive regulation in Ontario has shown, benchmarking tends to be an iterative process. Putting together data sets, explanatory variables, and models takes time and requires input from multiple stakeholders. Throughout this process, benchmarking evaluations tend to become more accurate, comprehensive, and trustworthy, resulting in improved evidence to better inform decisions.

5 H O D W L Y H th W Generation 3 (* ¶ V Incentive Regulation benchmarking model, the PEG Report made strides in conducting a fair total cost benchmarking evaluation in relation to THESL. This was primarily done by using the U.S. data set.[3] PSE agrees with PEG that excluding uncollectible account expenses from the U.S. data is appropriate, given that bad debt expenses were excluded for all of the Ontario utilities.[4] 3 (* DOVR LQFOXGHG 7 + (6 / ¶ V VPDUW PHWHU definition. While this is unfair to THESL, since only a handful of U.S. utilities in the dataset have fully deployed smart meters, in an effort to only focus on major issues, PSE will QRW PRGLI\ 3 (* ¶ V treatment of smart meters in the Reply Report results.

projected costs and those of the rest of the sample. The PSE approach is to simply subtract out bad debt expenses in the projected data so the cost definition matches the rest of the sampled data.

3.2 $GMXVWPHQW WR 'HPDQG 0DQDJHPHQW ([SHQV

PEG H[FOXGHG WKH HQWLUHW\ RI WKH ³FXVWRPHU VHUYLFH DQ
utilities, in an effort to exclude CDM expenses for U.S. utilities, similar to the Ontario cost definition. However, three problems arise with this: 1) THESL and other Ontario utilities also incur non-CDM customer service expenses that are not being excluded by PEG, creating a cost comparability problem and making the treatment advantageous to the U.S. and disadvantageous to THESL; 2) Eliminating a large expense category makes the total cost definition far less
FRPSUHKHQVLYH GHVSLWH WKH %RDUG¶V SUHIHUHQFH IRU FR
There is no assurance that U.S. utilities record all of their CDM expenses within the customer service and information cost category. [5]

To solve the first two problems, PSE added in THESL ¶V &'0 expenses and re-added customer service and information expenses back into the total cost definition for U.S. utilities. This made the cost definitions comparable between THESL and the U.S. sample, addressed 3(*¶V FRQFHUQ and made the cost definitions far more comprehensive than the definition used by PEG (which excludes all customer service and information expenses).

It is not known if all U.S. utilities report CDM costs in the customer service category. PEG claims on page 25 of its Report that CDM often constitutes the largest expense for the customer service and information expenses, thus somehow justifying the exclusion of the entire cost category for the U.S. sample only (THESL non-CDM customer service and information expenses are still included in the PEG definition). However, PEG does not provide any evidence that CDM constitutes the largest expense component of the customer service and information category, when asked in 1-THESL-24 (d).

To assist with this issue, PSE contacted FERC directly; the ³FERC Form 1 team´ explained to PSE that each state records these expenses differently, and there is no clear guidance on the issue. More specifically, the FERC Form 1 team stated:

[5] PEG claims in its response to 1-THESL-24 (a) to have subtracted out all of the customer service and information expenses not related to CDM for both the historical and projected THESL costs. This statement is incorrect, based on PSE ¶ review of PEG ¶ working materials, where no such adjustment is apparent nor mentioned in the PEG Report.

> Demand-side management (DSM) is a distribution activity regulated at the local jurisdictional level, not at the Federal level. Each jurisdiction sets its own methods for the accounting for and recovery of DSM activities, including direct expensing or recovery through of some or all of the costs in a regulatory asset. They may also have specific reporting requirements for DSM activities. /RRN WR HDFK FRPSDQ\¶V WDULII jurisdictional authority, for specific information on the treatment of DSM activities, and in which regulatory accounts such activity is charged.[6]

In an effort to provide conservative evidence in this proceeding and only address clear-cut necessary changes, PSE will assume that U.S. utilities report all CDM activities in the customer service and information expense category (even though this is likely not the case for all U.S. utilities). 7KXV 36(LQFOXGHG DOO RI ,7¶V DQG 6 /¶V SURMHFWHG 6 0 H[SHQGLWXUHV in 2015. Along with the smart meter expense inclusions for THESL, this assumption also makes the PSE Reply Report less favorable to THESL (e.g., if we were able to ascertain all CDM expenses for each utility and how they were recorded 7+(6/¶V UHVXOWV ZRXOG PRV better).

3.3 $GMXVWPHQW WR GHO 6SHFLILFDWLRQ ZLWK 8UEDQ &RUH 9DULDEOHV

3(* PRGLILHG 36(¶V 8 6 PRGHO E removing the urban core variable and including a high voltage capacity variable.[7] In this PSE Reply Report, following established industry practice, PSE removed 3(*¶V KLJK YROWDJH YDULDEOH EHFDXVH LW LV VWDWLVWLFDOO\ LQVLJQLILFDQW DQG LQFRUUHFWO\ signed, and re-included 36(¶V XUEDQ FRUH YDULDEOH ZKLFK LV VWDWLVWLFDOO\ VLJQLILFDQW at a 99% confidence level.

The fact that the high voltage variable is signed incorrectly (it should be positive, but is negative in the PEG Report Corrections) and statistically insignificant at even the 90% confidence level disqualifies the variable from being included. Business condition variables that are incorrectly signed or statistically insignificant are not included in econometric benchmarking mo GHOV 3(*¶V use of this variable, and its exclusion of the urban core variable, are not in-line with benchmarking best practices. PEG has stated the need for business condition variables to be correctly signed and statistically significant in a report to the Board. In a report dated March 20, 2008 [3] %HQFKPDUNLQJ WKH &RVWV RI 2QWDULR 3RZHU'HOLYHU\ ´ RQ SDJH PEG writes:

> All included business conditions were required to have elasticity estimates that were plausible (e.g. sensibly signed) and significantly different from zero. All variables found to be statistically significant were included in the final model. Since, additionally, we consider for inclusion only variables that are predicted by theory or that seem relevant on the basis of our industry experience, the model is not a ³black box´ that confounds attempts at earnest appraisal.

In this proceeding, PEG has provided conflicting models with different signs for the high voltage variable, but LQ ERWK PRGHOV WKH YDULDEOH LV VWDWLVWLFDOO\ 2014 Report provided a model in Table Three that showed a statistically insignificant high voltage variable, but one that was positively signed. Then in PEG Report Corrections, PEG submitted a revised Table Three; this time the high voltage variable was negatively signed, but still statistically

[6] Correspondence from FERC.

[7] PEG also removed the percent undergrounding variable, although failed to mention this change or explain why the change occurred in the PEG Report.

insignificant. Neither model meets the benchmarking best practice principles previously stated by PEG.[8]

7KH $SSHQGL[RI 36(¶V 6HSWHPEHU 5HSRUW SURYLGHG DQ HQJL
will have different cost challenges based on the development characteristics of their service territories. Costs are found to be well over double for urban service territories, relative to suburban RQHV ([FOXGLQJ WKH XUEDQ YDULDEOH FUHDWHV DQ RPLWW
disadvantages THESL in the process.

Excluding the urban core variable also violates benchmarking best practice. PEG wrote in a 2010 report written on behalf of Public Service Company of Colorado:

> One important result is that an econometric cost model can yield *biased* predictions of the true benchmark if relevant business condition variables are excluded from the model. It is therefore desirable to include in an econometric benchmarking model all business conditions which are believed to be relevant, for which good data are available at reasonable cost, and which have plausible and statistically significant parameter estimates.[9]

7KH 36(XUEDQ FRUH YDULDEOH LV QHFHVVDU\ WR LQFOXGH
LQFOXVLRQ 3(*¶V KLJK YROWDJH YDULDEOH GRHV QRW PHHW
high voltage variable for the urban core variable is, therefore, a necessary change to the total cost model and one that is made in this PSE Reply Report.

PEG summarizes this issue by writing the following on page 3 and 4 of the PEG Report:

> 7KH WKLUG VWHS RI 3(*¶V DQDOVLV LV WR DGG DQ

> model because it is redundant, inappropriate in electricity distribution benchmarking, and appears to distort the estimated impact of other business condition variables (especially undergrounding).

PEG seems to have added new requirements for including business condition variables. PEG FODLPV WKDW WKH XUEDQ YDULDEOH LV ³UHGXQGDQW´ LQDSSU
and appears to distort the estimated impact of other business condition variables (especially XQGHUJURXQGLQJ ´ 36(DGGUHVVHV HDFK RI WKHVH FRQFHUQ

3.3.1 The Urban Core Variable Is Not Redundant

On page 29 of the PEG Report, PEG states ³6LQFH 36(¶V PRGHO DOUHDG\ LQFOXG
XQGHUJURXQG YDULDEOH LQFOXGLQJ DQ µXUEDQ FRUH GXPP\¶

[8] PSE also notes that the high-voltage expenses are included in the ³TFP-based´ cost measure used by PSE. PEG incorrectly criticizes PSE ¶ use of a TFP-based cost in its Responses to Interrogatories (1-THESL-61) and in the PEG Report. The TFP-based costs capture the high-voltage costs that PEG is describing in its response. The TFP-based cost definition also excludes contributions in aid of construction (CIAC), which PEG itself subtracts from their cost definition for THESL (see PEG ¶ response to 1-THESL-20). Besides adding smart meter expenses, the rationale for which PEG fails to empirically substantiate in its response to 1-THESL-19 , PEG is effectively advocating for the cost definition used by PSE, while at the same time criticizing PSE for its use.

[9] PEG Report of Dr. Mark Newton Lowry, President of PEG, filed on Behalf of Public Service Company of Colorado RQ 'HFHPEHU 5HSRUW WLWOH ³6WDWLVWLFDO $QDO\VLV RI 3XEOLF

to be saying that the percent underground variable should be sufficient to pick up the impacts of higher costs for urban areas. This is incorrect for several reasons.

1. In our experience with hundreds of distributors, undergrounding tends to cost a great deal more in urban centers than in rural or suburban settings. In more rural and suburban settings, direct bury cables with pad mounted equipment are typically used. These are much less expensive than concrete-encased duct bank installations with underground vaults, submersible equipment and massive civil infrastructure, which are found in urban settings.

2. Similarly, overhead line construction can be found within all service area environments, but will also cost a great deal more in urban settings; these costs are not captured by an undergrounding variable.

3. The underground variable is not found LQ 3(*¶V ILQDO LPSOHPHQWDWLRQ 6HSWHPEHU 5HSRUW states in 1-THESL-32 the undergrounding variable was excluded because it was either statistically insignificant or had the wrong sign. It is not sensible to exclude the urban variab OH RQ WKH EDVLV LW LV ³UHGXQGDQW ´ EXW WKHQ DO as its replacement.

The costs of all types of construction based on the developed areas are laid out in the Appendix to WKH 36(6HSWHPEHU 5HSRUW The percent underground variable will pick up the cost variations for an urban utility is not correct. In the end, serving an urban core simply increases costs, and our report shows that the urban core variable captures this fact.

3.3.2 The Urban Core Variable Is Not Inappropriate

:H QRZ PRYH WR 3(*¶V FODLP WKDW WKH XUEDQ FRUH Y GLVWULEXWLRQ EHQFKPDUNLQJ ´ 7KLV VWDWHPHQW LV FO

variable in prior gas distribution cost benchmarking studies. On page 28 of the PEG Report it lays out its rationale for this statement as follows:

> Some PEG studies have used this variable in gas distribution models, but the rationale for using such a dummy variable is much stronger for gas distribution because essentially all gas distribution assets are underground. A dummy variable is one means of distinguishing between the higher costs of installing and maintaining underground gas distribution assets in densely-populated, mature urban areas compare G ZLWK ³JUHHQILHOG´ VXEXUE

The reasons that costs increase for urban gas distributors are the exact same reasons costs increase for urban electric distributors. Constructing and maintaining either underground or overhead assets in a densely-populated and mature urban area will cost considerably more than constructing and maintaining either overhead or underground power lines in a suburban environment. This is the same message in the PSE September Report Appendix.

3.3.3 The Urban Core Does Not Distort the Impact of Other Variables

3(*¶V ODVW FULWLFLVP RI WKH XUEDQ FRUH YDULDEOH LV WKH RWKHU EXVLQHVV FRQGLWLRQ YDULDEOHV HVSHFLDO

eliminated the undergrounding variable from their model. Eliminating the undergrounding variable vitiates the distortion argument VLPLODU WR 3(*¶V UHJUHVVLRQ FRQFH using econometrics, any included variable will change the estimated impacts of the other business condition variables. This is why there needs to be a theoretical basis for including variables, and they must be correctly signed and statistically significant. To not include a variable that is predicted by theory, correctly signed, and statistically significant because it will change the other business condition variables would distort the model by creating what is known in econometrics

as DQ 3RPLWWHG .YD%\LHEEHXGLQV WKH XUEDQ FRUH YDULDEOH this bias.[10]

The system R-VTXDUHG VWDWLVWLFV RI 3(*¶V PRGHO DQG 36(¶V 5HS R-VTXDUHG VWDWLVWLFV DUH PHDVXUHV RI ³JRRGQHVV RI IL variation in the dependent variable (total cost) is explained by the mRGHO 3(*¶V 5 0.926, implying that 92.6% of the variation in the data set is explained in their model. After making WKH WKUHH DGMXVWPHQWV, the R-squared for the resulting model increases to 0.962. This supports 36(¶V SRVLWLRQ that the need to include variables that are logical, statistically significant, and properly signed.

In summary, standard industry practice results in including the urban core variable and excluding 3(*¶V KLJK YROWDJH. This will also capture a highly relevant cost driver (serving an urban core), which is necessary to provide a fair and accurate PRGHO WR HYDOXDWH 7+(6 performance.

3(*¶V 6HSWHPEHU 5HSRUW VWDWHV projected spending should result in a utility more aligned with its externally-derived benchmark values from both a total cost and

[11] PSE did not put forth this model in its September report, it was only brought up in interrogatories by Board Staff, LQ TXHVWLRQLQJ E\ 'U .DXIPDQQ WR 0U)HQULFN DW WKH 7HFKQLFDO &RQ

6$,), SHUVSHFWLYH[12] discusses how a utility should strive to improve benchmark evaluations in both cost and reliability simultaneously. PEG illustrates this on page 19 with a graph that implies that a distributor should find ways to improve both total costs and reliability at the same time, thus entering the PEG concept of the ³]RQH RI FRQWLQXRXV LPSURYHPHQW

3(*¶V DQDO\VLV LV LQFRQVLVWHQW with industry practices; all utilities know there are trade-offs between improving reliability and costs. PEG acknowledges this later on page 43, when it states WKHUH LV -XVW VR PXFK PRQH\ DYDLODEOH´ EHWZHHQ FRVWV DQG UHOLDELOI[13]

PEG has not provided any detailed plans on how THESL can actually improve both reliability and WKHLU WRWDO FRVW SHUIRUPDQFH DW WKH VDPH WLPH 3(* speculation, not likely to be possible in practice, and ignores tKH ³FRPSURPLVH OLQNDJH´ EHV costs and reliability. Of course, it would be desirable if all utilities could simply reduce costs and enhance reliability, but in the real world, that is not feasible for the vast majority of utilities. Benchmarking can VHUYH DV D JXLGH WR KHOS DQVZHU ZKDW LV LC customers, thus offering customers with a better balance between two competing interests (low costs and high quality service).[14]

As discussed in the prior section, it appeared that Dr. Kaufmann of PEG had no issue with WPS ramping up capital spending for a five-year period in order to improve reliability. In fact, he estimated that the benefits outweighed the added costs. 2Q SDJH RI 'U .DXIPDQQ¶V U testimony on behalf of WPS, he states:

> Nevertheless, with an estimated value of more than $21 million per year to WPS customers after 2019, I believe the benefits generated because of the SMRP will certainly exceed the total costs of the program in less than 20 years, which is less than half of the 60-year expected life of the assets to be installed under the program.[15]

By conducting this capital spending program, :36¶V total cost benchmarks would suffer. Yet Dr. Kaufmann firmly rejected the idea that the program should be stretched out beyond the proposed five years. Dr. Kaufmann on behalf of WPS stated:

> Delaying the implementation of the SMRP would reduce benefits to customers. If the SURMHFW¶V LPSOHPHQWDWLRQ ZDV H[WHQGHG WR \HDU ben HILWV ODWHU %HFDXVH WKHUH LV D WLPH YDOXH RI benefits to customers.[16]

---

[12] Page 12 of the PSE September Report.

[13] PEG clarified its agreement in its Responses to Interrogatory (1-THESL-48); it did not dispute the common-sense linkage, as described the last sentence in paragraph 2 on page 43 of the PEG Report, which states that:

> 6LQFH µROG DQG IDLOLQJ LQIUDVWUXFWXUH¶ FDQ EH UHPHGLHG E\ SX posits a relationship between changes in THESL costs (especially the investment costs associated with installing new capital) and future changes in its SAIFI.´

(Emphasis added). In other words, as costs go up (especially new capital costs), SAIFI improves.

[14] Other tools are also helpful to find the EHVW EDODQFH EHWZHHQ FRVWV DQG UHOLDELOLV 0RGHO ³),0´ LV DQ H[DPSOH RI WKH XWLOLW\ DWWHPSWLQJ WR ILQG WK investment and customer preferences for reliability.

[16] Page 13 and 14, Case 6690-CE-198 Pre-filed Sur-Sur-Rebuttal Testimony of Lawrence Kaufmann for Wisconsin Public Service Corporation, May 6, 2013.

PSE believes WKLV VDPH ORJLF LV DSSOLFDEOH LQ 7KH (6/ RQH & RI W
FRQWLQXRXV LPSURYHPHQW´ that is likely to be impossible to achieve and, if attempted, would very likely result in far worse reliability than what would occur if the Custom IR plan is approved in full.

Furthermore, PSE sees no rationale for lengthening the Custom IR period from five years to eight years, as suggested by PEG. Improved reliability offers substantial benefits to customers. Even if THESL could deliver the same reliability outcomes in eight years rather than five (which is unrealistic given the reduced investment per year), there is little reason to delay a reliability outcome that is in the interests of customers. Dr. Kaufmann of PEG agrees in his WPS testimony quoted above. Providing a better alignment between costs and reliability is improvement.

sense ³VXJJHVWV´ certain´ statements, even if they are not strictly empirical conclusions. A benchmarking result that shows a utility with lower than expected costs, yet higher than expected SAIFI, suggests to PSE that the capital infrastructure is failing more often than expected, and is likely in need of added investment.[17]

There is a common-sense linkage between cost management and reliability outcomes. The total cost benchmarking results show the expected total costs for each utility in the sample, given their business condition variable values. One method of increasing the cost efficiency benchmarking score is to have older infrastructure. All else being equal, older infrastructure will increase total costs less than newer infrastructure. Yet there are limits on increasing cost efficiency in this manner. At some point, investment is needed to renew the infrastructure.

36(¶V EHQFKPDUNLQJ UHVXOWV IRXQG WKDW 7+(6/ LV KLVWRU

ANNUAL REPORTING

This schedule details Toronto Hydro's proposed Annual Reporting activities with respect to its 2015-2019 Custom Incentive Rate-Setting ("CIR" or "Custom IR") application, which consist of three components:

1) Meeting the Ontario Energy Board's ("OEB") Scorecard Approach for Performance Measurement;
2) Reporting on the Proposed Performance Measures Framework as detailed in the Distribution System Plan (DSP)[1]; and
3) Filing a rate schedule for the following year upon the OEB's update of its inflation factor.

These activities will be filed with the OEB at different times throughout the year based on the nature and purpose of each filing.

1. REPORTING ACTIVITIES

The OEB's RRFE Report[2] concluded that the appropriate device to monitor utility performance was a scorecard, noting that distributors would be required to report annually on their progress against metrics aligned with four core objectives:

1) Customer Focus;
2) Operational Effectiveness;
3) Public Policy Responsiveness; and
4) Financial Performance

The OEB is clear that its scorecard would apply to all distributors. Accordingly, annual reporting requirements will be the same for CIR, 4th Generation Incentive Rate-Setting or

[1] Exhibit 2B, Section C.
[2] Report of the Board "Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach" (October 18, 2012) [the "RRFE Report"].

Annual Incentive Rate-Setting applicants, such as the utility proposes to do so at its discretion. Toronto Hydro proposal for its annual reporting requirements is consistent with this view.

1.1. OEB's Scorecard

Toronto Hydro intends to comply with the OEB's Scorecard, as summarized in Figure 1:[3]

Figure 1: Measures of the Four Performance Outcomes in the OEB's Scorecard

[3] EB-2010-0379, Report of the Board Performance Measurement for Electricity Distributors: A Scorecard Approach (March 5, 2014) at page ii, Table I.

1.2. DSP Metrics

As part of its DSP, Toronto Hydro has developed a set of 12 metrics to monitor quality and drive continuous improvements in its distribution system planning and implementation efforts.[4] These metrics are summarized in Table 1.

Table 1: Proposed DSP Performance Measures Framework

Customer-Oriented Performance	Cost Efficiency/ Effectiveness of Planning and Implementation	Asset/System Operation Performance
1. System Average Interruption Duration Index "SAIDI"). 2. System Average Interruption Frequency Index ("SAIFI"). 3. Customer Average Interruption Duration Index ("CAIDI"). 4. Feeders Experiencing Sustained Interruptions ("FESI"). 5. Momentary Average Interruption Frequency Index ("MAIFI").	1. Distribution System Plan Implementation Progress. 2. Planning Efficiency: Engineering, Design and Support Costs. 3. Supply Chain Efficiency: Materials Handling On-Cost. 4. Construction Efficiency: Internal vs. Contractor Cost Benchmarking. 5. Construction Efficiency: Standard Asset Assembly Labour Input.	1. Outages caused by defective equipment. 2. Stations capacity availability.

[4] Exhibit 2B, Section C.

Toronto Hydro proposes to file an annual update on these metrics by June 30th of the year following the reporting year. For clarity, the first report would be filed in 2016 and would cover the utility's performance in the year 2015.[5] The manner of reporting is described in further detail in Exhibit 2B, Section C1.1.1, pages 4 and 5. /C

1.3. Annual Distribution Rates

Toronto Hydro's proposed rate framework[6] for the CIR application uses a custom Price Cap Index ("PCI") as the annual adjustment mechanism for its base distribution rates in 2016 to 2019. The custom PCI employs the OEB's inflation factor as an input to the formula. Accordingly, Toronto Hydro proposes to submit a distribution rate adjustment on an annual basis followings OEB's determination of the newest inflation factor (which typically occurs later in the calendar year) and at a date prior to when those rates are to come into effect. /C

[5] Although Toronto Hydro's 2015 rate year will not commence until at least May 1, 2015, the utility's proposal is to report the DSP performance measures results on a calendar year basis. In other words, the 2016 results will cover the timeline from January 1 to December 31, 2015. /C
[6] See Exhibit 1B, Tab 2, Schedule 3.

CUSTOMER ENGAGEMENT

The diversity of Toronto Hydro's customer base requires the use of a variety of engagement tools. This schedule first describes the utility's ordinary course, day-to-day engagement with its residential, non-residential and very large customers. The schedule then discusses the various customer engagement activities that Toronto Hydro has undertaken specifically in connection with this application and the utility's 2015-2019 Distribution System Plan ("DSP"). The DSP has been filed as Exhibit 2B.

1. ORDINARY COURSE CUSTOMER ENGAGEMENT

Toronto Hydro serves a broad and diverse customer base, which it engages with in a variety of "ordinary course" interactions every year. This section describes the utility's customers and outlines some of the regular interactions that Toronto Hydro has with residential and non-residential customers.

The utility has approximately 730,000 customers, ranging from individual residential consumers up to large industrial and commercial businesses. Toronto is home to the country's largest banks, stock exchanges, major manufacturers, and other large customers that are sensitive to service interruptions. The utility powers non-residential customers from a wide variety of sectors, from data centres to large industrial and manufacturing facilities. The utility has over 80 hospital accounts, 280 healthcare and long-term care facility accounts, 690 schools accounts, and 140 college and university accounts. Toronto Hydro also supplies electricity to the Ontario's Provincial Legislature and Ministries, as well as Toronto's municipal government. Toronto has over 2,900 high-rise multi-residential condominium and apartment building accounts, many of which are "bulk-metered". Taking these behind-the-meters customers into account, Toronto Hydro's effective customer base exceeds 1 million customers.

The city of Toronto is one of North America's largest urban centers. Due to the scale and density of Toronto Hydro's franchise area, as well as the varied nature of the utility's customer base, the safe and reliable operation of the utility's distribution system affects a number of key economic drivers for the city, the province and the country.

1.1. Residential Customers

The utility has numerous "ordinary course" points of contact with its residential customers. The vast majority of such contacts occur in connection with billing matters: setting up, closing, paying, conservation and demand management ("CDM"), and otherwise relating to customer accounts.

Toronto Hydro also engages with customers when it carries out capital work. The utility's goal is to proactively mitigate customer and stakeholder concerns with Toronto Hydro's projects. To enable the effective delivery of planned capital projects while maintaining focus on customers, Toronto Hydro has a team dedicated to communication with customers in connection with planned capital projects and resolution of customer issues related to that work. These issues can range from repairs, outages, scheduling, installation of equipment, construction noise, safety, private property easements and the utility's staging areas.

Part of this engagement is driven by the City of Toronto's Municipal Consent Requirements ("MCR"), which requires that Toronto Hydro communicate with certain customers affected by capital work. Chapter 5 of the MCR states that:

> The Applicant [i.e., Toronto Hydro] shall provide written notification to all adjacent properties, and all properties that will face or will have a line of sight to the proposed plant. Such notification shall outline the nature of the work and clearly describe the size, appearance and location of the proposed

plant. The notice shall include the name and phone number of a contact person at the Applicant's office.

However, understanding customer needs and preferences on the execution of capital work goes beyond the City's MCR, Toronto Hydro also communicates with customers about capital projects through a variety of channels such as: letters, email, telephone, face-to-face meetings, newspapers, advertisements, newsletters, community meetings, and website. In 2013, Toronto Hydro's Customer Operations Communications Office ("COCO") distributed close to 60,000 customer letters, and communicated on over 270 projects. In 2015-2019, COCO plans to maintain its focus on communicating project information to customers who are affected by utility's capital projects, and to address their concerns.

1.2. Non-Residential Customers

Given the variety of Toronto Hydro's non-residential customers, the utility considers the needs of its larger customers[1] in terms of market segments. Broadly speaking, Toronto Hydro's customers fall into the major market segments set out in Table 1 below. The table also includes sub-categories, which provide examples of the types of businesses within each market segment:

Table 1: Major Market Segments

Major Market Segment	Illustrative Sub-Categories
Commercial	Offices
	Data Centre (Stand Alone)
	Banks
	Restaurants
	Hotels-Motels
	Retail

[1] Customers whose demand is between 50kW and 5,000kW.

Major Market Segment	Illustrative Sub-Categories
	Malls/Plazas
	Grocery Stores
	Entertainment

	Toronto Parking Authority
	Public Works
	Agencies/Boards/Commissions
Industrial / Manufacturing	Food & Beverage
	Plastics/Rubber
	Chemical/Pharmaceutical
	Raw Materials/Textiles
	Electronics
	Other Manufacturing

Major Market Segment	Illustrative Sub-Categories
	Warehouse
	Refrigerated Warehouse
Multi-Residential	Apartments
	Condominiums

One of the reasons that Toronto Hydro considers its larger non-residential customers in terms of market segments is that different industries may have vastly differing operating environments/regulations, sensitivities, needs and preferences. For example, industrial and manufacturing customers maybe very sensitive to the frequency of outages – the occurrence of an outage, regardless of its duration, may require an entire batch of a product to be scrapped and production equipment to be reset and inspected. This is typically a significant cost and concern to such customers, and something that Toronto Hydro considers as it plans operations and capital investments.

In contrast with industrial and manufacturing customers, multi-residential customers may be less concerned with the frequency of outages than their duration – a brief outage may inconvenience the residents of a 500-unit condominium, whereas a long outage may entail significant costs and potentially safety concerns.

Institutional customers' interest may extend to the broader social effects of service reliability. For hospitals and other healthcare providers, outages may affect the delivery of critical care to patients. Outages affecting schools may create extreme inconvenience to large numbers of people, and may give rise to significant costs and potential safety risks if schools are required to relocate students.

Toronto Hydro has approximately 81,000 non-residential customers whose demand is less than 5MW. The utility's ordinary course engagement with such customers is similar

to its contact with residential customers that it generally relates to account inquiries, billing information changes, follow-up on outage restoration, energy conservation incentives or specific customer requests such as new connections.

Toronto Hydro also engages in other forms of indirect communication with customers through its interactions with industry associations on conservation, reliability and infrastructure investment issues. Organizations such as the Building Owners and Managers Association ("BOMA") and the Toronto Board of Trade can help the utility effectively disseminate critical information to their large memberships.

In addition, Toronto Hydro collaborates with the City of Toronto Better Buildings Partnership within the Energy Efficiency Office to pursue conservation opportunities within the municipal sector as well as leveraging demand response programs to support the emergency generation and preparedness plans of city affiliates such as Toronto Community Housing. Toronto Hydro is also a member of Weatherwise, a partnership convened by the City and Civic Action consisted of public, private and Not-For-Profit organizations identifying the risks of extreme weather.

1.3. Very Large Customers

Finally, Toronto Hydro has an engagement program – the Key Account Management Services program – dedicated to its very large "key account" customers. The utility created this program to better understand and respond to the unique experiences, preferences and service needs of this type of customer. Key account customers are typically sophisticated commercial and institutional entities who have a strong grasp of their service requirements and a good working knowledge of the electricity sector.

In 2012, the initial scope of the key account management service program was to offer formal engagement meetings annually to customers with an electricity demand greater

/C

than 5 MW or with a large aggregate of multiple commercial accounts throughout the city. In 2013 , Toronto Hydro expanded its scope to include customers whose demand exceeds 1 MW and who are served by feeders that have been experiencing a high frequency of outages. Generally, Toronto Hydro prioritizes meeting with key account customers who are experiencing the worst reliability and/or that are most significantly affected by service quality issues (e.g., food processors and pharmaceutical companies who must dump product and re-sterilize equipment; health care facilities concerned with patient procedures; plastic moulding companies with equipment concerns; etc.).

Formal key account management meetings typically address the following topics:

- Review of the customer's annual reliability performance and customer experience;
- Toronto Hydro reliability investigations and root cause analysis reports;
- Improving Reliability and Services – Infrastructure Renewal Program;
- Regulatory environment, current filing, system reliability, capital plan and investments, rate impact;
- Available account management services, including single point of contact, 24/7 outage management service, energy data management, billing services; and
- Conservation and Demand Management ("CDM"), including incentive program opportunities, energy efficiency training and support, electricity savings verification.

Toronto Hydro endeavours to customize its key account management services to best suit individual customers' specific needs and preferences. This customization can occur regarding the form and frequency of how the customer prefers to be engaged. Accordingly, while Toronto Hydro aims to meet with this group of customers on a consistent basis, some may choose to forego a meeting, while others prefer multiple meetings over the course of a year in order to address specific needs and opportunities.

/C

As explained in more detail below, the information presented by Toronto Hydro is customized for each customer for their reliability experience, current and planned investments in their local area, conservation and demand programs and the rate impact of investments on their current bill.

1.3.1 Key account meeting structure and engagement materials

Toronto Hydro's key account management customer meetings are currently structured around a standardized presentation. The presentation has evolved over time, but typically addresses four main topic sections:

1. Overview: Includes an overview of the utility, historical system spending, historical system reliability measures (i.e. SAIDI/SAIFI), drivers of outages, future investment needs, investments to improve reliability, and from time-to-time, current information on the regulatory process, including a brief, high-level discussion of recently concluded rate applications and/or pending applications.
2. Customer Specific Details: Includes customer specific reliability performance, reliability investigations and cause of outages, and generally serves as an opportunity to discuss the customer's experience. This typically includes a discussion of planned capital projects that will address the customer's service.
3. Bill Information: Using a bill sample or the customer's bill, Toronto Hydro explains the various components of the electricity bill and explains how costs could potentially be reduced.
4. Conservation and Demand Management (CDM) programs: Includes a status review of past and current conservation projects. Toronto Hydro introduces possible CDM program opportunities that could help reduce electricity costs for the customer.

/C

The objective of these meetings is to give large, sophisticated and knowledgeable customers (typically senior management) an opportunity to discuss their specific needs in a timely and efficient format. Therefore, the level of focus given to each section of the presentation is ultimately dictated by customer-specific needs and preferences. Generally, Toronto Hydro finds that large customers are interested in discussing the details of their specific reliability experience, potential remedies to reliability issues, and how to manage their electricity costs.

To illustrate the range of content provided to key account customers, Appendix C includes a sample of a presentation deck provided to a customer during the development of the Application. These decks were subject to updates from time-to-time and included customer-specific information. The sample deck provided does not include any customer-specific information, but rather an explanation of the type of customer-specific information that may appear on a given deck.

/C

1.3.2 Outcomes of the Key Account Process

Toronto Hydro uses the input received from the Key Account Management Services program to plan CDM programs and to inform capital and maintenance program planning in areas such as the Worst Performing Feeder program (Exhibit 2B, Section E6.21) and the Vegetation Management maintenance segment (Exhibit 4A, Tab 2, Schedule 1, Section 5). Toronto Hydro also uses these meetings to better understand the impact of momentary interruptions and to inform the prioritization of longer-term capital investments as the work plan is executed. The following are examples of projects that were created and/or prioritized in response to feedback received through key account engagement:

- A backup feed for a large financial institution was found to be susceptible to moisture related outages. On those occasions when it was active, the customer's

sensitivity to power quality made the risk unacceptable to them. Based on this customer input, operations was able to connect to an alternate feeder.

- The causes of some outages are difficult to source. For the most sensitive key account customers, Toronto Hydro has installed sophisticated power quality meters to assist in diagnosing reliability issues, which could be utility or customer equipment related.
- The supply to a particular hospital is through a heavily treed area, making it more susceptible to outages. Following discussions with the customer, Toronto Hydro responded by intensifying its tree trimming program in that location.
- A large retail mall was susceptible to frequent outages due to the deterioration of its direct buried feeder cable. As of ongoing engagement, Toronto Hydro replaced the feeder as a prioritized renewal project.

The utility plans to continue to offer its Key Account Management Services program throughout the 2015-2019 planning period.

For further information on the utility's day-to-day customer contacts and forms of engagement see Toronto Hydro's Customer Relationship Management program.[3]

1.3.3 Letters Of Comment From Key Account Customers

During its regular meetings in 2013 and 2014, Toronto Hydro informed key account customers about the OEB's increasing focus on customer engagement as part of the renewed regulatory framework, and invited customers to submit letters of comment outlining their concerns and opinions on matters such as service quality, reliability, and cost of electricity, as well as the utility's ongoing, renewal-focused capital investment plans. Overall, Toronto Hydro received 15 letters of comment, copies of which are attached as Appendix A. Toronto Hydro notes that it previously submitted similar letters

[3] Exhibit 4A, Tab 2, Schedule 13.

of comment with the 2012-2014 ICM application (EB-2012-0064). These were filed as Appendix B in the response to undertaking JT2.2 (Phase 1 of the proceeding). /C

2. DSP-SPECIFIC CUSTOMER ENGAGEMENT

In addition to the utility's ordinary course customer engagement activities described above, Toronto Hydro has engaged with its customers specifically around this application and the utility's DSP for 2015-2019.

Toronto Hydro's DSP-specific customer engagement activities were guided by the Ontario Energy Board's ("OEB") expectations in the RRFE Report,[5] which states that distributors should provide services in a manner that responds to identified customer preferences,[6] and Chapter 5 of the OEB's Filing Requirements for Electricity Distribution Rate Applications ("Chapter 5").[7] Chapter 5 requires that a distributor describe its customer engagement activities to obtain information on their preferences and show how it considered those preferences in its plan.[8]

[8] Chapter 5 at section 5.0.4.

2.2. Residential and Non-Residential Customers

Toronto Hydro engaged Innovative Research Group Inc. ("Innovative"), a national consultancy with expertise in public opinion research, with particular experience in issues of public policy. Toronto Hydro asked Innovative to design and carry out a consultation process that would provide the utility with meaningful information to assist in preparing the DSP, as set out in Chapter 5. Initially, Toronto Hydro hopes that the results of Innovative's consultation will be valuable as the utility continues to carry out its proposed capital work over the term of this application. Innovative produced a detailed report documenting the process and findings of this consultation (the "Innovative Report"), a copy of which is included as Appendix B to this schedule.

Toronto Hydro asked Innovative to bring the major components of the utility's DSP to its most populous rate classes (Residential and General Service < 50 kW) as well as the utility's most populous larger customer market segments (Commercial and Industrial / Manufacturing), and to assess how customers' values and preferences align with the utility's proposed capital work. The consultation also included customers who live in condominiums or other multi-residential buildings. Toronto Hydro relied on Innovative's expertise to help determine how to effectively engage this diverse group of customers on the technical and often inaccessible topic of utility capital planning. Innovative ultimately used several methods to gauge the views of these customers:

1) an online workbook, accessible to any Toronto Hydro customer;
2) randomly recruited focus groups of residential and GS < 50 kW customers, facilitated by Innovative and based on a workbook describing the central pillars of Toronto Hydro's 2015-2019 DSP;
3) consultation with randomly recruited Commercial and Industrial / Manufacturing customers, including a panel discussion with Toronto Hydro staff moderated by Innovative, and focus groups using the same workbook;

4) a statistical telephone survey of 2016 Toronto Hydro customers from both residential and GS < 50 rate classes.

Figure 1 illustrates the process that Innovative used to develop this model of consultation.

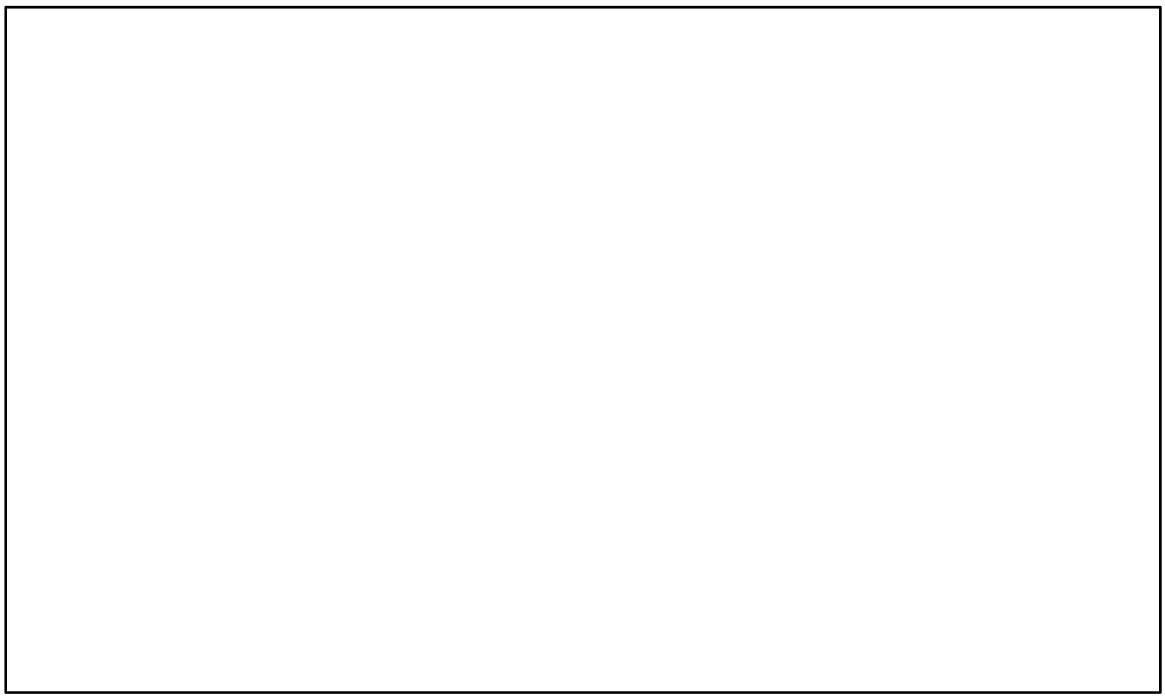

Figure 1: Innovative Research Group Consultation Structure

3. INNOVATIVE REPORT FINDINGS

The Innovative Report provides Toronto Hydro with valuable insight into its customers' perception of both the utility's priorities and those of the province's broader electricity sector. While the results of the consultation and the lessons drawn from it are addressed in more detail in the DSP, certain central themes can be briefly mentioned here:

- Customers' preferences align with central pillars of the utility's DSP. Toronto Hydro learned that, while its customers expect the utility to make prudent investment decisions, the majority accept the need for timely renewal of the

distribution system, while acknowledging that this will mean an increase in their monthly bills.

- Most customers would invest in the distribution system today in order to avoid paying more later.
- Customers believe they have an obligation to maintain the distribution system for future generations.
- While customers are generally satisfied with Toronto Hydro's response to major weather events, they would like to see enhanced communications.
- Most residential customers say that they are able to pay more for electricity, but are concerned about the potential effect that increased rates may have on vulnerable ratepayers.
- Customers also expect the utility to make prudent investments in new technologies, and that new technologies can make the distribution system more efficient and, ultimately, save ratepayers' money.
- Customers accept that Toronto Hydro should be making investment in IT systems, fleet and facilities.
- Interestingly, a large number of customers stated that Toronto Hydro should have increased rates more in the past to create a "reserve fund" to recover capital renewal investments required today.

The Innovative Report describes its methods and the results of the consultation in greater detail. For more detail on how customer values and preferences are reflected in Toronto Hydro's Asset Management Process and SPD programs, please see Exhibit 2B, E2.4.

Toronto Hydro is pleased to have received this more nuanced view of its customers' preferences on the utility's planned capital work. Toronto Hydro understands that its customers are sensitive to rate increases and expect the utility to be prudent in carrying

out its work. However, it is content to see that its customers accept the need to invest in Toronto's distribution system, despite the associated rate increases.

This is the first five-year rate application prepared by Toronto Hydro and one of the first Custom Incentive Rate-Setting ("CIR" or "Custom IR") applications prepared under the RRFE by any local distribution company (LDCs"). It also includes the most extensive and, necessarily, one of the first customer consultation exercises around any DSP. Toronto Hydro's customer engagement activities in connection with this application significantly exceed any past application-related consultation that it or any other Ontario LDC had previously undertaken. The results of this consultation will continue to inform the utility's capital work over the five-year term of the DSP, and provide an important starting point for subsequent customer consultations.

Dear Mr. Tyrrell,

We are writing to confirm that Epic Realty Partners very much supports Toronto Hydro's infrastructure renewal program.

We believe that continued investment in Toronto Hydro's electrical infrastructure is essential to maintaining overall levels of system reliability across the city.

Epic Realty Partners is committed to energy conservation initiatives and has implemented a number of projects in an effort to ease the demands on our buildings and on the electrical system. Epic Realty Partners manages 1.7 Million square feet of Commercial buildings across the city and the reliability of the electrical infrastructure is of paramount importance to EPIC and our tenants.

Toronto has been in growth for the last few years and this continued development will in no doubt place stresses on the existing systems.

We encourage careful consideration of any infrastructure renewal program to help ensure an outcome that is in the best interest of the City of Toronto's long term growth and development.

Yours truly,
Dwight Cooke
Regional Manager of Technical Services

EPIC Realty Partners Inc.

December 18, 2013

Mr. Chris Tyrrell
VP, Customer Care & Chief Conservation Officer
Toronto Hydro-Electric System Limited
5800 Yonge Street
Toronto, Ontario M2M 3T3

Dear Mr. Tyrrell,

Further to previous communications with you and your office, I would like to reiterate, on behalf of Cadillac Fairview and the Toronto-Dominion Centre, our unqualified support for what we believe to be essential and overdue infrastructure modernization initiatives needed to upgrade the delivery of hydro services to all parts of the property. As you can imagine, due to recent "brown-outs" and "black-outs", and too frequent power interruptions, our tenants have experienced unexpected and costly stress on their operations and their ability to conduct business. Our tenants rely on uninterrupted power 24 hours a day. We strongly believe that continued investment by Toronto Hydro in its power infrastructure is essential not just for Toronto-Dominion Centre, but for the systems reliability of the entire financial core.

Toronto-Dominion Centre has made it a priority to invest in energy smart capital projects and innovations to reduce the daily demands our buildings place on Toronto's power grid. We currently manage approximately 150 gigawatts of electricity consumption annually across our six towers, making the uninterrupted delivery of services a critical issue for the property as a whole as well as our individual tenants. We have long been a leader in promoting energy efficiencies in Toronto's downtown commercial sector and therefore believe we are in a unique position to comment on this matter and its potential impact on the long term health and viability of the core and its ability to provide the thousands of tenants that call it home with cost effective, reliable service.

The "new building" construction sector has been growing at an unprecedented rate for the last few years, making Toronto a global leader in construction activity. With this level of activity expected to continue for some time, it is not unreasonable to expect these new developments place added stress on an infrastructure system that has been unable to meet existing demands.

We encourage all concerned to carefully consider all reasonable infrastructure renewal programs designed to better serve the increasing energy requirements of the City of Toronto and specifically the downtown business community. Let's keep Toronto's financial core viable and dynamic.

Sincerely,

The Cadillac Fairview Corporation Limited,

David Hoffman
General Manager

Toronto Hydro-Electric System Limited
5800 Yonge Street
Toronto, Ontario M2M 3T3

Dear Chris,

York University is a leading interdisciplinary research and teaching university in Toronto. York offers a modern, academic experience at the undergraduate and graduate level. The third largest university in the country, York is host to a dynamic academic community of 55,000 students and 7,000 faculty and staff, as well as 250,000 alumni worldwide.

York's 11 faculties and 28 research centers conduct ambitious, groundbreaking research that is interdisciplinary, cutting across traditional academic boundaries. This distinctive and collaborative approach is preparing students for the future and bringing fresh insights and solutions to real-world challenges.

York relies on Toronto Hydro's services for a sprawling campus uptown, an intimate east-side campus, and downtown business centers. The Keele Campus is located at Keele Street and Steeles Avenue West on 550 acres. The Glendon Campus is located at Bayview and Lawrence Avenues on 85 acres. York has also established a Downtown Management Facility, the Miles S. Nadal Facility at King and Bay Streets, as part of the Seymour Schulich School of Business, and Osgoode Hall Law School Professional Development Centre at Yonge and Dundas Streets.

York acknowledges Toronto Hydro's electrical infrastructure capital investment application to the Ontario Energy Board. York University recognizes the need to upgrade outdated equipment for safety and reliability reasons, as York faces similar internal electrical infrastructure issues on a daily basis. World class ground breaking research requires 24/7 reliability, especially when working with the specialty research equipment in the physics and biology areas. York observes that the reliability issue goes beyond 24/7 power availability, and must include issues of voltage and frequency excursions, and transient short term interruptions.

York University observes that on average it experiences 1.5 grid related interruptions per month. Some of these interruptions result in service outages for students, residences, classroom activities and sensitive research facilities, as well as costly recall of maintenance staff.

York University supports initiatives to improve the reliability of the Toronto Hydro grid, and quality of the power supply.

Sincerely,

Richard Francki
Assistant Vice-President
Campus Services & Business Operations

Attention: Mr. Christopher Tyrell, Vice President,
Customer Care & Chief Conservation Officer

Dear Sirs:

Re: Power Interruption Concerns, Consumers Road, Toronto.

We recently met with Victor da Rosa and James Wei in order to learn more about Toronto Hydro's plans to ameliorate the high frequency of power interruptions being experienced at our 505 and 515 Consumers Road properties. It was confirmed by your team, that we continue to experience a *'higher than average'* frequency of power interruptions *(both 'momentary' and 'sustained' outages)*. These frequent outages are having a **severe** negative impact upon both our client population and on the marketing of the project to our customers. We have been advised that infrastructure improvement plans have been drafted and submitted for improvements to the Leslie TS and distribution network as part of a larger submission to the Ontario Energy Board. We are writing to confirm that Medallion Corporation supports Toronto Hydro's infrastructure renewal program.

We believe that continued investment in Toronto Hydro's electrical infrastructure is essential to maintaining overall levels of system reliability across the city.

Medallion Corporation owns and manages approximately two (2) million square feet of Commercial, Industrial and Retail properties in the City of Toronto and the reliability of the electrical infrastructure is of paramount importance to Medallion and our tenants. In addition to the Commercial portfolio, Medallion has approximately eight thousand (8,000) high-rise rental residential units in the City of Toronto with several new buildings under construction or in the planning stages.

We acknowledge that the Toronto market has been in a substantial growth mode for many years and this continued development will in no doubt place stresses on the existing infrastructure and systems. The successful continued growth in Toronto is directly linked to the ability of all of the essential service providers to both maintain and upgrade the necessary infrastructure to foster this growth.

We encourage careful consideration of any infrastructure renewal program to help ensure an outcome that is in the best interest of the City of Toronto's long term growth and development.

Yours very truly,

MEDALLION CORPORATION

Dear Mr. Tyrell,

Western Harbour Castle Hotel on One Harbour Square has implemented many conservation and electricity demand reduction projects and continues to coordinate with Toronto Hydro for the CDM incentive that makes it possible to pursue additional energy conservation and demand reduction opportunities.

On the other hand, we have recently struggled with an outage situation. The continued upgrade of old assets and electrical infrastructure is essential to maintain the reliability that we aspire. Therefore, we support any Toronto Hydro Infrastructure renewal programme that will positively affect the reliability of the distribution of electricity to our property.

We forward continued coordination and cooperation.
Kind regards

Mike Flint

Chris Tyrrell
Vice President, Customer Care & Chief Conservation Officer
Toronto Hydro-Electric System Limited
5800 Yonge St.
Toronto, Ontario
M2M 3T3

Dear Mr. Tyrrell:

Consistent with our previous communication, our operation continues to be negatively impacted by the poor reliability of our power supply.

In 2013 we experienced 21 power supply quality events that caused 35 hours of equipment downtime. The direct financial impact to our operation last year was $380,000. Further the environmental and employee safety implications associated with the process disturbances caused by the power supply quality events are significant.

Owens Corning has been implementing measures to improve the resilience of our equipment to *voltage sags* including installing 3 phase line reactors on all our variable frequency drives, utilizing auto-restarts on equipment and uninterrupted power supply (UPS) devices on control systems as well as aggressively pursuing energy conservation initiatives to reduce demand on the system. However, the severity of the voltage sags continues to overwhelm some of our counter-measures.

As partners, we expect that Toronto Hydro will intensify their efforts to reduce the frequency of power supply quality events. We strongly urge you to reassess your Infrastructure Replacement/Management Strategy to provide 24/7 reliability. We acknowledge the need to improve your infrastructure and support your Capital Investment initiatives.

The Owens Corning 7 R U R Q W R 3 O D Q W ¶ V H P S O R \ H H V D U H F R Q W L Q X R X V O \ F R P in our network south of the border. It is becoming increasely difficult for us to offset the competitive advantage given to the US based plants by the superior reliability of their power utility.

We look forward to hearing from you and welcome your input to help us run efficiently and compete in the global market.

Sincerely,

Lucian Radut, P. Eng.

Mr. Chris Tyrrell
Vice-President
Customer Care and Chief Conservation Offices
Toronto Hydro Electric System Limited
14 Carlton Street
Toronto ON.
M5B 1K5

Dear Mr. Tyrrell,

My name is Gary Porritt and I am the Chief Engineer at Redpath Sugar Limited. We are a Sugar Refining plant that generates most of our hydro requirements and purchases the difference from Toronto Hydro. We are synchronized to Toronto Hydro on one of the two feeders A38X or A39X, whichever is in service. We also have a new feed (2 years old) that is tapped off the same lines.

I have been working with your Save-On-Energy group over the last two years which has helped with projects and incentive money. This group has worked hard to help me complete the projects and ensure proper planning for each one was followed in order to successfully receive the incentives.

We are however looking at reliability of Toronto Hydro source and power quality for continuous VHUYLFH LQ WKLV DUHD ZKLFK , GRQ¶W VHH LPSURYLQJ DW SU Quality power causing our company some losses of equipment which I have had only the comments of the contract agreement conditions. This year we have experience 4 power interruption of minimum time, which has me concerned about what is going to happen in our area without some changes to your supply system. I would like to know how the reliability and power quality issues are being addressed. The frequency of Toronto Hydro outages at our site have increasing over the SDVW \HDU DQG , GRQ¶W VHH WKLV LPSURYLQJ waterfront area. I heard comments on the news about companies should have back-up generation installed at site (during this last ice storm) which has me concerned that improvements to present Toronto hydro system reliability are not being addressed. I want to know what is being done to address my concerns for future reliability.

I look forward to your comments and resolution on this item.

Yours very truly,

Redpath Sugar Ltd.

Toronto Community Housing

June 23, 2014

Mr. Chris Tyrrell
Vice-President, Customer Care and Chief Conservation Officer
Toronto Hydro Electric System Ltd.
14 Carlton Street
Toronto ON M5B 1K5

Dear Mr. Tyrell,

I am writing to express Toronto Community Housing's support for Toronto Hydro's regulatory filing for its 2015 electricity rates. Toronto Community Housing is a not-for-profit corporation wholly owned by the City of Toronto, and Canada's largest provider of social housing. Our 1,600 employees work to deliver clean, safe, well-maintained and affordable homes for some 58,500 households with low and moderate incomes, and to build vibrant communities where people can thrive.

Toronto Community Housing, like many public-sector organizations including Toronto Hydro, has major capital repair needs. We are applying and pursuing innovative solutions to generate new funding to repair our aging buildings. In this light, we recognize Toronto Hydro's challenges and believe that your infrastructure renewal plan, which balances cost increases with ensuring a reliable supply of electricity for your customers, is a sound approach in the current fiscal environment.

As a landlord serving a large, diverse population that includes some of our city's most marginalized residents, our success depends in no small part on reliable and affordable electricity. We are one of Toronto Hydro's largest customers, and electricity cost increases affect our bottom line. However, we are also impacted by the social and economic costs of service disruptions caused by aging electricity system infrastructure, which can be significant as the December 2013 ice storm attests. Power outages have a disproportionate economic impact on low-income households and they pose increased safety and security risks in our communities.

.../2

Furthermore, upgrades to Toronto Hydro's infrastructure will improve Toronto Community Housing's ability to participate in energy-savings programs offered by the Ontario Power Authority which can generate revenues for our own capital repair needs.

I hope that this statement of support is useful to Toronto Hydro as you bring forward your submission to the Ontario Energy Board later this year.

Sincerely,

Greg Spearn
Interim President and Chief Executive Officer
Chief Development Officer
Toronto Community Housing

October 15th, 2013

Toronto Hydro Electric System Limited
14 Carlton Street Toronto ON, M5B 1K5

Attention: Mr. Chris Tyrrell, Vice-President, Customer Care and Chief Conservation Officer

Dear Mr. Tyrrell,

Molson Coors Canada's Toronto Brewery at 1 Carlingview Drive is one of GTA's top employers with approximately 3700 employees. The plant operates 24 hours per day and 7 days per week throughout the year. Reliability of electrical supply is a paramount concern for us as it directly impacts facility production.

Interruptions of any kind, even very short term voltage surges or sags cause product waste and lost production time directly impacting the profitability of our brewery.

We recognize that failure to invest in electrical infrastructure upgrades within the City of Toronto may directly or indirectly impact our own power quality even when work is not on our feeders but elsewhere on our supply bus. The reliability of the distribution grid is a serious concern for Molson Coors' Toronto Brewery.

Molson Coors recognizes that our continued success depends on a balanced plan that addresses the need for a reliable electricity supply grid coupled with competitive rates and supports the need for the planned electrical infrastructure renewal within the City of Toronto.

Sincerely,

Ed Dickhoff P.Eng.

Mr. Chris Tyrrell
VP Customer Care & Chief Conservation Officer
Toronto Hydro-Electric System Limited
5800 Yonge Street
Toronto, Ontario M2M 3T3

Dear Mr. Tyrrell,

Wrigley is subsidiary of Mars Incorporated, leading food Manufacturing Corporation in the world.
Wrigley Canada is located at 1123 Leslie Street, Toronto.
Factory is built 1962; expended over time, most recent 2005, total area approximately 180,000 square feet.
On this location we have marketing and commercial team and gum manufacturing facility.
Total number of employees on site is approximately 450.
Facility is fed by 2x3MW transformers.

During last 12 months we have experienced close to 60 power interruption, majority been during summer months. In particular this summer, during hot and humid days, we had between 2 and 3 interruptions per day. Those interruptions have significant impact on our production process. Each interruption requires the reset of different systems that can take up to 1 hr downtime. In some instances we have to scrap product, which combined with idle labor cost, compromised quality and delivery time, is loss for our factory.

In addition, we recently had instances where power outage lasted few hours, where we had to send people home and delay product shipments.

We understand that Toronto Hydro has committed to improve service by investing in the electrical infrastructure in next few years and need to obtain funds to do that.

Wrigley Canada strongly supports this initiative, as we recognize that our continued success depends on a balanced plan that address the need for reliable electricity supply grid coupled with competitive rates.

Regards,

Milica Milovic, P.Eng.
Sr. Project Engineer
Wrigley Canada

Appendices: Toronto Hydro's Customer Engagement Workbooks

Introduction 1

About this Consultation 1

Innovative Research Group Inc. (INNOVATIVE) has been commissioned by Toronto Hydro to help the utility design, collect feedback and document its customer engagement and consultation process as part of the development of Toronto Hydro's Distribution System Plan[1] ("DSP") which was presented as the Grid Renewal Plan.

Toronto Hydro's Grid Renewal Plan is a key element of its next distribution rates application. The outcome of this application will determine Toronto Hydro's electricity distribution rates for a five year term beginning May 1, 2015 through to December 31, 2019.

The OEB's new "consumer-centric" approach to rate applications contained in the Renewed Regulatory Framework for Electricity (RRFE) requires LDCs to demonstrate services are provided in a manner that responds to identified customer needs and preferences[2]. Distributors are required to provide an overview of customer engagement activities that each distributor has undertaken with respect to its plans and how customer needs and preferences have been reflected in the distributor's application. While Toronto Hydro engages customers in a number of ways to explore their needs, it has not done so in the context of its capital plans. This initiative sought to bring customers directly into the process of finding the right balance between cost and reliability in Toronto Hydro's Grid Renewal Plan.

This process of identifying and reacting to customer needs and preferences as it pertains to their DSP development and execution is new to Ontario's LDCs. There is no established practices and there are a number of options available to engage with customers. The following section explains how we approached this engagement.

Approach to Meaningful Customer Engagement

It is our experience at INNOVATIVE that engaging customers in meaningful consultation can be a challenge. The reality of most consultation processes is they start out aiming to collect the views of the average person, but end up collecting the views of organized advocacy groups.

Many customers feel they don't know enough to contribute to a public consultation. Others fear the combative nature of some public processes or prefer not to risk offending friends and neighbours by taking firm positions on issues that are sometimes controversial. Moreover, many customers simply do not pay attention and remain unaware of particular consultations that they would participate in if they had been aware.

[1] In the workbook that was used for this consultation, the DSP was referred to as the "Grid Renewal Plan" as a more consumer friendly term. As such, the term "Grid Renewal Plan" appears throughout this report and is synonymous with DSP.

[2] OEB Renewed Regulatory Framework for Electricity Sections 2.4.2, 5.0, and 5.0.4.

Running a consultation on the Grid Renewal Plan has an additional challenge – the lack of awareness of the distribution system including how it is funded, regulated and the nature of its challenges. This is well documented in Ontario Energy Board research and in INNOVATIVE's own experience.

Considering both the challenge of engaging a representative group of customers and the challenge of lack of knowledge, we built a process built on six key principles:

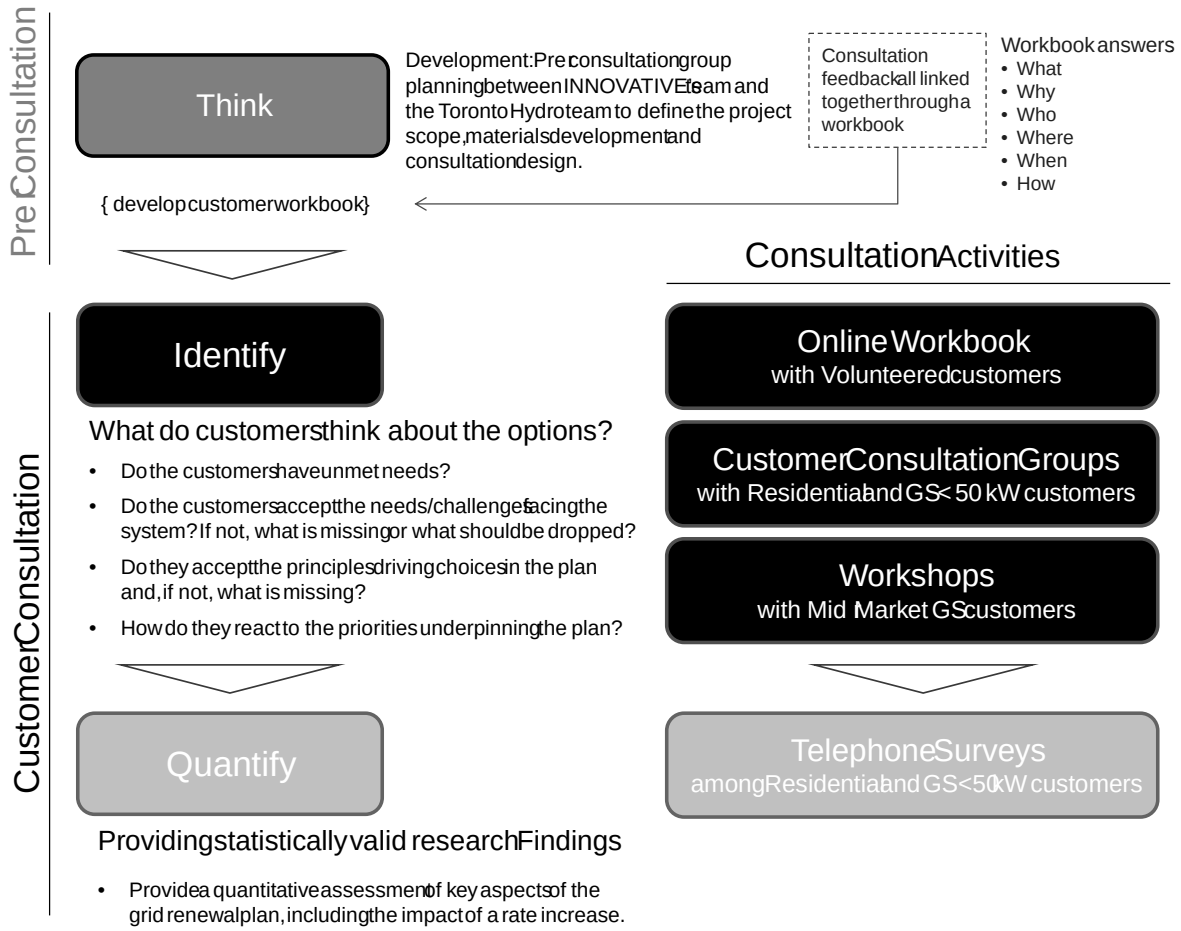
1. Ensure customers from across Toronto Hydro's customer base have an opportunity to be heard.
2. Use random sampling research elements to ensure a representative sample of customers are engaged.
3. Create open voluntary processes to allow anyone who wants to be heard to be heard.
4. Focus on fundamental value choices. Look for questions that ask people to choose between key outcomes rather than focus on the technical questions of how to reach those outcomes.
5. Create an opportunity for the public to learn the basics of the distribution system so they can provide a more informed point of view.
6. Test the consultation material ahead of time for clarity of language, appropriateness of questions, ability to respond to questions, and the right balance between comprehensiveness and simplicity.

Since this was the first time Toronto Hydro so explicitly engaged customers in the development of their DSP, a specific effort was made to collect participant comments on the process itself. While most customers felt this approach to engagement was effective at soliciting their feedback on Toronto Hydro's 5 Year Grid Renewal Plan, other ideas on how to improve upon the process were collected throughout the consultation. This is discussed in detail throughout the body of this report.

Customer Consultation Overview

Based on the principles outline above, INNOVATIVE worked with Toronto Hydro staff to design a multifaceted customer engagement program which included a combination of traditional consultation services as well as qualitative and quantitative research elements. This comprehensive consultation was designed to engage various rate classes and collect feedback on preferences and priorities as they relate Toronto Hydro's 5 Year DSP.

The consultation encompassed four core elements of customer engagement.



1. Online Workbook: The online workbook was promoted through traditional print advertising and social media as well as Toronto Hydro's website. This first phase of the consultation was available to all Toronto Hydro customers who wanted to participate.
2. General Service and Residential Consultation Groups: The General Service and Residential Customer phase of Toronto Hydro's multi faceted customer consultation was used as an engagement tool to educate customers, access customer preferences and priorities, gauge customer acceptance of rate increases, as well as inform subsequent phases of the consultation.

The groups were randomly recruited and held in different locations across the city. A workbook was used to provide the participants with core information about Ontario electricity system and Toronto Hydro's Grid Renewal Plan. They were provided incentives in recognition of their time commitment.

3. Mid Market General Service Workshops: General Service customers over 50 kW (GS > 50kW) were engaged through a series of randomly recruited workshops. They were provided incentives in recognition of their time commitment.
4. Random Telephone Surveys: INNOVATIVE conducted telephone surveys with residential and general service (GS < 50kW) customers to provide a quantitative assessment of key aspects of the grid renewal plan. Customer lists for both respondent groups were provided by Toronto Hydro and the sample was randomly selected by INNOVATIVE.

There were three stages in developing and implementing this consultation:

- Think: The first stage was developing the core background material and key questions for the workbook. INNOVATIVE and Toronto Hydro worked together to review the Grid Renewal Plan to identify potential questions that would allow customers to share their needs and preferences and then to develop a workbook that would provide the information needed to allow customers with different levels of initial knowledge to find answers to those questions.
- Identify: The second step was to find out the range of view in the public about the Grid Renewal Plan through the more qualitative elements of the process. This included an online workbook using a voluntary sample and a series customer discussion groups and workshops using randomly recruited samples of residential and GS customers. In parallel, Toronto Hydro continued its one on one meetings with major customers.
- Quantify: The third step was quantitative – randomly recruited telephone surveys of residential and GS customers. Randomly recruited surveys allow us to draw generalizable conclusions that can be applied to the broader population of Toronto Hydro customers. The surveys were developed based on the feedback from the qualitative research.

The consultation was designed so anyone who is interested would have an opportunity to participate in the process through the online workbook. However, in our approach, we distinguish between responses from the opinion research discipline (random recruits and scientific polls) and responses from an "open invitation" consultation discipline.

The small group results are presented as numeric counts to help readers remember that qualitative research only identifies points of view, it does not project the incidence of that point of view in the broader public.

The results from the workbook and random surveys are presented as percentages due to the larger numbers involved.

- Readers are cautioned that the workbook results represent the views of volunteers. The workbook sample is not randomly selected and cannot be generalised to the broader public.
- The telephone surveys are based on random samples so we can reliable project the incidence to the broader population of Toronto Hydro Customers.
- In some instances, the quantitative total may be greater than 100% due to rounding. This is in keeping with standard research practice.

It is important to note that these consultations occurred as Toronto Hydro was developing its plan. One critical change that occurred during the consultation is that the forecasted bill increase of the Toronto Hydro DSP changed between the qualitative and quantitative phase. Readers should bear this in mind when considering differences in results between the qualitative and quantitative phase.

Workbook Development 1

As we noted earlier, a key challenge in getting public feedback on Toronto Hydro's Grid Renewal Plan is the lack of knowledge of customers about the Ontario electricity system, and Toronto Hydro's role in the system and the local distribution system. The DSP itself is a very detailed and extensive document that uses technical language. Our challenge was to briefly cover these key issues and to frame meaningful questions about customer needs and preferences.

The process of developing the consultation workbook began in the fall of 2013. INNOVATIVE and Toronto Hydro staff began the process of reviewing Toronto Hydro's Grid Renewal Plan while INNOVATIVE conducted one night of exploratory groups on October 3rd, 2013 with randomly selected members of the general public asking who pay at least some attention to current events to ask what they were looking for in a consultation process and what they needed to know to make up their minds on whether Toronto Hydro's Grid Renewal Plan and associated rate plan was reasonable or not.

Based on the initial review of the plan, exploratory groups, and feedback from testing, the workbook was divided into key sections that explained Toronto Hydro' electric system, the challenges facing the system, and how Toronto Hydro intended to meet those challenges over time.

The final consultation workbook had six distinct chapters:

1. Introduction: the purpose of the discussion, where the discussion fits
2. Electricity 101: how the overall system works and the players involved in operating and regulating the system.
3. Toronto's Grid Today: a discussion of the structure and key elements of Toronto Hydro's distribution system.
4. Challenges Facing the Grid: a discussion of the various challenges facing the grid.
5. How We're Managing Grid Pressures an overview of recent and current initiatives to manage the challenges.
6. The Bottom Line: A section covering the level of planned spending for 2015 to 2019 by general Plant (described as Business Support), System Access, System Service and System Renewal; the expected impact on rates and reliability and feedback on priorities, pacing and overall reaction.

Although the sophistication of customers varied, the same basic workbook was used in all qualitative customer engagements – the online workbook, the residential and small GS discussion groups and the mid sized GS workshops. The key change between audiences is that the bill references were varied to reflect the details of that specific rate class. As the customer went through the consultation workbook – either independently or through a facilitated session – they were prompted with questions related to

system reliability, system challenges, and preferences on the direction of Toronto Hydro's proposed Grid Renewal Plan.

Another key element of the workbook were the questions. In developing the questions, we looked for questions that could work also on telephone without all the information in the workbook.

The needs questions were the easiest. We started with a basic satisfaction question and then asked an open ended question about how Toronto Hydro could improve its services. We let customers go to whatever topics they wanted to cover with no boundaries. Later in the workbook we probed satisfaction with the number and duration of routine outages and probed the impacts of those outages. We also zeroed in on major events by asking customers if they had experienced an outage during the ice storm or flooding, how satisfied they were with Toronto Hydro's response and how Toronto Hydro could improve its services during those events.

Preferences took a bit more thinking. We were looking for value choices rather than technical issues. Key topics for preferences included:

- Should the utility follow a run to failure or a pro active replacement strategy?
- What are acceptable outcomes for the number and duration of outages?
- Given the other major needs for investment, how important is it to invest in modernizing the Grid?
- Willingness to participate in centrally controlled demand response programs?
- Whether the overall Grid Renewal Plan was heading in the right or wrong direction and why?
- Whether Toronto Hydro had the balance right in its spending priorities and which areas should have more or less priority?
- Whether Toronto Hydro's goals are too high, too low or about right with probes for which are too high and which too low?

One challenging topic was system access. System access spending is mandated by legislation or other external obligations. There is little room for changes. In that area we simply asked how reasonable some of the major spending areas were to customers.

The final substantive question asked about the cost of the Plan and the outcomes it planned to receive. Sometimes this questions is asked with a simply support or oppose response scale, but we found that type of scale didn't effective capture customer responses. Instead, we gave customers four options as well as a not sure opt out:

- Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more.
- I am satisfied with the balance between outcomes and the proposed rate increase.
- I don't like the rate increase, but I think it is necessary to maintain the grid to a reasonable standard.
- I think the bill impact is too high and Toronto Hydro needs to scale back its plans.

The workbook concluded with a final set of five questions to assess the workbook and process itself.

The workbooks can be found in the Appendix of this report.

Executive Summary 1

More than 300 customer participated in the qualitative stages of the consultation where we explored the range of responses, while another 1,200 customers responded to the quantitative stage where we documented the incidence of needs and preferences across the customer population.

The following section provides the detailed findings on the needs and the preferences of Toronto Hydro's General Service and residential customer base. In this section, we provide a high level overview of Toronto Hydro customers' needs and preferences.

Customer Needs 1

Most Toronto Hydro customers are generally satisfied with the job Toronto Hydro does running the electricity distribution system. This pattern was consistent across all forms of customer input.

Overall Satisfaction across Consultation Activities

	Directional				Generalizable	
	Residential Groups	GS under 50 kw Groups	Mid Market GS Workshop	Online Workbook	Residential Survey	GS Survey
Very Satisfied	6	5	9	26%	23%	19%
Somewhat satisfied	15	21	25	49%	50%	54%
Somewhat dissatisfied	9	4	7	12%	14%	13%
Very dissatisfied	3	1	0	9%	10%	8%
Don't know	0	0	0	4%	3%	7%

When we asked what Toronto Hydro can do better to improve services, comments focused on four major areas:

- Lower prices.
- A general desire for improved reliability or increased investment in infrastructure to improve reliability.
- Faster restoration times, particular during major outages such as the summer flooding or ice storm.
- Improved communications, again particularly during major outages.

This paradox of lower prices while seeking service improvements is the key dilemma the consultation sought to explore and better understand.

The consultation focused deeper on the question of outages. In the qualitative stage, the workbook shared information about the systems current average level of reliability and sought customer feedback on satisfaction with current levels of reliability and response to major events. With the flooding in the summer and the ice storm in December of 2013, major events were at the forefront of customer thoughts.

As the tables below illustrate, while a majority of customers are satisfied with the average frequency and duration of outages and with Toronto Hydro's management of recent major events, a significant minority are not satisfied.

Customer Satisfaction with Current Average Outage Frequency

	Directional			
	Residential Groups	GS under 50 kw Groups	Mid Market GS Workshop	Online Workbook
Very Satisfied	5	3	4	16%
Somewhat satisfied	12	14	13	37%
Somewhat dissatisfied	7	6	9	25%
Very dissatisfied	9	7	7	20%
Don't know	0	1	0	2%

Customer Satisfaction with Current Average Outage Duration

	Directional			
	Residential Groups	GS under 50 kw Groups	Mid Market GS Workshop	Online Workbook
Very Satisfied	4	4	9	17%
Somewhat satisfied	13	10	15	38%
Somewhat dissatisfied	9	7	12	24%
Very dissatisfied	7	10	4	19%
Don't know	0	0	1	2%

Customer Satisfaction with Management of Major Events

	Directional			
	Residential Groups	GS under 50 kw Groups	Mid Market GS Workshop	Online Workbook
Very Satisfied	3	4	10	27%
Somewhat satisfied	12	13	13	39%
Somewhat dissatisfied	7	4	10	15%
Very dissatisfied	9	6	4	14%
Don't know	0	3	3	5%
Refused / No response	2	1	1	N/A

The qualitative consultation activities spent additional time on exploring the impacts of outages on customers, acceptable frequencies and durations of outages as well as trade-offs between frequency and duration. Those findings are detailed in the following section.

The telephone survey built on the qualitative feedback and asked questions about customer preferences on the trade-off between cost and reliability.

Customer Preferences

Looking at the question of reliability performance, the residential and GS customer surveys asked respondents to choose between three options on how Toronto Hydro should respond to the frequency and duration of outages. Both residential and GS customers gave similar responses to both duration and frequency.

- Roughly 30% said Toronto Hydro should spend what is needed to reduce the number and frequencies of outages.
- Between 10 and 15% said Toronto Hydro accept more or longer outages to reduce costs.
- Between 34% and 41% said Toronto Hydro should spend what is needed to maintain the current number and frequencies of outages.

Although most spending in system access is mandated, most customers felt spending on connections, enabling other civic improvements and meters as reasonable with some reservations noted in the following qualitative sections of this report. The qualitative elements raised the topic of system access in an effort to help participants understand where Toronto Hydro's of the capital is spent.

The main focus for exploring customer preferences in the quantitative surveys was on system renewal, system service and general plant issues. The results from the qualitative elements were used to inform the customer surveys and the details are reported later, so for brevity we will focus on the generalizable survey results in this discussion.

On system renewal, the customer surveys asked respondents to pick between two points of view:

- Toronto Hydro should invest what it takes to replace the system's aging infrastructure to maintain system reliability; even if that increases my monthly electricity bill by a few dollars over the next few years.
- Toronto Hydro should lower its investment in renewing the system's aging infrastructure to lessen the impact of any bill increase, even if that means more or longer power outages.

A majority of both residential and retail customers believe Toronto Hydro should replace aging infrastructure, even if that means their bill will increase.

On system service, the surveys explored the issue of new technology. Again, the surveys asked respondents to pick between two points of view:

- In these tough economic times, investments in new technologies are more of a luxury than a necessity and will cost customers more than they are willing to pay.
- Investments in new technology will increase system reliability, make our local distribution system more efficient, and save us money in the long run.

This time, at least 60% of both residential and GS customers said they believe investments in new technology will deliver important benefits and did not see them as unaffordable luxuries.

The surveys took the same approach to general plant spending. The two points of view included:

- Toronto Hydro should find ways to make do with the buildings, equipment and IT systems it already has.
- While Toronto Hydro should be wise with its spending, it is important that its staff have the equipment and tools they need to manage the system efficiently and reliably.

Again, a majority of both residential and GS customers say it is important that staff have the equipment and tools they need to manage the system efficiently and reliably.

Customer Reaction to Rate Impacts

As we found earlier in the needs discussion, Toronto Hydro's customers are conflicted when it comes to the DSP and the rate application.

Many customers are feeling a financial pinch. Others reacted to the latest stories in the newspapers about waste and mismanagement or perks and compensation in any part of the electricity system when considering Toronto Hydro's plan. As noted earlier, few customer welcome the idea of a rate increase.

Yet, reliable electricity service is critical to Toronto Hydro's customers. The recent major event outages reminded Torontonians that electricity is an indispensable necessity. It's not just about making do without lighting and television. Customers had to throw out spoiled food and do without showers or laundry. For others there was no heat and noted difficulty preparing food. Workplaces closed and had to send employees home for, in some cases, extended periods of time. Credit card systems and ATMs went down. Traffic signals, public transit and gas pumps were inoperable. There are few illusions about the need for reliable electricity in Toronto today.

Of course, coming into this process few customers had much understanding of what it takes to build and maintain their local distribution. Many participants in the qualitative exercises expressed appreciation for the opportunity to learn about some of those details. In the surveys we could not provide the same level of information but were able to raise awareness of the complexity through the choice and attitudinal questions.

At the end of each of these consultation processes, we concluded with a question to assess whether customers feel Toronto Hydro has found the right balance or not.

Customer Views on Cost and Outcomes of DSP

	Directional				Generalizable	
	Residential Groups	GS under 50 kw Groups	Mid r Market GS Workshop	Online Workbook	Residential Survey	GS Survey
Plan higher outcomes, even if rates go up	5	6	5	14%	4%	3%
Satisfied with balance	8	4	11	16%	15%	15%
Don't like increase but feel it is necessary	17	13	02	32%	39%	30%
Bill impact is too high, scale back plans	1	2	2	34%	34%	41%
Don't know / Refused	2	6	3	6%	8%	11%

In every consultation activity, the largest group is those who are either satisfied Toronto Hydro has found the right benefit of costs and outcomes or those who say they are unhappy with the price increase but feel it is necessary. While a significant minority say the price increase is too high and the plan should be scaled back, they are partially offset by a smaller group of customers that feel Toronto Hydro should aim for higher outcomes, even if their rates increase.

There is no simple answer to electricity utility spending in the public's view. Price increases are undesirable, but lower reliability is unacceptable and the need to invest in building and maintaining the distribution system is understood and accepted. As a result, Toronto Hydro customers reluctantly accept the proposed DSP and its accompanying price increase as an unfortunate necessity.

1

Online Workbook

Online Workbook
with Volunteered Customers

PURPOSE: To inform customers on the details of Toronto Hydro's proposed DSP and obtain feedback on the proposed plan

Summary

The following summary highlights key findings from residential customer feedback collected through an online workbook tool designed for Toronto Hydro.

Context: Familiarity & Satisfaction with the System

- More than three quarters (77%) have at least some understanding of the electricity distribution process; in fact, one in four (24%) say they could explain the details of the system to others. Almost all (95%) have at least somewhat of an understanding of how the parts of the system work together and which services Toronto Hydro is responsible for.
- Three quarters are either "very" (26%) or "somewhat" (49%) satisfied with the job Toronto Hydro is doing running their local distribution system. Suggested improvements include lower rates (25%) and eliminating/controlling power outages (16%).

System Reliability: Experiences and Perceptions

- Just over half of respondents feel that the current frequency (53%) and duration (55%) of power outages is acceptable. This leaves almost half who feel both are currently unacceptable.
- Almost all (91%) had experienced at least one power outage over the past two years, half of which lasted fewer than 12 hours. We see evidence of the two major storms of 2013 in the proportion reporting outages lasting longer than 12 hours.
- Almost three quarters (73%) were impacted by at least one of the major storms. Regardless of how long they were without power, most did not report any major inconveniences, and they were at least somewhat satisfied (66%) with how Toronto Hydro responded to these major storms. As heard in other research, respondents here feel there is a need for improvement when it comes to communicating the status and estimated length of outages.

Challenges Facing the System

- More than two thirds (68%) feel it is reasonable to prioritize connecting new customers over other investments. Slightly fewer feel it is reasonable to prioritize moving existing infrastructure to accommodate other projects (65%) or maintaining and upgrading grid customer meters to meet provincial standards (63%).
- The majority (73%) prefer a proactive approach over a run to failure strategy with aging equipment.

Modernizing the Grid

- Almost all (93%) feel they understand the challenges facing Toronto Hydro and what they are planning to do to meet those challenges.
- More than half (56%) feel it is "very important" for Toronto Hydro to invest now in modernizing the grid.
- Half (52%) say Toronto Hydro's investment plan is heading in the right direction, primarily because they feel it is necessary to upgrade for the future (57%). One in five (20%) say the plan is headed in the wrong direction.
- Just over half (53%) say the balance is right when it comes to how much Toronto Hydro is spending on each investment priority. Those who feel the priorities should be changed would like to see more spent on modernizing the grid (53%) and less spent on management salaries (20%) and construction projects (20%).
- Half (51%) feel that Toronto Hydro's goals are just right. One in four (24%) say they are aiming too high, while only one in ten (12%) say they are aiming too low. Rate increases (39%) are the primary concern among those who say the goals are too high.
- Overall, three in five (62%) approve of Toronto Hydro's plan. About half of this group (32%) don't like the rate increase but feel it is necessary. One third (34%) feel the bill impact is too high and plans should be scaled back.

Feedback on Workbook Approach

- Respondents deem the workbook "interesting" (35%) and "well done" (32%). The majority (56%) feel it contained the right amount of information, and more than one in four (27%) said there wasn't any content missing as far as they were concerned.
- Almost half (45%) say they prefer an online workbook for this type of consultation.

Methodology

About the Online Workbook

Throughout the fall and winter of 2013, Toronto Hydro and INNOVATIVE staff began developing an accessible customer workbook designed to both inform customers of the 5 year grid renewal plan and collect customer feedback.

The online workbook was divided into key sections that explained Toronto Hydro's electric system, the challenges facing the system, and how Toronto Hydro intended to meet those challenges over time. The online workbook had six distinct chapters:

1. Introduction
2. Electricity 101
3. Toronto's Grid Today
4. Challenges Facing the Grid
5. How We're Managing Grid Pressures
6. The Bottom Line

As the respondents went through the online workbook, they were prompted with questions related to system reliability, system challenges, and what the distribution system plan means to them. In total, the online workbook contained 35 questions, with opportunities for open-ended responses and additional comments. All responses were anonymous and kept strictly confidential.

For customers, this was an opportunity to learn more about Toronto Hydro's plan and to share their feedback. The ultimate goal was to ensure alignment between Toronto Hydro's operational plans and their customers' preferences and priorities.

Customer feedback was also incorporated into the design of subsequent consultation phases.

Field Dates:

The online workbook was available for Toronto Hydro customers to access for 37 days between February 21, 2014 and April 1, 2014.

Participation:

To ensure customer privacy, answers were grouped together with those of others who completed the same question and the information provided was used for statistical purposes only.

Responses to the online workbook are as follows:

- 1,233 unique visitors came to the online workbook's landing page.
- 485 customers moved beyond the online workbook's landing page and identified themselves as either residential customers or business customers (467 residential / 18 business customers).
- 300 qualified customers completed at least the profiling section of the online workbook (291 residential / 9 business customers).
- 209 customers completed the entire online workbook by answering all questions (202 residential / 7 business customers).

The results are based on completed answers to the online workbook questions by residential customers. Due to the small sample size, business customer responses are not reported in the body of this document, but rather recorded as footnotes below each chart.

Promoting the Online Workbook:

The online workbook was promoted by Toronto Hydro through traditional print advertising (the Toronto Star), Toronto Hydro's web site, customer bill inserts, and Toronto Hydro's social media accounts, including Facebook and Twitter.

Hosting the Online Workbook:

The online workbook was hosted by INNOVATIVE under the URL www.torontohydroworkbook.com.

The online workbook was designed to prevent respondents from completing the questions more than once and to save the progress of respondents in the event of survey mid-termination.

Cookies were used in the design of the online workbook to ensure that respondents only completed the online workbook once. Cookies are small amounts of data that attach to a user's computer hard drive when they visit a web site. When respondents reached the final web page, the survey was considered complete and the site was no longer accessible to the internet protocol (IP) address used to complete the online workbook.

At the same time, the site saved respondent answers if they left the online workbook or experienced a mid termination before reaching the final webpage of the workbook. When respondents returned to the online workbook, all previously entered answered were saved and appeared in the workbook linked to the user's internet protocol (IP) address.

We do not link the information we store in cookies to any personally identifiable information submitted on our site.

Respondent feedback data was only ever available to INNOVATIVE project team staff through a secure data retrieval portal.

Validating Customer Responses

Respondents who visited the online workbook were asked to self identify as either a residential or business customer of Toronto Hydro. Respondents were then asked to provide the postal code that corresponded to either their residence or business serviced by Toronto Hydro and answer the remaining questions from the perspective of the self identified customer type.

Only feedback from customers who provided a valid postal code were included in this report. In total, seven residential customers were removed from the dataset due to invalid postal codes that did not correspond with Toronto Hydro's service area.

Respondent Profile

The following details the demographic characteristics of qualified respondents who completed the profiling section of the Online Workbook [n=291 residential and n=9 business customers].

Figure 1.A: Residential Customer Profile

For business respondents, a total of nine respondents at least completed the profiling section of the online workbook. The total number of business respondents who completed the online workbook was seven.

Figure 1.B: Business Customer Profile 1

Respondent Feedback 1

A total of 202 residential customers completed Toronto Hydro's online workbook. However, 291 residential customers completed at least the profiling questions within the online workbook. Answers from the 89 semi-complete respondents have been included in the findings.

Responses provided by business customers are included in the following charts as footnotes because only nine business customers semi-completed the online workbook (seven business customer completed the entire online workbook).

Context: Familiarity & Satisfaction with the System 1

This section provides an introduction in terms of how familiar respondents are with the electricity system, how the different parts work together, and Toronto Hydro's role in the system.

1

Familiarity with the System

- More than three quarters (77%) of residential respondents report having at least some level of understanding when it comes to Toronto Hydro's electricity distribution system. One in four (24%) say they can explain the details of the system to others.
- Given what they already knew and what they had read in the online workbook, almost all (95%) respondents say they understand the important parts of the electricity system, how they work together and which services Toronto Hydro is responsible for. Half (50%) say they understand this "somewhat well", while almost as many (45%) say they understand this "very well".

Satisfaction with Toronto Hydro

- Three quarters of respondents are either "very" (26%) or "somewhat" (49%) satisfied with the job Toronto Hydro is doing running their local distribution system.
- Asked to suggest ways in which Toronto Hydro can improve its service, lower rates topped the list at 25%, followed by eliminating/controlling power outages (16%), and improving the infrastructure (13%).

Figure 1.1: Familiarity with Electricity Distribution System

Half of residential respondents say they can explain the details of Toronto Hydro's electricity distribution system to others (24%) or that they are generally familiar with it, but can't explain it to others (24%). An additional three in ten (28%) say they have some understanding of the system but are not sure of the details. The final quarter (23%) report having a very limited knowledge of Toronto Hydro's electricity distribution system.

Figure 1.2: Understanding Toronto Hydro's Role 1

Based on what they already knew, and what they had read in the online workbook, almost all (95%) residential respondents feel they understand the important parts of the electricity system, how they work together and which services Toronto Hydro is responsible for either "very well" (45%) or "somewhat well" (50%).

Of the 8 business respondents, 4 indicate they understand the system "very well" and the remaining 4 say they understand it "somewhat well".

Figure 1.3: Satisfaction with Toronto Hydro 1

Half (49%) of residential respondents are "somewhat" satisfied with the job Toronto Hydro is doing running the local distribution system, and a further one in four (26%) are "very" satisfied. About one in five are either "somewhat" (12%) or "very" (9%) dissatisfied.

Business respondents are also satisfied with the job Toronto Hydro is doing as 6 out of 8 respondents indicated they are either "very" or "somewhat" satisfied.

Figure 1.4: Improving Service 1

In particular, lowering rates and reducing power outages top the list of things residential respondents feel Toronto Hydro can do to improve their service. There were also suggestions for improving the infrastructure, better communication regarding outages, reducing salaries and tracking consumption.

For business respondents, only two provided an answer. One said "track consumption" and the other response did not fall into any of the above categories.

1

System Reliability

This section of the workbook explores experiences with power service interruptions and measures respondents' expectations of the frequency and length of these interruptions.

Experiences with Power Service Interruptions

- Half (53%) of residential respondents say the current average number of electricity outages is either "very" (16%) or "somewhat" (37%) acceptable.
- Results are very similar when it comes to average amount of outage time, with just over half (55%) finding the current average outage time either "very" (17%) or "somewhat" (38%) acceptable.
- Nine in ten (91%) residential respondents have experienced at least one power outage in the past two years, with some experiencing up to six or more. Half of these outages lasted for fewer than 12 hours.
- For one in five (19%), the power outage had little or no impact on them personally, but others were inconvenienced with issues like food spoilage (16%), having to relocate (15%), or having no heat (13%).
- There is no general consensus on what length of time leads to costs and consequences becoming serious as the result of a power outage, with answers ranging from one hour to more than three to five days.
- A plurality (33%) feel that two power outages per year are reasonable, although one in six (17%) feel no outages are reasonable. Over half (55%) think an hour or less is a reasonable duration for a service interruption, while one in ten (11%) maintain that no outage is acceptable.
- Almost three quarters (73%) were affected by at least one of 2013's major storms. One in ten (9%) were impacted by the flooding in July, while almost four times as many (35%) were hit by the ice storm in December. Three in ten (29%) were affected by both of these storms.
- Whether personally impacted or not, two thirds (66%) are satisfied with Toronto Hydro's management of these events. Despite being generally satisfied, some (31%) would have preferred better communication on the status of the outages.

Figure 1.5: Perception of Outage Frequency 1

Just over half (53%) of residential respondents find the current average number of electricity outages either "very" (16%) or "somewhat" (37%) acceptable. One in four (25%) find the number "not very acceptable" and slightly fewer (20%) say it is "not acceptable at all".

For the 7 business respondents who answered, 3 find the current level "very acceptable", 1 finds it "somewhat acceptable", 2 find it "not very acceptable", and the remaining 1 finds it "not acceptable at all".

Figure 1.6: Perception of Outage Duration 1

Similar to the responses noted for the frequency of outages, over half (55%) of residential respondents find the current average duration of outages either "very" (17%) or "somewhat" (38%) acceptable. One in four (24%) find the number "not very acceptable" and slightly fewer (19%) say it is "not acceptable at all".

For the 7 business respondents who answered, 3 find the current level "very acceptable", 1 finds it "somewhat acceptable", 1 finds it "not very acceptable", and the remaining 2 find it "not acceptable at all".

Figure 1.7: Power Service Interruption Experiences 1

Most residential respondents experienced a power service interruption in the past two years. Nine in ten (91%) indicated they had at least one power outage. One in five (19%) had only one outage in the past two years, while almost as many (17%) were hit by six or more.

Some outages (likely those related to one of the major storms of 2013) reportedly lasted two days or longer, but most lasted fewer than 12 hours. One in five (19%) service interruptions lasted less than an hour, with slightly more (22%) lasting between one and four hours.

Figure 1.8: Impact of Power Service Interruption

Concerning the impact of these service interruptions, one in five (19%) report little or no impact, followed by food spoilage/unable to cook (16%), had to relocate (15%), and having no heat (13%). Only one percent reported damages due to surges.

For business respondents, 3 out of the 8 respondents who answered the question experienced a service interruption. Two were left "unable to work", and one experienced "food spoilage/unable to cook".

Figure 1.9: Time at Which Costs and Consequences Become More Serious

There is no clear point beyond which residential respondents feel the costs and consequences of an outage become more serious for them. Equal proportions say it's more than 1 hour, 2 hours, 3 or 4 hours, 8 to 10 hours, 12 hours, or 2 to 3 days. For five percent, it depends on what time of year the outage occurs.

Concerning business respondents, 3 out of 4 responded "other" and the remaining respondents said 5 to 6 hours.

Figure 1.10: Reasonable Frequency of Power Service Interruptions

According to residential respondents, two power service interruptions a year is the most reasonable. One is seen as the next most reasonable (24%), followed by none (17%), followed by three outages (13%), then four outages (7%) and finally more than four (7%) outages per year.

Most business respondents indicated that one outage is acceptable (n=3), followed by none (n=2), then three (n=1) or four (n=1).

Figure 1.11: Reasonable Duration for Service Interruption 1

More than half (55%) of residential respondents feel that an outage lasting an hour or less is acceptable (29% say 1 hour, 26% say 30 minutes). One in five (19%) deem an outage of two hours to be reasonable. One in ten (11%) hold that no outage is acceptable.

Business respondents stated that 30 minutes (n=3) or 2 hours (n=1) is the most reasonable duration for a service interruption, although almost half (n=3) prefer no outages at all.

Figure 1.12: Impact of Major Storms in 2013

About three quarters (73%) of residential respondents were impacted by one or both of the two major storms of 2013. More than a third (35%) were affected by the ice storm, while one in ten (9%) were impacted by the flooding in July. Three in ten (29%) were affected by both storms.

Four business respondents were affected by December's ice storm, two were impacted by both, and one was not affected by either storm.

Figure 1.13: Satisfaction with Management of Storms 1

Two thirds (66%) are satisfied (27% "very" and 39% "somewhat") with Toronto Hydro's management of the major storms of 2013. About one in seven (15%) are "somewhat dissatisfied", and a similar proportion (14%) are "very dissatisfied".

Among business respondents, 2 were "very satisfied", 3 were "somewhat satisfied", and 1 was "very dissatisfied".

Figure 1.14: Improving Service During Major Storms 1

A plurality of residential respondents (31%) would have liked better communication on the status during the storms. Others would have liked their power restored faster (13%), or better updates on the outage maps (5%). Some suggested proactive measures like keeping trees trimmed (6%), hiring more staff (5%) and upgrading equipment (6%).

Among business respondents, 1 would like better communication on status, and 1 would like better updates on outage maps.

1

Challenges Facing the Distribution System

This section explores respondent views concerning service of the local distribution system. It focuses on the degree of satisfaction with the current system and means of improving the system in the future.

Understanding and Improving the Local Distribution System

- Overall, residential respondents agree it is reasonable to prioritize connecting new customers, moving existing infrastructure to enable other projects such as street widening or new developments, and maintain and upgrading grid customer meters to meet provincial standards over other investments.
- A solid majority (73%) of residential respondents prefer replacing equipment before it breaks down over running to failure.

Figure 1.15: Spending Priorities

Overall, residential respondents agree it is reasonable to give each of the three investments tested priority over other grid investments.

- 32% feel it is "very reasonable" to prioritize connecting new customers such as new housing, condominiums, or businesses. Another 36% find it "somewhat reasonable".

- 22% feel it is "very reasonable" and 43% feel it is "somewhat reasonable" to prioritize moving existing electricity infrastructure to enable other projects such as street widening or new developments.
- The result is very similar (22% "very", 41% "somewhat reasonable") for prioritizing maintaining and upgrading grid customer meters to meet provincial standards.

Figure 1.16: Running to Failure 1

Around three quarters of residential respondents (73%) would rather Toronto Hydro replace equipment before it breaks down to avoid power outages, rather than a run to failure approach (27%).

For business respondents, 7 out of 8 agreed with replacing equipment before breakdown.

1

Modernizing the Grid

This section touches on customer understanding of the challenges currently facing the Toronto Hydro grid and reaction to proposed investments into the system, including priorities, spending plans, and the balance between rate increases and investments into system improvements.

Understanding Toronto Hydro's Responsibility & Grid Challenges

- Based on what they already knew and had been exposed to in the online workbook, almost all (93%) feel they understand the challenges facing the Toronto Hydro grid and what they are planning to do to meet those challenges.
- More than half (56%) of residential respondents agree that it is "very important" for Toronto Hydro to invest now in modernizing the grid. An additional three in ten (30%) feel this is "somewhat important".
- Respondents are divided on whether or not they would participate in Demand Response (DR) programs. Three in ten (31%) say they are "not likely at all" to participate, while slightly fewer (27%) say they are "very likely" to participate. The remaining two in five are either "somewhat" (22%) or "not very" (19%) likely to take part in a DR program.

Reaction to Toronto Hydro's Investment Plan

- Half (52%) of residential respondents say it seems like Toronto Hydro's investment plan is headed in the right direction. One in five (20%) feel it is headed in the wrong direction, and the remaining 28% don't know. Those who feel Toronto Hydro is headed in the right direction tend to feel that way because they feel it is necessary to upgrade for the future (57%).
- A slim majority (53%) of residential respondents say the balance seems right when it comes to how much Toronto Hydro is spending on each of its investment priorities. Among those who feel the priorities should be changed, there is a desire for more spending on modernizing the grid (53%), and less spending on management salaries (20%) and construction projects (20%).
- Given the option of a proactive or reactive approach to maintaining the grid, half (51%) feel that Toronto Hydro's goals are about right. One in four (24%) say their goals are too high, and half as many (12%) say they are aiming too low. Those who feel the goals are too high are concerned about rate increases (39%), while those who say the goals are too low would like to see more effort put into replacing aging equipment (20%).
- Overall, three in five (62%) approve of Toronto Hydro's plan and the outcomes it is expected to achieve, even if half this group (32%) don't like the rate increase (but feel that it is necessary to maintain the grid to a reasonable standard). However, one third (34%) feel the bill impact is too high and Toronto Hydro needs to scale back its plans.

Figure 1.17: Understanding the Distribution System and Its Challenges 1

Given what they already knew and what they read in the online workbook, more than nine in ten (93%) respondents feel they understand the challenges facing the Toronto Hydro grid and what they are planning to do to meet those challenges. About half (48%) say they understand this "somewhat well", while almost as many (45%) say they understand it "very well".

Of the 7 business respondents who answered, 3 indicate they understand the challenges "very well" and the remaining 4 say they understand it "somewhat well".

Figure 1.18: Modernizing the Grid 1

A majority (56%) of residential respondents feel it is "very important" for Toronto Hydro to invest now in modernizing the grid. Another three in ten (30%) say this is "somewhat important". Only about one in ten (12%) feel it is either "not very" or "not at all" important to invest in the grid now.

Of the 7 business respondents who answered, 4 feel it is "very important" to invest in the grid now, 2 feel it is "somewhat important", and only 1 feels it is "not very important"

Figure 1.19: Demand Response Programs 1

1

Residential respondents are divided on whether or not they would participate in Demand Response programs. Half are either "very" (27%) or "somewhat" (22%) likely to participate in a DR program, while the other half are "not very likely" (19%) or "not likely at all" (31%) to do so.

Business respondents are also split on whether or not they would participate in DR programs. Of the 6 who responded, 1 said they were "very likely", 3 said "somewhat likely", 1 said "not very likely", and the remaining 2 said "not likely at all".

Figure 1.20: Reaction to Investment Plan 1

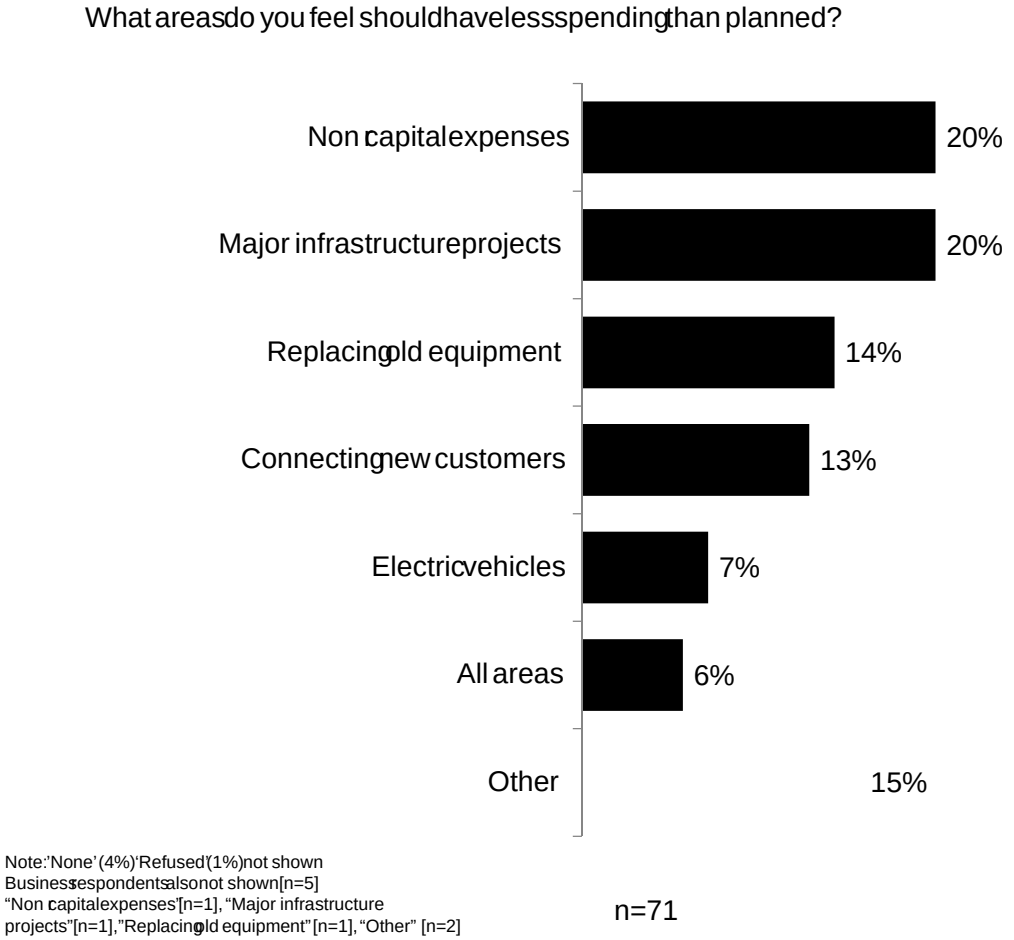
Just over half of residential respondents (52%) think Toronto Hydro's investment plan seems like it is going in the right direction. One in five (20%) say it is going in the wrong direction, and the remainder (28%) don't know.

Among business respondents, 4 say the plan is going in the right direction, 1 says wrong direction, and the other 2 don't know.

Figure 1.21: Reaction to Investment Plan (Reasons) 1

- Those who feel the plan is heading in the right direction primarily feel that way because they think it is necessary to upgrade for the future (57%).
- Among those who feel the plan is headed in the wrong direction, poor management/planning is the main reason (30%).
- Those who don't know are, for the most part, either concerned about communication regarding the plan (31%), or they feel that rates are already too high (22%).

Figure 1.22: Investment Priorities 1



By a fairly slim margin (53% versus 47%), residential respondents feel Toronto Hydro has the balance right when it comes to how much they are spending on each of its investment priorities.

The result is similar among business respondents, with 4 saying the balance seems right and 3 saying they should change some of their priorities.

Figure 1.23: Investment Priorities (Where to Spend More)

Asked where they feel Toronto Hydro should be spending more than planned, more than half (53%) said they want more spent on modernizing the grid system.

Figure 1.24: Investment Priorities (Where to Spend Less)

Asked where Toronto Hydro should be spending less than planned, responses were more varied. One in five (20%) wanted to reduce spending on non-capital expenses[3] or major electric infrastructure projects (which often disrupt day to day life), while others wanted to cut back investment on replacing old equipment (14%) or connecting new customers (13%).

[3] Non-capital expenses include items related to Toronto Hydro's operating budget.

Figure 1.25: Spending Proposal 1 1

Half of residential respondents (51%) think (based on a table below which was shown in the online workbook) Toronto Hydro's goals are "about right". One in four (24%) feel their goals are too high, while half as many (12%) feel they are aiming too low. The remaining respondents (14%) are not sure.

Business respondents are more evenly divided on this question. Equal numbers feel the goals are "about right" (n=2) or "too high" (n=2). Another respondent feels the goals are "too low" and the remaining is not sure.

Note: forecasted rate increases were updated throughout the course of the consultation. This resulted in different forecasted rate increases used in the subsequent customer telephone surveys. For more information, please see Section 4: Customer Telephone Surveys

Figure 1.26: Reaction to Spending Proposal 1

Rate increases are the main reason (39%) that some feel Toronto Hydro's goals are too high, followed by the need for better communication or planning of their agenda (17%).

For those who feel the goals are too low, some says it's because they want to replace aging equipment (20%), while others say they want to reduce costs (13%) or outage times (13%). Still others feel the goals are too low because they want Toronto Hydro to pursue conservation solutions (7%), or they feel Toronto Hydro should be advocating for assistance from the government (4%).

Figure 1.27: Acceptance of Rate Increase 1 1

One third (34%) of residential respondents think the bill impact is too high and Toronto Hydro needs to scale back its plans. A similar proportion (32%) say they don't like the rate increase, but think it is necessary to maintain the grid to a reasonable standard. Half as many (16%) are satisfied with the balance between outcomes and the proposed rate increase, and slightly fewer (14%) say Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more.

Of the business respondents, 2 of 7 say Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more. Another 2 say they are satisfied with the balance between outcomes and the proposed rate increase. One doesn't like the rate increase but thinks it is necessary to maintain the grid, and one thinks the bill impact is too high and Toronto Hydro should scale back its plans. The remaining business respondent is not sure.

1

Feedback on Workbook Approach

This section provides respondent feedback on the online workbook itself and the research process.

In summary, respondents reacted favourably to the workbook, saying it was interesting (35%) and well done (32%). Most (56%) found it to contain the right amount of information, and over a quarter (27%) said there was not any content missing that they would have liked to have seen included. The primary outstanding questions were communication on costs/spending (21%), and improving system reliability (11%). For this type of consultation, an online workbook is the preferred format by almost half (45%).

Figure 1.28: General Feedback

Feedback on the workbook was generally positive, with about two thirds finding it interesting/ informative (35%) or well done (32%). There were a few who found the workbook too long or confusing (7%), biased (3%) or that it needed space for comments in each section (1%).

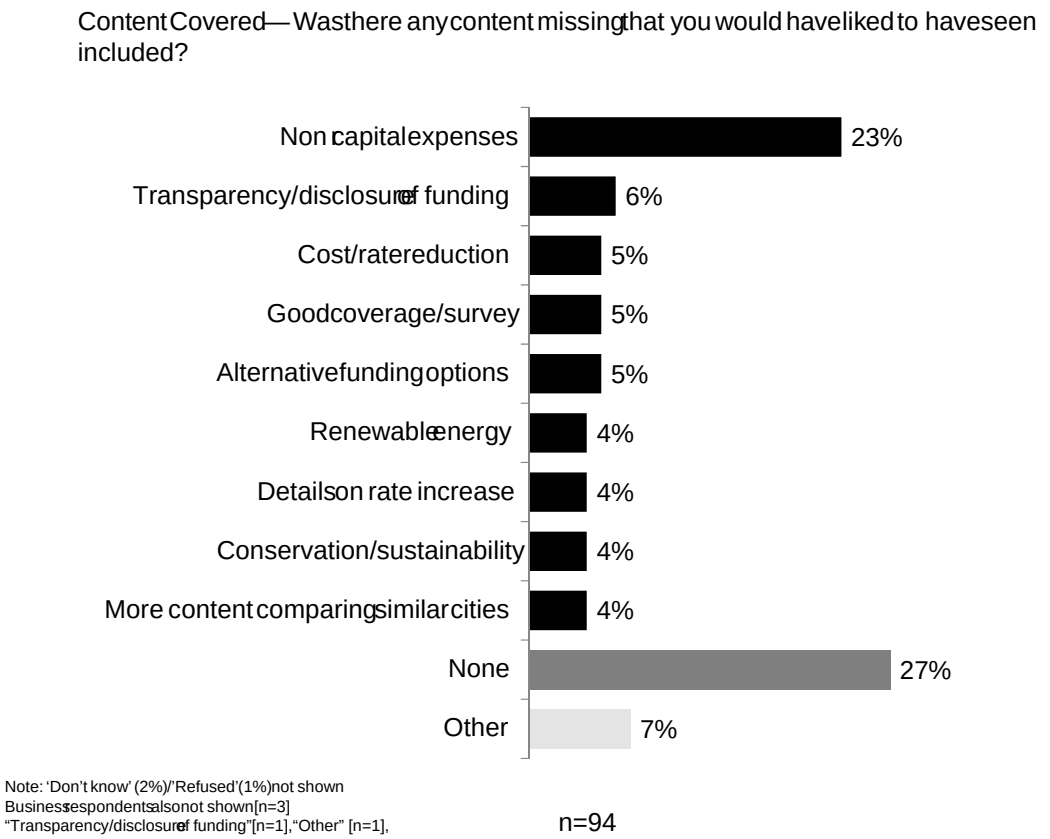


Figure 1.29: Volume of Information 1

Most (56%) residential respondents felt the workbook contained the right amount of information. One in four (25%) felt it was too much information, and about one in ten (12%) felt there was not enough information.

Business respondents were divided with 2 saying there was too much information, and 2 saying there wasn't enough information.

1

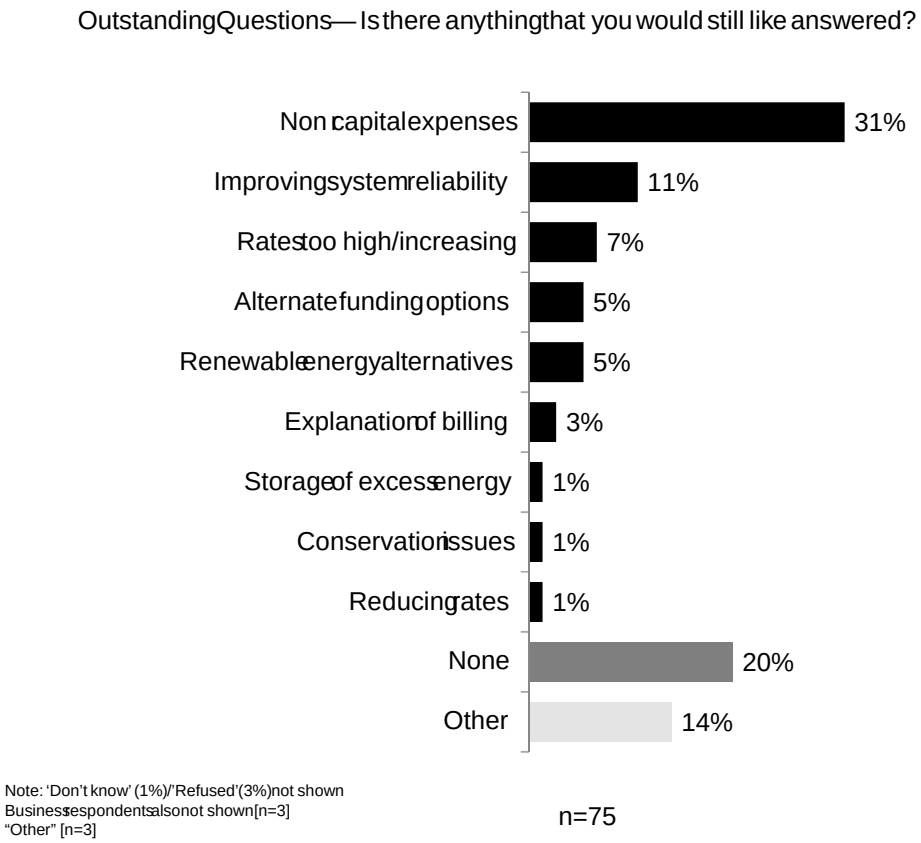

Figure 1.30: Content Covered 1

Note: 'Don't know' (2%)/'Refused'(1%) not shown
Business respondents also not shown [n=3]
"Transparency/disclosure of funding" [n=1], "Other" [n=1], "Don't know" [n=1]

A plurality (27%) didn't feel there was any content missing from the workbook. Areas were respondents would have liked to have seen additional information tended to focus on non-capital expenses (23%).

Figure 1.31: Outstanding Questions 1

Note: 'Don't know' (1%)/'Refused'(3%) not shown
Business respondents also not shown [n=3]
"Other" [n=3]

Nearly a third (31%) of residential respondents would like more details on non-capital expenses and spending. One in ten (11%) would like to know more about improving system reliability. Fewer had outstanding questions about rates being too high (7%), alternative funding options (5%), and renewable energy alternatives (5%).

One in five (20%) respondents had no outstanding questions.

Figure 1.32: Suggestions for Future Customer Engagement 1

An online format seems to be the favoured approach to this type of consultation among online respondents, with almost half (45%) saying they prefer an email/online/workbook format. Significantly fewer prefer a survey (16%), or an in person forum (13%).

Workbook Based Facilitated Discussion 1

Customer Consultation Groups
with RS and GS Customers

PURPOSE: To gain qualitative input/ response to proposed DSP from RS and GS < 50 kW customers and to feed into survey design

Summary 1

The following summary highlights key findings from the general service (under 50 kW) and residential consultation sessions held in North York, Central Toronto, Etobicoke, and Scarborough.

System Reliability: Customer Experience and Expectation 1

Most participants in the consultation groups had experienced an average of two to four power service interruptions at their businesses and/or homes in the past twelve months. The duration of the service interruption lasted from a few minutes to many hours in some cases. Both general service and residential customers reported losses of revenue and productivity within their respective businesses and households due to outages.

All of the participants in the group stated that they wanted better customer service from Toronto Hydro and its staff. Specifically, several participants in the group stated Toronto Hydro should improve its communication with customers especially when outages and other similar power service interruptions occur.

Improving Service of the Local Distribution System 1

Residential customers are concerned about both the frequency and duration of the outages and would prefer less of both. The general service users stated that depending on the type of business, both frequency and duration of outages can have major consequences.

Most participants in the consultations were unfavourable towards conservation and demand management programs because they did not want to lose control over their electrical equipment.

For the most part, general service and residential customers are satisfied with the job Toronto Hydro is doing running the local distribution system. When asked about improvements, the main suggestions concerned limiting rate increases, reducing power service interruptions, and having better communication with customers regarding and during power outages. Further, participants stated that Toronto Hydro should have saved up and created a reserve capital fund to use in case of emergencies and to replace aging equipment.

Coverage of Distribution System Topics

Most of the participants in both groups found the workbook to be very informative, providing the group with the right amount of information needed to discuss the issues at hand.

Many stated that they wanted to have more information on Toronto Hydro's operating budget, revenues, expenses and their profits and losses reports. Several wondered what other options there were for system investment besides the run to failure approach and Toronto Hydro's grid renewal plan.

A few of the participants thought the workbook consisted of too much technical information and they felt they were not qualified to answer some of the questions regarding reasonable investments, measures on connection issues, maintaining smart meters, and moving of electricity infrastructure.

Lastly, some of the participants stated that they wanted more time both to prepare and read through the workbook, and to express their views on the proposed plan during the consultation discussions.

System Renewal

Most participants support the policy of replacing equipment before it breaks down, and see this as a fiscally prudent approach to controlling system costs in the long term. When it comes to Toronto Hydro's overall grid investment plan, most felt they are heading in the right direction, but they would have preferred a "gradual cost increase".

Most stated that Toronto Hydro should spend and prepare more rigorously to cover major issues which in the long term would save money. In contrast, a few stated that they wanted an updated grid that would bring costs down in the long term. Others felt that Toronto Hydro should find effective and better ways to maintain and upkeep the current aging infrastructure.

Many within the residential groups felt that Toronto Hydro should invest more in renewable generation and renewable energy. Additionally, a few felt they did not have enough information or knowledge to comment on Toronto Hydro's planned spending.

Response During Major Weather Events

Almost everyone mentioned wanting better communication from Toronto Hydro to its customers during major weather events. Specifically, they stated Toronto Hydro should have engaged and consulted with customers on emergency management fixes and updates during extreme weather events.

Participants stated that Toronto Hydro should review and modify its emergency plans and make it a more "hands on" approach. Further, they went on to state that during major events Toronto Hydro should hire help from other Canadian cities, provinces, and private contractors. Lastly, most seemed to agree that Toronto Hydro should advise and inform people when services are going to be restored during major events.

Many felt that major event catastrophes could have been avoided if Toronto Hydro better maintained its system by investing in new equipment and/or had been proactive about removing or pruning trees around wires.

Toronto Hydro's Proposed Plan and Rate Impact

Most participants (53 of 64) accepted Toronto Hydro's plan to increase customer rates by the proposed amount; with 23 saying they support the proposed rate increase and 30 saying they don't like it, but think it is necessary.

Most felt that Toronto Hydro's proposed plan was well researched and documented. Moreover, they felt that there was a balanced perspective on the risks, benefits, and overall cost effectiveness of the proposed plan. Further, participants in the consultation stated that the evidence given was satisfactory for the proposed plan to be effective. They went on to say that Toronto Hydro appears to be proactive and seemed to be putting money where it would have the highest and most effective return.

Some participants felt unsure about Toronto Hydro's proposed plan and whether or not it was headed in the right direction. These participants felt they didn't have enough information to effectively answer the questions, while some others felt a sense of distrust toward Toronto Hydro. Moreover, most were disappointed that Toronto Hydro had found itself caught up in the present situation of aging infrastructure equipment.

Some felt Toronto Hydro should invest more in preventative methods and be more proactive with its spending. Various participants also thought that Toronto Hydro should work in conjunction with the Province of Ontario and the City of Toronto to get funding, instead of raising prices for customers. Participants recommended that since all of the revenue and profits accumulated from Toronto Hydro electricity bills were going back into a municipal body, that public money should be used to subsidize the proposed rate increase for the ratepayers.

General Service and residential customer permission on Toronto Hydro's proposed rate increase:

Looking at the cost of the Toronto Hydro plan and the outcomes it is expected to achieve, which point of view is closest to your own? [based on 64 respondents]

Response	Sum Total
Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more	11
I am satisfied with the balance between outcomes and the proposed rate increase	12
I don't like the rate increase, but I think it is necessary to maintain the grid to a reasonable standard	30
I think the bill impact is too high and Toronto Hydro needs to scale back its plans	3
Not sure	4
No response	4
Total	64

How Could the Consultation Process be Improved?

At the conclusion of the sessions, participants were asked what they thought of this approach to customer consultation and how it could be improved.

The majority of the participants in the groups felt that the consultation process was helpful, accountable, and transparent. There were a few who felt the purpose of the consultation was to highlight the accomplishments of Toronto Hydro.

Some liked the consultation process but wanted other sides of the argument to be present. Others wanted to know more about the role of other provincial players within the system. Finally, some participants wanted to know what would happen after the initial five years and what Toronto Hydro's long term plan was for the future.

Most liked the way the consultation was conducted and the round table format, which gave all a chance to share their opinions. Many of the participants in the consultation suggested an online survey to get more of a quantifiable and democratic response.

Some participants in the group felt that they needed to have more information to provide educated answers and substantive feedback. Some stated that they would have liked to see an expert panel discussion on the pros and cons of the proposed plan. Others agreed and thought that the pros and cons of modernizing the grid should have been laid out in the workbook and explained in further detail during the consultation.

Methodology

About the General Service and Residential Customer Consultation

Innovative Research Group (INNOVATIVE) was engaged by Toronto Hydro Electric System Limited (Toronto Hydro) to conduct a series of general service and residential customer consultation sessions designed to identify the needs and preferences of consumers as they relate to the proposed Five Year Grid Renewal Plan.

The consultation sessions were held in North York on February 3, 2014, Central Toronto on February 4, 2014, Etobicoke on February 6, 2014, and Scarborough on February 12, 2014. A total of 64 general service and residential customers participated in these consultation sessions.

North York: February 3, 2014

General Service under 50 kW Rate Class	7 participants
Residential Rate Class	6 participants

Central Toronto: February 4, 2014

General Service under 50 kW Rate Class	7 participants
Residential Rate Class	8 participants

Etobicoke February 6, 2014

General Service under 50 kW Rate Class	7 participants
Residential Rate Class	10 participants

Scarborough February 12, 2014

General Service under 50 kW Rate Class	10 participants
Residential Rate Class	9 participants

Recruiting Consultation Participants

General Service customers in the under 50 kW rate class were randomly selected by telephone from customer lists and screened for appropriateness as session participants. General Service customers qualified for the consultation if they managed or oversaw their business electricity bill. This was to ensure they were at least somewhat knowledgeable of their electricity costs and could have an informed discussion on the impact of the proposed rate increases.

Customer recruitment lists were randomly generated and provided to INNOVATIVE by Toronto Hydro.

An incentive of $100 was provided to all general service and residential customers who participated in the consultation sessions.

All consultation sessions were video recorded to verify participant feedback and quotes.

Consultation Session Structure

The consultation sessions were structured around the themes contained in the workbook, which was developed by INNOVATIVE and Toronto Hydro staff in the fall of 2013.

The workbook themes included the following:

1. What is this about?
2. Electricity 101
3. Toronto's Grid Today
4. Challenges Facing the Grid
5. How We're Managing Grid Pressures
6. The Bottom Line

All consultation participants were sent electronic copies of the workbook via email as part of a pre read package in advance of the sessions.

At the start of the sessions, the facilitator gave an overview explaining the purpose of the consultation and why Toronto Hydro is seeking feedback from general service and residential customers.

After explaining the purpose of the consultation, hard copy workbooks were distributed to act as a session guide and for participants to record their answers to the questions contained within.

The facilitator then led the participants through the workbook section by section to ensure they understood the information and to answer any questions they had about the content.

When it came to the questions within the workbook, participants were asked to fill in their answers independently. The facilitator then led a group discussion on the answers participants provided and what the various issues meant for them or their businesses.

Hard copy workbooks were collected from the participants at the conclusion of each consultation session.

Each consultation session ran for approximately 2.5 hours.

Informing the Consultation Process

In addition to identifying customer needs and preferences as they relate to the proposed DSP, feedback collected from this phase of the consultation was used to inform the design of the telephone survey and used in the subsequent online consultation phase of Toronto Hydro's customer engagement program as part of their rate application.

NOTE: Results contained within this report are based on a limited sample and should be interpreted as directional only.

Participant Feedback

The following section highlights the general feedback from each consultation group.

North York Consultation Sessions

General Service Under 50 kW Rate Class (North York)

System Reliability: Customer Experience and Expectation

Communication was the biggest concern, particularly during outages when business owners and managers need to make decisions on how to run their daily operations. Another concern shared by many was the bills they receive. Bills were considered confusing and hard to read in terms of how much electricity they are consuming. Further, some would prefer monthly bills because every other financial aspect of their business is conducted on a monthly basis.

Improving Service of the Local Distribution System

The general service users stated that depending on the type of business, both frequency of outages and duration of outages can have major consequences. Some commented that the three hour mark is where they might do things differently, like sending staff home, closing their business for the day, etc. While it was generally felt that Toronto Hydro comes up short when it comes to communication during outages,

it then became apparent that most were not making much effort to get updates aside from perhaps making a phone call.

One outage per year lasting no longer than 30 minutes was generally agreed upon as reasonable, though there was one individual who maintained that no outages are acceptable.

There was some discussion about trees that may be older or damaged and which are located close to hydro wires. The feeling was that Toronto Hydro is not being adequately responsive to requests to deal with these trees.

System Renewal

Everyone felt they understood the challenges facing Toronto Hydro 'somewhat well', and felt that they had done a good job of conveying the information. It was agreed that getting to a 'very well' level of understanding was an unreasonable goal given all that is involved.

Initially participants strongly preferred that aging equipment be replaced before it fails. For one participant, it was considered to be an assumed part of running Toronto Hydro because their job is to keep the lights on. Upon further conversation, a few began to feel that it is more financially prudent to try to maximize the lifecycle of equipment, but to be prepared to replace it as soon as breakdown occurs.

Coverage of Distribution System Topics

At this point in the discussion, it was generally agreed that there was a steep learning curve in understanding the system to be able to answer some of the questions in the workbook effectively.

Response During Major Weather Events

There was group consensus that more information was needed during storms. Specifically, participants wanted to know the estimated duration of the outages so that they could take appropriate measures for their business.

Only a couple of participants reported having tried to contact Toronto Hydro during either of the storms, and they described being transferred from one person to another and ultimately not getting the information they were looking for.

Toronto Hydro's Proposed Plan and Rate Impact

Most felt the proposed plan was headed in the right direction, but there were a couple who weren't sure. One participant was unsure due to his current difficulties in getting an accurate bill from his smart meter readings. He felt that the technology needed to be fixed before moving forward. Another felt there was a lot of information to take in and he simply hadn't had time to give it any thought.

Among those who thought the plan was headed in the right direction, the priorities were fixing the billing and improving customer service.

When asked, only one participant suggested that the spending priorities needed to be adjusted. Specifically, he felt that it would be good to spend more on renewable generation if possible, as there may be some long term benefit. Most felt they didn't know enough about the subject matter to be able to give an opinion. One participant wondered about the actual amount of money being spent.

Everyone struggled to give an opinion on Toronto Hydro's outcome goals with the DSP, but most seemed to be supportive. One participant commented that he would be willing to pay for it if the system was more reliable and so he felt Toronto Hydro should be spending more.

How Could the Consultation Process be Improved?

Most felt the current process worked for them. Some suggested an online survey.

Residential Rate Class (North York)

System Reliability: Customer Experience and Expectation

Many of the residential participants from North York felt that Toronto Hydro should improve its communication with its customers, specifically regarding outage issues. Moreover, several stated that they wanted to be regularly updated on the overall development plan of Toronto Hydro and how their particular regions of the city would be impacted.

Several commented that replacing aging equipment before or after breakdown depends on how critical the equipment is and the extent and duration of the outage. For these participants, the decision was nuanced, as they thought seniors' residences, hospitals, and residential homes would have different priorities and thus a cost benefit analysis was required to properly assess the situation.

Improving Service of the Local Distribution System

As the discussion began, participants almost immediately wondered why Toronto Hydro hadn't been putting money aside to maintain the grid. It was agreed that grid upgrades are needed, but some think it could be done and should be done without the customer having to pay for it.

Participants spoke about having a high number of power outages and subsequent inconveniences and food spoilage. It was felt that such frequent outages (at least once per month for one individual) were entirely unacceptable.

Most felt that Toronto Hydro should better invest in aging infrastructure, in particular changing old overhead systems with the Canadian climate in mind. One individual thought that Toronto Hydro should better manage contractors to avoid extra costs.

There was a desire for more long term information, that is, what happens after the implementation of the five year plan.

Communication with customers was a common theme, particularly during power outages. It was felt that planned outages should be properly communicated, and that communication during major outages should be better.

System Renewal

Some participants stated that Toronto Hydro should prepare more rigorously to cover major issues, thereby allowing them to save money in the long term. Others stated that they wanted an updated grid that would bring costs down in the long term.

There was some suggestion that Toronto Hydro should find effective and better ways to maintain and upkeep aging infrastructure, or that the city of Toronto should be paying for system improvements rather than customers.

Participants were divided on "run to failure" versus extending equipment lifecycles. Ultimately, everyone favoured whichever option would cost the least overall – whether that means proactively replacing equipment to avoid failure or leaving equipment in place as long as possible was not agreed upon. One individual said a cost benefit analysis would be required in order to answer the question properly.

Coverage of Distribution System Topics

Most found the workbook to be very informative, providing the group with the right amount of information needed to discuss the issues at hand.

Some felt there were other issues that were not covered in the workbook, while others felt that they needed more time to cover all of the topics.

Response During Major Weather Events

Many of the participants felt that major event catastrophes could have been avoided if Toronto Hydro better maintained its system by investing in new equipment.

During the storms, it was felt that Toronto Hydro was not well organized and was lacking in efficiency.

Concerning communication during major weather events, many felt that Toronto Hydro should have relayed up to date information regarding power outages during both the flooding in July and the ice storm in December of 2013. Participants stated that if they had updated information from Toronto Hydro, they could have made informed decisions about their needs for accommodation, food, and so forth.

Many reported having tried to call Toronto Hydro during these major outages, but none were satisfied with the response they received and felt that no one was giving them any information. It was acknowledged by one pariticipant that Toronto Hydro has been proactive with her in the past in terms of warning her of planned outages.

Toronto Hydro's Proposed Plan and Rate Impact

Most participants were unable to answer whether Toronto Hydro's plan seemed to be going in the right or wrong direction because they felt they needed to have more information to answer the question effectively.

For those who thought that Toronto Hydro's Five Year Grid Renewal Plan was not headed in the right direction, a variety of reasons were provided as to why the felt this way. Some felt the plan didn't seem practical, while others felt they needed to know what would happen once the five year plan was over.

For a couple of participants there was the sense that the present situation could have been avoided with preventative planning in place. Finally, there were those who simply objected to customers having to pay to implement the plan.

How Could the Consultation Process be Improved?

Within the group, there was a general consensus among participants that the consultation process was both effective and engaging. One of the participants suggested that he would prefer a referendum amongst Toronto Hydro customers to make a decision on the proposed plan.

Presented with the option, participants liked the idea of a year long consumer advisory group.

Central Toronto Consultation Sessions

General Service Under 50 kW Rate Class (Central Toronto)

System Reliability: Customer Experience and Expectation

In the general service group, everyone felt that they understood the electricity system at least 'somewhat well', but some would have liked to see more financial information in the workbook.

The group struggled with regard to the current frequency and duration of power outages. While they realized it may not be a realistic goal, many would still prefer to see zero outages. One participant didn't believe the average numbers presented in the workbook as she felt they were inflated in order for Toronto Hydro to make their case for a rate increase. Two gentlemen didn't want to allow for any power outages, as a way of communicating to Toronto Hydro that striving for anything other than zero is not good enough.

It was agreed by all that reducing duration is more important than reducing frequency of outages because it is the duration that really impacts their businesses.

Improving Service of the Local Distribution System

Power interruptions were the main theme in terms of desired improvements. Participants would like to see fewer outages and better customer service during outages. One participant would like to see Toronto Hydro help businesses avoid difficulties during power outages by providing them with generators.

There was general agreement that shorter duration of outages is more important that reducing frequency.

Some felt that the customer service issue extended beyond the realm of outages and that improvement was needed overall. One participant commented that he finds the Toronto Hydro website difficult to use.

Coverage of Distribution System Topics

The group generally felt that the questions regarding required investment priorities (questions 4, 5 and 6) should have been left out of the workbook as there was nothing to be done about them. They found

the types of investments themselves to be reasonable, but most didn't feel there was much point in discussing them as part of the consultation.

System Renewal

Many participants in the group had thoughts on where Toronto Hydro's main priorities should lie, whether it is investing in underground infrastructure, working less with developers in favour of residential and business customers, or reducing spending on things like electric vehicles.

Everyone in the group felt that, from a business perspective, they cannot afford the time lost if hydro equipment breaks down, and so they prefer replacement before breakdown.

Response During Major Weather Events

The primary request was for information on when the power would be restored, although it was recognized that this may not be possible.

One participant wondered why the tree trimming budget had been reduced last year.

Toronto Hydro's Proposed Plan and Rate Impact

Modernizing the grid was considered to be very important because of the perception that it gets at the root of the problem and can prevent business losses due to outages. One participant felt she was unable to answer the question because she was skeptical about the entire process and the information she was being presented with in the workbook.

Interest in participating in CDM programs was minimal. There was the sense that business owners/managers would be losing control over their business equipment which could impact their business, revenue and customers. One participant didn't like the "Big Brother" feel of the program.

Many felt unable to gauge whether or not Toronto Hydro's plan seemed to be heading in the right direction in terms of spending priorities. One participant was confused and wondered why Toronto Hydro doesn't have money set aside for this situation. A couple of participants felt that more should be spent on modernizing the grid.

Asked about Toronto Hydro's goals, most feel that the change is necessary, but they don't want a rate increase. On the other hand, one individual would like to see Toronto Hydro aim higher, even if it means a bigger rate increase. Two participants felt they were not able to answer the question without having more time to consider all of the information.

How Could the Consultation Process be Improved?

An online approach was suggested as an optional approach to this consultation. Others said that more time was needed to be able to read the workbook.

A couple of participants felt that the decisions had already been made, so they weren't sure what the point of the consultation was.

A few participants had issues with the questions, but were unable to come up with suggestions for improving them.

Asked what further information they would like to have, a few participants said they would like to have been given more financial information.

Presented with the option, participants liked the idea of a year long consumer advisory group.

Residential Rate Class (Central Toronto)

System Reliability: Customer Experience and Expectation

Overall, most participants feel that the current average number and duration of outages was at least "somewhat acceptable". Some were willing to accept more and longer outages, but there were a couple who felt that no outages are acceptable. One participant suggested that "understandable" may be a more appropriate term than "acceptable".

When discussing the consequences of power outages, participants mentioned medical equipment, elevators, food spoilage, gas pumps, public transportation and those who work from home being unable to work.

All of the participants in the group stated that they want better customer service from Toronto Hydro and its staff. Specifically, several said Toronto Hydro should improve its communication measures with its customers, especially when outages and other similar incidents occur.

Participants also stated that Toronto Hydro should focus on replacing aging infrastructure for safety concerns. They went on to say that old distribution units can be fire hazards to communities. One of the participants said that he would like Toronto Hydro to invest more in upgrading infrastructure and to replace overhead lines to avoid future outages.

Improving Service of the Local Distribution System

Several participants stated that Toronto Hydro should continue to concentrate on reducing the number and duration of outages. A couple of participants said that more money should be spent on preventative maintenance of equipment. One specifically stated that he would like Toronto Hydro to invest more capital into sophisticated infrastructure and solar panels.

Generally, participants would like to see an improvement in customer service, specifically, they would like Toronto Hydro to be more responsive when they call with issues or concerns. Communication during major outages was also raised, as well as during more minor outages. One participant who expressed having frequent summer "pop offs" shared her frustration with not being able to get an explanation. Door to door or automated dialing were suggested as means of communication during major outages.

Several would like either a more granular breakdown of their bill, or some other type of adjustments that would make their bill easier to understand.

Coverage of Distribution System Topics

Some of the participants stated they would have liked the workbook to tell a better story on how electricity reaches users and how much work goes on behind the scenes to keep Toronto lit up.

Several said they were not sure whether they were qualified to answer questions 4, 5, and 6 on page 11 regarding reasonable investment measures on connection issues, maintaining smart meters, and moving electricity infrastructure.

System Renewal

Participants in this group did not have much to say about system renewal during the majority of the discussion. Many felt that Toronto Hydro should have planned and saved ahead for the infrastructure maintenance and replacement costs. One of the participants in particular said that he wanted Toronto Hydro to do a better job with the upkeep of transmission wires.

Response During Major Weather Events

Many participants said that Toronto Hydro should have had better communication with its customers during the flooding and ice storm. Some went on to say that Toronto Hydro should not label these major storm events as "unusual" since Toronto Hydro should be ready for these types of situations to arise due to changing climate patterns.

Toronto Hydro's Proposed Plan and Rate Impact

Many felt unable to comment on whether they felt the balance of the spending plan looks right. The workbook was described as a good primer, but lacked the details required to make a judgment on the plan. Participants wanted more information behind the numbers – where do they come from and what exactly will the impact of the relative spending amounts be in the longer term. Conversely, some wondered what the future would look like if these investments were not made.

There were several questions about the various proportions indicated throughout the workbook in terms of the proportion of equipment over a certain age, etc.

As the discussion progressed, many wondered why Toronto Hydro hadn't planned on and budgeted for replacing aging equipment.

Almost everyone felt that the goals set by Toronto Hydro are too low and that more should be spent in order to do more and do it sooner. One participant felt it is their duty as citizens to undertake something like this for the sake of future generations. One participant felt there was a significant infrastructure deficit and he was not sure that the plan in its current form addressed it sufficiently.

Some participants wanted to know what the situation would look like in 2019 after the plan has been implemented. It was generally agreed that five years wasn't going to solve the problem. There were some who wondered about the layoffs referred to in the workbook, given the amount of work about to be undertaken.

How Could the Consultation Process be Improved?

One of the participants questioned why this type of consultation was not carried out by Toronto Hydro before and why it was not mandated by the OEB in previous years. Another participant, while liking the information, wanted Toronto Hydro to spend less on the workbooks (e.g. less glossy photos).

Some thought that the workbook should have had more choices laid out for participants to choose from instead of just two. In particular, one participant stated that some of the examples and comparative case studies did not help explain which plan was better. Another said that more information is needed as questions are raised (e.g. one fourth of the electricity bill goes to Toronto Hydro, but where does the rest go?).

Others were basically fine with the workbook, but wished they had had more time in advance to read it so that they could come to the group prepared to discuss it.

Several participants wanted to have more information in the workbook. One individual felt that the workbook seemed incomplete, especially when it came to fully disclosing the numbers and price of choices. Further, he stated that up to page 30 the workbook was effective, but after page 30, the workbook became uninformative.

As for specific information, some participants requested information on Toronto Hydro's operating budget while others stated that they would have liked more information on alternative forms of energy (e.g. wind farms and solar panels) that Toronto Hydro was currently investing in. They also wanted to know more about the role of other provincial players within the system. Another also requested information regarding excess power and where it goes.

Presented with the option, participants liked the idea of a year long consumer advisory group.

Etobicoke Consultation Sessions

General Service Under 50 kW Rate Class (Etobicoke)

System Reliability: Customer Experience and Expectation

Several participants in the group stated that Toronto Hydro's service was great because power outages were few in frequency and short in duration. One of the participants who runs a service based business stated that she would like Toronto Hydro to provide some type of notification as to when an outage might occur so that she can inform her customers and close the store to avoid any revenue shortfalls.

One participant felt that Toronto Hydro's prices have increased too fast, and service has not improved in terms of reliability. He went on say that communication during outages should be more open and transparent.

About half of the group felt that the current average number and duration of outages is acceptable. There were a few in the group who said that no outages are acceptable, and while they recognized that this may not be achievable, they still feel that in terms of goal setting, Toronto Hydro should be aiming for zero. One participant said she would like to have no outages but not if it was going to cost her significantly more.

There were two participants who reported experiencing many more outages than the average range, but they felt the duration of their outages was reasonable.

Two hours was agreed upon as the limit after which there would business implications such as food that would need to be thrown out, or businesses closed and staff sent home.

Improving Service of the Local Distribution System

Several participants agreed they want Toronto Hydro to clear out the trees that are currently blocking or interfering with the distribution lines.

A widely supported suggestion for improvement was communication during outages. One participant commented that the technology is there to use social media to provide updates and that in a place like Toronto Hydro they could have someone dedicated to that type of communication.

A couple of participants spoke of frequent outages and said they would like to see improvement in that regard.

Coverage of Distribution System Topics

Most of the participants in the group thought that the workbook was effective in explaining the proposed Toronto Hydro plan and that the consultation process was an effective approach for hearing the concerns of the general service users. One participant felt that the workbook was informative but too general.

Participants for the most part struggled to answer the questions about investment priorities (4, 5 and 6), but didn't necessarily feel the questions should have been left out. One participant described them as impossible to answer based on the information she had in front of her.

System Renewal

Several participants in the group said that although Toronto Hydro's plan is headed in the right direction, there should be more transparency Further, they felt that Toronto Hydro should let customers know the full costs of upgrading the system and the challenges Toronto Hydro faces in both the long and short term in modernizing the grid.

Many stated that Toronto Hydro should invest more in renewable generation and renewable energy. A few felt that they did not have enough information or knowledge to comment on Toronto Hydro's planned spending.

In response to CDM programs, most were in favour and said they would participate as long as they are made aware of planned outages in advance. However, there were a few who simply wouldn't trust anyone to put a meter on their equipment. One individual said he didn't feel the program is even necessary because there hasn't been a brownout due to lack of power in more than a decade.

Response During Major Weather Events

Several participants stated that Toronto Hydro should have taken the time to cut trees before the storm so that the trees would not become a major problem after the storm. And, several felt that Toronto Hydro should generally be more prepared and proactive in their approach to dealing with major weather events.

Many wished Toronto Hydro had better communicated with its customers during both the flood and the ice storm. They specifically stated that they wanted to be notified as to when services would be restored in their businesses and neighbourhoods.

Toronto Hydro's Proposed Plan and Rate Impact

All agreed that modernizing the grid was at least "somewhat important" in order to keep businesses up and running. They didn't necessarily know where it fit in with other investment priorities though.

Based on what they knew already and what they read in the workbook, most participants felt they understood the challenges facing Toronto Hydro.

The majority felt that Toronto Hydro's plan was moving in the right direction and thought that replacing the aging infrastructure was vital in renewing the grid.

One participant stated that, although Toronto Hydro's plan is headed in the right direction, he feels as if Toronto Hydro has started to modernize the grid too late since the demand for electricity has been increasing substantially over the last fifty years.

A couple of participants felt Toronto Hydro generally had the right balance, but she wondered why modernizing the grid was separate from replacing aging and obsolete equipment. And, if the items were to be separate, they wondered why modernizing the grid was such a low priority or even why it was part of a general capital upgrade.

While a couple in the group were satisfied with the balance between outcomes and the proposed rate increase, most don't like the rate increase, even if they feel it is necessary in order to maintain the grid to a reasonable standard. One participant wanted to know why the dividend being paid to the city of Toronto isn't being used to fund the plan.

One participant felt he didn't know enough to make a judgment on the plan, but he felt that the public cannot afford any more rate increases.

How Could the Consultation Process be Improved?

For the most part, participants found the consultation enjoyable and informative. One participant said she was intrigued when she got the recruitment call, and she enjoyed the process. On the other hand another participant, felt the process was about trying to convince customers that Toronto Hydro's rate increase is justified.

When asked, most said they would be interested in an advisory panel, but one participant added the caveat that such a panel would need to have some kind of "power" or ability to enforce decisions.

Residential Rate Class (Etobicoke)

System Reliability: Customer Experience and Expectation

Outages were mentioned as the primary area of concern. A few participants in the group mentioned experiencing frequent outages and not being able to communicate with Toronto Hydro about it. Two participants expressed frustration in not being able to get a response from Toronto Hydro in spite of calling them multiple times.

Several participants mentioned more communication of information during outages. Further, a couple of respondents said they wanted Toronto Hydro to minimize the number and duration of power outages. Another participant mentioned faster response times by Toronto Hydro when there is a blackout.

A couple of participants wondered why Toronto Hydro isn't being more proactive about either removing or pruning trees or burying lines underground.

Others said they were generally satisfied with Toronto Hydro and had no suggestions for improvements.

In terms of the average frequency and duration of outages, participants were generally accepting. In their own lives, they would find an outage lasting longer than a day to be problematic.

Improving Service of the Local Distribution System

Multiple participants said that replacing equipment is a priority, especially modernizing the grid and replacing old equipment. A few mentioned spending more money on knowledgeable employees. A couple of participants said that connecting renewable generation needs to be a higher priority. And one individual said that money needs to be spent on improving reliability.

Coverage of Distribution System Topics

Several participants said that the workbook was very informative and appeared to be filled with valuable information. One member of the group stated that both the workbook and consultation overall was very easy to follow. One added that although it was the right length, the information in the workbook was more technically oriented than needed. Mostly, participants in the group asked for more time to be able to read and evaluate the information presented in the workbook.

One participant thought that the workbook was interesting but very self-serving. Another participant said the workbook was too simple to be able to accurately assess the plan. Several said there was not enough information as the workbook seemed to present too narrow of a scope to be able to properly assess Toronto Hydro's plan. One individual also commented that they would have liked to know more about Toronto Hydro's communication and engagement plans.

System Renewal

Several of the participants thought that Toronto Hydro and its customers have no choice but to deal with a rate increase because at this point, customers need to deal with the "growing pains" of modernization. In contrast, others felt that the proposed plan was just a way for Toronto Hydro to raise the rates but that nothing would really improve.

Everyone preferred the strategy of replacing equipment before it breaks down as being more cost-effective than the run-to-failure option. One participant compared it fixing a problem with his car, saying it's always more if he waits.

1

Response During Major Events

Many participants said they would like better communication during major outages, especially with regards to when service will resume, so that they can plan accordingly.

One participant gave Toronto Hydro kudos for handling both major storms as well as possible under the circumstances.

Overall, for every person who had a complaint about how Toronto Hydro responded to the major storms, there was someone else defending them for doing the best they could do when dealing with an "act of God".

Toronto Hydro's Proposed Plan and Rate Impact

With only two exceptions, everyone said they don't like the rate increase but they feel it is necessary to maintain the grid to an acceptable standard. One individual wondered why the provincial government wasn't stepping in to ease the burden on customers.

One participant said that the plan is presented in isolation and that there are no contrasting views or other pertinent information. Further, many of the participants said they needed more information before they made up their mind.

When asked about improvements to the system, several said less money should be spent on upgrading customer meters and connecting customers. Another mentioned that Toronto Hydro should stop focussing its energy on debt reduction and delivery charges. One participant also stated that updating IT structure should be less of a priority while others thought that renewable generation and reliability goals should be more of a priority.

How Could the Consultation Process be Improved?

When asked about the consultation process, one participant commented that it feels like Toronto Hydro has already made up its mind and that the consultations are too late. A couple of other participants thought the process should be more inclusive and include Toronto Hydro staff who can answer any outstanding questions. There was also a suggestion that the workbook should have been written by a third party.

When asked about specific topics and questions, one participant mentioned that information about operating costs including administration costs, benefits, and salaries were not properly explained. Another participant said that rebates should have been discussed. One person also asked how Toronto Hydro will be improving their communications systems going forward.

Scarborough Consultation Sessions

General Service under 50 kW Rate Class (Scarborough)

System Reliability: Customer Experience and Expectation

Most of the participants in the group said Toronto Hydro should reduce outages. One in particular added that Toronto Hydro could offer business customers credit or a rebate for time and revenue lost when power is out.

Further, communications seemed to be a prevalent issue with most participants. Some said that there needs to be more communication with the public as well as improved customer service.

Improving Service of the Local Distribution System

A couple of participants mentioned upgrading equipment and the grid with more modern technology. And, as noted above there was a desire for better communication.

Coverage of Distribution System Topics

A few participants said that the workbook was long but straightforward. On the other hand, a couple of participants said they felt like information had been left out. Another said that the workbook does a reasonable job of explaining a very complex set of systems.

Many said there was too much information in the workbook. One said there was too much on technological systems and there was too much jargon. On the other hand, another participant said they wished there was more information on the technological side. A couple of participants thought the workbook covered the relevant areas sufficiently. However, one in the group wished there was more detail on where the money is being spent.

Response During Major Weather Events

Some participants expressed a need for improvement and for priority to be given to schools and seniors' residences during major weather events. Participants suggested that more workers from other areas should be brought in to help with large scale power outages or during major weather events. The lack of information or ability to reach someone at Toronto Hydro was also mentioned.

Lastly, several participants felt that during major weather events power should be restored to businesses and larger buildings before restoring power to single houses.

Toronto Hydro's Proposed Plan and Rate Impact

Two participants said they thought the proposed plan was headed in the right direction as aging equipment needs to be updated in order to prepare for the future. One participant said it was headed in the right direction because Toronto Hydro is building an effective system for the good of users.

When asked about how Toronto Hydro spends its money, a few said more money should be spent on improving the grid and more money for micro generators that can keep vital equipment functioning in the event of a power outage longer than 30 minutes. Another participant commented that more money should be spent on employee talent and recruitment.

An individual who was unsure about the direction said they don't have enough information and don't know if Toronto Hydro's priority is making money or serving Torontonians.

One participant said there should be a realistic assessment of costs for the "unusual costs" that were referred to in one part of the workbook. Another participant said there should be less spent at the top level of execution planning. Still another said the real benefits do not seem to justify the costs. Construction also seemed to be an issue of contention. A couple of participants mentioned a lot of Toronto Hydro money and resources were being wasted in supporting new developments and construction projects.

When it comes to goals and priorities, some said the goals were reasonable but that the city should be able to handle more of the expenses without the consumers picking up the costs. One participant said the priority should be with replacing aging and obsolete equipment. Another participant felt there should be more of a focus on training and retention of employees.

How Could the Consultation Process be Improved?

At the end of the session, there were two questions for which participants wanted answers. The first was "if we don`t have to answer technical stuff on the grid, why is there so much complex technical stuff in this booklet?" and the second was "how does Toronto Hydro compare to other service providers?"

When discussing improvements to the consultation process, one participant said that perhaps Skype or email could be used while another participant said that there should be more lead time for reading the information provided. Two suggested making the focus groups shorter. And one participant wanted more information on renewable energy sources.

Residential Rate Class (Scarborough)

System Reliability: Customer Experience and Expectation

Several participants mentioned improving communications especially when there are power outages. One individual suggested that there should be an option to call someone at Toronto Hydro when there is an emergency. Another said that improvements to the website would also be helpful.

Many participants mentioned that the number of power outages should be reduced and one in particular felt that rebates should be given in the event of outages. There was also a request for more realistic estimates on times needed for repairs. One of the participants in the group wanted underground cables to be put in. Another suggested eliminating peak use times.

Improving Service of the Local Distribution System

Several participants stated that Toronto Hydro should replace aging infrastructure and not wait until the equipment fails to replace it.

Coverage of Distribution System Topics

Most of the participants found the workbook to be very informative, and that it covered all of the necessary topics sufficiently. Specifically, one participant commented that the workbook was helpful and the language and content were easy to understand.

A few said that the workbook consisted of too much information at once. However, at the same time they realized that to explain everything clearly, the workbook needed to include a great deal of information. One of the participants felt there needed to be more on costs for improvements but less on other things.

System Renewal

Many mentioned spending more on modernizing the grid. A couple of these participants said that more money should be spent on preventative maintenance of equipment. In particular, one participant said that more spending needs to be spent on underground cables.

Most didn't seem to know what should be prioritized with regards to spending. One individual said that less money should be spent on expanding capacity and accommodating construction projects in the city. Some wondered why Toronto Hydro couldn't set money aside for future expenses/costs.

Response During Major Weather Events

Almost everyone mentioned that communication from Toronto Hydro could be improved during major weather events. One participant suggested a real person instead of a recording on the phone. Others said there needs to be a better system for giving updates on the state of repairs during these major weather events. One participant suggested that until the power came back on Toronto Hydro could have provided temporary generators.

Toronto Hydro's Proposed Plan and Rate Impact

None of the participants in the group said Toronto Hydro was headed in the "wrong direction" and most participants who said "not sure" provided no further comments concerning why they said that. However, one participant who thought Toronto Hydro was headed in the right direction said that renewing equipment must be a priority. Another who agreed that Toronto Hydro was heading in the right direction thought that more money should be spent on preventative maintenance of equipment.

Most didn't seem to know what should receive less spending. However, one participant said that less money should be spent on expanding capacity and accommodating construction projects in the city.

How Could the Consultation Process be Improved?

All of the participants in the group agreed that the consultation was well put together. Further, most thought there was just enough information in the consultation to be an informative and accountable discussion. Another wanted to hear more about costs for modernization. Smart meters were also raised as a potential discussion topic.

Questionnaire Results 1

The following tables are the tabulations of participant feedback to questions in the hard copy workbooks, which were returned at the end of each consultation session.

Note: "GS" = general service less than 50 kW customers, while "RS" = residential customers. Due to the high occurrence of non-response to open-ended questions and subsequent small sample size, these results are not segmented by region, but rather only between general service and residential customers.

Blue tallies denote feedback from North York Customers (GS and RS)
Orange tallies denote feedback from Toronto Customers (GS and RS)
Green tallies denote feedback from Etobicoke Customers (GS and RS).
Purple tallies denote feedback from Scarborough Customers (GS and RS)
Numbers in red denote the sum of all participant feedback tallies.

1. How well do you feel you understand the important parts of the electricity system, how they work together and which services Toronto Hydro is responsible for?

Response	GS	RS	Total	GS	RS	Total	GS	RS	Total	GS	RS	Total	Sum Total
Very well	3	0	3	1	4	5	3	3	6	3	3	6	20
Somewhat well	4	5	9	6	4	10	4	6	10	6	6	12	41
Not very well	0	1	1	0	0	0	0	1	1	1	0	1	3
I don't understand at all	0	0	0	0	0	0	0	0	0	0	0	0	0
Total	7	6	13	7	8	15	7	10	17	10	9	19	64

2. How satisfied are you with the job Toronto Hydro is doing running your local distribution system?

Response	GS	RS	Total	GS	RS	Total	GS	RS	Total	GS	RS	Total	Sum Total
Very satisfied	0	0	0	1	3	4	1	2	3	3	1	4	11
Somewhat satisfied	6	1	7	5	3	8	4	4	8	6	7	13	36
Somewhat dissatisfied	1	2	3	0	2	2	2	4	6	1	1	2	13
Very dissatisfied	0	3	3	1	0	1	0	0	0	0	0	0	4
Don't know	0	0	0	0	0	0	0	0	0	0	0	0	0
Total	7	6	13	7	8	15	7	10	17	10	9	19	64

3: Is there anything in particular that Toronto Hydro can do to improve its service to you? (OPEN ENDED)

Response	General Service	Residential	Sum Total
Better communication with customers/improved customer service	6	8	14
Improve and invest more in electricity system to make it more reliable to make it more reliable	6	5	11
Lower costs of electricity rate	4	6	10
Faster/better response times during power outages	3	2	5
Service is good	3	0	3
Cut trees where overhead wires to avoid entanglement	2	0	2
Better and accurate smart meter readings	1	0	1
Simpler invoices	1	0	1
Safety	1	0	1
Improve and invest more in electricity system to make it more reliable	0	1	1
Other	0	3	3
Don't know	1	0	1
No response/ refused	3	8	11
Total	31	33	64

4. Under provincial legislation, there are several types of investments Toronto Hydro must make when the need presents itself. How reasonable do you feel it is to give each of these investments priority over other investments (for example, replacing aging equipment)? Connecting new customers such as new housing, condominiums or businesses.

Response	GS	RS	Total	GS	RS	Total	GS	RS	Total	GS	RS	Total	Sum Total
Very reasonable	4	1	5	4	6	10	3	5	8	3	3	6	29

Mid-Market GS 1-4 Workshops

Workshop Presentations and Discussion Groups
with Mid-market GS Customers

PURPOSE: To gain qualitative input/ response to proposed DSP from GS> 50 kW customers and to feed into survey design

Summary

The following summary highlights key findings from the commercial and industrial customer consultation sessions held in the Toronto area on March 31st and April 2nd of 2014.

System Reliability: Customer Experience and Expectation

- Most participants in the consultation groups have experienced power service interruptions at their businesses in the past twelve months. The duration of the service interruption lasted from a few minutes to many days in some cases. The frequency of outages averaged around two to three power service interruptions per year.
- Both commercial and industrial users reported losses of revenue and productivity within their respective businesses due to power service interruptions.
- Service-based commercial users would like Toronto Hydro to concentrate on limiting the duration of outages. Similarly, larger industrial businesses in the manufacturing sector wanted Toronto Hydro to focus on limiting the duration or length of power service interruptions per year. They stated that longer outages can have a serious consequence to productivity, as production cannot continue for long periods of time and can cause a "logistical nightmare" with workers.
- Alternatively, other manufacturing businesses stated that they would want Toronto Hydro to concentrate on limiting the frequency of outages as every time there is an outage their production equipment is forced to shut down, and that the time required to reset their production equipment could lead to significant loss of productivity.
- A number of participants stated that with a rate increase should come an obligation on behalf of Toronto Hydro to proactively communicate with customers on how the additional funds are being spent and to provide on-going status updates on the grid renewal plan.
- Both commercial and industrial customers stated that they wanted better customer service from Toronto Hydro staff. Specifically, many suggested better customer communications around power outages. Participants in the group stated that they wanted to know how long outages would last so they could prepare for a "contingency plan" and not suffer losses in productivity.

Improving Service of the Local Distribution System

- Overall, both commercial and industrial customers are satisfied with the work Toronto Hydro is doing maintaining the local distribution system. As stated above, when participants in the groups

were asked about improvements, the main suggestions concerned limiting rate increases, reducing power service interruptions and better customer communications around power outages.

- Participants in the groups were impressed overall by Toronto Hydro's accomplishments in reducing employee headcount, keeping absenteeism low, working safely, and improving the coordination of capital projects.
- Large-scale industrial customers expressed concerns about electricity costs. They stated that, unlike commercial service-based businesses that can more readily pass costs onto their customers, many industrial manufacturers operating within the Toronto Hydro grid are unable to pass on costs as their products are sold in competitive, international markets. A number of industrial customers suggested that rate increases could put them at a disadvantage with competing firms operating in jurisdictions with lower electricity costs.
- When it came to the choice between "running to failure" or replacing equipment before it breaks down, most participants prefer the more proactive approach of replacing equipment before it breaks.

Coverage of Distribution System Topics

- Overall, participants in the consultation sessions felt the workbook did an effective job of covering the topics they expected and allowed them to have a meaningful discussion about Toronto Hydro's grid renewal plan.

System Renewal

- Most participants felt the proposed pace of system renewal is "about right". That is, most agreed that the plan balanced the need to replace aging infrastructure with customer bill impacts.
- Most commercial and industrial participants (36 of 41) accepted the need to increase customer rates by the proposed amount; with 16 of 41 saying they support the proposed rate increase and 20 of 41 saying they don't like it, but think it is necessary. On the contrary, 2 of 41 participants believe the rate increase is unreasonable and opposed it.
- The main reasons for the opposition to the bill increase was because both commercial and industrial businesses are concerned about their ability to pay and the impact it will have on their competitiveness with other firms in lower cost jurisdictions.
- Those who accepted the proposed DSP believed the plan seemed reasonable and was necessary to maintain system reliability.

Response During Major Weather Events

- Participants in both the commercial and industrial groups stated that Toronto Hydro staff worked "tremendously hard" during the major weather events of 2013. All of the participants in the groups stated that they were both pleased by the service received and applauded the hard work Toronto Hydro did to repair the damages caused by both the flooding in July and the ice storm in December.
- Participants in both the commercial and industrial groups also understood that Toronto Hydro's hands were tied during the major events of 2013 and they did the best job "humanly possible" given the circumstances.

- Some of the participants in the group stated that they wanted Toronto Hydro to do a better job in updating their website and customer service call centres during the major weather events. Specifically, participants stated that Toronto Hydro could have had a better online format (e.g. "tell us areas where the outage is occurring, give us an ETA for fixing issues on the Toronto Hydro main page"). Participants went on to say that Toronto Hydro should better advertise its website and social media accounts to get people engaged and "in the know" of what's happening with electricity outages/issues in the Toronto area.

Toronto Hydro's Proposed Plan and Rate Impact

- A number of commercial and industrial customers expressed concern over what they saw as poor fiscal management at Toronto Hydro. Specifically, participants questioned why Toronto Hydro did not save money in anticipation of grid renewal requirements. As owners and managers, these groups of commercial and industrial participants explained that they have to budget and have some sort of reserve fund to replace their equipment and business tools – so why didn't Toronto Hydro have a contingency plan in place for grid renewal needs? However, after the moderators explained the OEB mandate, participants in both the commercial and industrial groups understood that Toronto Hydro's regulatory regime does not allow it to have a reserve fund.
- Overall, all of the participants understood the proposed "Grid Renewal Plan" and the process Toronto Hydro must go through to apply for a rate increase (e.g. through the OEB). Participants in both the commercial and industrial groups were generally intrigued by the role played by interveners and the OEB hearings and rate setting process. Most felt that these steps help keep the rate setting process fair, where different perspectives on the proposed rate increase would be represented, and ultimately assist the process in being more accountable.
- Participants in both the commercial and industrial groups were genuinely pleased and happy about Toronto Hydro's cost saving efforts and plans.
- Participants in both the commercial and industrial groups said that both the consultation and workbook only looked at 11% of the bill. They inquired about the rest of the 89% left over and if that portion of the bill would also have an increase. They understood that Toronto Hydro was only responsible for distribution of electricity (11% of the bill), but irrespectively stated they would have a hard time budgeting their total costs spent on electricity if they were "left in the dark" about the undiscussed 89% of the bill (e.g. transmission and generation costs as well as global adjustment, regulatory costs and debt retirement).
- Furthermore, participants wondered how much of an increase they can afford by stating that "if there is increase in all sectors of the bill, then it will have a negative effect on our business bottom line". Participants in both the commercial and industrial groups stated they could live with a rate increase – but said that they would have to consider the other parts of the bill (e.g. transmission and generation costs) to come to a final decision on whether to support a rate increase or not. However, they went on to state within the context of Toronto Hydro's proposed plan they were willing to live with the rate increase if it is a necessary course of action to maintain reliability within the distribution system.

Mid-Market Opinion on Toronto Hydro's Proposed DSP

Looking at the cost of the Toronto Hydro plan and the outcomes it is expected to achieve, which point of view is closest to your own? [Based on 41 responses]

Response	Sum Total
Toronto Hydro should plan to achieve higher outcomes, even if the rates need to up even more;	5
I am satisfied with the balance between outcomes and the proposed rate increase;	11
I don't like the rate increase, but I think it is necessary to maintain the grid to a reasonable standard;	20
I think the bill impact is too high and Toronto Hydro needs to scale back its plans	2
Not sure	0
No response / Refused	3
Total	41

How Could the Consultation Process be Improved?

- At the conclusion of the sessions, participants were asked what they thought of this approach to commercial and industrial consultation and how it could be improved.
- Some of the participants in the commercial and industrial groups wanted to know why Toronto Hydro did not address these problems related to grid renewal before as well as why this type of customer consultation was only happening now, and not on an on-going basis. Participants stated that they would have liked Toronto Hydro to take a more pro-active approach in discussing the proposed plans with its customers.
- The vast majority stated they very much liked this approach to customer consultation. They felt the workbook-led format allowed them to have a meaningful discussion on what is often seen as a confusing and complex topic.
- Participants went on to say that they appreciated Toronto Hydro for actively seeking feedback from its commercial and industrial customers and that they would like to see this approach incorporated into on-going policy decision-making.

- Participants had very little to suggest in terms of ways in which the process could be improved. One suggestion was to have even more specific and relevant information in the workbook about the rate proposal process.

Methodology 1

About the Mid-Market GS>50 Workshop Consultation 1

INNOVATIVE conducted a series of commercial and industrial customer consultation sessions designed to identify the needs and preferences of Toronto Hydro's mid-market consumers as they relate to the proposed 5-Year DSP.

Two evening workshops were conducted at a rented hotel space between 5:30 pm and 9:00 pm. Each 3.5 hour session was customized for either COMMERCIAL or INDUSTRIAL customers. The workshops were divided between a presentation and question and answer session managed by Toronto Hydro staff and a facilitated discussion session lead by moderators from INNOVATIVE.

- Presentation and Q&A: approximately 1.25 hours
- Break: 15 minutes.
- Facilitated discussion approximately 2 hours

GS>50 kW customers were recruited for each the commercial and industrial workshops to participate in the group presentation and Q&A. After the group presentation, three smaller facilitated breakout discussion sessions were scheduled for the second half of the evening.

Both workshops were located off of Hwy 401 in Toronto. The commercial customer workshop was held in North York on March 31st, 2014, while the industrial customer workshop was held in Etobicoke on April 2nd, 2014.

A total of 41 commercial and industrial customers participated in these consultation sessions:

Commercial Workshop (21 Commercial Customers): March 31, 2014	
Group One	5 participants
Group Two	8 participants
Group Three	8 participants
Industrial Workshop (20 Industrial Customers): April 2, 2014	
Group One	8 participants
Group Two	6 participants
Group Three	6 participants

Recruiting Consultation Participants

Commercial and industrial users were randomly selected by telephone from customer lists and screened for appropriateness as session participants. Users qualified for the consultation if they managed or oversaw their commercial or industrial business' electricity bill. This was to ensure they were at least somewhat knowledgeable of their electricity costs and could have an informed discussion on the impact of the proposed rate increases.

The customer screening process ensured that only customers who met the following criteria qualified to participate in the workshops:

- Participants must work at businesses that receive an electricity bill from Toronto Hydro.
- Participants must be in charge of managing or overseeing their business' Toronto Hydro electricity bill(s).
- Participants had to be willing participate in a Toronto Hydro presentation and read through a 30 page workbook. Furthermore, participants were required to write out answers to a series of questions and carry on a discussion in English.

A list of mid market customers was provided to INNOVATIVE by Toronto Hydro. In terms of consumption, customers included in this list ranged from over 50 kW to 1 MW in size. Approximately 3,000 mid market customer contacts were provided.

Given the longer time commitment required of workshop participant than in previous customer consultation sessions, a larger incentive of $150 was provided to all commercial and industrial customers who participated in the consultation sessions.

All consultation sessions were video recorded to verify participant feedback and quotes.

Facilitated Discussion Session Structure

The consultation sessions were structured around the themes contained in the workbook. The workbook themes included the following:

1. Introduction
2. Electricity 101
3. Toronto's Grid Today
4. Challenges Facing the Grid
5. How We're Managing Grid Pressures
6. The Bottom Line

- All mid market participants were sent electronic copies of the workbook via email as part of a pre r read package in advance of the workshops.
- At the start of the sessions, the facilitator gave an overview explaining the purpose of consultation and why Toronto Hydro is seeking feedback from business users.
- After explaining the purpose of the consultation, hard copy workbooks were distributed to act as a session guide and for participants to record their answers to the questions contained within.

- The facilitator then led the participants through the workbook section by section to ensure they understood the information and to answer any questions they had about the content.
- When it came to the questions within the workbook, participants were asked to fill in their answers independently. The facilitator then led a group discussion on the answers participants provided and the implications for their commercial or industrial businesses.
- Hard copy workbooks were collected from the participants at the conclusion of each consultation session.
- Each consultation session ran for approximately 2 hours.

Informing the Consultation Process: 1

In addition to identifying customer needs and preferences as they relate to the proposed DSP, feedback collected from this phase of the consultation was used to inform the design of the telephone survey.

NOTE: Results contained within this report are based on a limited sample and should be interpreted as directional only.

Participant Feedback 1

The following section highlights the general feedback from each night of the consultation discussion group.

Commercial Workshop Session 1

General Overview 1

Generally, participants in the commercial consultation group felt that the proposed Grid Renewal Plan was reasonable, effective, and representative of the electrical power needs of the businesses in the Toronto region.

Some of the participants in the group thought that Toronto Hydro should spend more in the grid renewal plan to achieve higher outcomes. Two of the participants in the group stated that they were satisfied with the present balance between the bill and reliability of services. No one was opposed to a bill increase, as they all thought that it was necessary.

Generally participants within this commercial group agreed that the rate increase was necessary to replace aging infrastructure. In particular, some participants felt that the Grid Renewal Plan was reasonable and not an "easy fix" to a complex problem.

System Reliability: Customer Experience and Expectation

Most participants in the consultation groups have experienced power service interruptions at their commercial businesses in the past twelve months. The duration of the service interruption lasted from a few minutes to many days in some cases. The frequency of outages averaged around one to three power service interruptions per year. Further, commercial users reported loss of both revenue and productivity within their respective businesses due to outages.

Most of the participants in the groups stated that they wanted better customer service from Toronto Hydro and its staff. Specifically, several stated that Toronto Hydro should improve its communication measures with its customers especially when outages and other similar power service interruptions occur.

Several participants stated that the problem with outages is that they didn't know how long the outages would last. They thought that better communication is needed from Toronto Hydro so that businesses can figure out how to mitigate the impact of power outages.

Participants also wanted Toronto Hydro to regularly update them on how their money is being spent and the state of the grid renewal.

Improving Service of the Local Distribution System

Some of the participants in the industrial groups wanted Toronto Hydro to let them know of any planned outages and when power would be coming back on. "Let us know how long outages will be, so we can plan accordingly".

Commercial users stated that depending on the type of business, both frequency and duration of outages can have major consequences. Further, one of the participants recommended that Toronto Hydro give higher priority to larger businesses during outages since they employ a large part of the community and have a greater impact on the local economy.

System Renewal

While most commercial participants stated that their businesses could afford the proposed rate increase and believed it was necessary to maintain system reliability, a few voiced concerned about the impact it could have on some their suppliers and customers who struggle financially.

Most participants in the commercial workshop believe they would likely be able to pass on any rate increase to their customers as this would be a common cost borne by similar businesses and the competition.

Coverage of Distribution System Topics

Most of the commercial users found the workbook to be very informative, providing the group with the right amount of information needed to discuss the issues at hand.

Many of the participants in the consultation groups stated that they wanted to have more information on "Toronto Hydro's operating budget and their corporate structure". In particular, some of the participants stated that they wanted more time to prepare and read through the workbook, and also be given more discussion time during the consultation to express their views on the proposed plan.

Further, other participants in the groups felt that the workbook did not contain enough information, as they would have liked to see the operating budget, revenues, expenses, and profits and losses reports.

Lastly, participants also felt that both the workbook and the consultation process did not have a wide array of choices when it came to the investment plans Toronto Hydro was proposing.

Several participants stated that they would want Toronto Hydro to make commercial users more aware about conservation efforts and how to be more energy efficient (e.g. shutting down of extra equipment). Further, participants in the commercial groups also stated they wanted Toronto Hydro to install more accurate smart meters within businesses.

A few of the participants in the commercial user groups stated that Toronto Hydro should invest more in renewable generation and renewable energy.

Most stated that Toronto Hydro should spend and prepare more "rigorously" to cover major issues which in the long term "save money". A select few stated that they wanted an updated grid that would bring costs down in the long term. One of the participants felt that Toronto Hydro should find effective and better ways to maintain and upkeep aging and old infrastructure.

Response During Major Weather Events

Almost every participant in the commercial groups mentioned better communication from Toronto Hydro to its customers during major weather events. Several of these participants also said there needs to be a better system of updating on the state of repairs during these major weather events.

Many stated that events such as the two major storms of 2013 could have been avoided if Toronto Hydro better maintained its system by investing in new equipment.

Overall, participants in the commercial groups felt that Toronto Hydro should have relayed better, up to date information regarding power outages during both the flooding in July and the ice storm in December of 2013. The participants said that if they had more accurate information from Toronto Hydro, they could have made better decisions concerning staffing.

Participants in the commercial sessions stated that they hoped Toronto Hydro could have restored service sooner during the major storms. Further, some participants stated that Toronto Hydro should have engaged and consulted with customers on emergency management fixes and updates.

Some pointed out that the widespread outages were the result of things that happened due to adverse weather and that there was little Toronto Hydro could do prevent such outages.

Toronto Hydro's Proposed Plan and Rate Impact

Some voiced concern over "the other 89 percent" of their bill because it represents a much larger proportion of their expense than the distribution portion. At the same time, they expressed relief that the rate increase applied only to the small portion of their bill that goes to Toronto Hydro.

As an alternative to a rate increase, some suggested moving the cost of required investments from ratepayers to taxpayers. Various participants in the groups suggested that Toronto Hydro work in conjunction with the Province of Ontario and the City of Toronto to get funding, instead of asking business customers to pay more.

A number of participants suggested that since all of the profits accumulated from Toronto Hydro electricity bills were going back into a municipal body, that public money should be used to subsidize the proposed rate increase for the ratepayers.

Further, a few participants were also critical of what they believed was mismanagement at Toronto Hydro and the Ontario Energy Board, blaming them for the present situation where Toronto Hydro is requesting a rate increase.

Some participants felt Toronto Hydro should invest more in preventative methods and be more proactive with its spending. Further, one of the participants stated Toronto Hydro should subsidize its large scale commercial customers with the cost and installation of backup generators.

However, after much concern voiced over a proposed rate increase, most of the commercial participants in the group accept the proposed rate increase, so long as it meant better and more reliable service for their businesses.

How Could the Consultation Process be Improved?

The commercial users within the group enjoyed the consultation process, as they thought it was an effective way to engage people and get them to start talking about electrical distribution issues, which many felt are often taken for granted.

Generally, participants in the commercial consultation group felt that the proposed Grid Renewal Plan was reasonable, effective, and representative of the electrical power needs of the businesses in the Toronto region.

However, a number of the participants in the commercial groups stated that they wanted access to progress reports that would update them on system renewal projects and that this in turn would make Toronto Hydro seem more accountable and transparent.

Industrial Workshop Session 1

General Overview

As seen in other Toronto Hydro consultations, most industrial customers do not like the idea of a price increase over the next 5 years, but generally feel it's necessary to maintain the system reliability.

In terms of the Toronto Hydro's workshop consultation materials, most participants felt the information presented made a compelling case to justify the need for increased investments in system renewal and new technologies that would support system reliability.

System Reliability: Customer Experience and Expectation

From the perspective of industrial customers, most were relatively satisfied with the level of system reliability their businesses receive from Toronto Hydro.

However, it's important to note that most participants in this group largely agreed that poor system reliability far outweighed the costs of Toronto Hydro's proposed rate increase for their rate class.

Improving Service of the Local Distribution System

While most accept the proposed rate increase, a number of the participants wanted Toronto Hydro to increase their efforts to help businesses find ways to reduce their electricity consumption to offset the impact of the proposed rate increase. Specifically, a number of participants cited that Conservation Demand Management (CDM) measures did not save their businesses much money. These participants found that the CDM measures were "not worth their time, service, or effort" and largely found it to be an inconvenience.

Overall, a common theme cited by participants within the industrial group was better communication from Toronto Hydro (e.g. customer service, better updates, and quicker repairs). Specifically, a number of participants in the industrial groups felt that Toronto Hydro could improve their customer services by better providing businesses with accessible information on the status of power outages and the length of time it will take to restore it. Participants suggested more timely and accurate web site updates on power service interruptions as well as mobile apps that would provide updates to customer account contacts.

Coverage of Distribution System Topics

Most participants in this group felt that the workbook helped them better understand the challenges facing their local distribution system and that a proactive approach to system renewal is better than a reactive one.

While out of scope for this consultation a few participants wanted more information on the other 89% of their electricity bill, outside of their distribution costs. Overall, the participants thought the workbook was easy to read, well put together, and comprehensive.

System Renewal and Rate Impact

While most participants in this group thought that Toronto Hydro's plan was headed the right direction, a few were not sure, as they thought they needed more information to come to a full conclusion on what the rate increase would mean for their businesses.

Customers who did not accept the price increase generally cited that they were not convinced that Toronto Hydro had made enough efforts to cut costs elsewhere or find operational efficiencies that could help pay for the increased in required capital expenditures. Although these concerns were shared by other industrial customers, most participant in these workshops accepted the proposed price increase.

When given the pacing option between "invest now" or "pay more later", most participants felt that Toronto Hydro should begin investing in system renewal now in order to avoid ratepayers from paying more in the future to fund delayed system renewal investments.

As heard in other consultations with business owners and managers, a number of participants in the industrial groups felt that Toronto Hydro should have created a reserve fund in anticipation of required capital expenditures required for system renewal.

Finally, some of the participants in the industrial group said that they would like to see a line on the bill (e.g. "system renewal investment") – which makes both the proposed plan and bill increase seem more accountable and transparent.

How Could the Consultation Process be Improved?

Participants in the group stated one way to improve the consultative process was to have less of a presentation element and more of an open dialogue process. Some participants also thought the consultation was rushed through and wanted to be given more of an opportunity to express their concerns and opinions.

On the other hand, some of the participants in the industrial groups stated the consultation process made them understand the issues facing the distribution system at a level where they could have a meaningful and informed discussion about system priorities and challenges. One of the participants felt that consultation on system renewal and capital investing should be an ongoing and regular customer engagement process, as opposed to only part of Toronto Hydro's rate application process.

Questionnaire Results

The following tables are the tabulations of participant feedback to questions in the hard copy workbooks which were returned at the end of each consultation session.

Due to the high occurrence of non response to open ended questions and subsequent small sample size, these results are not segmented by region, but rather only between commercial and industrial customers.

Blue tallies denote feedback from Commercial (Co) customers.
Red tallies denote feedback from Industrial (Ind) customers.
Numbers in green denote the sum of both Commercial and Industrial participant feedback tallies

Missing values are recorded beneath each table to indicate the number of participants who left a particular question unanswered.

Q1. How well do you feel you understand the important parts of the electricity system, how they work together and which services Toronto Hydro is responsible for?

Response	Co1	Co2	Co3	Total	Ind1	Ind2	Ind3	Total	Sum Total

Customer Telephone Surveys

Telephone Surveys among Residential and GS Customers

PURPOSE: To obtain statistically significant quantitative feedback on the proposed DSP and assess reaction to customer opinions obtained from the previous research phases

Summary

The following summary highlights the key findings from two telephone surveys of 1,006 Toronto Hydro residential customers and 200 General Service <50 kW customers:

General Satisfaction

- About half (48%) of residential customers are familiar with their local distribution system, while General Service customers are slightly less familiar (43%). High volume electricity consumers are more familiar than those who consume less.
- Three quarters (73%) of residential and General Service customers are satisfied with Toronto Hydro. Residents consuming the least power are most satisfied, while General Service customers using the highest volume of electricity (84%) are the most satisfied.
- When asked how to improve service, four in ten want cheaper (39% RS; 40% GS) and more consistent service/less power outages (12% RS; 6% GS). A quarter (26%) of residential customers and nearly three in ten (28%) GS customers said Toronto Hydro could do "nothing/already satisfied".

System Reliability

- Two thirds (66%) of residents and more than half (55%) of General Service customers experienced power outages during extreme weather. Not including extreme weather, six in ten (57%) residential customers and about half (49%) of General Service customers experienced "other" power outages in the last twelve months.
- Roughly two thirds (64%) of General Service customers report costs to their business during "other" power outages.
- Regarding the frequency of outages, seven in ten (70%) residential customers think Toronto Hydro should spend what is needed to either reduce (31%) or maintain (39%) the level of power outages. General Service numbers are similar (67%) on the frequency of outages.
- Three quarters (74%) of residential and two thirds (67%) of General Service customers think Toronto Hydro should spend what is needed to either reduce (33% RS; 30% GS) or maintain (41% RS; 37% GS) the length of power outages.

System Challenges & Priorities

- On infrastructure investment, six in ten (60%) residential customers and half (51%) of General Service customers believe that Toronto Hydro should invest in its aging infrastructure to reduce future outages, even if it means higher bills. Highest support for infrastructure investment among residential customers is in Central Toronto (68%).

- On investment in new technologies, two thirds (67%) of residential customers and six in ten (61%) General Service customers agree that investments in new technology will increase system reliability, make local distribution system more efficient and save money in the long run. About two in ten (RS 19%; GS 20%) preferred the argument against investment in new technologies. Again, residents in Central Toronto region (73%) are most likely to agree to investment in new technologies.
- Two thirds (66%) of residential customers and over half (56%) of General Service customers believe that Toronto Hydro should be wise with its spending on equipment and tools, but they also think it is important that staff have the equipment and tools needed to manage the system efficiently and reliably.

Overall Assessment of Plan 1

Residential Acceptance Nearly six in ten residential (58%) customers accept the rate increase. Most of that support appears reluctant (39%): they "don't like the increase, but feel it's necessary to maintain the grid". However, only a third (34%) thinks the rate increase is unreasonable and would not support it.

Q: Looking at the cost of the Toronto Hydro plan and outcomes it is expected to achieve, which point of view is closest to your own? Would you say…?	
Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more	4%
I am satisfied with the balance between outcomes and the proposed rate increase	15%
I don't like the rate increase, but I think it is necessary to maintain the grid to a reasonable standard	39%
I think the bill impact is too high and Toronto Hydro needs to scale back its plans	34%
No response	8%

General Service Acceptance General Service customers are less supportive of rate increases than residential customers; just under half (48%) of organizational customers support the proposed Toronto Hydro plan and about four in ten (41%) think the bill impact would be too high.

Q: Looking at the cost of the Toronto Hydro plan and outcomes it is expected to achieve, which point of view is closest to your own? Would you say…?	
Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more	3%
I am satisfied with the balance between outcomes and the proposed rate increase	15%
I don't like the rate increase, but I think it is necessary to maintain the grid to a reasonable standard	30%
I think the bill impact is too high and Toronto Hydro needs to scale back its plans	41%
No response	11%

1

Methodology 1

INNOVATIVE conducted two customer surveys by telephone for Toronto Hydro:

1. A residential customer survey conducted among 1,006 respondents between June 10 and 25, 2014; and
2. A general service customer (GS < 50 kW) survey conducted among 200 respondents between June 10 and 25, 2014.

Note: No calls were made on June 12, 2014 – the date of the Ontario provincial election – given the increased likelihood of customers being out of their homes or offices, as well as a potential preoccupation with provincial policy issues which could bias survey responses.

Participants were randomly selected from customer lists provided by Toronto Hydro (30,000 residential records and 6,000 GS records).

- A sample of 1,006 residential customers is considered accurate to within ±3.1 percentage points, 19 times out of 20.
- A sample of 200 General Service customers is considered accurate to within ±6.9 percentage points, 19 times out of 20.

The margin of error in both surveys will be larger within each sub grouping of the samples.

Questionnaire Design 1

The questionnaires were designed to simulate the journey that respondents in the Online Workbook and Workbook led Consultation Sessions experienced. This included a combination of educating the customer, having customers reflect on their personal experience with their distribution system, and having them make value judgments on trade offs between system reliability and bill impact.

As part of simulating the "workbook journey", the questionnaires were informed by and incorporated feedback from the previous phases of Toronto Hydro's customer engagement. This included sharing both supportive and non supportive feedback in the survey from previous phases of Toronto Hydro's customer consultation as it related to Toronto Hydro's proposed capital work and the associated rate increase. Wording of questions differed slightly between the Residential and General Service survey – for example, in the preambles the size of monthly bills differed between residential and general service customers – but otherwise remained generally consistent.

One notable difference between surveys is an additional question on service reliability and cost that was added to the General Service survey: "Thinking back to the most recent power outage – which was caused by something other than last year's floods or ice storm – how did it affect your organization in terms of cost?..."

The average survey ran at approximately 10 minutes. Both survey instruments can be found at the end of this section of the report.

Fielding the Survey 1

Residential (RS) Customer Survey:

For the purposes of executing the residential survey, Toronto Hydro provided INNOVATIVE with a confidential list containing 30,000 of their residential customers' contact information. Toronto Hydro built this contact list by randomly selecting records from among approximately 700,000 residential contact records on file in their customer database.

The contact list included only residential customers with residential landline contact information on file and who had been a customer of Toronto Hydro since at least January 1, 2013. The information contained in the contact list included customer name, home telephone number, home address, service area, and total annual usage between January 1 and December 31, 2013.

Only one customer per household was eligible to complete the residential survey. Survey respondents were screened to certify that only the resident primarily responsible for paying their Toronto Hydro electricity bill was interviewed. This step was taken to ensure that survey respondents represented the most qualified person within a household to answer questions about their electricity bill and how Toronto Hydro's proposed rate increase would have a relative impact on their bill.

Before retiring any randomly selected telephone number from the contact list, 12 attempts were made to reach a potential respondent for each unique telephone number, or until an interviewer received a hard refusal. Each number was called twice a day for the first four days and once a day for the final four. Each night – from June 10th to June 25th, new sample was released from the contact list to replace completed or retired numbers.

Toronto Hydro's residential customers were contacted at their home by telephone between 4pm and 9pm on weekdays, between 10am and 8pm on Saturdays, and between 11am and 8pm on Sundays.

General Service (GS) Customer Survey:

The GS survey consisted of 200 customers drawn from a confidential list provided to INNOVATIVE by Toronto Hydro. Toronto Hydro provided a list of approximately 6,000 GS < 50 kW contact records, randomly selected from its customer database.

GS customers were contacted on weekdays between 9am to 4pm. In addition, customers were screened to ensure they were in charge of managing the electricity bill at their organization.

All fieldwork was conducted using INNOVATIVE's computer assisted telephone interviewing (CATI) system.

Sample Design 1

The two surveys followed a stratified random sampling methodology. This is a method of sampling that involves the division of a population into smaller groups known as strata. In stratified random sampling, the strata are formed based on members' shared attributes or characteristics (in this case, customer service area or electricity usage). A random sample from each stratum is taken in a number proportional to the stratum's size when compared to the customer population. These subsets of the strata are then pooled to form a random sample.

In the first survey, residential customers were initially divided into strata based on service area populations. Within service area populations, residential customers were then divided into quartiles based on annual electricity usage to ensure the sample had a proportionate mix of customers from low, medium low, medium high, and high electricity usage households.

Residential Sample Design:

The following table illustrates the segmentation of the residential survey sample by Toronto Hydro's customer service areas.

Service Area	Customer Distribution	Target Sample	Actual Sample	Difference
East York	4.0%	40	41	+1
Etobicoke	14.7%	147	147	0
North York	21.9%	219	220	+1
Scarborough	21.7%	217	220	+3
Central Toronto	32.3%	323	324	+1
York	5.4%	54	54	0
TOTAL	100.0%	1,000	1,006	+6

Within service area populations, customers were divided into quartiles based on annual electricity usage. The table below illustrates the actual survey interviews by usage quartile within Toronto Hydro's six customer service areas.

Service Area	Low Usage	Medium-Low Usage	Medium-High Usage	High Usage	Total
East York	10	10	10	11	41
Etobicoke	37	37	36	37	147
North York	55	55	55	55	220
Scarborough	54	56	55	55	220
Central Toronto	81	81	81	81	324
York	13	14	13	14	54
TOTAL	250	253	250	253	1,006

GS Sample Design:[4]

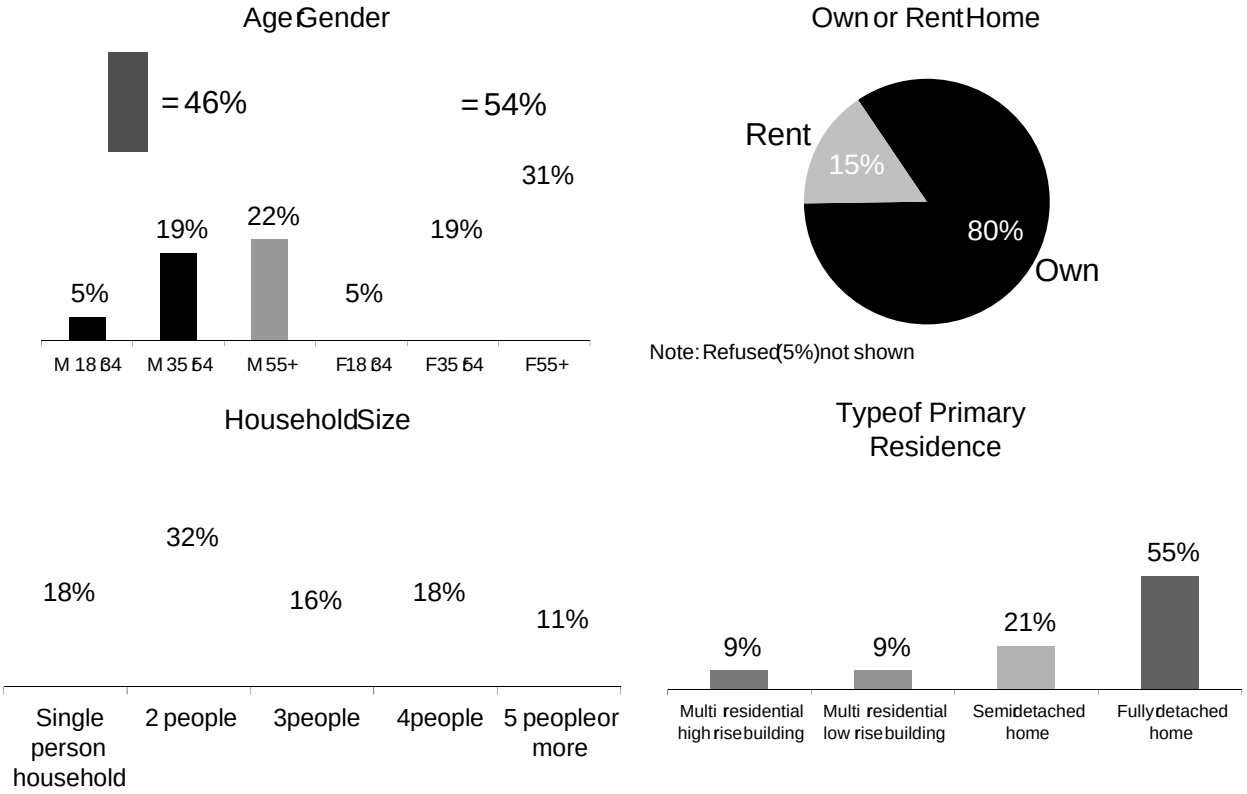
The survey of General Service customers also divided the respondents by region and annual electricity usage to reflect the actual distribution of Toronto Hydro GS customers:

Service Area	Customer Distribution	Target Sample	Actual Sample	Difference
East York	4.1%	8	8	0
Etobicoke	8.2%	16	16	0
North York	20.2%	40	43	+3
Scarborough	10.4%	21	22	+1
Central Toronto	47.0%	94	96	+2
York	10.1%	20	15	5
TOTAL	100.0%	199	200	+1

[4] Throughout this section, the term Outer Toronto is used to reference the regions of Etobicoke, North York, Scarborough and York.

Again, within service area populations, GS customers were divided into quartiles based on annual electricity usage. The table below illustrates the actual survey interviews by usage quartile within Toronto Hydro's six customer service areas.

Service Area	Low Usage	Medium-Low Usage	Medium-High Usage	High Usage	Total
East York	2	2	2	2	8
Etobicoke	4	4	4	4	16
North York	11	10	11	11	43
Scarborough	6	5	6	5	22
Central Toronto	25	25	19	27	96
York	5	5	4	1	15
TOTAL	53	51	46	50	200



Sample Weights

Weights have not been applied to either the residential or GS data as the stratified random samples are accurate representations of Toronto Hydro's actual customer distribution and type.

Demographic Profiles

The following details the demographic characteristics of respondents who completed the Residential Ratepayer Survey [n=1,006].

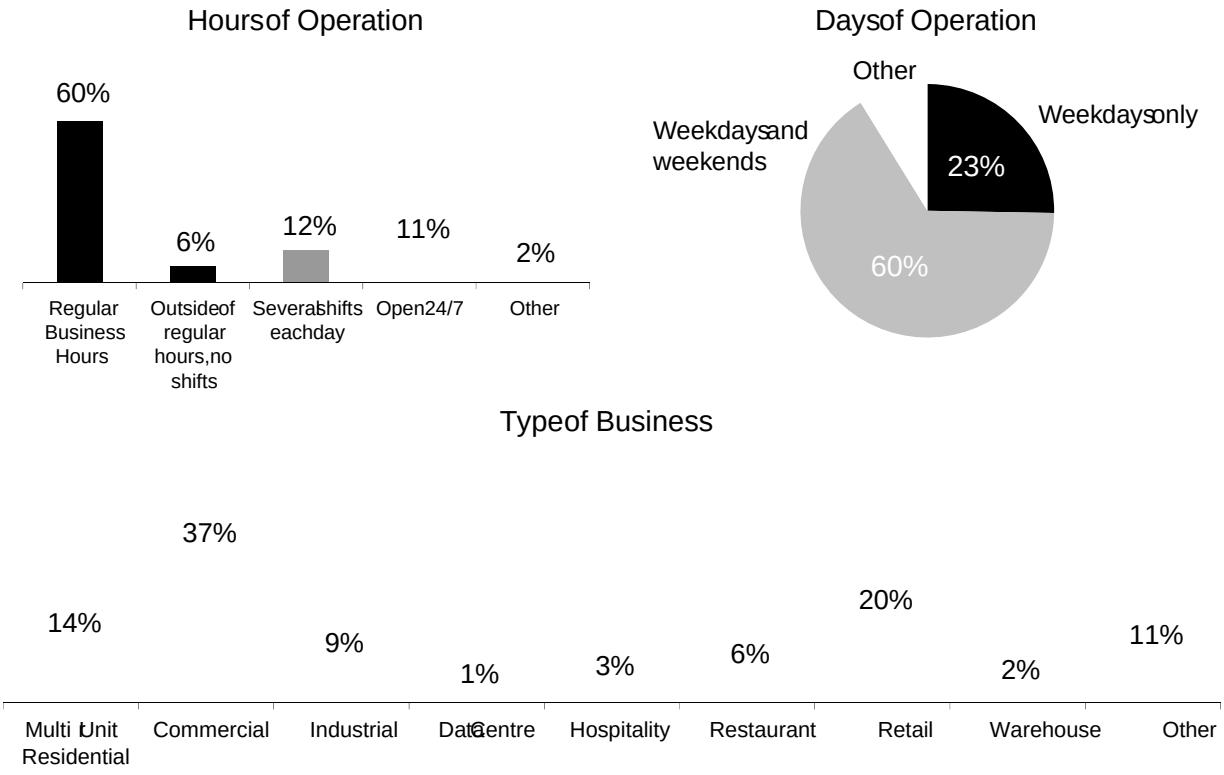


Figure 4.A: Residential Customer Profile

Firmographic Profiles 1

Below are the firmographics of respondents who completed the General Service Ratepayer Survey [n=200].

Figure 4.B: GS Customer Profile 1

1

Respondent Feedback 1

Familiarity and Satisfaction 1

This section of the workbook explores familiarity and experiences with the local distribution system and satisfaction with Toronto Hydro in running that system. The results for residential customers will be presented first, followed by general service (GS) customers.

Familiarity and Satisfaction Summary 1

- Almost half of residential customers (48%) are familiar with the local distribution system, while General Service customers are slightly less familiar (43%).
    - Residential consumers in East York (59%) and York (54%) are the most familiar with the system.
    - High consumption consumers (55% RS; 44% GS) are more familiar with the system than low (45% RS; 36% GS) level consumers.
    - General Service respondents in Central Toronto/East York (49%) are much more familiar with the system than those in the Golden Horseshoe (36%).
- Three quarters (73%) of residential and General Service customers are satisfied with the job Toronto Hydro is doing.
    - The highest consumption residential customers (84%) are the most satisfied.
- When asked how to improve service, a plurality (39% RS; 40% GS) want reduced rates and charges, followed by more consistent service/less power outages (12%).
- A quarter (26%) of residential customers and nearly three in ten (28%) GS customers say Toronto Hydro could do "nothing/already satisfied".

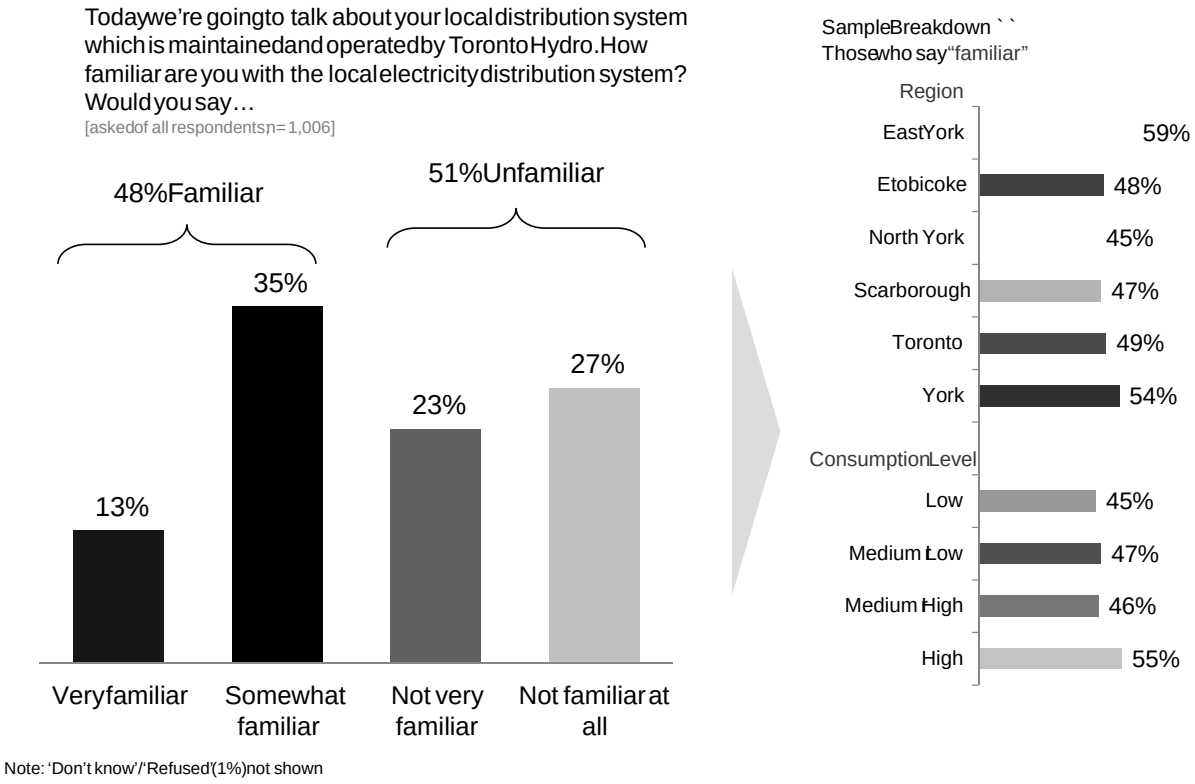
Preamble for Familiarity and Satisfaction Section 1

Prior to answering the questions in the General Satisfaction Section, respondents were presented with a preamble concerning key components of Ontario's electricity system. The preamble read as follows:

"To start, I'd like to ask you a few questions about the electricity system…

As you may know, Ontario's electricity system has three key components generation, transmission and distribution.

- Generating stations convert various forms of energy into electric power;
- Transmission lines connect the power produced at generating stations to where it is needed across the province; and
- Distribution lines carry electricity to the homes and businesses in our communities.



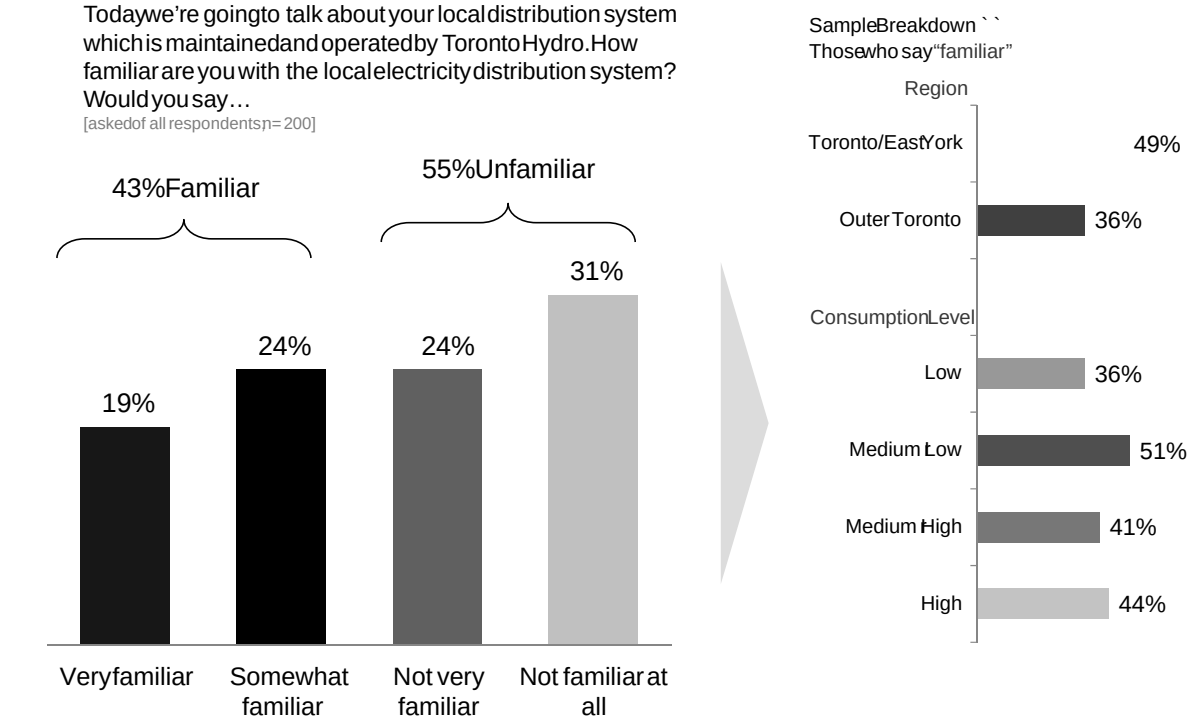
Today we're going to talk about your local distribution system which is maintained and operated by Toronto Hydro."

Familiarity with Local Electricity Distribution System

Almost half of residential respondents (48%) are familiar with their local distribution system. Of those who indicated they are familiar, 13% say they are very familiar with the system.

- The East York (59%) and York (54%) Regions have the highest level of familiarity with the local system.
- Differences in consumption level are also related to familiarity. High (55%) levels of consumption are associated with greater familiarity than low (45%) level consumption.
- Single person households (40%) are the least familiar with their local electricity distribution system (2: 50%; 3 or 4: 49%; 5 or more: 57%). And owners (50%) are more familiar than renters (39%).

Figure 4.1 RS: Familiarity with the Local Distribution System



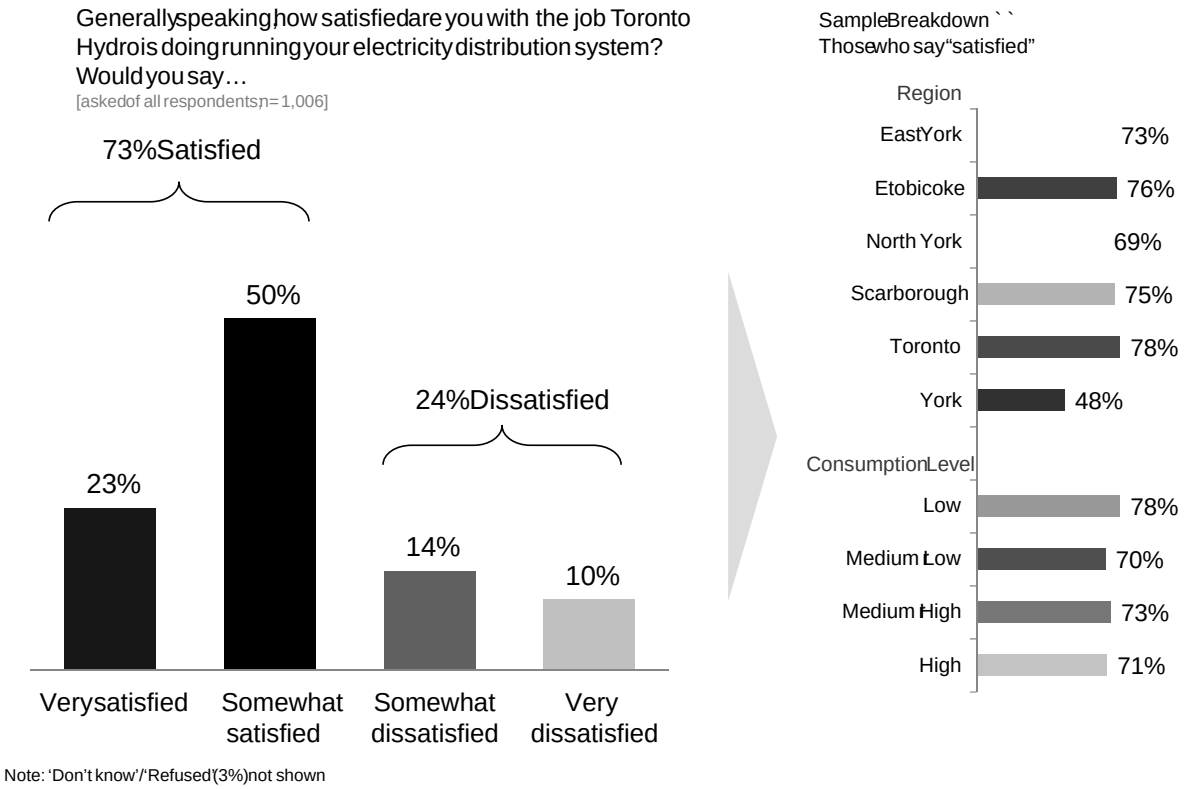
Note: 'Don't know'/'Refused' (1%) not shown

Of the General Service respondents, more than four in ten (43%) are familiar with their local distribution system. Of those who indicated they are familiar, 19% say they are very familiar with the system.

- Half (49%) of General Service customers in Central Toronto/East York are familiar, while only 36% of Golden Horseshoe customers state the same.
- Low (36%) consumption organizations are the least familiar with their local distribution system.
- Bill size appears to affect familiarity: those organizations with larger bills are more familiar with the system (<$500/month: 37%; between $500 and $1000: 46%; $1000+/month: 54%)

Figure 4.1 GS: Familiarity with the Local Distribution System 1

Note: 'Don't know'/'Refused' (3%) not shown



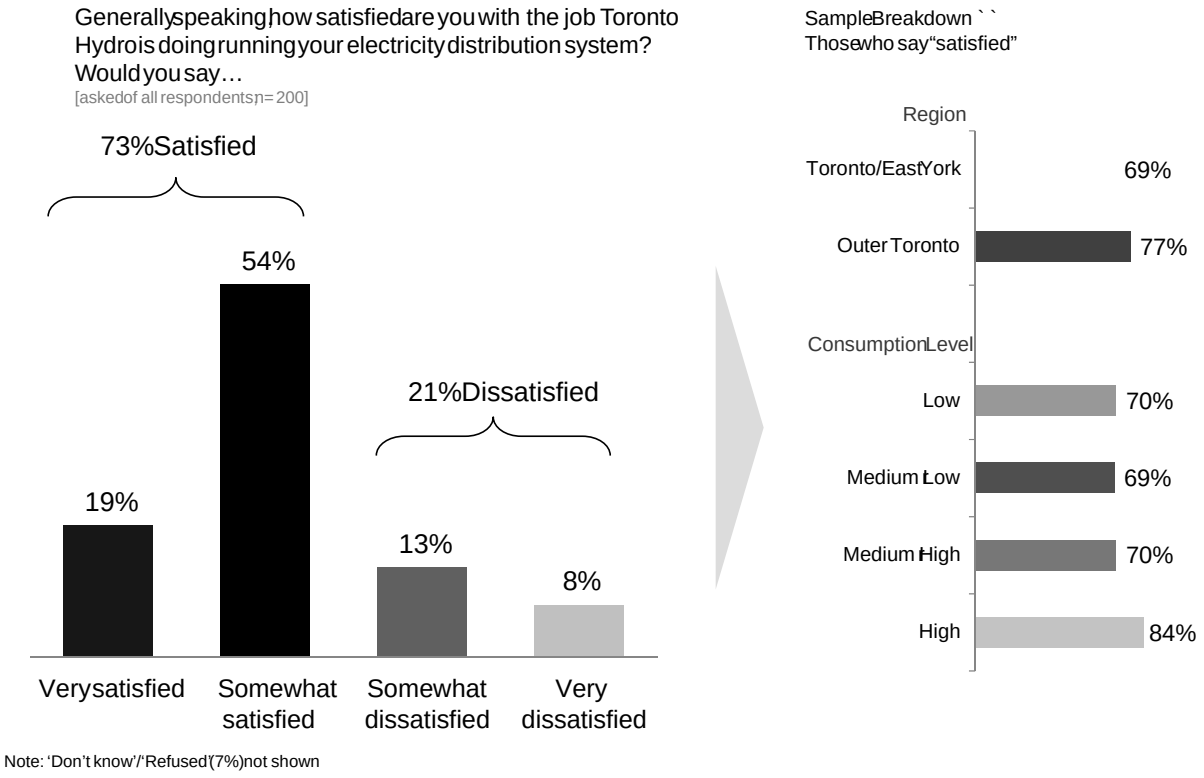
1

Satisfaction with Toronto Hydro Running the Distribution System

Almost three quarters (73%) of residential customers are satisfied with the job Toronto Hydro is doing running their electricity distribution system, with nearly a quarter (24%) of residential customers responding "very satisfied".

- All regions but one are mostly satisfied with Toronto Hydro: North York (69%), East York (73%), Scarborough (75%), Etobicoke (76%) and Central Toronto (78%) all range between seven in ten and three quarters satisfied. However, in York, just under half (48%) of residential customers are satisfied with the job Toronto Hydro is doing.
- Those residents consuming the lowest amount (78%) of power are most satisfied with Toronto Hydro, between five and eight percent higher than respondents with higher consumption levels (70 to 73%).
- Residents of houses (fully detached: 72%; semi detached: 73%) are a bit less satisfied with Toronto Hydro than those in multi residential buildings (less than five stories: 81%; greater than five stories: 76%)
- Single and two person households (77%) are slightly more satisfied with Toronto Hydro than respondents in larger households (three: 72%; four: 66%; five or more: 72%).
- Residents who agree that their electricity bill "has a major impact on my finances" are less satisfied (68%) with Toronto Hydro than those who do not feel their bill has a major impact on their finances (82%).

Figure 4.2 RS: Satisfaction with Toronto Hydro



Note: 'Don't know'/'Refused' (3%) not shown

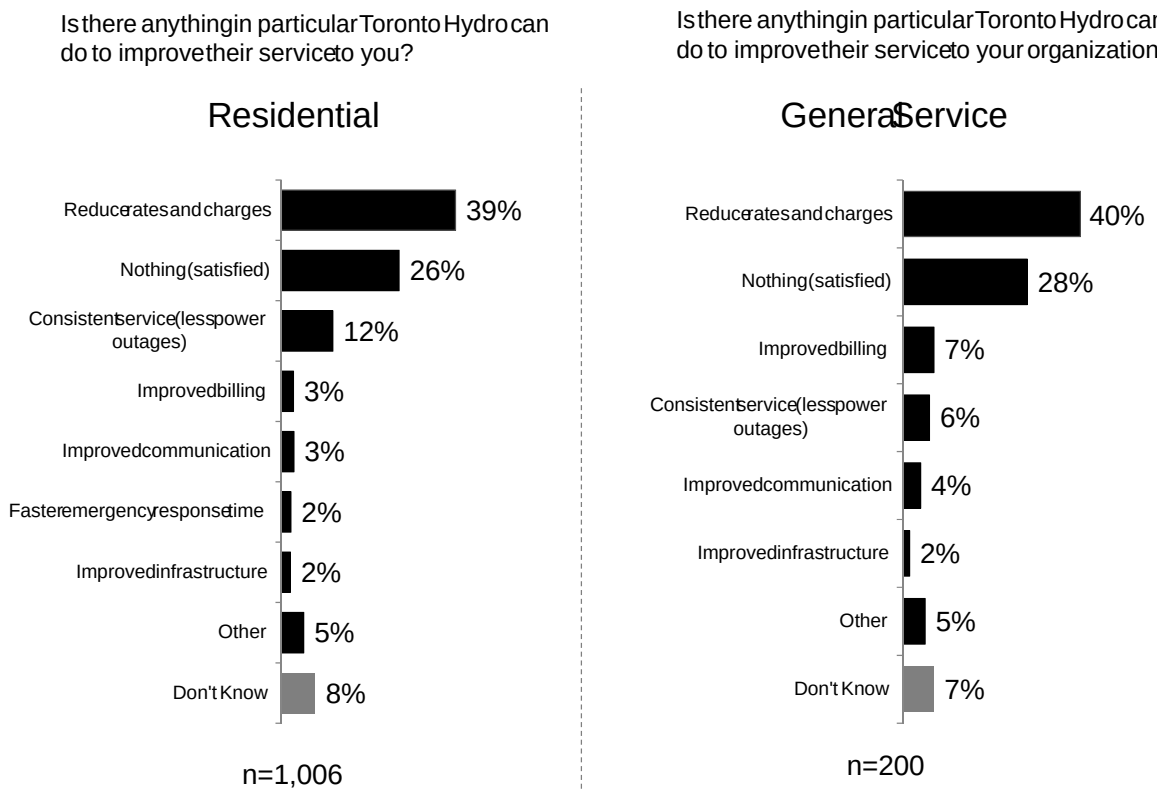
Like residential customers, almost three quarters (73%) of General Service customers are satisfied with the job Toronto Hydro is doing running the distribution system. About two in ten (19%) General Service customers are very satisfied with Toronto Hydro.

- The highest consumption volume (84%) General Service consumers are the most satisfied with Toronto Hydro.
- Organizations who feel their electricity bill has "a major impact on their bottom line" (76%) are slightly less satisfied with Toronto Hydro than those who do not feel it has a major impact on their finances (86%).

Figure 4.2 GS: Satisfaction with Toronto Hydro 1

Note: 'Don't know'/'Refused' (7%) not shown

1



How to Improve Service

When asked how Toronto Hydro could improve service, a plurality of residential (39%) and General Service (40%) customers suggest that Toronto Hydro could "reduce rates and charges".

Other areas for improvement mentioned by residential respondents include "more consistent service/less power outages" (12%), "improved billing" (3%), "improved communication" (3%), "faster emergency response time" (2%), and "improved infrastructure" (2%).

A quarter (26%) of residential customers and nearly three in ten (28%) General Service customers say Toronto Hydro could do "nothing to improve their service".

Figure 4.3 RS/GS: How to Improve Service

Electricity Bill Knowledge

This section explores Residential and General Service respondent perceptions and knowledge of their electricity bill. It specifically focuses on the breakdown of the bill and what portion respondents estimate goes to Toronto Hydro.

Electricity Bill Knowledge Summary

- Most residential (35% familiar) and General Service (36%) respondents are not overly familiar with the breakdown of their electricity bill.
- In the Residential survey, East York (44%) and York (43%) prove the most familiar with their billing; highest consumption (40%) customers are more familiar than lowest (31%).

Preamble for Bill Knowledge & Impact Section

For this component of the survey, respondents were presented with a preamble concerning the breakdown of costs of an electricity bill. The two surveys provided different preambles based on targeted respondents.

The preamble for residential customers read as follows:

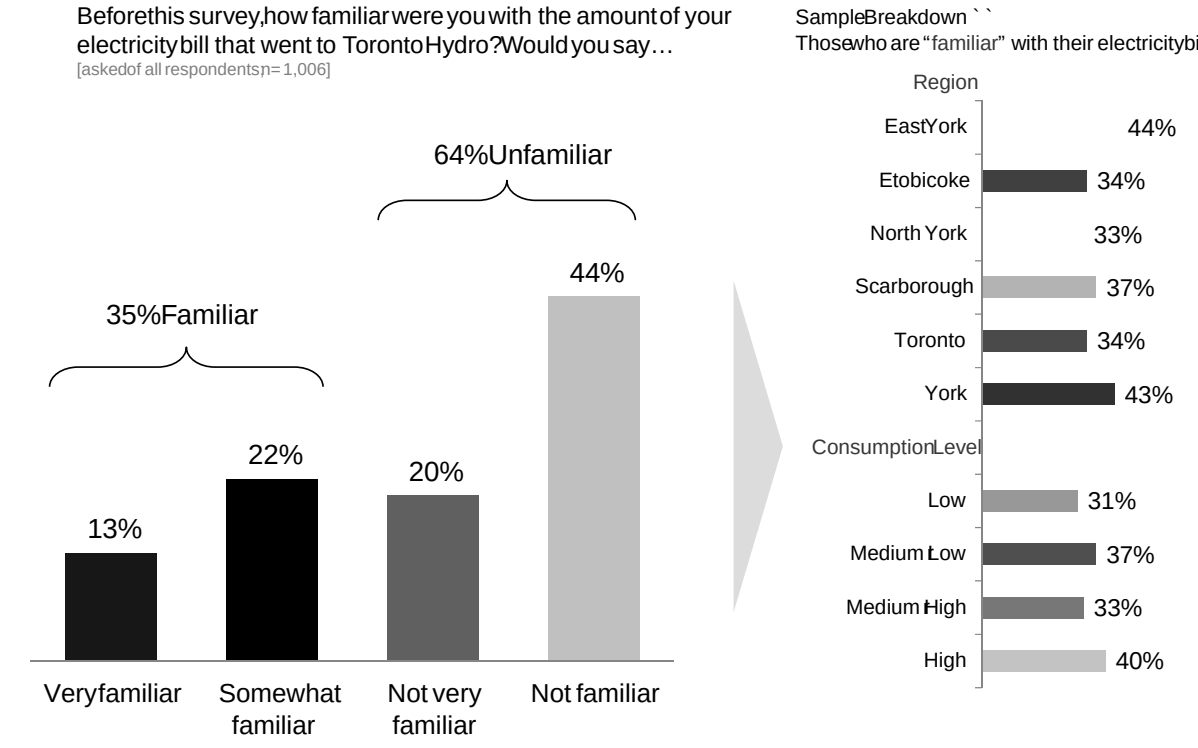
"I'd now like to talk with you about your electricity bill …

While some customers pay more and others pay less, the average residential customer pays about $132 a month for electricity of which $33 or approximately 25% goes to Toronto Hydro. The rest of the bill goes to power generation companies, transmission companies, the provincial government and regulatory agencies."

The General Service preamble explained it slightly differently:

"I'd now like to talk with you about your electricity bill …

While some customers pay more and others pay less, the average small and medium sized business pays about $330 a month for electricity of which $80 or approximately 25% goes to Toronto Hydro. The rest of the bill goes to power generation companies, transmission companies, the provincial government and regulatory agencies."



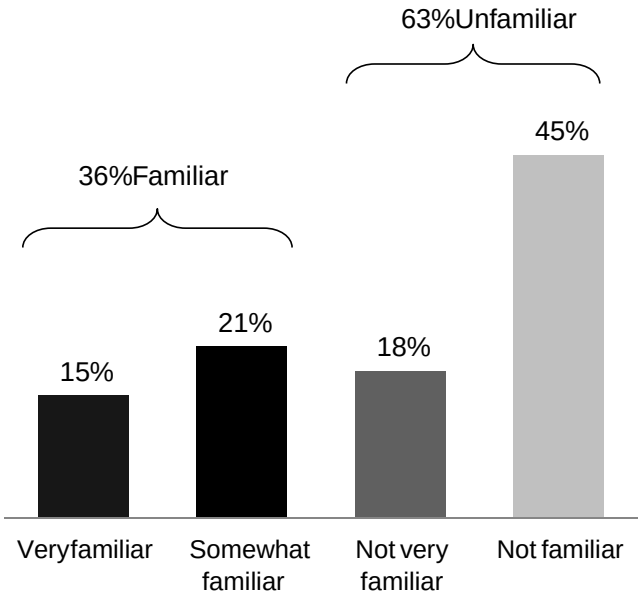
1

Familiarity with Share of Bill Going to Toronto Hydro

After the preamble, when asked about the breakdown of their electricity bill, 35% state they were familiar with the amount of their electricity bill that went to Toronto Hydro. In contrast, nearly two r thirds (64%) indicate they are not familiar with the breakdown of their bill.

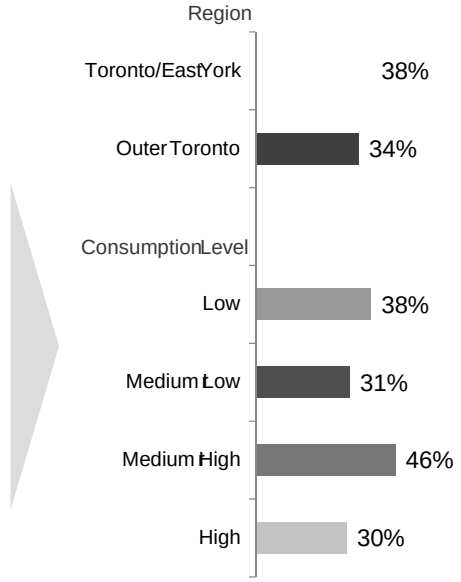
- Regionally, East York (44%) and York (43%) are the most familiar with their electrical bill, with all other regions (33 r 37%) close to the mean (35%).
- Those with the highest consumption (40%) prove more familiar with their bill than the lowest (31%).
- Single detached home owners (39%) are more familiar with their bill than other residents (Semi r detached home: 31%; Multi less than five stories: 25%; Multi more than five stories: 33%).

Figure 4.4 RS: Familiarity with Share of Bill Going to Toronto Hydro



Note: 'Don't know'/'Refused' (0%) not shown

Similar levels of familiarity occur in the GS survey: 36% of respondents say they are familiar with the amount of their bill going to Toronto Hydro, while 63% indicate they are not familiar with how their bill is broken down.



- By region (Central Toronto/East York: 38%; Outer Toronto: 34%) and at all consumption levels, there tends to be low knowledge concerning the breakdown of electricity bills.
- Organizations paying the lowest amount for electricity are the least familiar with their electricity bill (<$500/month: 24%; $500 to <$1000/month: 41%; >$1000/month: 46%).

Figure 4.4 GS: Familiarity with Share of Bill Going to Toronto Hydro

Before this survey, how familiar were you with the amount of your organization's electricity bill that went to Toronto Hydro? Would you say…
[asked of all respondents, n = 200]

Sample Breakdown
Those who are "familiar" with their electricity bill

Note: 'Don't know'/'Refused' (2%) not shown

1

System Reliability

This section covers the feedback provided by respondents on previous power service interruptions, due to weather and non-weather related events, as well as the cost of service interruption to General Service respondents. It also discusses perceptions surrounding spending and reducing the number and length of power service interruptions.

System Reliability Summary

- Two-thirds (66%) of residents and just over half of organizations (55%) experienced power service interruptions during extreme weather.
- Not including unusual weather events, six in ten (57%) residential customers experienced "other" power outages in the last twelve months. About half (49%) of General Service customers report the same.
- When asked how much the "other" power outages cost their organization, almost two-thirds (64%) of General Service customers report at least some cost to their business.
- To address the number of outages, three in ten (31%) residential customers think Toronto Hydro should spend what is needed to reduce the number of power outages and four in ten (39%) think it should spend what is needed to maintain the current level.
- Two-thirds (67%) of GS customers think Toronto Hydro should spend what is needed to either reduce (30%) or maintain (37%) the length of power outages.

Preamble for Power Service Interruptions

Prior to the question being asked in this section, a preamble concerning power interruptions and extreme weather was provided. The preamble read as follows:

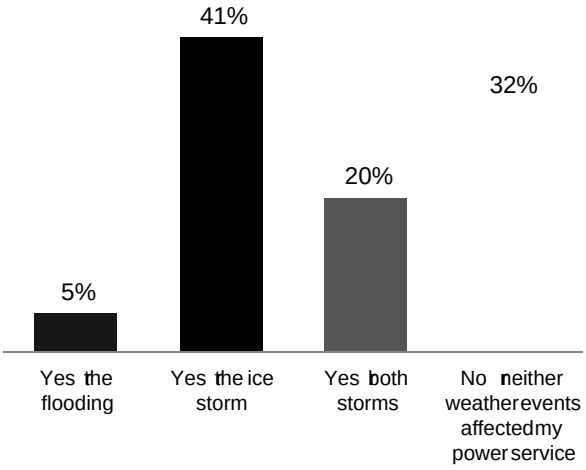
"This past year Toronto Hydro customers experienced unusually extreme weather – a wind storm in July and an ice storm in December. These storms caused power outages across the Toronto Hydro service area."

Power Service Interruptions

Two-thirds (66%) of residential customers experienced power outages in their homes during the extreme weather last year. The ice storm caused four in ten (41%) to lose power and five percent lost power due solely to the flooding; one in five (20%) lost power due to both. A third (32%) of Residential customers did not have an interruption in service due extreme weather.

- Central Toronto residents (44%) are much less likely to report outages during the extreme weather than other regions (Scarborough 72%; Etobicoke 73%; York 79%; North York 80%; East York 93%).
- Low consumption residential consumers (62%) are a bit less likely to report outages during the extreme weather than higher consumers (68-69%).
- Single-detached (74%) and semi-detached (64%) homes are the most likely to report power outages during the extreme weather and high rises (5+ stories: 42%) the least likely.
- Owners (69%) experienced power outages more frequently than renters (55%).

Among the General Service customers, 55% experienced outages and more about four in ten (42%) did not have weather events affect their power service. One in four (25%) lost power due to the ice storm and nearly three in ten (28%) lost power due to both the ice storm and the flooding. Only two percent lost power during the Toronto flooding.

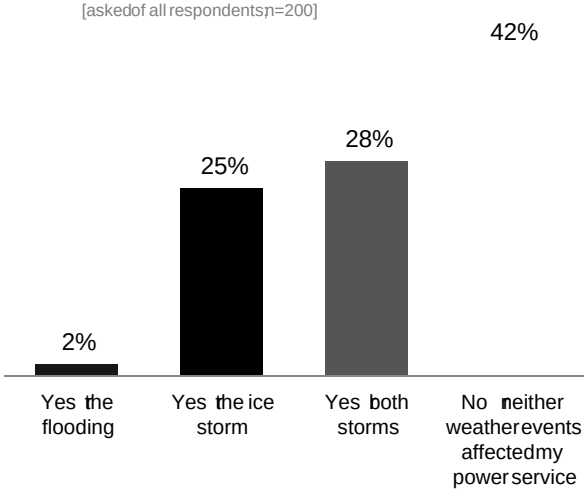


- For General Service, no statistically significant differences by region.
- Low (47%) consumers report slightly fewer outages during the extreme weather than higher energy consumers (60%: Medium low; 54%: Medium High; 54%: High).
- Organizations with a monthly bill of over $1000/month are much more likely to lose power during extreme weather than those paying less than $500/month (41%) or $500 to $1000/month (56%).
- Of the GS respondents who agree that their electricity bill "has a major impact on the bottom line" of their organizations, 65% report an outage during extreme weather, compared to just 41% who disagree with the statement.

Figure 4.5 RS/GS: Power Service Interruptions [1]

This past year Toronto Hydro customers experienced unusually extreme weather – flooding last July and an ice storm in December. These major weather events caused power outages across the Toronto Hydro service area.

Residential



Did either of these major weather events cause a power outage at your home?
[asked of all respondents; n=1,006]

Note: 'Don't know'/'Refused' (1%) not shown

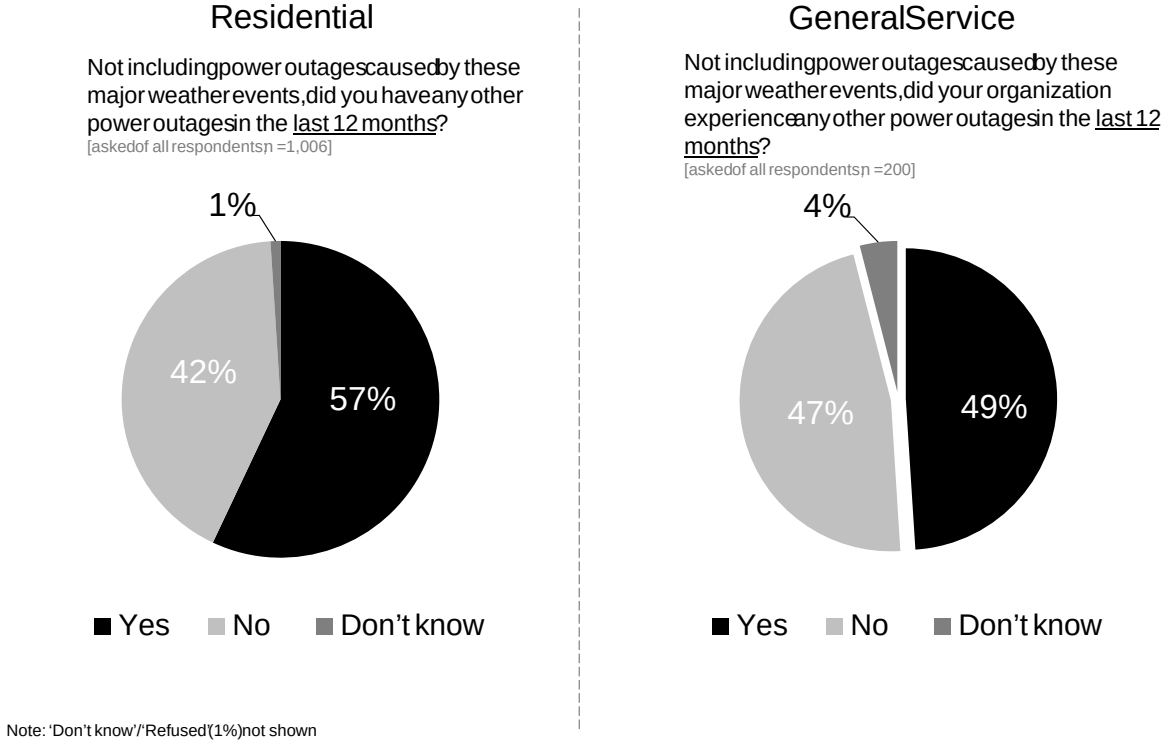
General Service

Did either of these major weather events cause a power outage at your home?
[asked of all respondents; n=200]

Note: 'Don't know'/'Refused' (5%) not shown

[1]

Other Power Outages



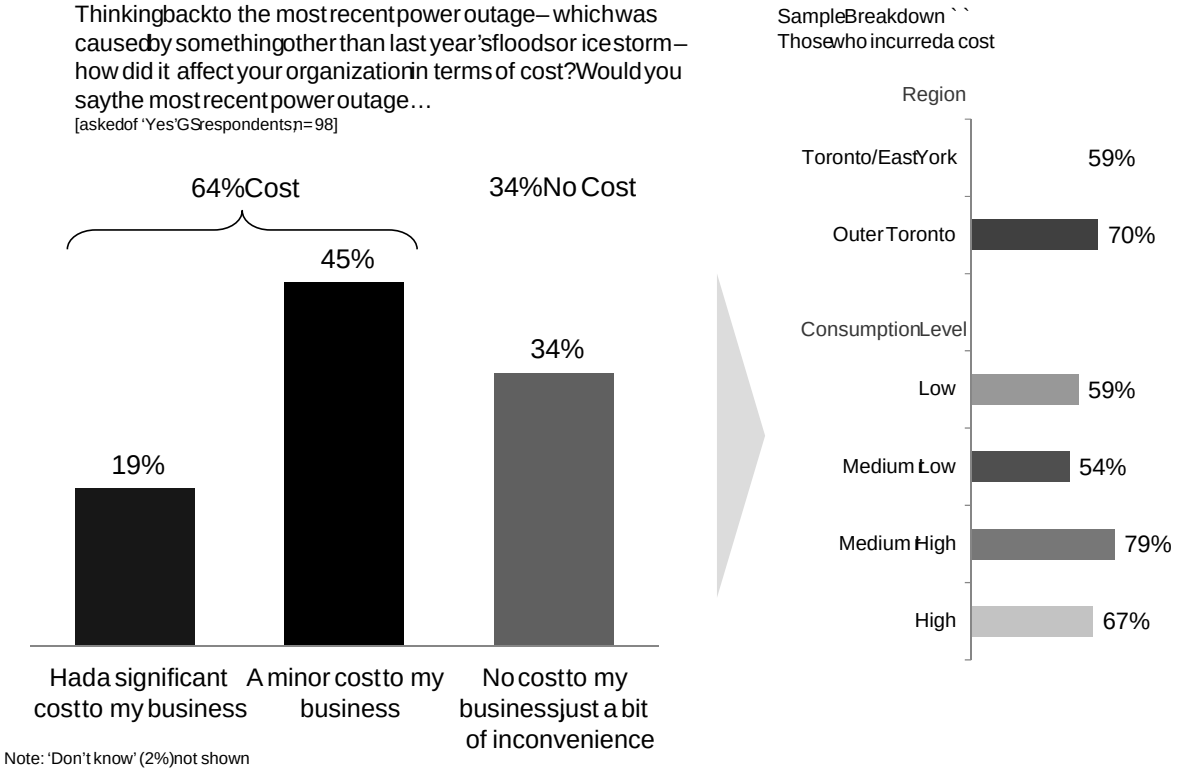
Not including power outages caused by major weather events, nearly six in ten (57%) residential customers say they experienced "other" power outages in the last twelve months. Only about four in ten (42%) residential customers did not experience such an outage.

- Looking by region, residential customers in York (81%) and East York (73%) are the most likely to report "other" power outages, while those in North York (66%), Etobicoke (47%) and Scarborough (45%) are less likely to report them.
- Residents living in houses (single detached: 61%; semi detached: 62%) and low rise buildings (53%) are much more likely to report "other" outages than those living in 5+ story buildings (35%).
- More residence owners (59%) report "other" outages than do renters (48%).

General Service reports slightly better service during normal weather with roughly a 50/50 split (49% experienced outages; 47% did not; 4% don't know).

- Outer Toronto GS customers (57%) are slightly more likely to report an "other" power outage than those organizations based in Central Toronto and East York (41%).
- Commercial businesses (52%) are slightly more likely to report "other" power outages than Retail and Restaurants (42%).

Figure 4.6 RS/GS: Other Power Outages



Note: 'Don't know'/'Refused' (1%) not shown

Only General Service respondents who responded "Yes" were asked an additional question on the cost of other (i.e. not caused by extreme weather) power outages: "how did it affect your organization in terms of cost?"

Almost two thirds (64%) of General Service customers report that the most recent power outage cost their business. For two in ten (19%) organizational customers, it had a significant cost to their business. About one third (34%) of respondents respond it had "no cost to their business just a bit of inconvenience".

- Of GS respondents who state that their electricity bill "has a major impact on the bottom line" of their organizations, 74% report a business cost to the recent outage with 24% dealt a significant cost.
- By region, seven in ten (70%) of Outer Toronto GS customers report a cost to their business, compared with six in ten (59%) in Toronto and East York. However, the cost impact appears to be more significant among respondents in Toronto/East York: a quarter (26%) of Toronto/East York customers had a significant cost to their business, compared with just 15% of Outer Toronto GS customers.
- Higher consumption organizations (High (67%); Medium high (79%) are more likely to report a cost to the power outage than lower consumption customers (Medium Low: 54%; Low: 59%).

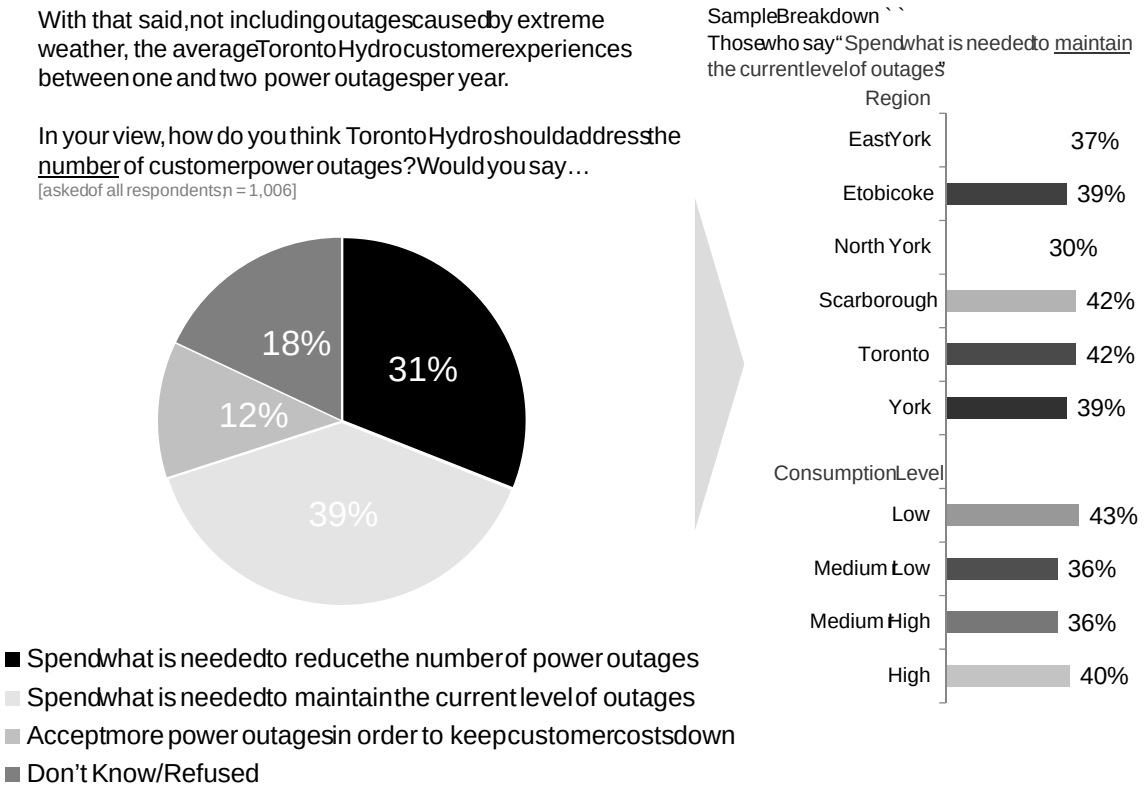
Figure 4.7 GS: Commercial Cost of Outages 1

Note: 'Don't know' (2%) not shown

Preamble for Addressing the Frequency of Service Outages

The next question focused on how, according to the respondent, Toronto Hydro should address the number of outages financially. A preamble concerning the average number of power interruptions was provided before the question concerning addressing the number of outages. The preamble read as follows:

"Despite best efforts, no electrical distribution system can deliver perfectly reliable electricity. As a general rule, the more reliable the system, the more expensive the system is to build and maintain.



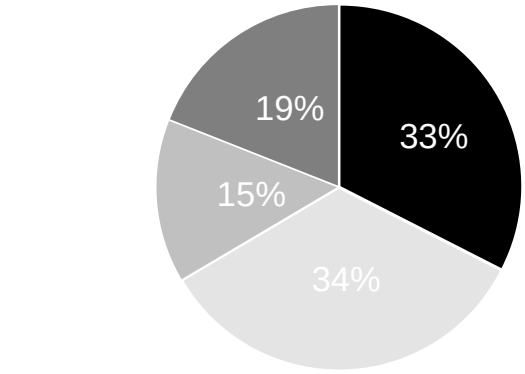
With that said – not including outages caused by extreme weather – the average Toronto Hydro customer experiences between one and two power outages per year."

Addressing the Frequency of Service Outages

Three in ten (31%) residential customers think Toronto Hydro should spend what is needed to reduce the number of power outages and four in ten (39%) think it should spend what is needed to maintain the current level. Just 12% state that Toronto Hydro should accept more power outages in order to keep customer costs down. Under two in ten (18%) don't know or refused to answer.

- Regionally, the only difference is that North York (30%) residents are less likely to want to "spend to maintain" than the rest of the GTA.
- There is little difference on this question when looking at consumption levels.
- Residents who agree that their electricity bill "has a major impact on their bottom line" are much less likely to want to "spend to maintain" (33%) than those who do not feel their bill has a major impact on their bottom line (48%).

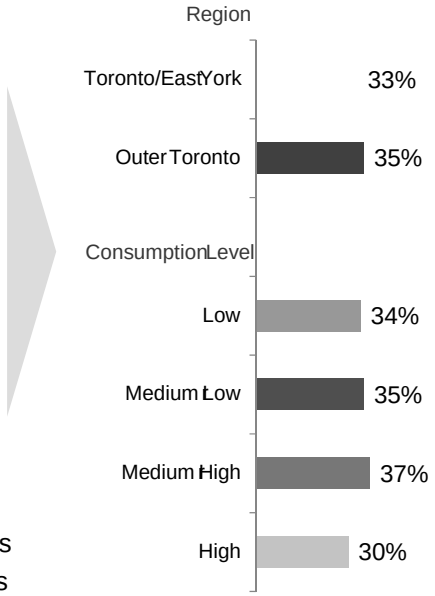
Figure 4.8 RS: Addressing the Frequency of Service Outages



General Service customers respond likewise on how to address the number of outages: a third (33%) think that Toronto Hydro should spend what is needed to reduce the number of power outages and a third (34%) say it should spend what is needed to maintain the current level.

- Across region and consumption patterns there are no significant differences in opinion. Those with larger bills are less likely to want to "spend to maintain" ($1000+/month: 22% vs. 39% <$1000/month).

Figure 4.8 GS: Addressing the Frequency of Service Outages 1



With that said, not including outages caused by extreme weather, the average Toronto Hydro customer experiences between one and two power outages per year.

In your view, how do you think Toronto Hydro should address the number of customer power outages? Would you say…
[asked of all respondents; n = 200]

- Spend what is needed to reduce the number of power outages
- Spend what is needed to maintain the current level of outages
- Accept more power outages in order to keep customer costs down
- Don't Know/Refused

Sample Breakdown
Those who say "Spend what is needed to maintain the current level of outages"

1

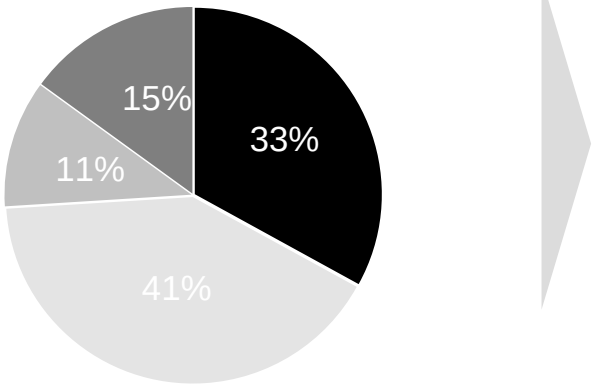
Preamble for Addressing the Duration of Service Outages

Before the follow-up question on how Toronto Hydro should address the length of time without power, respondents were read the following preamble:

"Again, not including outages caused by extreme weather, the average Toronto Hydro customer is without power for <u>one to one and a half hours</u> per year."

Addressing the Duration of Service Outages

Three-quarters (74%) of residential customers think Toronto Hydro should spend what is needed to either reduce (33%) or maintain (41%) the length of power outages. Only one in ten (11%) think that Toronto Hydro should accept longer power outages to keep costs down.

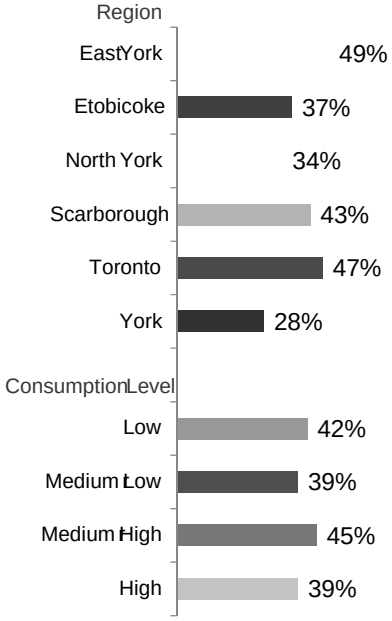


- Residents of East York (49%) and Central Toronto (47%) are the most likely to say "spend to maintain" the length of outages.
- No significant patterns by consumption level.
- Residents who say that their electricity bill "has a major impact on their bottom line" are less likely to want Toronto Hydro to "spend to maintain" (37%) than those unaffected financially by their bill (48%).

Figure 4.9 RS: Addressing the Duration of Service Outages

Again, not including outages caused by extreme weather, the average Toronto Hydro customer is without power for one to one and a half hours per year.

In your view, how do you think Toronto Hydro should address the <u>length of time</u> customers are without power? Would you say…

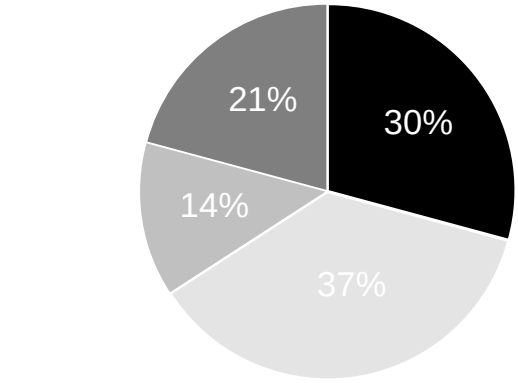


[asked of all respondents; n = 1,006]

- Spend what is needed to reduce the length of power outages
- Spend what is needed to maintain the current length of outages
- Accept longer power outages in order to keep customer costs down
- Don't Know/Refused

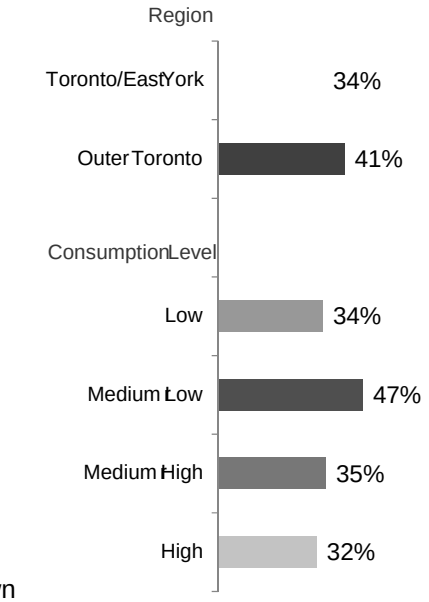
Sample Breakdown

Those who say "Spend what is needed to <u>maintain</u> the current length of outages"



General Service customers are slightly less likely to think Toronto Hydro should spend what is needed to reduce (30%) or maintain (37%) the length of power outages. No significant differences arise within region or consumption.

Figure 4.9 GS: Addressing the Duration of Service Outages 1



Again, not including outages caused by extreme weather, the average Toronto Hydro customer is without power for one to on r and a half hours per year.

In your view, how do you think Toronto Hydro should address the length of time customers are without power? Would you say…
[asked of all respondents; n = 200]

- Spend what is needed to reduce the length of power outages
- Spend what is needed to maintain the current length of outages
- Accept longer power outages in order to keep customer costs down
- Don't Know/Refused

Sample Breakdown
Those who say "Spend what is needed to maintain the current length of outages"

System Challenges & Priorities 1

This section explores respondents' support for various types of investment including infrastructure, technology and tools and equipment.

System Challenges & Priorities Summary 1

Investment in Aging Infrastructure

Six in ten (60%) residential customers and half (51%) of General Service customers believe that Toronto Hydro should invest in aging infrastructure to reduce future power outages, even if it means their bills may increase.

- Highest support among residential customers for infrastructure investment lies in Central Toronto (68%).

Investment in New Technologies

Two thirds (67%) of residential customers and six in ten (61%) General Service customers agree that investments in new technology will increase system reliability, make the local distribution system more efficient and save money in the long run. About two in ten (RS 19%; GS 20%) prefer the view that the utility should not invest in new technologies.

- Residents in the Toronto region (73%) are most likely to agree to investment in new technologies.

Investment in Equipment and Tools

Two thirds (66%) of Residential customers believe that Toronto Hydro should be wise with its spending, but they also think it is important that staff have the equipment and tools needed to manage the system efficiently and reliably.

- Residential customers struggling with the cost of their electricity bill (63%) are less likely to believe it is important that Toronto Hydro has proper equipment and tools than those who are unaffected financially by the electricity bill (74%).

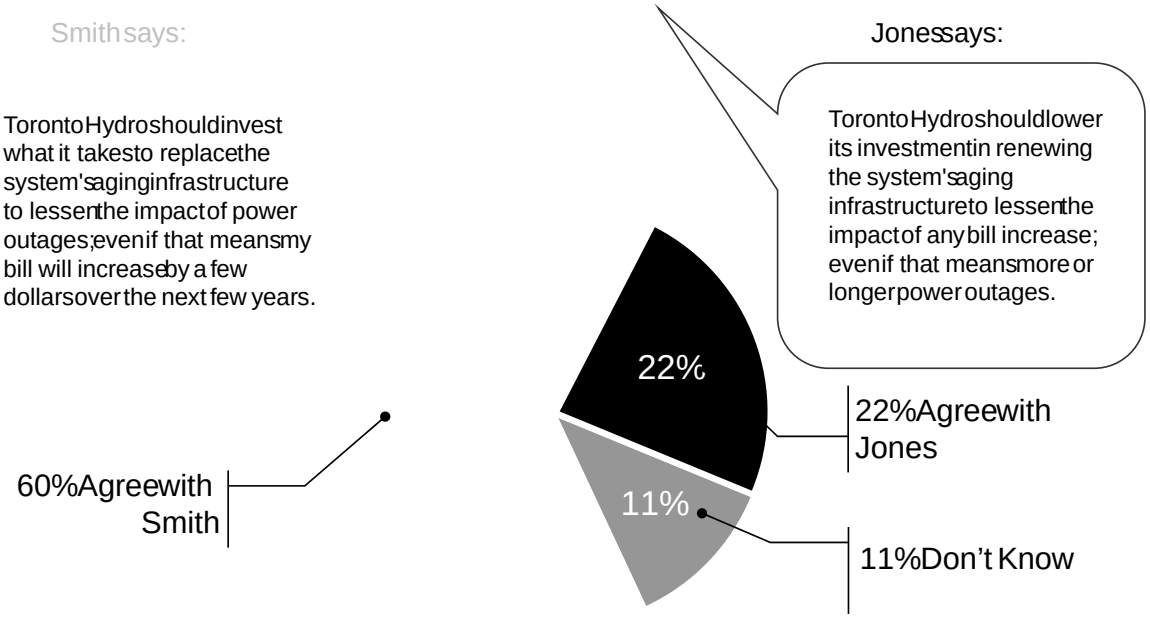
Preamble for System Challenges & Priorities Section 1

At this point in the survey, respondents were presented with a preamble concerning the status of current electricity infrastructure and the need to rebuild it to prevent future service disruptions:

"As you may be aware, much of your local electricity system is aging and needs to be replaced in the near future. The time lost to power service interruptions caused by aging equipment has been growing steadily over the past decade.

According to Toronto Hydro's engineers, almost 60% of Toronto's electricity distribution infrastructure needs to be rebuilt over the next two decades. The price of these upgrades is approximately $5.6 billion overall.

As part of its 5 year plan, Toronto Hydro is proposing to continue its significant annual infrastructure renewal investment program. Although this plan will allow Toronto Hydro to make necessary investments it will have an impact on customer bills."



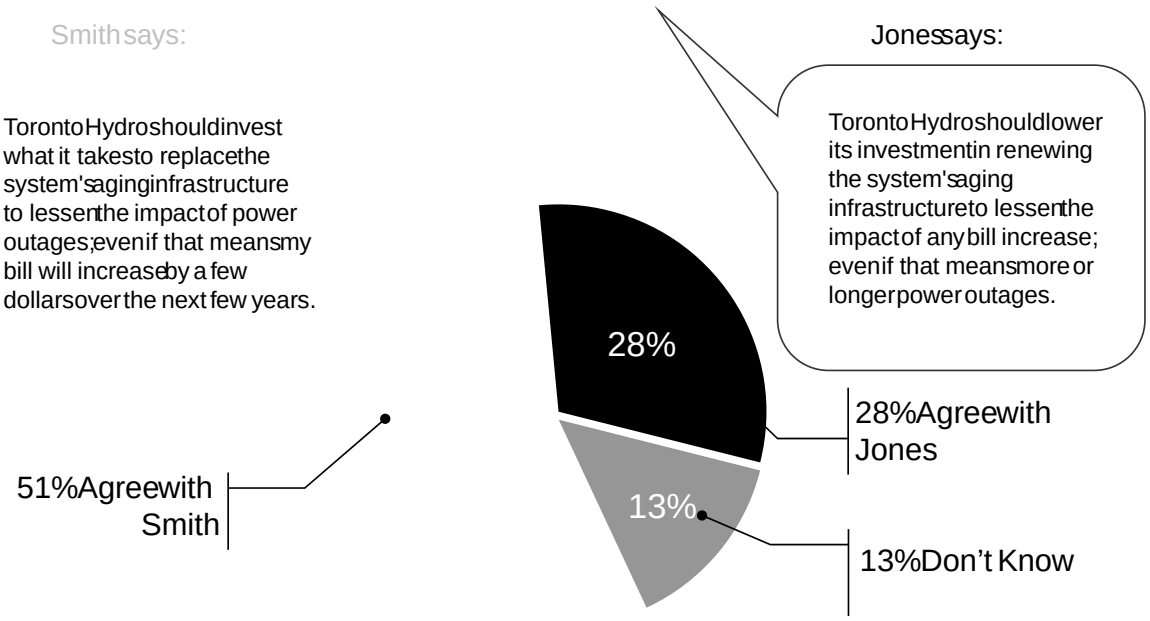
Investment in Aging Infrastructure

Six in ten (60%) residential customers believe that Toronto Hydro should invest what it takes to replace the system's aging infrastructure to lessen the impact of power outages, even if it means their bills will increase. In opposition, 22% of respondents think Toronto Hydro should lower its investment in renewing the system's aging infrastructure even if it means there will be more or longer outages.

- Highest support for infrastructure investment lies in Central Toronto (68%), with the lowest in Etobicoke (55%) and Scarborough (54%).
- There are no significant differences across consumption or residence type for investing in aging infrastructure.
- Residents who claim that their electricity bill "has a major impact on their bottom line" (51%) are much less likely to support investment in aging infrastructure than those who are unaffected financially by the electricity bill.

Figure 4.10 RS: Investment in Aging Infrastructure

Throughout Toronto Hydro's consultation process, customers have made a number of statements about the proposed increased investment. Which of the following statements best represents your point of view?
[asked of all respondents; n=1,006]



Note: 'Refused' (6%) not shown

As for General Service customers, half (51%) think Toronto Hydro should invest what it takes to replace the system's aging infrastructure to lessen the impact of power outages, despite a possible bill increase. Less than three in ten (28%) think Toronto Hydro should lower its investment in aging infrastructure, even if that means more outages.

- Central Toronto and East York (57%) are somewhat more likely to support investment in aging infrastructure than Outer Toronto (45%).

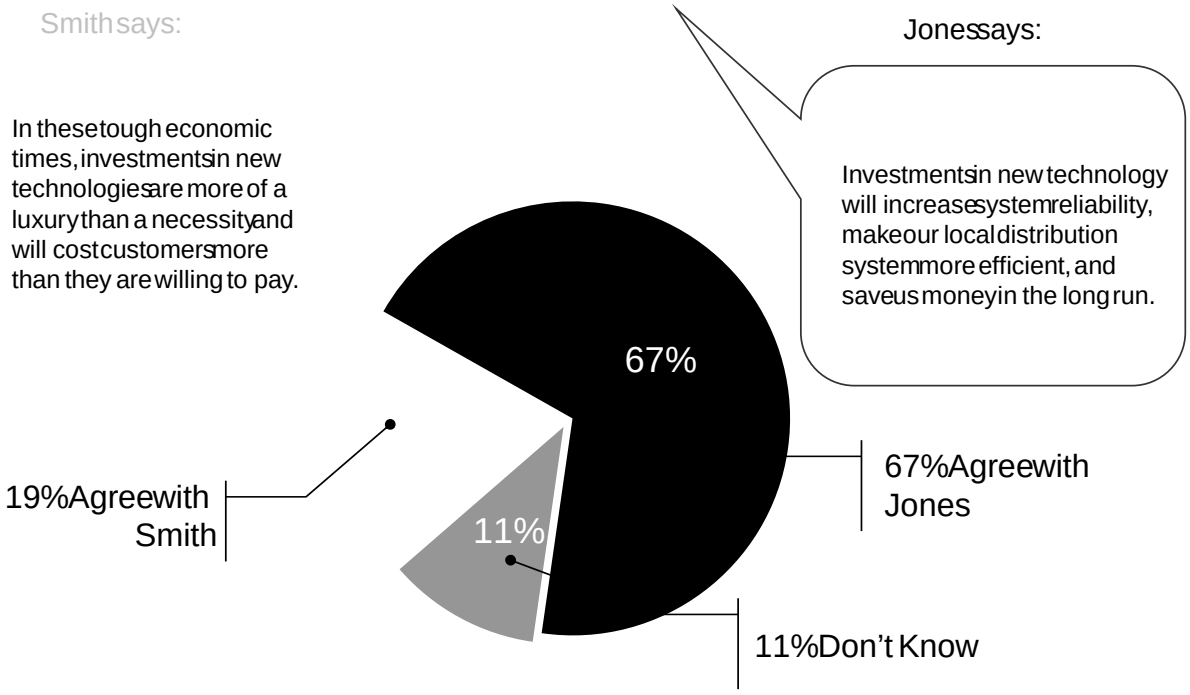
Figure 4.10 GS: Investment in Aging Infrastructure [1]

Throughout Toronto Hydro's consultation process, customers have made a number of statements about the proposed increased investment. Which of the following statements best represents your point of view?
[asked of all respondents; n=200]

Note: 'Refused' (9%) not shown

[1]

Investment in New Technology



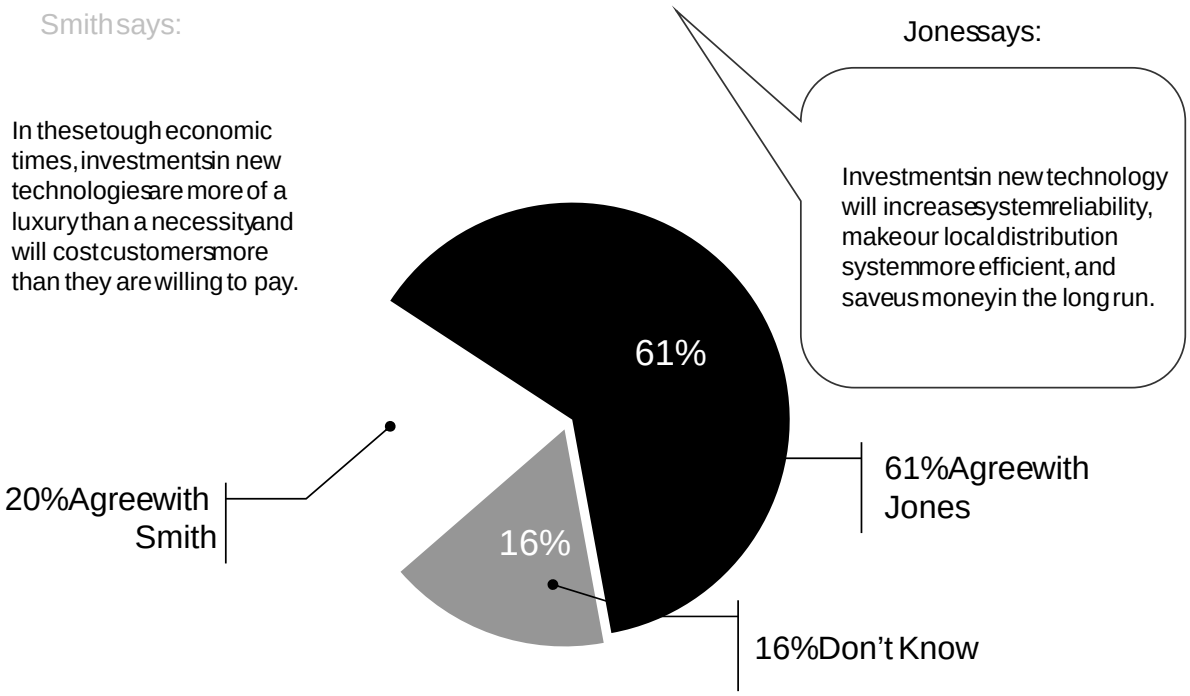
Following the questions on infrastructure investment, customers weighed in on investment in new technology.

Two thirds (67%) of residential customers agree that investments in new technology will increase system reliability, make local distribution system more efficient and save money in the long run. Just two in ten (19%) prefer the counter argument that new technologies are a luxury, not a necessity and would cost the customers more than they are willing to pay.

- Customers in Central Toronto (73%) are most likely to agree on the benefits of investment in new technology.
- Consumption rate does not appear to affect opinion on investment in new technology.
- Residential customers claiming that their electricity bill "has a major impact on their bottom line" (66%) are somewhat less likely to support investment in new technology than those who are unaffected financially by the electricity bill (75%).

Figure 4.11 RS: Investment in New Technology

Other Toronto Hydro customers have made a number of statements about aging infrastructure and future investments required to improve the reliability of the electricity system. Which of the following statements best represents your point of view?
[asked of all respondents; n=1,006]



Note: 'Refused' (3%) not shown

Six in ten (61%) General Service customers agree with the statement praising investments in new technology, compared with just two in ten (20%) who prefer the counter argument

- No significant differences emerge by region or consumption.
- Those paying more on their monthly bill ($1000+: 50%) are less likely to agree that investment in new technology will increase reliability, efficiency and save money in the long run.

Figure 4.11 GS: Investment in New Technology 1

Other Toronto Hydro customers have made a number of statements about aging infrastructure and future investments required to improve the reliability of the electricity system. Which of the following statements best represents your point of view?
[asked of all respondents; n=200]

Note: 'Refused' (4%) not shown

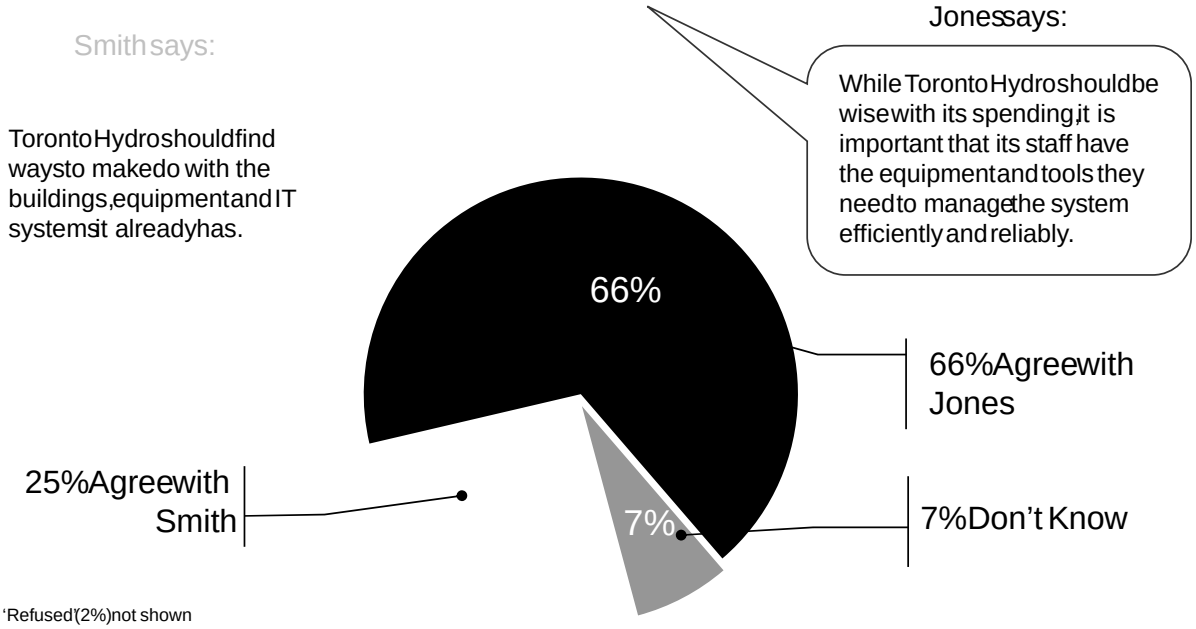
1

Preamble for Investment in Equipment and Tools

For the following question on investment in equipment and tools, respondents were read this brief preamble:

"Toronto Hydro is not just the local electricity distribution system itself, but a company that operates the system. As a company, Toronto Hydro needs buildings to house its staff, vehicles and tools to service the power lines and IT systems to manage the system and customer information." 1

Investment in Equipment and Tools



Two thirds (66%) of Residential customers believe that Toronto Hydro should be wise with its spending, but they also think it is important that staff have the equipment and tools needed to manage the system efficiently and reliably. One quarter (25%) of respondents think that Toronto Hydro should find ways to make do with the buildings, equipment and IT systems it already has.

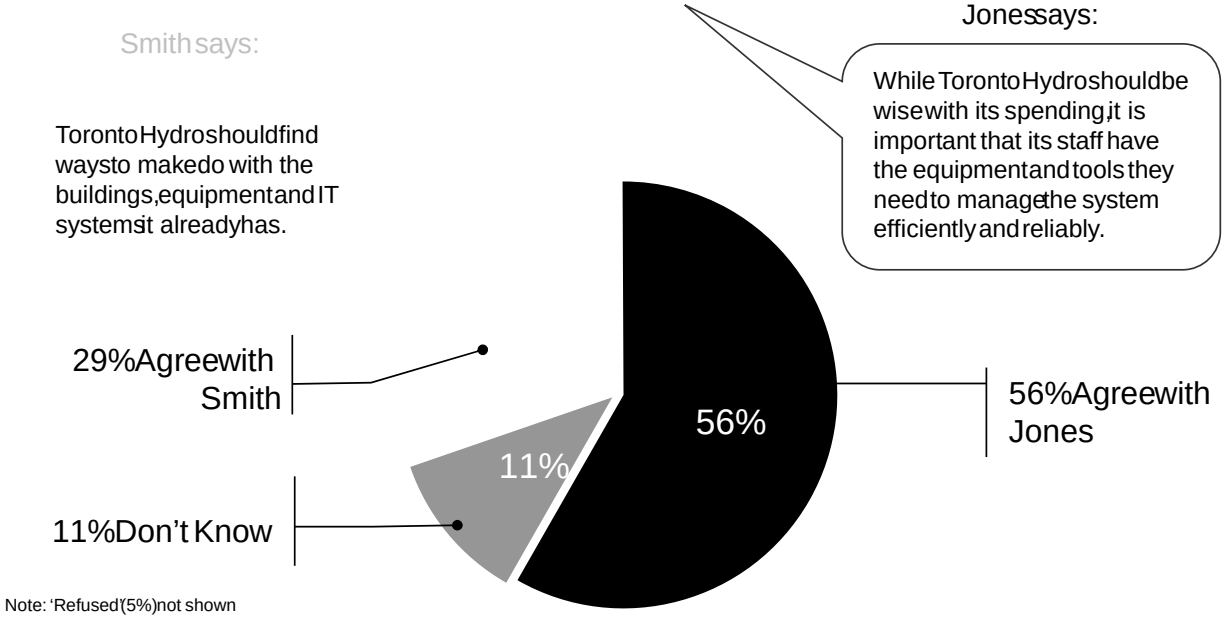
- Across region and consumption patterns there is little change in belief on properly equipping Toronto Hydro to manage its system.
- Residential customers struggling with the cost of their electricity bill (63%) are less likely to believe it is important that Toronto Hydro has proper equipment and tools than those who are unaffected financially by the electricity bill (74%).

Figure 4.12 RS: Investment in Equipment and Tools

Toronto Hydro is not just the local electricity distribution system itself, but a company that operates the system. As a company Toronto Hydro needs buildings to house its staff, vehicles and tools to service the power lines and IT systems to manage the system and customer information.

Customers have made number of statements about this sort of investment. Which of the following statements best represents your point of view?
[asked of all respondents; n=1,006]

Note: 'Refused' (2%) not shown



Less than six in ten (56%) General Service customers believe that, while Toronto Hydro should be wise with its spending, it is important that Toronto Hydro's staff have the equipment and tools they need to manage the system efficiently and reliably.

- Regionally, there is little difference among General Service customers.
- High consumption organizations (64%) are the most likely to agree with the positive statement on investing in Toronto Hydro equipment and tools.

Figure 4.12 GS: Investment in Equipment and Tools

Toronto Hydro is not just the local electricity distribution system itself, but a company that operates the system. As a company Toronto Hydro needs buildings to house its staff, vehicles and tools to service the power lines and IT systems to manage the system and customer information.

Customers have made number of statements about this sort of investment. Which of the following statements best represents your point of view?
[asked of all respondents; n=200]

Note: 'Refused' (5%) not shown

Reaction to Previous Customer Consultation Input

This section measures agreement with some of the key opinion statements provided by Toronto Hydro's customers in previous phases of the consultation.

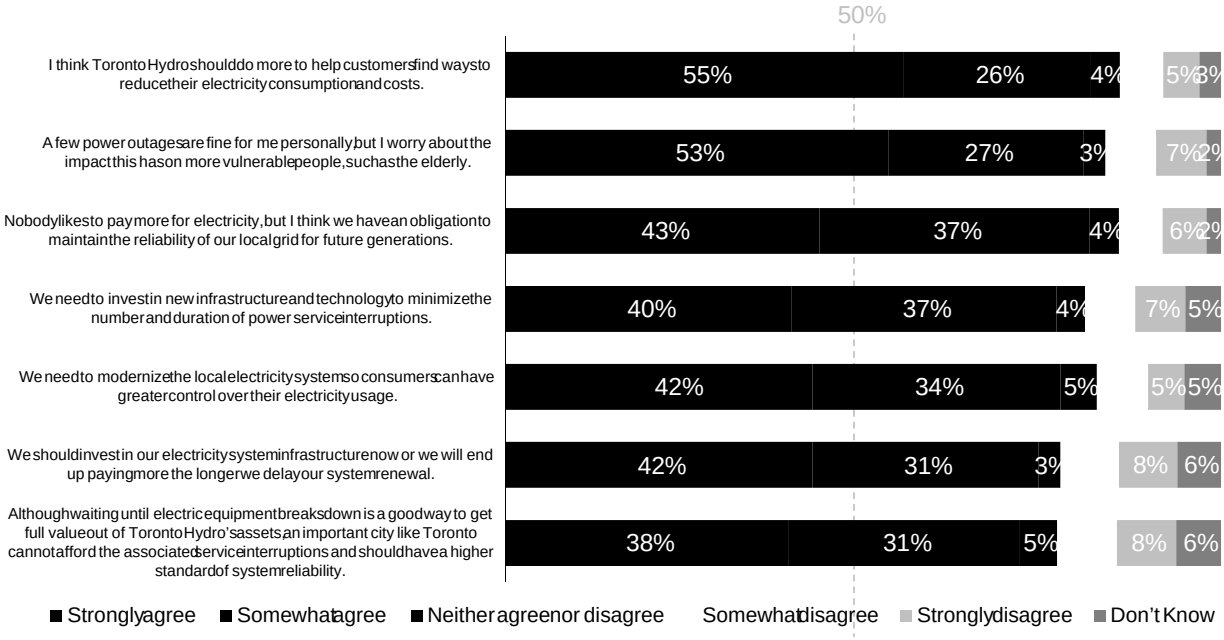
Customer Reaction Statements Summary

Of the thirteen customer input statements provided in the questionnaire, the statement with the most support among residential customers is "I think Toronto Hydro should do more to help customers find ways to reduce the electricity consumption and costs".

Similarly, among General Service customers, the most supported statement was the business version of the same question: "I think Toronto Hydro should do more to help business customers find ways to reduce their electricity consumption and costs."

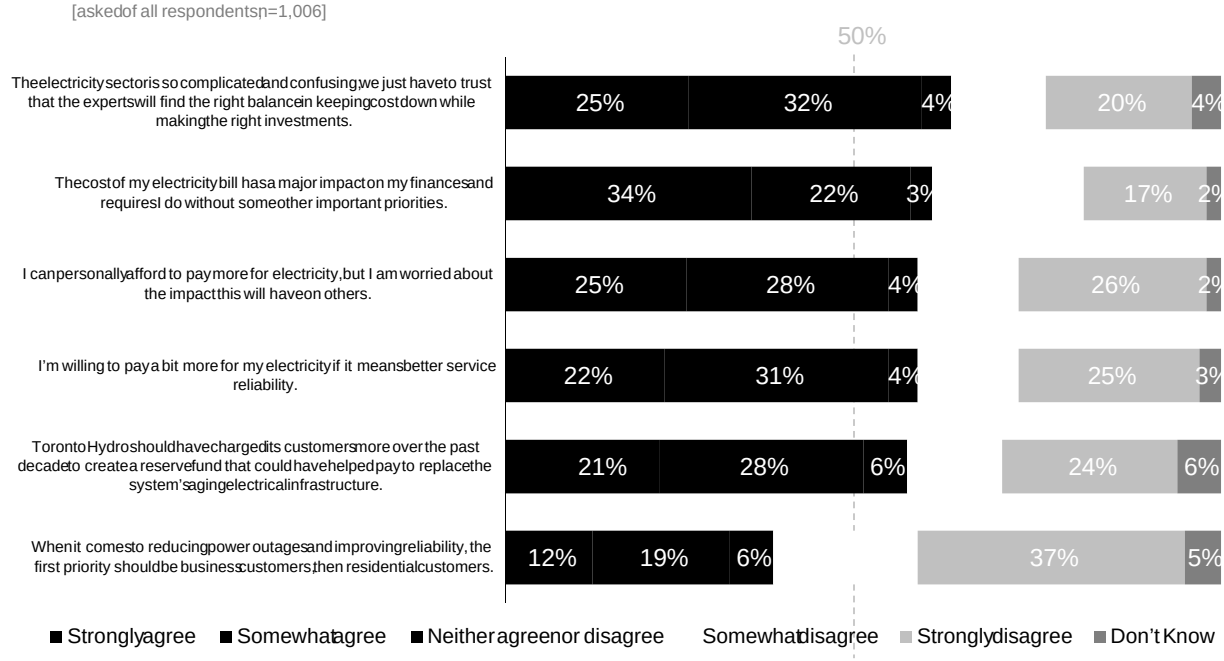
The statement with the lowest level of agreement is "when it comes to reducing power outages and improving reliability, the first priority should be business customers, then residential customers."

Again, the statement with the lowest level of General Service agreement is "when it comes to reducing power outages and improving reliability, the first priority should be business customers."



Residential Customer Reaction

A majority of residential respondents agree with all of the customer input statements provided in the questionnaire except one: "When it comes to reducing power outages and improving reliability, the first priority should be business customers, then residential customers." (31% agree; 57% disagree; 37% strongly disagree).



Of the thirteen statements put forth to residential customers, three of them have at least 80% support. These three statements focus on cost, the vulnerability of the elderly and the future of infrastructure. In the statement with the most support, eight in ten (81%) agree that "I think Toronto Hydro should do more to help customers find ways to reduce the electricity consumption and costs" and 55% of respondents strongly agree. Eight in ten (80%) residential customers also agree that "a few power outages are fine for me personally, but I worry about the impact this has on more vulnerable people, such as the elderly". This statement on the vulnerability of the elderly also has intense agreement: over half (53%) of residential customers strongly agree. Eight in ten (80%) of those surveyed also agree that "nobody likes to pay for more for electricity, but I think we have an obligation to maintain the reliability of our local grid for future generations". Again, this statement elicits strong intensity of agreement (43% strongly agree).

Figure 4.13: RS: Reaction to Customer Input 1

The following statements have been made by customers throughout Toronto Hydro's consultation process. For each statement, please tell me if you strongly agree, somewhat agree, somewhat disagree or strongly disagree.
[asked of all respondents n=1,006]

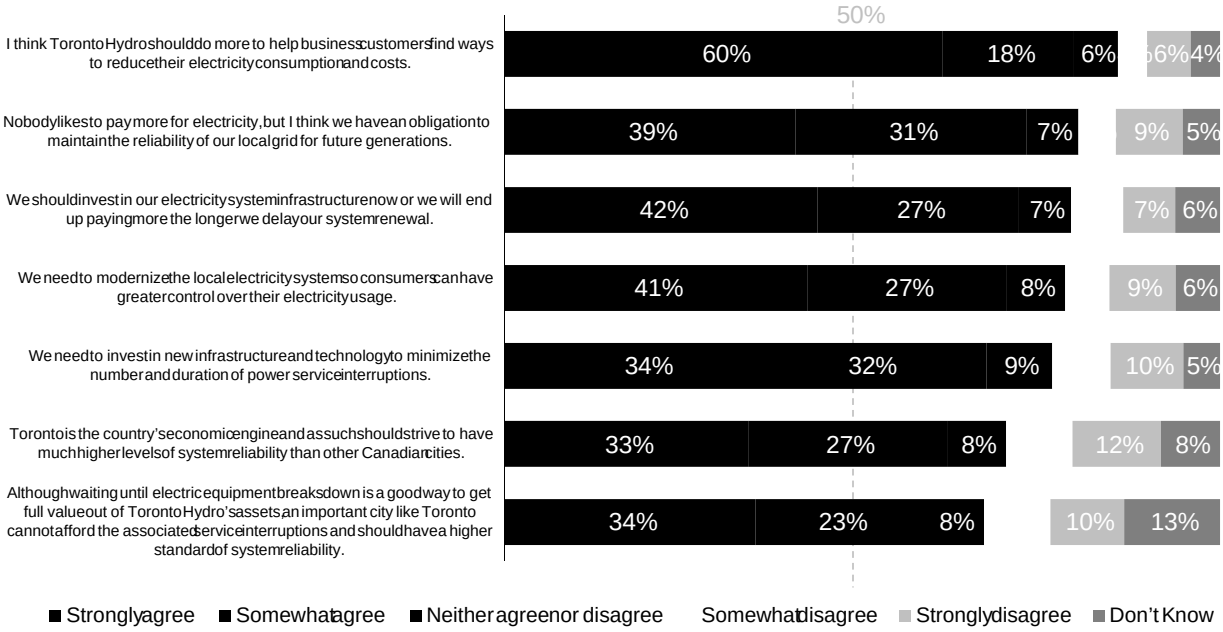
[asked of all respondents n=1,006]

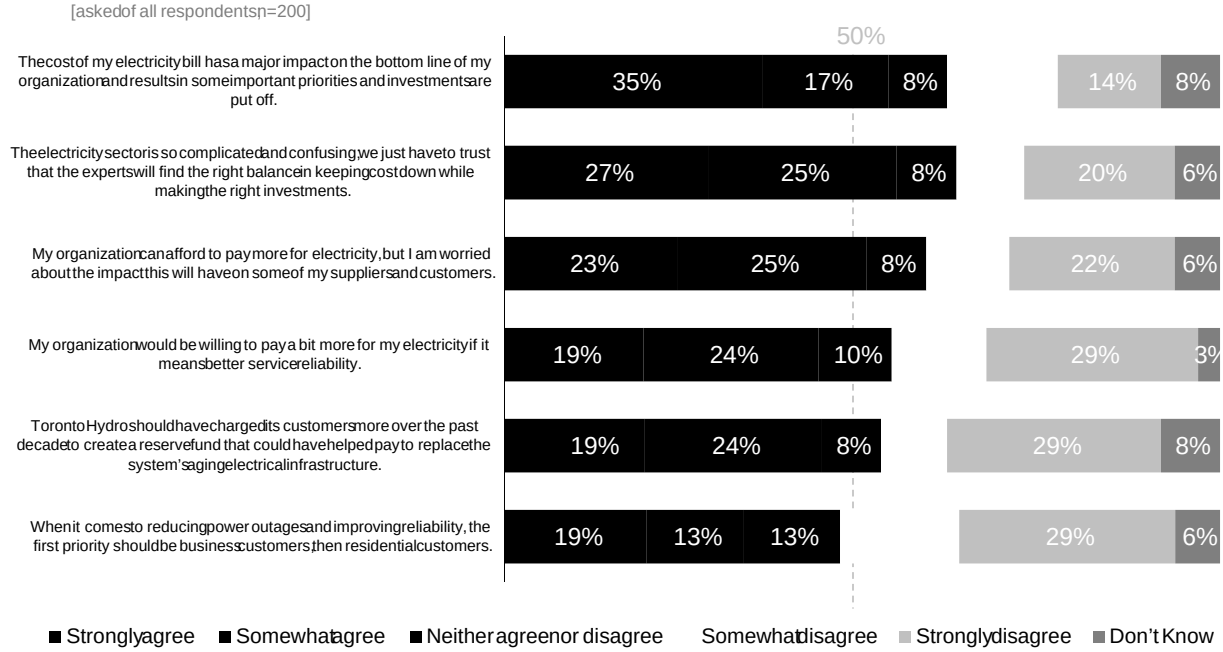
1

GS<10 Customer Reaction 1



A majority of General Service agree with ten of the thirteen statements provided in the questionnaire. The strongest agreement is on cost savings: "I think Toronto Hydro should do more to help business customers find ways to reduce their electricity consumption and costs." Nearly eight in ten (78%) agree with that statement, with six in ten who strongly agree.

Less than half of General Service respondents agree with three of the thirteen statements:



- Only 43% think that their organization would be willing to pay a bit more for electricity if it means better service reliability, with intense disagreement (29% strongly disagree).
- 43% also believe that Toronto Hydro should have charged its customers more over the past decade to create a reserve fund for infrastructure, with again 29% who strongly disagree.
- And just 32% agree that when it comes to reducing power outages and improving reliability, the first priority should be business customers.

Figure 4.13 GS: Reaction to Customer Input 1

The following statements have been made by customers throughout Toronto Hydro's consultation process. For each statement, please tell me if you strongly agree, somewhat agree, somewhat disagree or strongly disagree.
[asked of all respondents n=200]

[asked of all respondents n=200]

Assessment of Plan

This section explores the degree of acceptance that Toronto Hydro's customers give for a rate increase. Acceptance is defined as either support for a rate increase or agreeing that it is necessary. This section also explores the underlying reasons for acceptance and opposition to a rate increase, probing more specifically through open-ended questions.

Acceptance of Rate Increase: Summary

Nearly six in ten residential (58%) customers accept the rate increase. However, most of these respondents offer reluctant acceptance (39%): they don't like the increase, but feel it's necessary to maintain the grid. Only a third (34%) thinks the rate increase is unreasonable.

- The highest rates of acceptance come from Central Toronto (67%), East York (65%), and York (63%) with less support in the rest of Outer Toronto (North York: 53%; Etobicoke: 52%; Scarborough 52%).
- Consumption rates have little effect on acceptance numbers.
- Residential customers who feel their electricity bills are a significant toll on their finances are much less likely to accept a rate increase (51% "toll on their finances" support the increase; 70% "not a toll").
- Single person households (53%) are least likely to support the rate increases.

General Service customers are less willing to accept of rate increases than residential customers; just under half (48%) of organizational customers support the proposed Toronto Hydro plan. Much of that acceptance appears to be reluctant: they "don't like the rate increase, but feel it is necessary" (30%). Four in ten (41%) think the bill impact is too high and Toronto Hydro needs to scale back.

- Regionally, there is little difference in opinion among GS customers.
- However, businesses that consume high levels of electricity (60%) are much more likely to accept a rate increase than low consumption businesses (34%).

Reasons why Customers Accept or Opposed Toronto Hydro's proposed DSP:

- In the residential breakdown, those who are most strongly accepting of the rate increase cite "concerns over future infrastructure needs" (29%) and "better service" (22%) as their key reasons.
- Those who are satisfied with the balance give "reasonable cost" (31%) as the main reason.
- Residents who are reluctantly accepting they don't like it, but it's necessary cite "reasonable cost" (22%), "necessary sacrifice" (18%), "better service" (14%) and the "future infrastructure crisis" (11%) as the main reasons.
- Six in ten (60%) of those against the rate increase cite "cost too much" as the reason for their disapproval, followed by "concerns about non-capital expenses" (15%).

Preamble for Assessment of Plan Section 1

Prior to the questions given in the Assessment of Plan Section, residential customers were presented with a preamble concerning the breakdown of pricing for Toronto Hydro's 5 year plan:

To maintain the reliability of the local electricity system, Toronto Hydro's proposed 5 year plan will cost an estimated $500 million per year. This includes…

- 54% to replace aging infrastructure;
- 19% to maintain metering and connect new customers to the electricity system;
- 13% to invest in tools, computers and software systems, vehicles and facilities needed to manage the electricity system;
- 8% to expand system capacity to accommodate future growth; and
- 6% for new technologies to make the system more efficient, reliable and safe.

To fund this plan, Toronto Hydro is proposing the average residential customers' rate increase by $2.90 on the distribution portion of their bill for the next five years. So, by 2019, the average residential household will be paying an estimated $14.50 more per month on the distribution portion of its electricity bill.

(Note: in the GS Survey, the two bolded phrases in the last paragraph were replaced with "average small and medium sized business customers' rate increase by $5.75" and "estimated $28.75 more per month", respectively. The rest of the preamble remained the same for organizational customers.)

Note: In the online workbook and the workbook led facilitated discussions, the monthly bill impact was presented differently from the telephone surveys. The telephone surveys were updated to reflect adjustments to Toronto Hydro's capital plan made over the course of the consultation process.

- For Residential: Toronto Hydro's proposal is expected to lead to a total increase of approximately $11.75 on the average residential customer's monthly bill by 2019.
- For GS < 50 kW: Toronto Hydro's proposal is expected to lead to a total increase of approximately $30.50 on the average small business customer's monthly bill by 2019.

1

Assessment of Plan

When asked the "acceptance question" on rate increases, nearly (58%) six in ten residential customers agree to the rate increase. Four percent (4%) of respondents think that Toronto Hydro should plan to achieve higher incomes even with increased rates and 15% state they were satisfied with the balance between outcomes and the proposed rate increase. Four in ten (39%) residents don't like the rate increase, but think it's necessary to maintain the infrastructure. Just one third (34%) of respondents feel the bill impact is too high and Toronto Hydro needs to scale back its plans.

- Looking regionally, Central Toronto (67%), East York (65%) and York (63%) are most likely to accept the rate increases. The rest of Outer Toronto (Etobicoke: 52%, Scarborough: 52%; North York: 53%) are the least supportive of the rate increase.
- A majority of support exists across all consumption levels (56 61%).
- Residential customers who feel their electricity bills are a significant toll on their finances are much less likely to support a rate increase (51% "toll on their finances" support the increase; 70% "not a toll").
- Single person households (53%) are the least likely to support the rate increase.

Figure 4.14 RS 1A, Acceptance of Rate Increase

General Service customers, on the other hand, are less likely to support rate increases just under half (48%) of GS respondents accept the increase.

Breaking down "acceptance": 3% of GS respondents thought Toronto Hydro should plan to achieve even higher outcomes despite rates; 15% were satisfied with the balance between outcomes and proposed rate increase and 30% do not like the rate increase, but think it's necessary to maintain the grid. Four in ten (41%) think the bill impact is too high and Toronto Hydro needs to scale back its plan.

- No significant differences emerge by region for General Service customers.
- Consumption appears to play a significant role in assessment of the plan: just a third (34%) of low consumption customers accept the plan compared to six in ten among high consumption organizations (60%).
- GS customers struggling with the cost of their electricity bill (46%) are less likely to accept the proposed increase than those who are unaffected financially by their electricity bill (67%).

Figure 41.14 GS 1A Acceptance of Rate Increase 1

1

Opinions on Proposed Rate Increase

For residential customers, due to the larger sample size, the responses can be broke down into four groups: "acceptance hydro should plan higher"; "acceptance satisfied with the balance"; "acceptance don't like, but necessary" and "no acceptance cost impact too high".

When broken down into these subgroups, some striking differences emerge:

- Residents who are most strongly accepting of the plan are most likely to answer "future infrastructure crisis" (29%) and "better service" (22%) as the reasoning, with "reasonable cost" (12%) as the third key driver.
- For those who accept and are "satisfied with the balance", the most important reason is again cost (31%) it is "reasonable" to them. Other key reasons include the "future infrastructure crisis" (13%), "better service" (13%) and "necessary sacrifice" (11%).
- For those who reluctantly accept they don't like it, but feel it is necessary the "reasonable cost" (22%), "necessary sacrifice" (18%) and "better service" (14%) and the "future infrastructure crisis" (11%) were given as the main reasons.
- Among those against the proposed increase, six in ten (60%) state "cost too much" as the reason and about one in seven (15%) citing "concerns about non capital expenses".

Figure 4.15 RRS 10 Opinion on Proposed Rate Increase

And why do you say that? (Rate increase for local distribution system)
Residential Customers

ACCEPTANCE HYDRO SHOULD PLAN HIGHER	% RS
Future infrastructure crisis	29%
Better service most important	22%
Cost increase reasonable	17%
Necessary sacrifice	7%
Cost too much	5%

Concerns about non capital expenses	15%
Efficiency	8%
Someone else should pay	5%
Future infrastructure crisis	1%
Other	7%
Don't know/Refused	4%

N=339

For general service customers, the responses are be broken down into the same four groups: "acceptance hydro should plan higher"; "acceptance satisfied with the balance"; "acceptance don't like, but necessary" and "no acceptance cost impact too high".

When broken down into these subgroups, some striking differences emerge:

- Residents who are most strongly accepting of the plan are most likely to answer "better service most important" (50%). It is important to note however, that this group consists of only 6 customers.
- For those who accept and are "satisfied with the balance", the most important reason is that they see the cost as reasonable (40%). Other key reasons include the "better service" (17%), "future infrastructure crisis" (13%) and "necessary sacrifice" (10%).
- Those who give reluctant acceptance they don't like it, but feel it is necessary are most likely to see it as a necessary sacrifice (17%), many are worried the cost is high (13%), while some others are motivated by "future infrastructure crisis" (10%) and "better service" (10%).
- Among those against the proposed increase, about half (48%) state "cost too much" and after that the main reasons are "concerns about efficiency" (12%) and "concerns about non-capital expenses" (12%).

Survey Instruments

Residential Survey Instrument 1

Section A: Introduction

Hello, my name is _____ and I'm calling from Innovative Research Group on behalf of Toronto Hydro, your local utility for electricity. Innovative Research Group is a national public opinion research firm. We have been commissioned by Toronto Hydro to help them better understand the needs and preferences of customers who are responsible for paying their household's electricity bill.

Toronto Hydro – which distributes electricity to customers in the Toronto area – is in the process of developing its 5 year grid investment plan and wants to hear from their customers to help inform this plan.

A1. Would you mind if I had ten minutes of your time to ask you some questions? All your responses will be kept strictly confidential.

Yes	1 [continue]
No – NOT PRIMARY BILL PAYER	2 [go to TRANSFER]
No – BAD TIME	3 ARRANGE CALLBACK
No – HARD REFUSAL	4 [Terminate]

MONIT

This call may be monitored or audio taped for quality control and evaluation purposes.

PRESS 1 TO CONTINUE	1

A2. Have I reached you at your home phone number?

INTERVIEWER NOTE; IF "NO" ASK: May I speak to someone who does live there?

Yes [SPEAKING, CONTINUE]	1 [continue to A3]
YES [TRANSFERRED, GO BACK TO INTRODUCTION)	2 [back to INTRO]
No [NOT AVAILABLE – (ARRANGE CALLBACK)	3 [ARRANGE CALLBACK]
Refused – LOG (THANK AND TERMINATE)	9 [Terminate]

A3. Are you the person primarily responsible for paying the electricity bill in your household?

Yes	1 [continue to A4]
No	2 [go to TRANSFER]
Don't know (DNR)	98 [Terminate]

TRANSFER

Can I speak with the person in your household who usually pays the electricity bill?

Yes	1 [BACK TO INTRO]
No – NOT AVAILABLE/BAD TIME – (ARRANGE CALLBACK)	2 [ARRANGE CALLBACK]
No – HARD REFUSAL	3 [Terminate]
Don't know (DNR)	98 [Terminate]

A4. Can you confirm that your household receives an electricity bill from Toronto Hydro?

Yes	1 [continue]
No	2 [Terminate]
Don't know (DNR)	98 [Terminate]

GENDER Note gender by observation:

Female	2

Section B: General Satisfaction

B5. PREAMBLE

To start, I'd like to ask you a few questions about the electricity system…

As you may know, Ontario's electricity system has three key components: generation, transmission and distribution.

- Generating stations convert various forms of energy into electric power;
- Transmission lines connect the power produced at generating stations to where it is needed across the province; and
- Distribution lines carry electricity to the homes and businesses in our communities.

Today we're going to talk about your local distribution system which is maintained and operated by Toronto Hydro.

How familiar are you with the local electricity distribution system? Would you say…[READ LIST]

Very familiar	1
Somewhat familiar	2
Not very familiar	3
Not familiar at all	4
Don't know (DNR)	98
Refused (DNR)	99

B6. Generally speaking, how satisfied are you with the job Toronto Hydro is doing running your local distribution system? Would you say…[READ LIST]

Very satisfied	1
Somewhat satisfied	2
Somewhat dissatisfied	3
Very dissatisfied	4
Don't know (DNR)	98
Refused (DNR)	99

B7. Is there anything in particular Toronto Hydro can do to improve their service to you? [OPEN]

Don't know (DNR)	98
Refused (DNR)	99

Section C: Bill Knowledge

I'd now like to talk with you about your electricity bill …

C8. While some customers pay more and other pay less, the average residential customer pays about $132 a month for electricity of which $33 or approximately 25% goes to Toronto Hydro. The rest of the bill goes to power generation companies, transmission companies, the provincial government and regulatory agencies.

Before this survey, how familiar were you with the amount of your electricity bill that went to Toronto Hydro? Would you say…[READ LIST]

Very familiar	1
Somewhat familiar	2
Not very familiar	3
Not familiar	4
Don't know (DNR)	98
Refused (DNR)	99

Section D: System Reliability

D9. This past year Toronto Hydro customer experienced unusually extreme weather – flooding last July and an ice storm in December. These major weather events caused power outages across Toronto Hydro's service area.

Did either of these storms cause a power outage at your home?

INTERVIEWER NOTE: Make sure respondents specify which storm affected their power.

Yes – flooding	1
Yes – the ice storm	2
Yes – both storms	3
No – neither weather events affected my power service	4
Don't know (DNR)	98
Refused (DNR)	99

[Ask all respondents]

D10. Not including power outages caused by these extreme weather events, did you have any other power outages in the last 12 months?

Yes	1
No	2
Don't know (DNR)	98
Refused (DNR)	99

[Ask all respondents]

D11. Despite best efforts, no electrical distribution system can deliver perfectly reliable electricity. The more reliable the system, the more expensive the system is to build and maintain.

With that said – not including outages caused by extreme weather – the average Toronto Hydro customer experiences between one and two power outages per year.

In your view, how do you think Toronto Hydro should address the number of customer power outages? Would you say…[READ LIST]

[Rotate response code 1 and 3]

Spend what is needed to reduce the number of power outages	1
Spend what is needed to maintain the current level of outages	2
Accept more power outages in order to keep customer costs down	3
Don't Know (DNR)	98
Refused (DNR)	99

D12. Again, not including outages caused by extreme weather, the average Toronto Hydro customer is without power for one and a half hours per year.

In your view, how do you think Toronto Hydro should address the length of time customers are without power? Would you say…[READ LIST]

[Rotate response code 1 and 3]

Spend what is needed to reduce the length of power outages	1
Spend what is needed to maintain the current length of power outages	2
Accept longer power outages in order to keep customer costs down	3
Don't Know (DNR)	98
Refused (DNR)	99

Section E: System Challenges & Priorities

E13. As you may be aware, much of your local electricity system is aging and needs to be replaced in the near future. The time lost to power service interruptions caused by aging equipment has been growing steadily over the past decade.

According to Toronto Hydro's engineers, almost 60% of Toronto's electricity distribution infrastructure needs to be rebuilt over the next two decades. The price of these upgrades is approximately $5.6 billion overall.
As part of its 5 year plan, Toronto Hydro is proposing to continue its significant annual infrastructure renewal investment program. Although this plan will allow Toronto Hydro to make necessary investments, it will have an impact on customer bills.

Throughout Toronto Hydro's consultation process, customers have made a number of statements about this proposed increased investment. Which of the following statements best represents your point of view?
[Read and Rotate statements 1 and 2]
Some customers have said…

> Toronto Hydro should invest what it takes to replace the system's aging infrastructure to maintain system reliability; even if that increases my monthly electricity bill by a few dollars over the next few years. 1

Others have said…

> Toronto Hydro should lower its investment in renewing the system's aging infrastructure to lessen the impact of any bill increase, even if that means more or longer power outages. 2

Don't know (DNR) 98
Refused (DNR) 99

E14. Other Toronto Hydro customers have made a number of statements about aging infrastructure and future investments required to improve the reliability of the electricity system. Which of the following statements best represents your point of view?
[Read and Rotate statements 1 and 2]

Some customers have said…

> In these tough economic times, investments in new technologies are more of a luxury than a necessity and will cost customers more than they are willing to pay. 1

Others have said…

> Investments in new technology will increase system reliability, make our local distribution system more efficient, and save us money in the long run. 2

Don't know (DNR) 98
Refused (DNR) 99

E15. Toronto Hydro is not just the local electricity distribution system itself, but a company that operates the system. As a company, Toronto Hydro needs buildings to house its staff, vehicles and tools to service the power lines and IT systems to manage the system and customer information.

Again, customers have made number of statements about this sort of investment. Which of the following statements best represents your point of view?
[Read and Rotate statements 1 and 2]

Some customers have said…

Toronto Hydro should find ways to make do with the buildings, equipment and IT systems it already has.	1

Others have said…

While Toronto Hydro should be wise with its spending, it is important that its staff have the equipment and tools they need to manage the system efficiently and reliably.	2
Don't know (DNR)	98
Refused (DNR)	99

Section F: Reaction to Customer Consultation Input

The following statements have been made by customers throughout Toronto Hydro's consultation process.

For each statement, please tell me if you strongly agree, somewhat agree, somewhat disagree or strongly disagree.

Strongly agree	1
Somewhat agree	2
Neither agree nor disagree (DNR)	3
Somewhat disagree	4
Strongly disagree	5
Don't Know (DNR)	98
Refused (DNR)	99

RANDOMIZE QUESTIONS

F16. The cost of my electricity bill has a major impact on my finances and requires I do without some other important priorities.

F17. I'm willing to pay a bit more for my electricity if it means better service reliability.

F18. I can personally afford to pay more for electricity, but I am worried about the impact this will have on others.

F19. We need to modernize the local electricity system so consumers can have greater control over their electricity usage.

F20. We need to invest in new infrastructure and technology to minimize the number and duration of power service interruptions.

F21. We should invest in our electricity system infrastructure <u>now</u> or we will end up paying more the longer we delay our system renewal.

F22. The electricity sector is so complicated and confusing, we just have to trust that the experts will find the right balance in keeping cost down while making the right investments.

F23. A few power outages are fine for me personally, but I worry about the impact this has on more vulnerable people, such as the elderly.

F24. When it comes to reducing power outages and improving reliability, the first priority should be business customers, then residential customers.

F25. Although waiting until electric equipment breaks down is a good way to get full value out of Toronto Hydro's assets, an important city like Toronto cannot afford the associated service interruptions and should have a higher standard of system reliability.

F26. I think Toronto Hydro should do more to help customers find ways to reduce their electricity consumption and costs.

F27. Toronto Hydro should have charged its customers more over the past decade to create a reserve fund that could have helped pay to replace the system's aging electrical infrastructure.

F28. Nobody likes to pay more for electricity, but I think we have an obligation to maintain the reliability of our local grid for future generations.

END BATTERY

Section G: Overall Assessment of Plan

G29. PREAMBLE

To maintain the reliability of the local electricity system, Toronto Hydro's proposed 5 year plan will cost an estimated $500 million. This includes…

- 54% to replace aging infrastructure;
- 19% to maintain metering and connect new customers to the electricity system;
- 13% to invest in tools, computers and software systems, vehicles and facilities needed to manage the electricity system;
- 8% to expand system capacity to accommodate future growth; and
- 6% for new technologies to make the system more efficient, reliable and safe.

To fund this plan, Toronto Hydro is proposing the average residential customers' rate increase by $2.90 on the distribution portion of their bill for the next five years. So, by 2019, the average residential household will be paying an estimated $14.50 more per month on the distribution portion of its electricity bill.

G30. Looking at the cost of the Toronto Hydro plan and outcomes it is expected to achieve, which point of view is closest to your own? Would you say [READ LIST]…?
Rotate response code order: "4 to 1" vs. "1 to 4"

Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more	1
I am satisfied with the balance between outcomes and the proposed rate increase	2
I don't like the rate increase, but I think it is necessary to maintain the grid to a reasonable standard	3
I think the bill impact is too high and Toronto Hydro needs to scale back its plans	4
Not sure (DNR)	98
Refused (DNR)	99

Ask only if G30 = 1, 2, 3 or 4

G31. And why do you say that? [OPEN]

Don't know (DNR)	98
Refused (DNR)	99

Section H: Demographics

These last few questions are for statistical purposes only and we remind you again that all of your responses are completely confidential.

H32. In which year were you born? [Enter YEAR]

INTERVIEWER NOTE if REFUSED, ask "AGE".

RANDOMIZE QUESTIONS

F19. The cost of my electricity bill has a major impact on the bottom line of my organization and results in some important priorities and investments are put off.

F20. My organization would be willing to pay a bit more for electricity if it means better service reliability.

F21. My organization can afford to pay more for electricity, but I am worried about the impact this will have on some of my suppliers and customers.

F22. We need to modernize the local electricity system so consumers can have greater control over their electricity usage.

F23. We need to invest in new infrastructure and technology to minimize the number and duration of power service interruptions.

F24. We should invest in our electricity system infrastructure <u>now</u> or we will end up paying more the longer we delay our system renewal.

F25. The electricity sector is so complicated and confusing, we just have to trust that the experts will find the right balance in keeping cost down while making the right investments.

F26. Toronto is the country's economic engine and as such should strive to have much higher levels of system reliability than other Canadian cities.

F27. When it comes to reducing power outages and improving reliability, the first priority should be business customers, then residential customers.

F28. Although waiting until electric equipment breaks down is a good way to get full value out of Toronto Hydro's assets, an important city like Toronto cannot afford the associated service interruptions and should have a higher standard of system reliability.

F29. I think Toronto Hydro should do more to help business customers find ways to reduce their electricity consumption and costs.

F30. Toronto Hydro should have charged its customers more over the past decade to create a reserve fund that could have helped pay to replace the system's aging electrical infrastructure.

F31. Nobody likes to pay more for electricity, but I think we have an obligation to maintain the reliability of our local grid for future generations.

END BATTERY

Section G: Overall Assessment of Plan

G32. PREAMBLE

To maintain the reliability of the local electricity system, Toronto Hydro's proposed 5 year plan will cost an estimated $500 million. This includes…

- 54% to replace aging infrastructure;
- 19% to maintain metering and connect new customers to the electricity system;
- 13% to invest in tools, computers and software systems, vehicles and facilities needed to manage the electricity system;
- 8% to expand system capacity to accommodate future growth; and
- 6% for new technologies to make the system more efficient, reliable and safe.
-

To help pay for this plan, Toronto Hydro is proposing the average small and medium sized business customers' rate increase by $5.75 on the distribution portion of their bill for the next five years. So, by 2019, the average small and medium sized business will be paying an estimated $28.75 more per month on the distribution portion of its electricity bill.

G33. Looking at the cost of the Toronto Hydro plan and outcomes it is expected to achieve, which point of view is closest to your own? Would you say [READ LIST]…?

Technical Glossary 36

Have your say about Toronto Hydro s proposed grid renewal plan and its impact on your rates

Toronto Hydro-Electric System (Toronto Hydro) is in the midst of modernizing a distribution system that was largely built in the 1950s and 1960s. The pace at which this is accomplished will inevitably impact your electricity rates and service reliability. The purpose of this consultation is to gather your feedback on Toronto Hydro s proposed ve-year grid renewal and modernization plan for 2015 to 2019.

About This Consultation

This consultation focuses speci cally on what Toronto Hydro does: taking electricity from the provincial grid and distributing it to people and businesses in Toronto.

The electricity industry in Ontario is regulated by the Ontario Energy Board, which recently developed a new framework requiring local distribution companies to gather customer preferences on electricity investments. Your feedback will be presented to the regulator when Toronto Hydro les its rate application for 2015 to 2019. During the rate hearing process, Toronto Hydro will be held accountable for the way you were consulted and the ways in which the utility s plans respond to what you said.

Will you be expected to answer technical questions about the grid?

Toronto Hydro does not expect you to make electrical engineering decisions. The utility is asking you about the electricity issues that matter most to you, and if you feel Toronto Hydro s priorities for investing your electricity dollars are reasonable.

Toronto s distribution system is aging, the city is facing unprecedented growth in the downtown core, and a variety of innovative grid technologies are providing new opportunities for electricity management. This workbook is designed to give you enough background about these issues to develop an informed opinion.

The most important parts of this workbook are the survey questions. By completing them, you can ensure that Toronto Hydro considers your views as they relate to future investments in the distribution grid.

Where are the survey questions located?

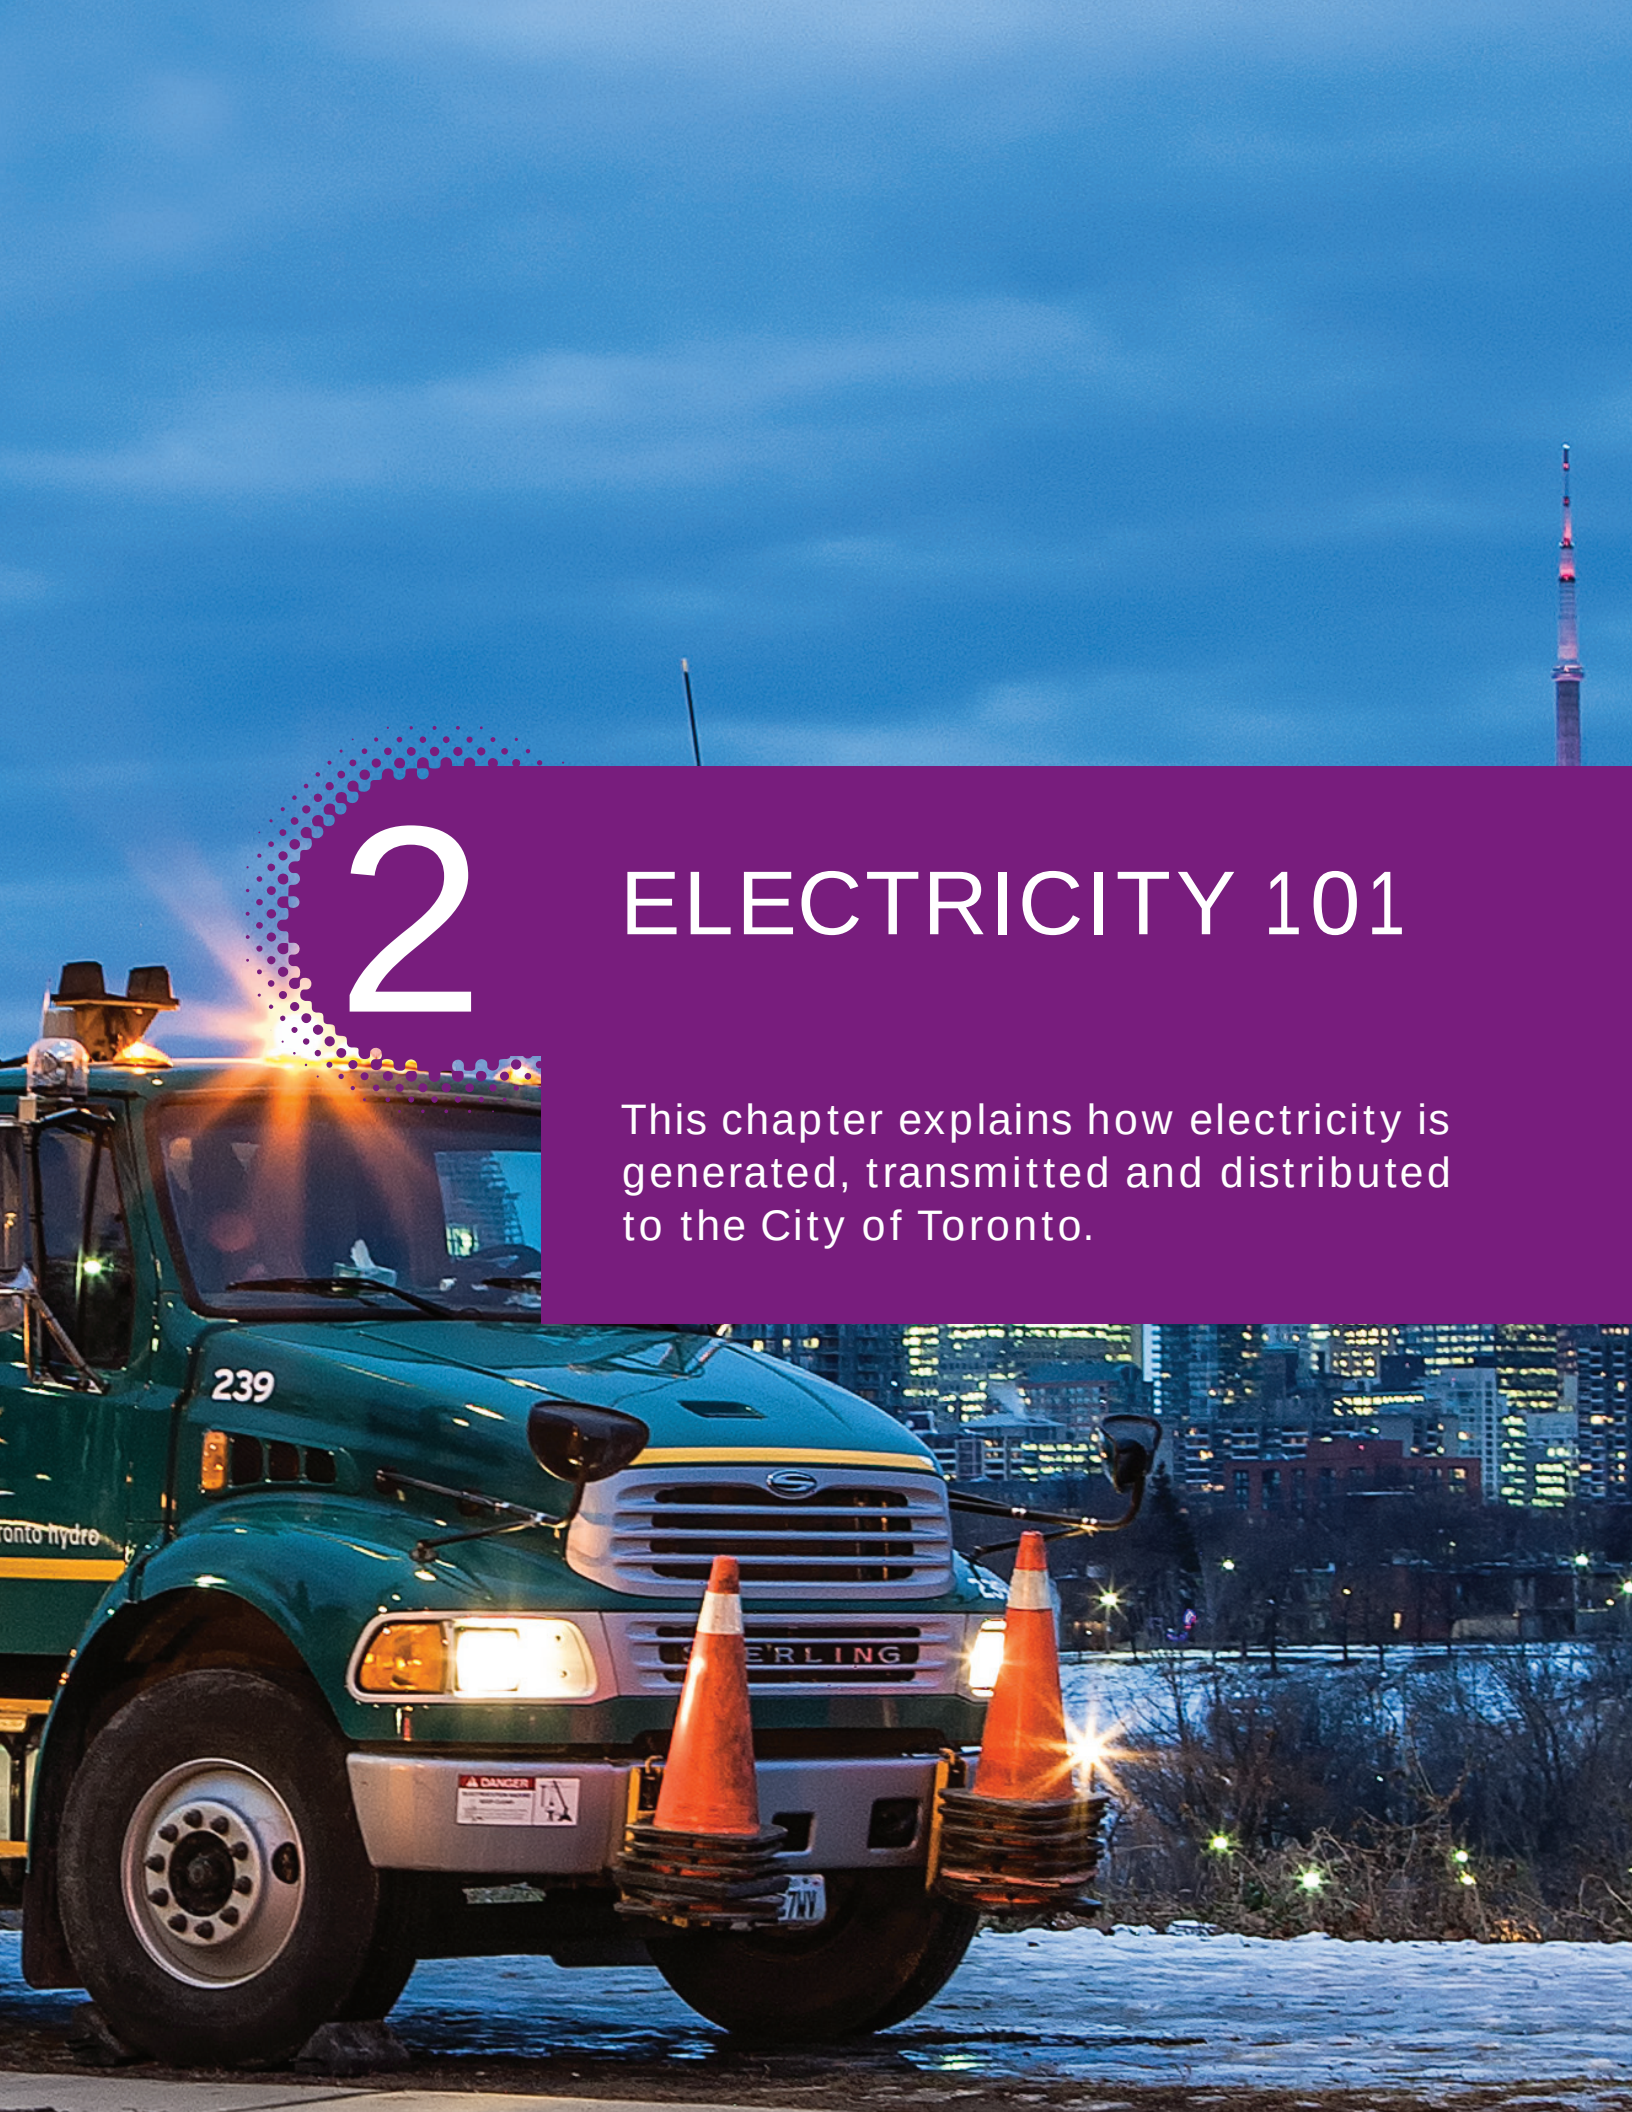
Questions are located on pages:

« « « « « « « « « « «
«« « « « « « « « « « «

How much will Toronto Hydro s proposed grid renewal plan cost me?

About one quarter of your electricity bill currently goes to Toronto Hydro. That s about $33 per month for the average residential customer. Toronto Hydro s proposed grid renewal plan will add:

- « ,,. 4%) 0(5« $2.35 each year to an average residential customer s monthly bill for the period of 2015 to 2019,
- «3$% $«)1*0/0 «0 (%* .! /
approximately $11.75 per month by 2019 compared to 2014.



These bill impacts include capital investments and operating expenses. Toronto Hydro is planning to keep increases in operating expenses below in ation for the duration of the plan, which is why this consultation focusses solely on capital investments in the system.

How This Consultation is Being Managed

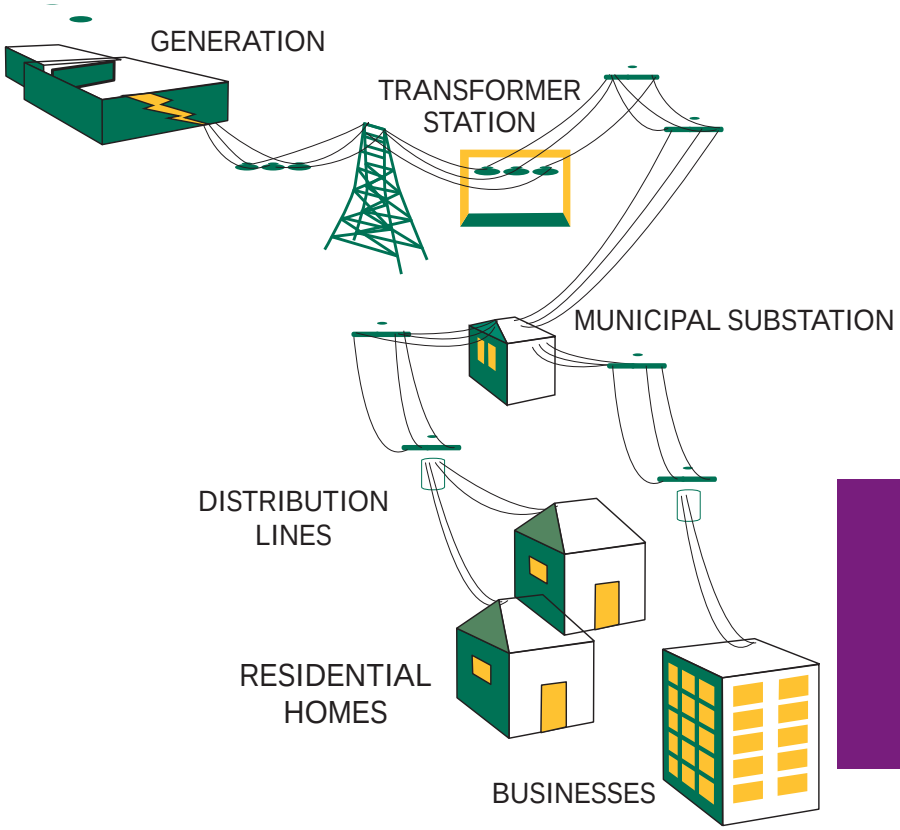
This public consultation process is being managed by a third-party research company. They will compile the results of all surveys and submit a report to Toronto Hydro. Your responses will be combined with others to protect your privacy.

You Can Participate in a Separate Conversation About Long-Term Energy Planning

Do we have enough electrical infrastructure to meet Toronto s needs? The Central Toronto Integrated Regional Resource Plan looks at where demand for electricity is growing and how this can be best managed over the next 25 years. Options considered include: conservation, local distributed generation, transmission and distribution infrastructure. You ll pay later for the choices being made today about your electricity system. Visit torontohydro.com/haveyoursay for more information.

2 ELECTRICITY 101

This chapter explains how electricity is generated, transmitted and distributed to the City of Toronto.



Understanding Toronto Hydro s Role in Ontario s Electricity System

There are three main components to all electricity systems: generation, transmission and distribution.

Where Electricity Comes From

In Ontario, 70 per cent of electricity is generated by Ontario Power Generation. This provincially-owned organization has generating stations across Ontario that produce electricity from hydroelectric, nuclear and fossil fuel sources.

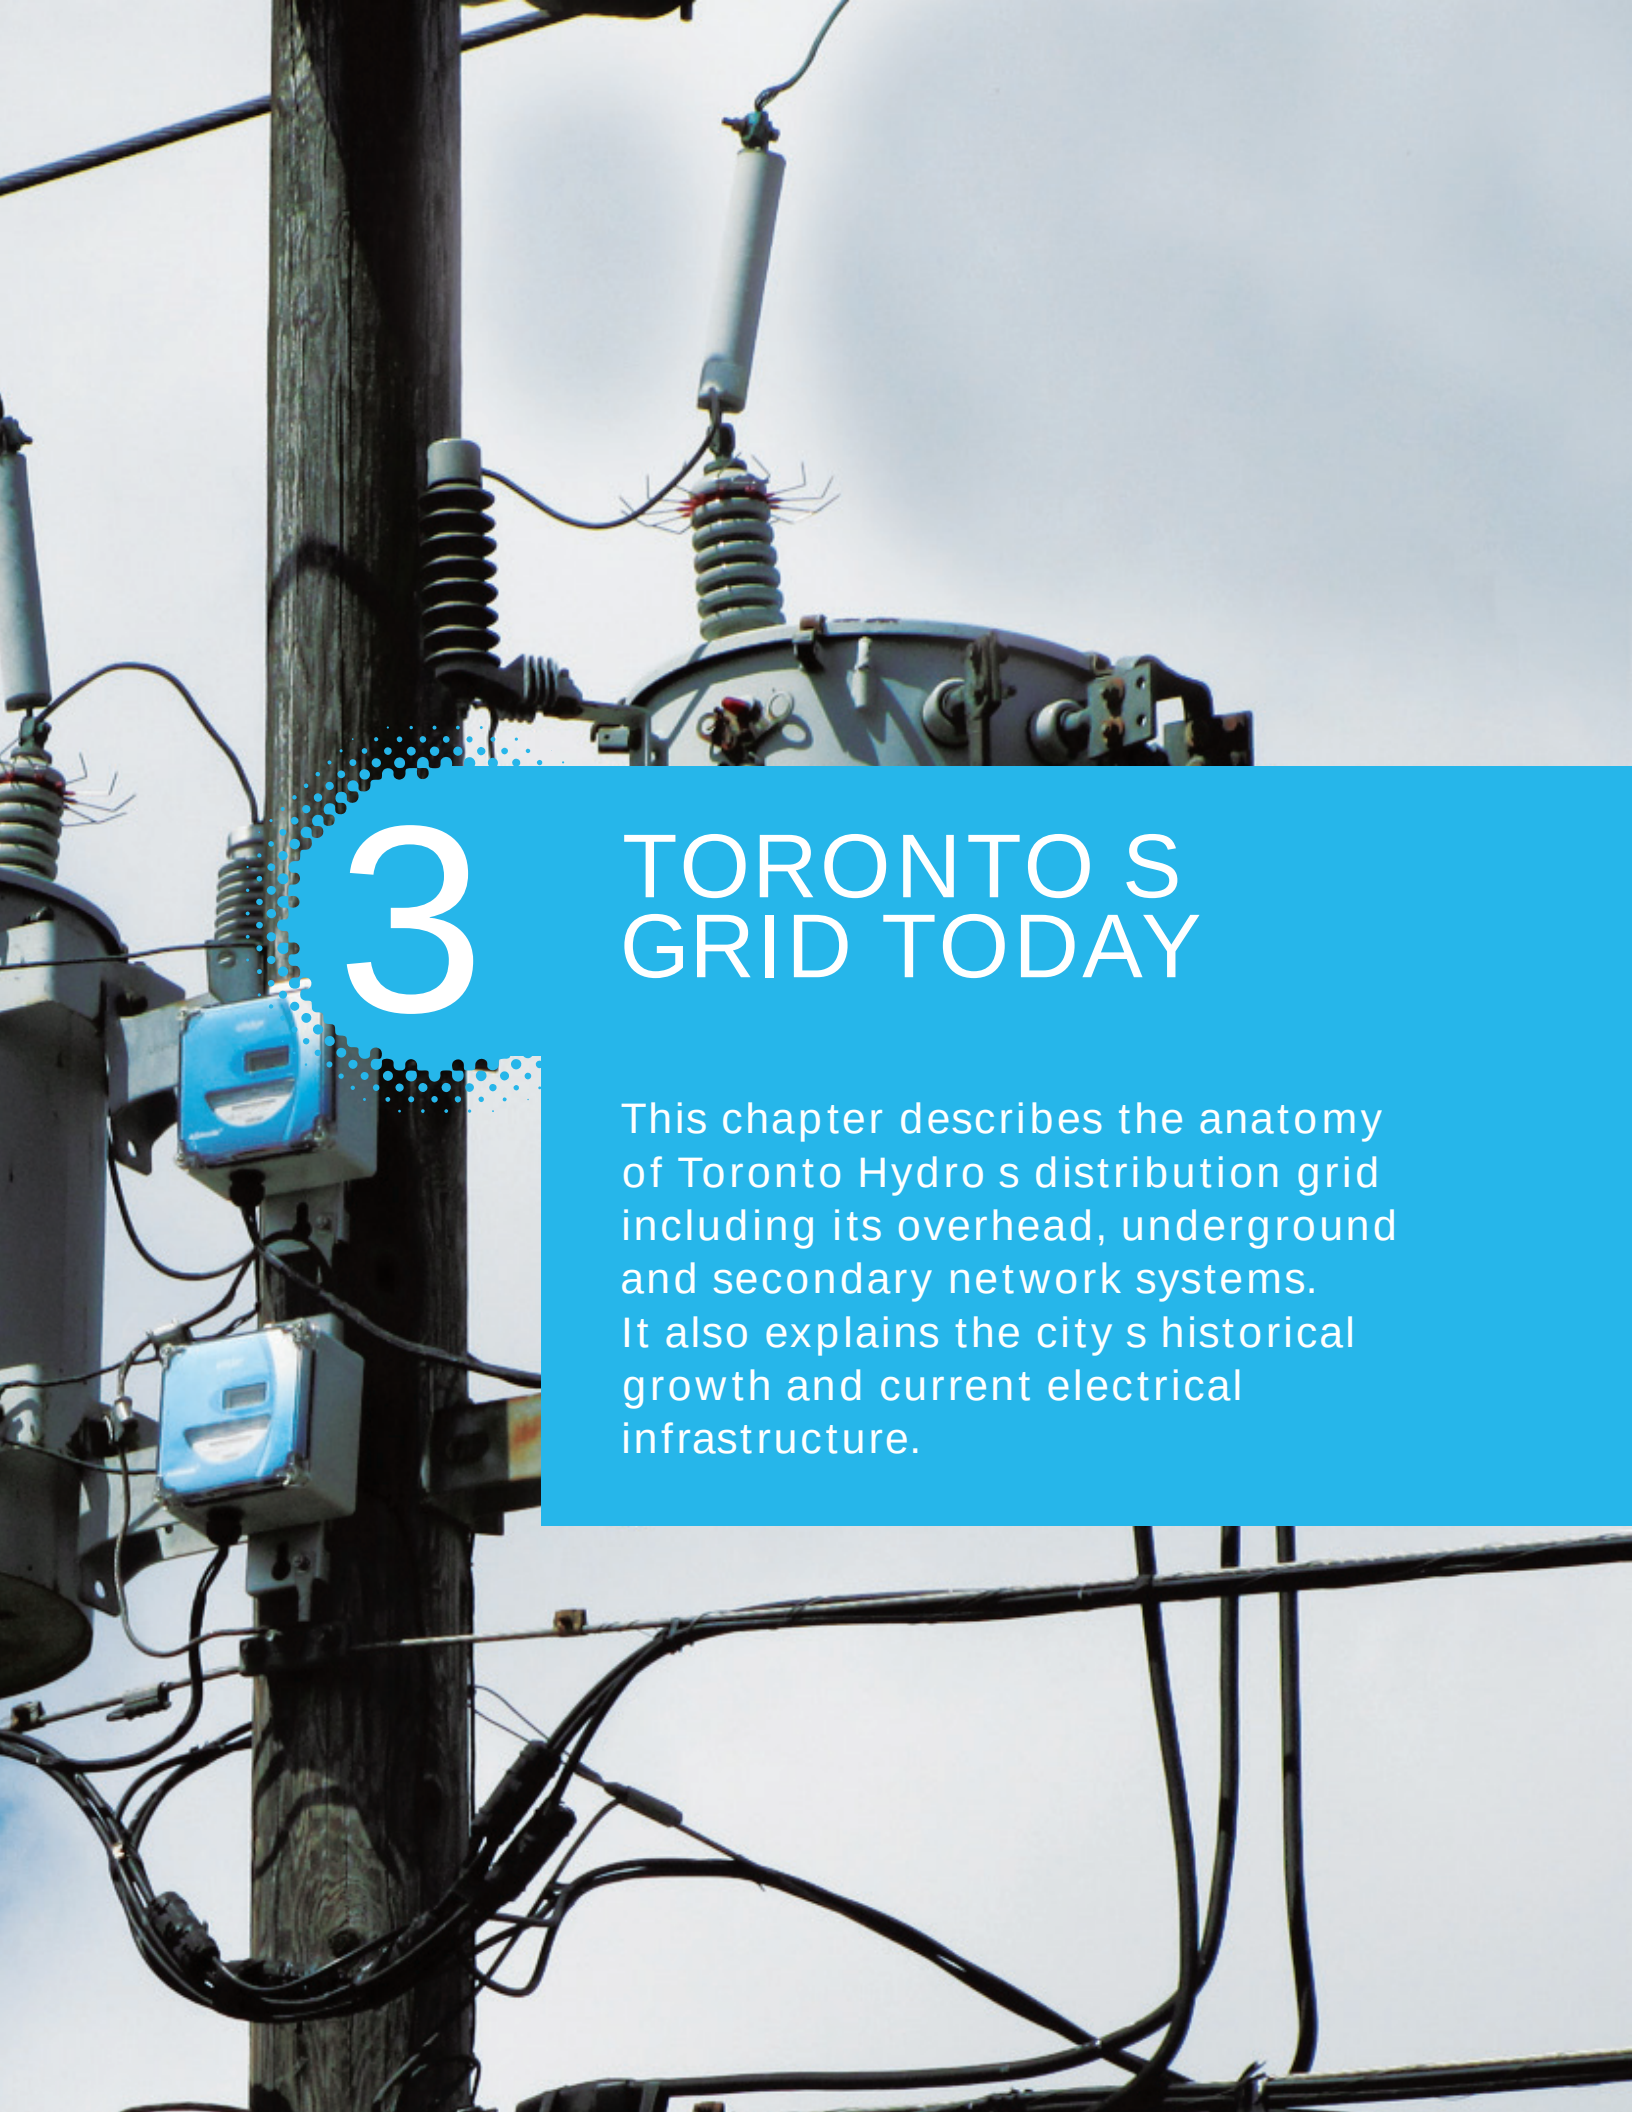
Once electricity is generated, it must be delivered to urban and rural areas in need of power. This happens by way of high voltage transmission lines that serve as highways for electricity. The province has more than 30,000 kilometres of transmission lines*, owned mostly by Hydro One.

Toronto Hydro

Toronto Hydro is responsible for the last step of the journey: distributing electricity to customers in Toronto.

The City of Toronto

The City of Toronto is Toronto Hydro s sole owner and shareholder. The Ontario Energy Board allows Toronto Hydro to earn a speci ed annual return, part of which is used to pay an annual dividend to the shareholder. The City uses this dividend to fund city services like snow removal and garbage collection. Toronto Hydro reinvests the remaining portion of this amount back into the utility.



How are Electricity Rates Determined?

Toronto Hydro is funded by the distribution rates paid by its customers. Periodically, Toronto Hydro is required to le an application with the Ontario Energy Board to determine the funding available to operate and maintain the distribution system. Toronto Hydro must submit evidence to justify the amount of funding it needs to safely and reliably distribute electricity.

Who Protects Consumer Interests?

Toronto Hydro s evidence is assessed in an open and transparent public process known as a rate hearing. A number of public intervenors with electricity industry expertise submit their own evidence challenging Toronto Hydro s plans and assumptions. At the end of the process, the Ontario Energy Board weighs the evidence and decides on the rates Toronto Hydro can charge for distribution.

3 TORONTO S GRID TODAY

This chapter describes the anatomy of Toronto Hydro s distribution grid including its overhead, underground and secondary network systems. It also explains the city s historical growth and current electrical infrastructure.

The Nuts and Bolts of Toronto Hydro s Distribution Grid

Toronto s electricity grid is comprised of overhead, underground and secondary network systems. The mix is largely due to the utility s amalgamation. In 1998, Toronto Hydro merged with North York Hydro, Scarborough Hydro, East York Hydro, York Hydro, and Etobicoke Hydro. Each utility operated independent distribution systems, and as a result, the infrastructure varies from region to region. Toronto Hydro has been working to gradually standardize this equipment, which will help improve reliability and safety across the city, and make system operation more e cient.

A Look at Toronto Hydro s Growth

Toronto Hydro has been serving the city since 1911 and has experienced many changes over the years.

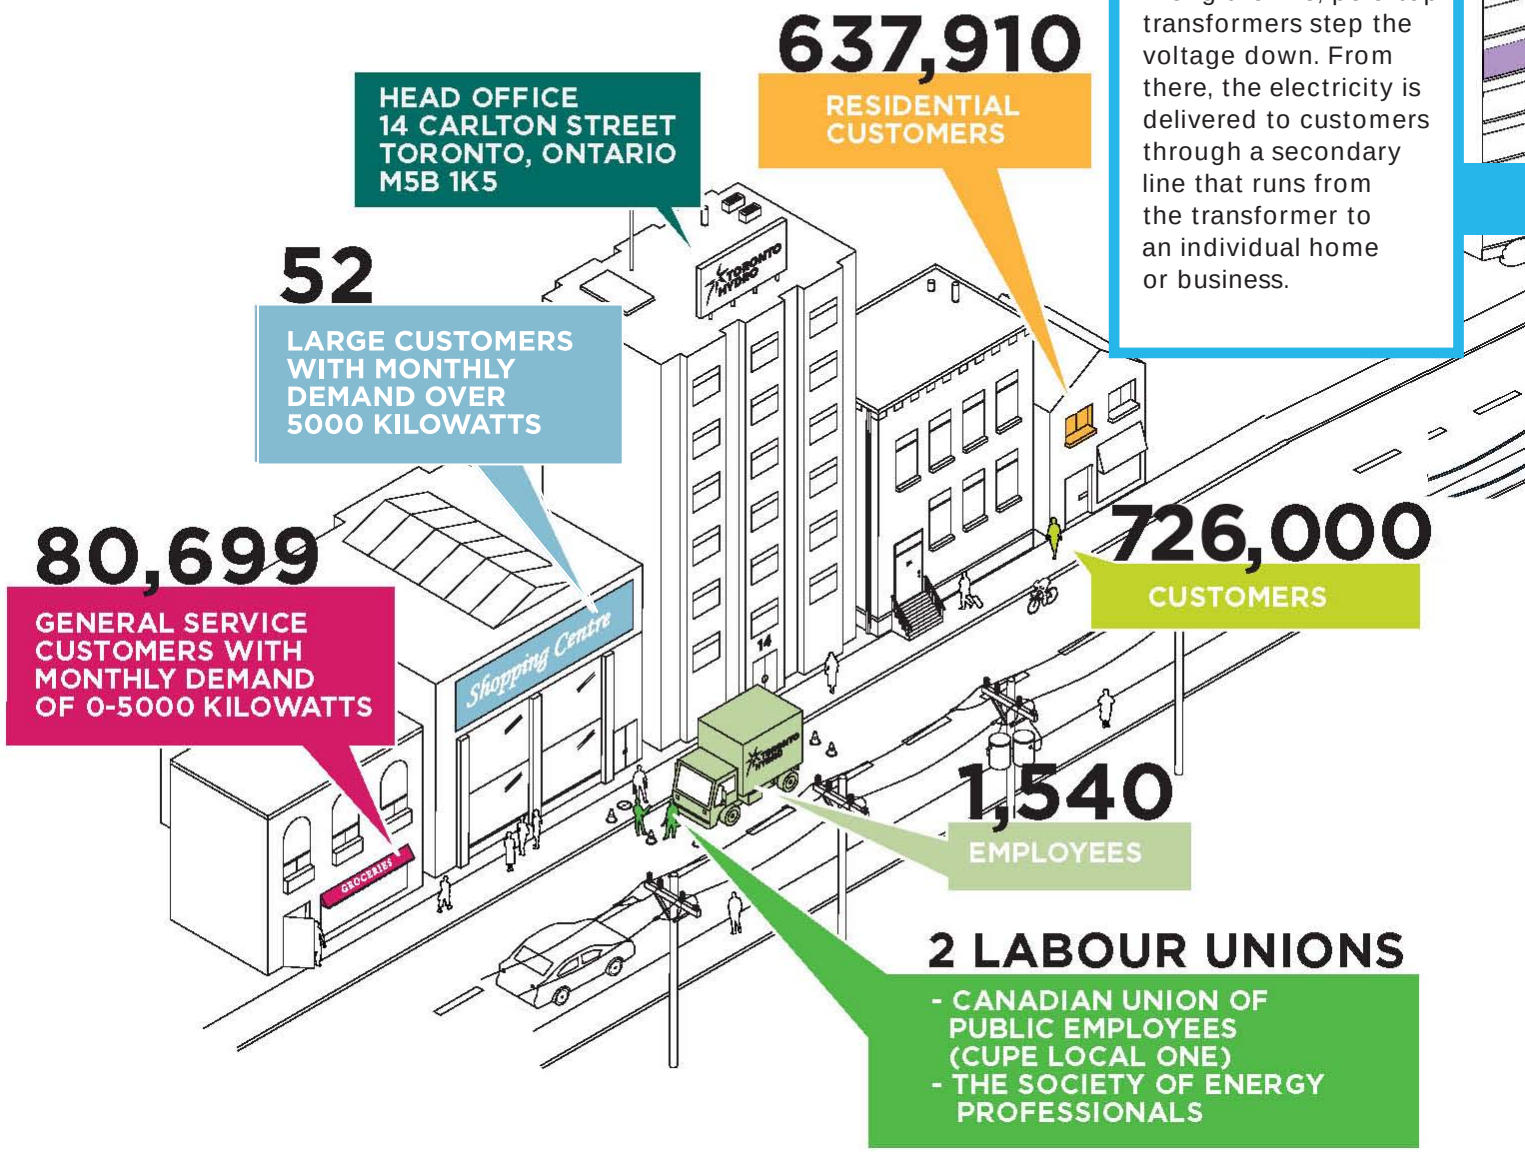
The rst electrically-powered trolley bus and electric tra c lights were introduced in the 1920s. Street lighting was introduced in the 1930s and was upgraded following World War II.

Between 1945 and 1955, the City s power consumption increased by 75 per cent thanks to the post-war baby boom and immigration. The dramatic growth created a need to expand the system. Toronto Hydro built 12 new municipal substations. Much of the equipment installed during this decade is still in operation today.

The 1970s saw dramatic skyline changes with the addition of the CN Tower, First Canadian Place, and the Royal Bank Plaza. As society started to become more environmentally conscious, Toronto Hydro introduced energy conservation programs and incentives to many of its customers.

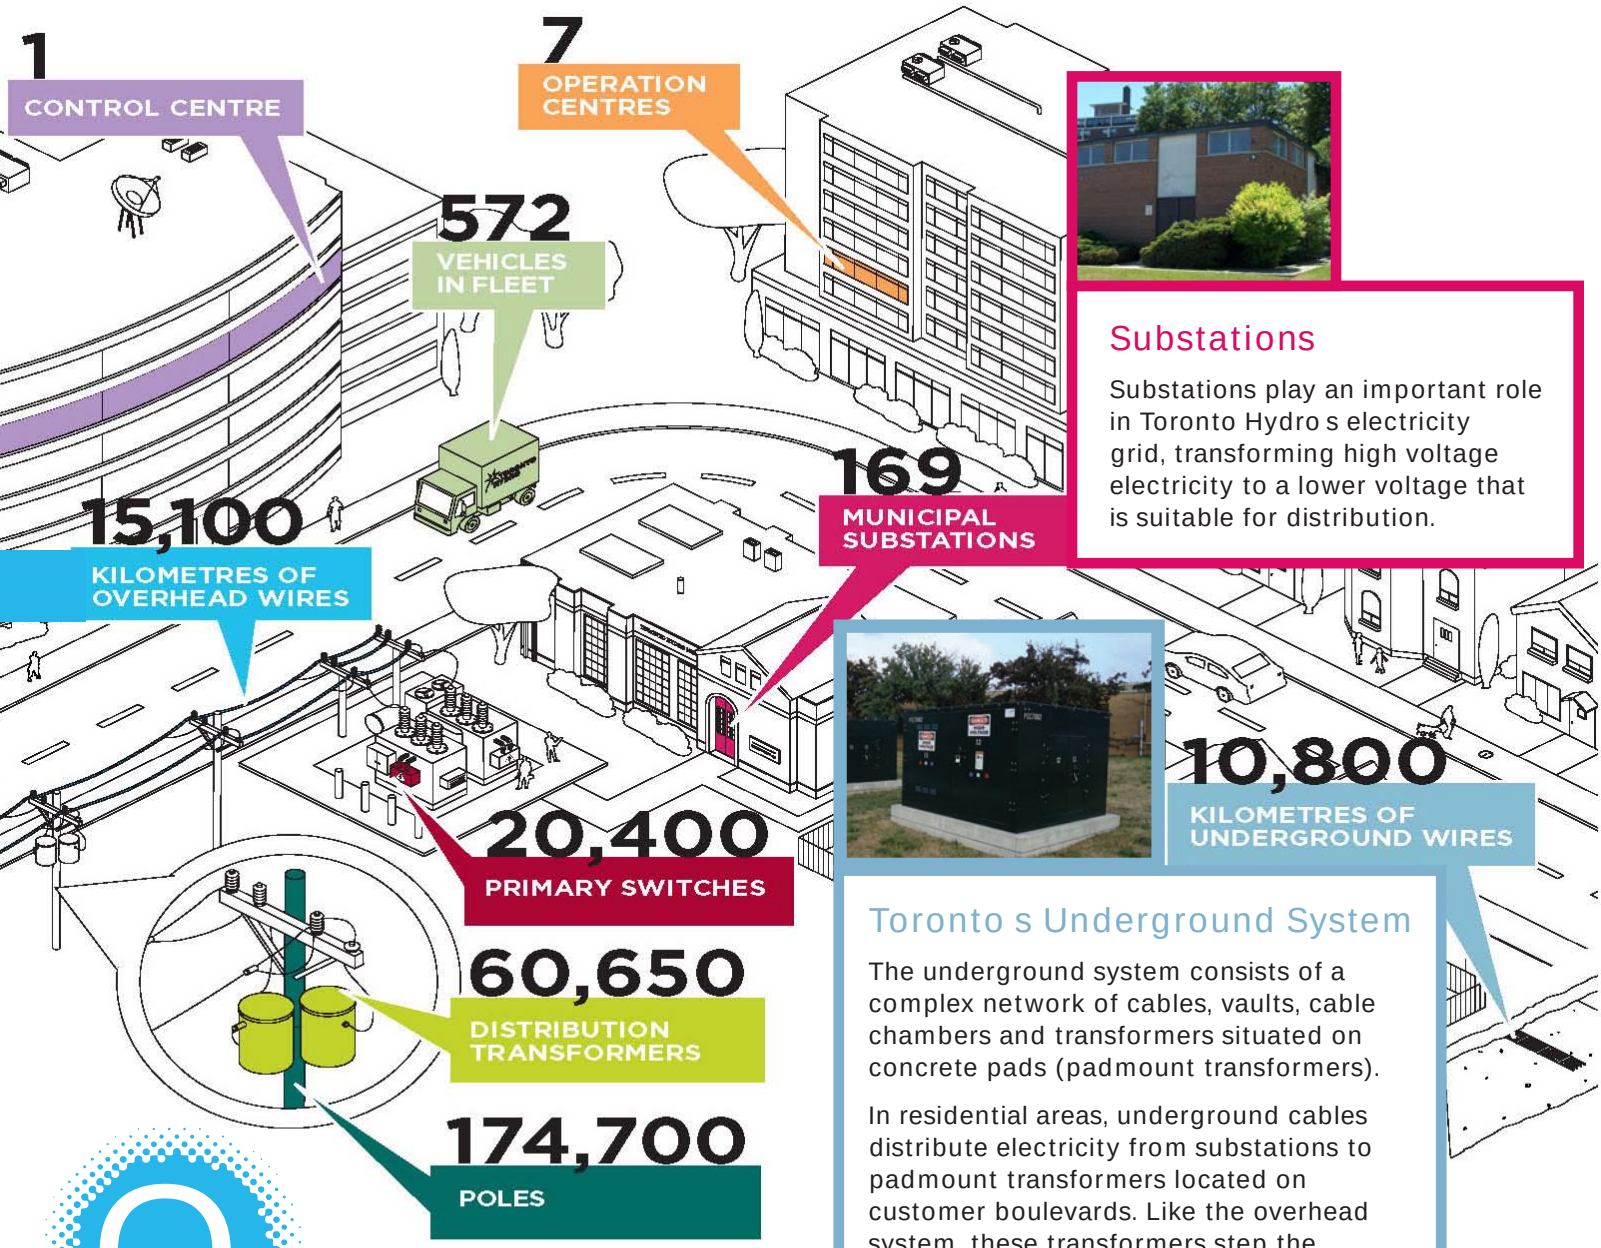
In the early 1980s, Toronto Hydro introduced a computerized control system to remotely monitor the distribution system and respond more quickly to emergencies.

In 2006, facing the challenges described in the following chapters, Toronto Hydro embarked on the largest infrastructure renewal program in its history.



About Toronto Hydro

Toronto Hydro owns and operates $2.6 billion in capital assets and is the largest municipal electrical utility in Canada. It distributes about 19 per cent of Ontario s electricity demand.



Toronto s Overhead System

The overhead system is made up of distribution lines that operate at either 4.16 kilovolts, 13.8 kilovolts or 27.6 kilovolts. These primary lines are strung across hydro poles. Along the line, pole-top transformers step the voltage down. From there, the electricity is delivered to customers through a secondary line that runs from the transformer to an individual home or business.

1. Given what you know and what you have read so far, how well do you feel you understand the important parts of the electricity system, how they work together and which services Toronto Hydro is responsible for?

   _____ Very well
   _____ Somewhat well
   _____ Not very well
   _____ I don t understand at all

Substations

Substations play an important role in Toronto Hydro s electricity grid, transforming high voltage electricity to a lower voltage that is suitable for distribution.

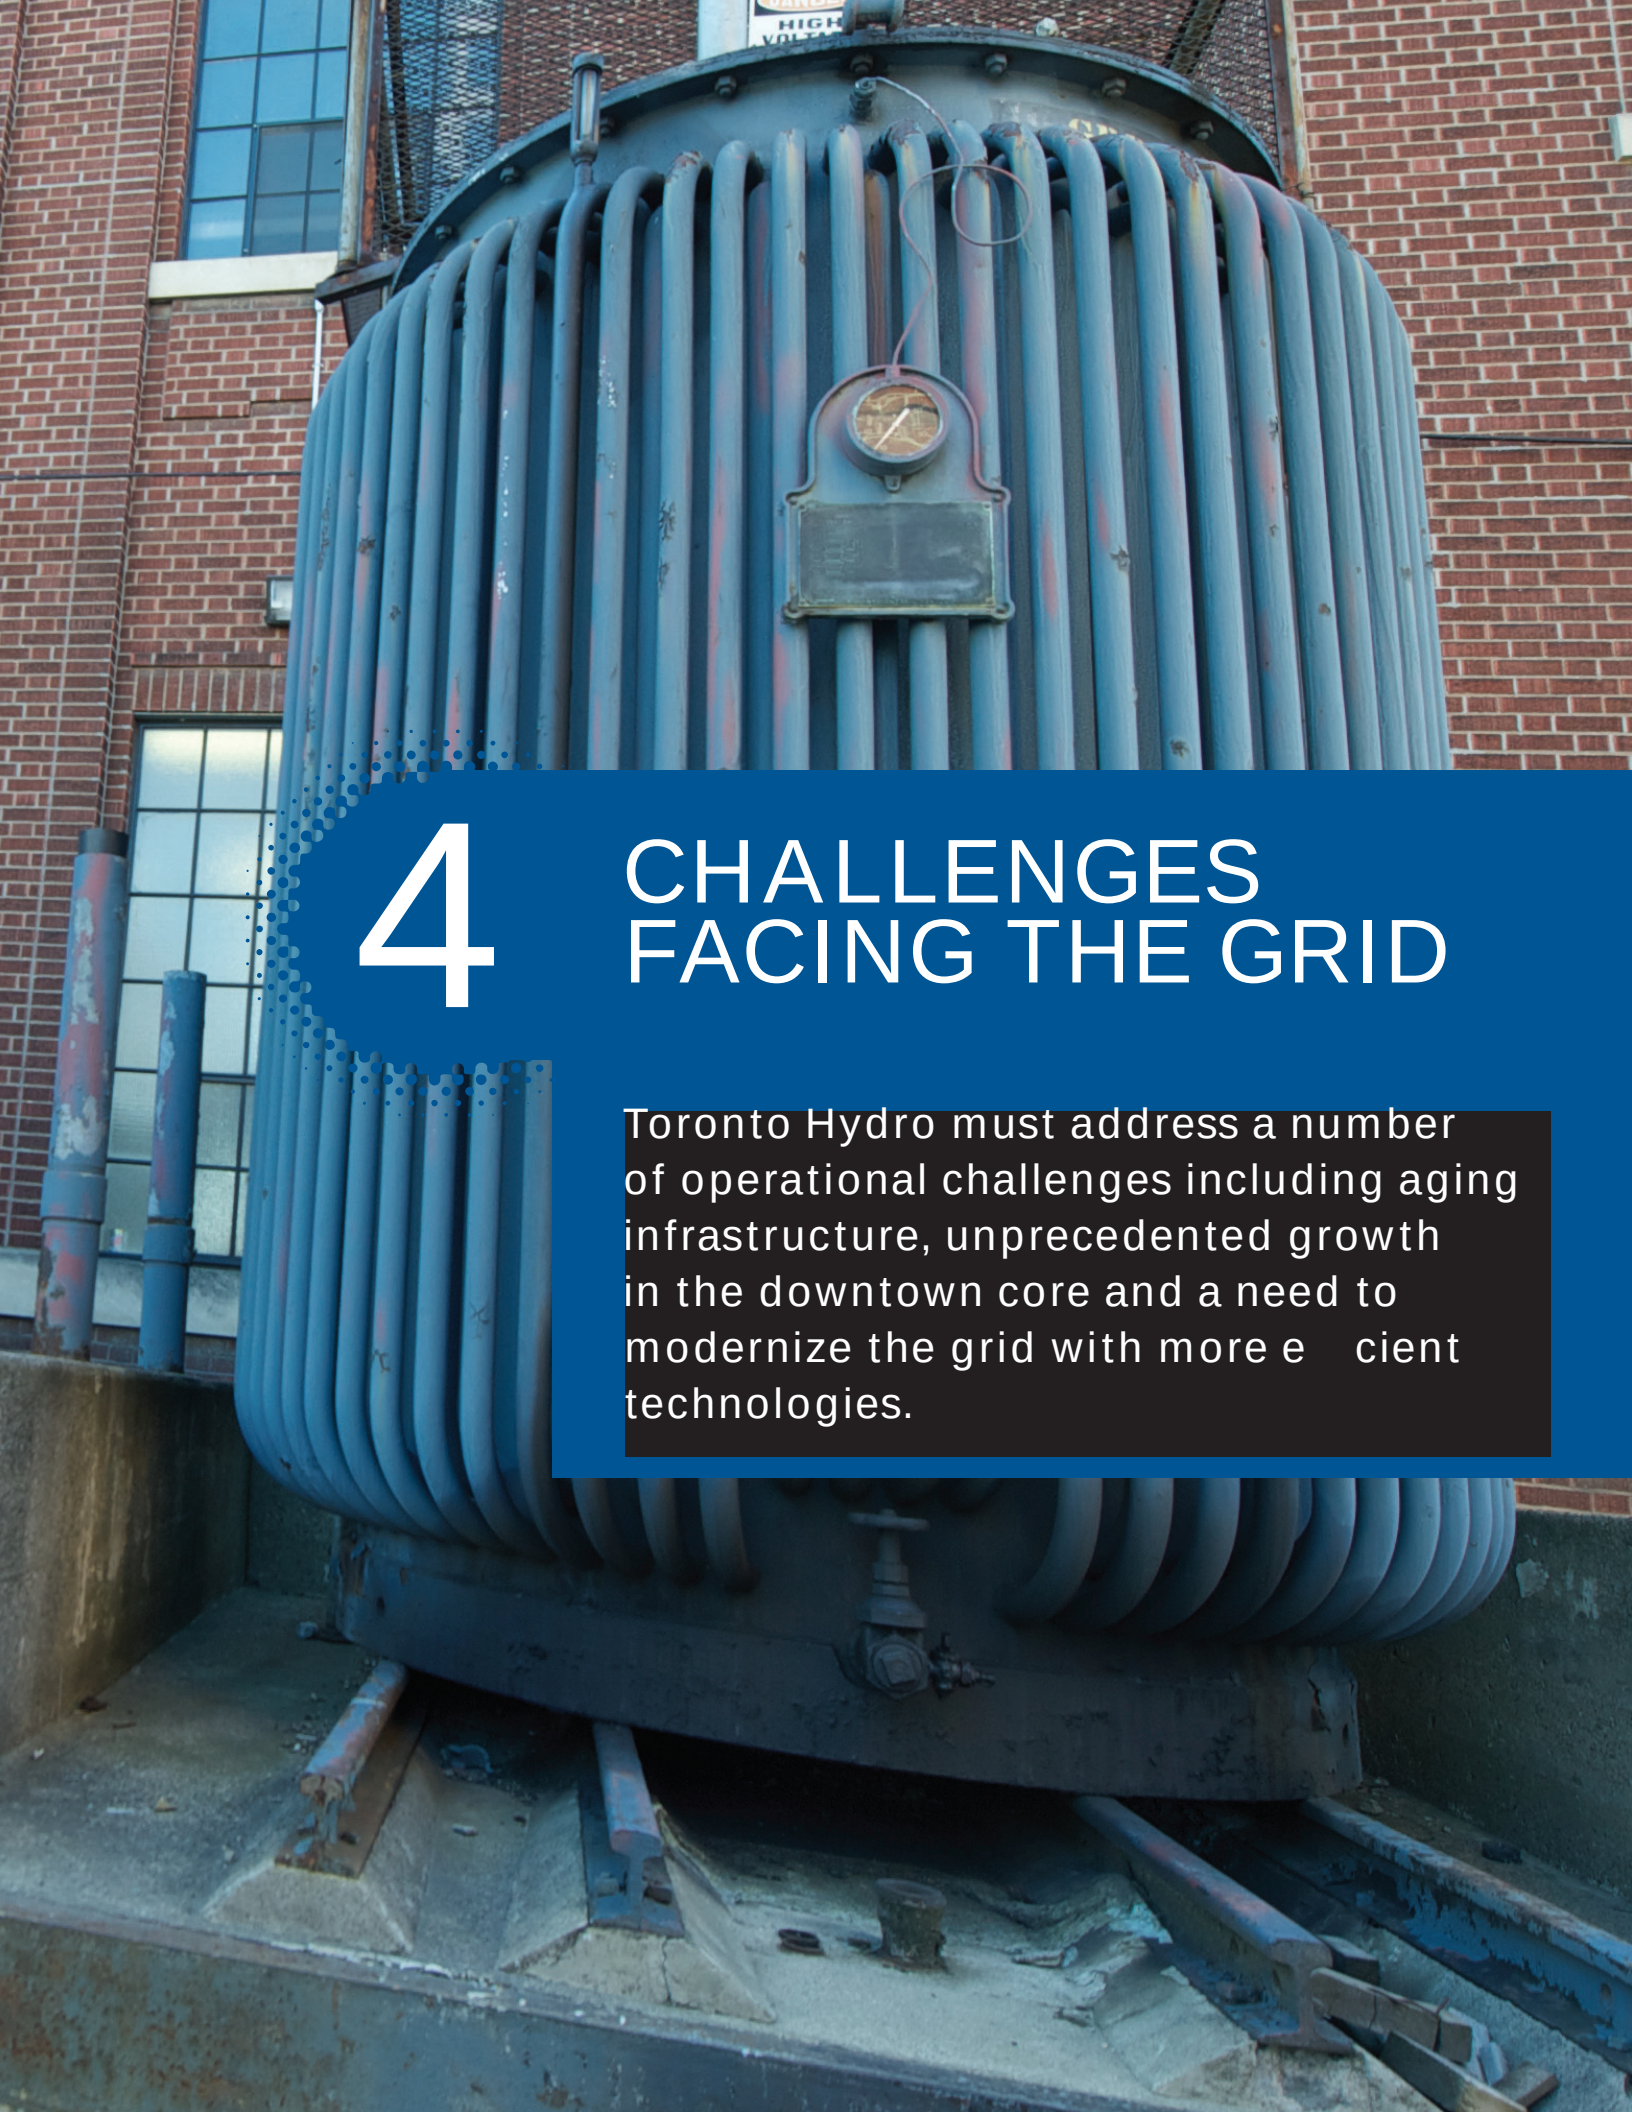
Toronto s Underground System

The underground system consists of a complex network of cables, vaults, cable chambers and transformers situated on concrete pads (padmount transformers).

In residential areas, underground cables distribute electricity from substations to padmount transformers located on customer boulevards. Like the overhead system, these transformers step the electricity down to a lower voltage, and current is delivered to customers through a secondary line. When distributing electricity to urban areas or larger customers, bigger vault transformers are used. Cable chambers are located throughout the underground system to provide crews with access to feeder cables.

2. How satis ed are you with the job Toronto Hydro is doing running your local distribution system?

____ Very satis ed
____ Somewhat satis ed
____ Somewhat dissatis ed
____ Very dissatis ed
____ Don t Know



3. Is there anything in particular that Toronto Hydro can do to improve its service to you?

_____

_____

_____

_____

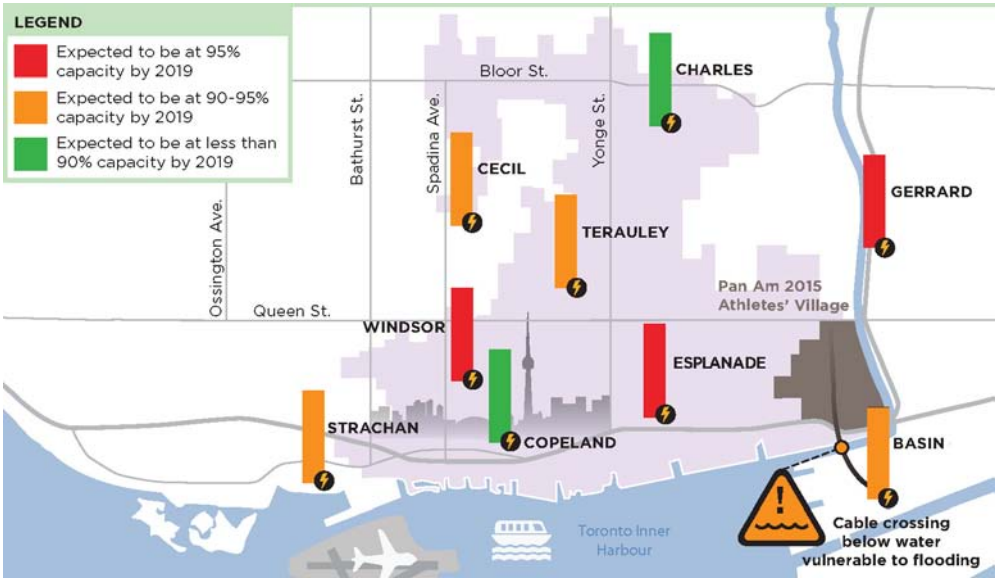
4 CHALLENGES FACING THE GRID

Toronto Hydro must address a number of operational challenges including aging infrastructure, unprecedented growth in the downtown core and a need to modernize the grid with more e cient technologies.

Toronto s Renaissance: Accommodating a City Under Construction

Recently crowned the fourth largest city by population in North America and a continued leader in high rise development, Toronto is a city under construction. Toronto Hydro plays an important role in this growth.

Toronto Hydro is required by law to:



« *+! 0*B«1/0)!/00$#%
« 1. 0(5)0!«1/0)!(! 0.% %05«*/1),0%*
«4, *)+ 2!%/0.% 10%*!1%,)!0(«)+ 0!!0 %*&! 0/%*%0% 0!«50$!%05«
of Toronto, TTC, Metrolinx and GO Transit

The rate of Toronto s growth is making it increasingly di cult to ful ll these responsibilities while maintaining system performance:

« $!!.)!5/ . ,!/1* !«*/0.1 0%*0$ *B«%05$% #* 4% %05
« $!!.)!0$ *&!*0% ((+ 0%*&! 0/!(0!!*/0.1 0%*«50$!*

Growth from high-rise construction is putting immediate and longer-term pressures on the existing grid.

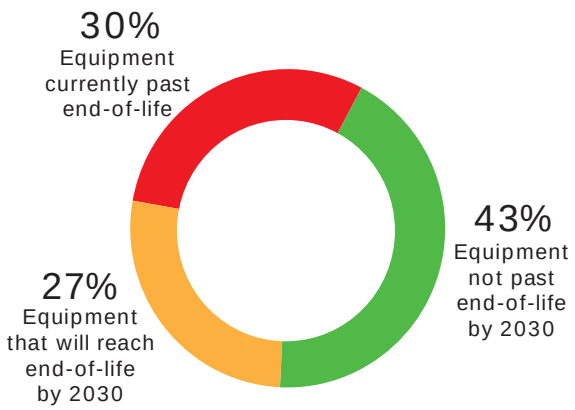
Downtown Stations are Overloaded

To help ensure the city s continued economic success and its ability to serve the growing population, Toronto Hydro is investing in expanding the capacity of its stations and feeders.

Under provincial legislation, there are several types of investments Toronto Hydro must make when the need presents itself. How reasonable do you feel it is to give each of these investments a priority over other investments (for example, replacing aging equipment)?

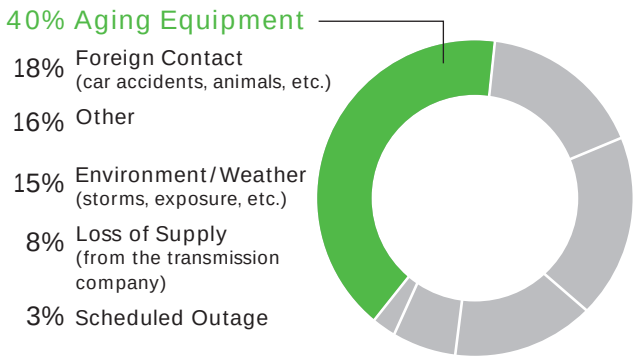
4. Connecting new customers such as new housing, condominiums or businesses. (Provincial regulations set connection fees which cover unusual costs).
   _____ Very reasonable _____ Somewhat reasonable
   _____ Not very reasonable _____ Not reasonable at all _____ Don t Know

5. Maintaining and upgrading customer meters to meet provincial standards.
   _____ Very reasonable _____ Somewhat reasonable
   _____ Not very reasonable _____ Not reasonable at all _____ Don t Know



6. Moving existing electricity infrastructure such as poles and transformers to enable other projects such as street widening or new developments. (Provincial regulations set fees which cover unusual costs).
   _____ Very reasonable _____ Somewhat reasonable
   _____ Not very reasonable _____ Not reasonable at all _____ Don t Know

Aging Equipment: All Good Things Must Come to an End



A large part of Toronto Hydro s distribution system was installed in the 1950s and 1960s. This infrastructure has served the city well beyond its expected lifespan. But now the grid is at a point where renewal investments can no longer be deferred without a ecting service reliability.

Almost 60% of the city s distribution infrastructure needs to be rebuilt over the next two decades. The price of these upgrades is approximately $5.6 billion overall.

How Fast is the System Aging?

Aging Equipment is Responsible for Approximately 40% of Outages

About 30 per cent of our distribution equipment is past its end of life and an additional 30 per cent will reach this state over the next 20 years.

7. Thinking about the aging equipment in the grid, do you feel it s best to wait until the equipment breaks down to get full value from each piece of equipment, even if it means power outages, or do you feel the best approach is to replace the equipment before it breaks down to avoid power outages, even if it means not getting all the use possible from each piece of equipment?

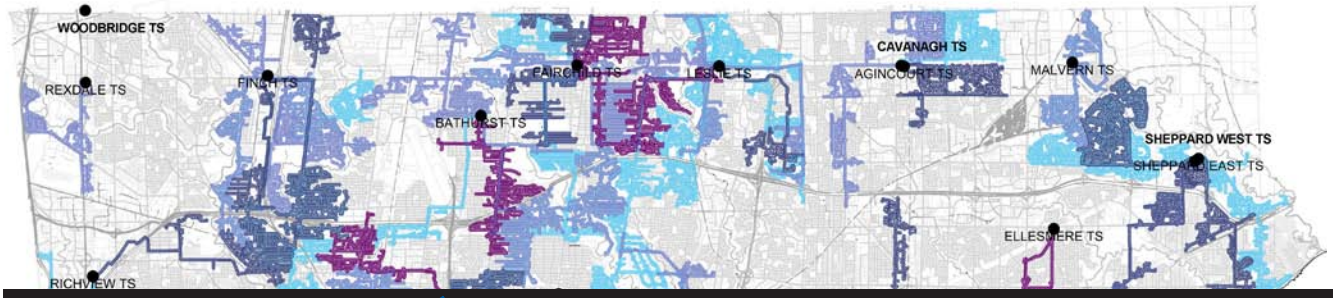
____ Wait until break down ____ Replace before break down

A Look at Toronto Hydro s Service Reliability

Aging infrastructure is a major challenge to service reliability. Toronto Hydro is managing this through grid renewal and modernization.

Toronto Hydro uses two main measures to evaluate service reliability: frequency and duration.

Over the past decade, the average customer has experienced:

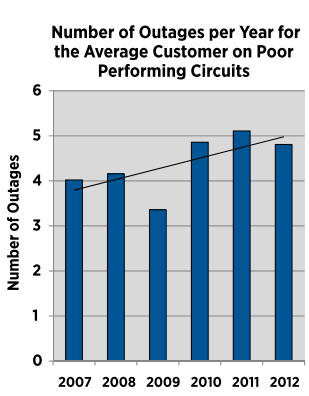


- 03 !« 1.4 and 2 outages per year.
- 03 !« 60 and 90 minutes without power per year.

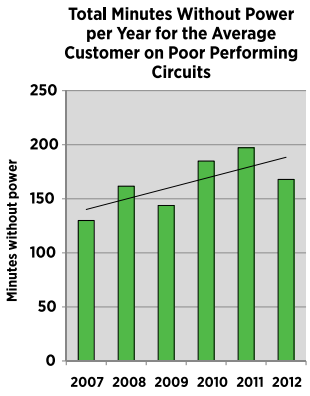
While outage frequency and duration averages are trending downwards, actual customer experiences vary. Some customers on newer parts of the system may not experience any outages while others are experiencing as many as 20 outages per year.

The Least Reliable Equipment on the Block

Toronto Hydro pays special attention to circuits with exceptionally poor performance. Engineers maintain a list of circuits experiencing seven or more outages in a year, and addressing this list is a continuous e ort. The system is aging at such a rate that new poor performing circuits are added to the list almost as fast as Toronto Hydro can deal with existing problem circuits.



Where are Poor Performing Circuits Located?



Customers Located in These Areas are Receiving Poor Service Reliability

Over the past decade, the average customer on a poor performing circuit has experienced:

- « ve outages per year (compared to the system average of two)
- «150 to 200 minutes without power per year (compared to the system average of 60 to 90 minutes for the year)

Without su cient investment in renewing and modernizing the distribution grid, Toronto Hydro expects service reliability of poor performing circuits to continue deteriorating.

8. Do you feel the current average number of electricity outages is acceptable or not acceptable?
   ____ Very acceptable ____ Somewhat acceptable
   ____ Not very acceptable ____ Not acceptable at all ____ Don t Know

9. Do you feel the current average amount of outage time is acceptable or not acceptable?
   ____ Very acceptable ____ Somewhat acceptable
   ____ Not very acceptable ____ Not acceptable at all ____ Don t Know

10. How many outages have you experienced over the past two years?
    ____ INSERT ACTUAL NUMBER

11. (IF 1 OR MORE OUTAGE) How long was the power out during your most recent power outage?
    ____ INSERT ACTUAL NUMBER

12. (IF 1 OR MORE OUTAGE) How did the power outage a ect you personally?

    _____
    _____
    _____
    _____
    _____
    _____

13. Is there a certain length of time at which the costs and consequences of an outage become more serious for you?

    _____
    _____
    _____
    _____
    _____
    _____

No system delivers perfectly reliable electricity. Generally, the more reliable the system, the more expensive the system is to build and maintain. Please answer the following two questions.

14. How many power service interruptions are reasonable in a year?
    ____ No outage is acceptable
    ____ One ____ Two ____ Three ____ Four ____ More than four

15. What is a reasonable duration for a service interruption?
    ____ No outage is acceptable
    ____ 30 minutes ____ 1 hour ____ 2 hours ____ 3 hours
    ____ 4 hours or more

Changing Weather Patterns

Climate change is raising the risk of severe weather events impacting the system more frequently in the future. Toronto has experienced several major storms over the last year-and-a-half alone:

- 0@$# Hurricane Sandy (October 2012), 65,000 customers were without power.
- $ torrential downpour on July 8, 2013, caused severe ooding in stations and the underground system. Approximately 300,000 customers were a ected about half of all customers and thousands experienced extended outages.
-) 0 ice storm in its history. Freezing rain caused massive destruction to trees and power lines, leading to widespread and extended outages. About 300,000 customers were impacted and some people were without power for as long as 12 days. Many customers spent their holidays in City of Toronto warming stations.

Planning for the weather

Toronto Hydro is studying the results of these unusual weather events to determine whether changes are needed to any of the utility s best practices. In the meantime, Toronto Hydro anticipates that a number of the planned capital investments for 2015 to 2019 will help improve system performance during major weather events. For example, replacing box construction circuits (explained on page 20) with taller, higher-voltage circuits will help reduce the impact of falling trees and branches in certain areas.

Why not move everything underground?

There are pros and cons to both overhead and underground circuits. Underground circuits were hit harder than overhead circuits in the summer ooding, while overhead circuits were hit harder in the ice storm. Underground circuits can cost many times more than simply replacing the existing overhead lines; the cost for moving all circuits underground would be in the range of $15 billion. Toronto Hydro must consider these options in light of the other capital needs discussed in this workbook and the need to keep increases in customer bills as low as possible.

16. Over the past year, Toronto has experienced two unusual weather events the ooding in July and the ice storm in December. Thinking back to the two major storm events of 2013, were you a ected by either or both of these events?

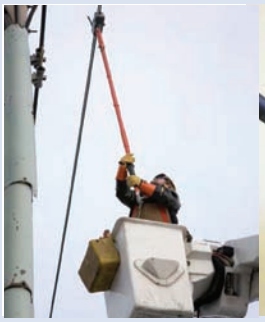
____ Yes the ooding in July
____ Yes the ice storm in December
____ Yes Both
____ No neither weather event a ected my electricity

17. Whether you were personally a ected or not, how satis ed are you with Toronto Hydro s management of these events?

____ Very satis ed
____ Somewhat satis ed
____ Somewhat dissatis ed
____ Very dissatis ed
____ Don t Know

18. Is there anything in particular that Toronto Hydro could have done to improve its service to you during these events?

Grid Modernization



The pressures of economic growth and system aging are at the heart of Toronto Hydro s investment plan for 2015 and beyond. For the most part, responding to these pressures will involve rebuilding and expanding the system using tried and true distribution technology. At the same time, technological innovation in the industry has begun to change the way that utilities can manage the system and the way that customers can use the grid. The following section highlights some of the pressures and opportunities associated with the evolving technological landscape.

Here are some of the modern grid management technologies that Toronto Hydro is exploring:

Feeder Automation

« « (/ 0 +)0!3%0 $%0+«0! 0« « «
isolate power interruptions.
«(,/« !1 0$1) !1/0)!/«

excess supply during o -peak hours.
« $0:5« *«, % (5(5!«5« «
system operators to address local capacity issues throughout the distribution system and to moderate peak power costs.

19. Modernizing the grid can allow Toronto Hydro to improve reliability. Investments such as automated switches may allow Toronto Hydro to minimize the number of people impacted by outages and to restore electricity to most customers in a matter of seconds. Given there are many other areas of needed investment, such as connecting new customers, replacing aging equipment and expanding capacity for long-term growth, how important do you feel it is for Toronto Hydro to invest now in modernizing the grid?

_____ Very important
_____ Somewhat important
_____ Not very important
_____ Not important at all
_____ Don t Know

Here are some of the new technologies that are changing the way that customers use the grid:

Electric Vehicles

allows Toronto Hydro to develop charging pro les for all vehicle models.

vehicles on the lifespan and performance of equipment and make proactive upgrades when necessary.

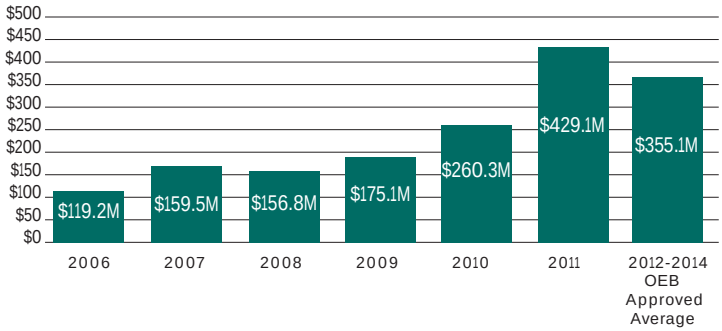
Making Room for Renewable Generation Projects

Solar power and energy-from-waste facilities are renewable forms of distributed generation that are growing in popularity and a ordability. Toronto Hydro is mandated to connect distributed generation as part of the province s Feed-in Tari program. Since 2012, Toronto Hydro has connected more than 375 distributed generation projects to the grid.

5 HOW WE RE MANAGING GRID PRESSURES

This chapter covers the work Toronto Hydro is doing to address grid challenges. It includes information about historical grid investments, ongoing capital projects and productivity improvements.

Working Hard to Improve Reliability



Since 2006, Toronto Hydro has invested approximately $2.5 billion in infrastructure renewal. This investment represents some of the largest construction programs in the utility s history, replacing approximately:

« «%(-0./ «+ « %*# «(%*/
« «(«(/
« «0. */!)!/

From 2006 to 2009, Toronto Hydro gradually increased its capital spending on poor performing feeders and underground cables that were negatively impacting reliability.

In 2010 and 2011, the utility increased spending to a level needed to execute a broader grid renewal and modernization program.

Toronto Hydro has increased capital spending

The following case studies provide a snapshot of major projects being executed across Toronto Hydro s distribution system. Feel free to read about whichever projects interest you.

Stretching your Electricity Dollars

Reducing Strain on the Grid

Toronto Hydro is reducing strain on the grid by supporting provincial conservation and demand management programs for residential, business and industrial customers. These programs are not generally an alternative to renewing the aging distribution system in the near-term, but they may help defer the need for capacity expansion and renewal investments over the longer-term.

Conservation Program Results from 2012

Here is a look at conservation programs provided to customers and the electricity savings they yielded.

saveONenergy℠ Conservation Programs	Results	MW Saved	MWH Saved
FRIDGE & FREEZER PICK-UP	2,802 refrigerators and freezers collected	0.2	1,092
COUPONS	Bi-annual customer events and coupons for energy e cient products held at participating retailers	0.2	3,606
DEMAND RESPONSE CONTRACTUAL DR3	48 commercial and industrial customers contracted to reduce energy use at speci ed times	14.7	312
SMALL BUSINESS LIGHTING	3,498 lighting retro ts installed	2.5	9,383
HEATING & COOLING INCENTIVE	13,047 participants received an incentive for installing an ENERGY STARfi quali ed central heating or cooling system	2.8	4,782
peaksaver PLUSfi	43,149 installation	22.9	169
RETROFIT PROGRAM	1,168 project applications	15.9	80,294

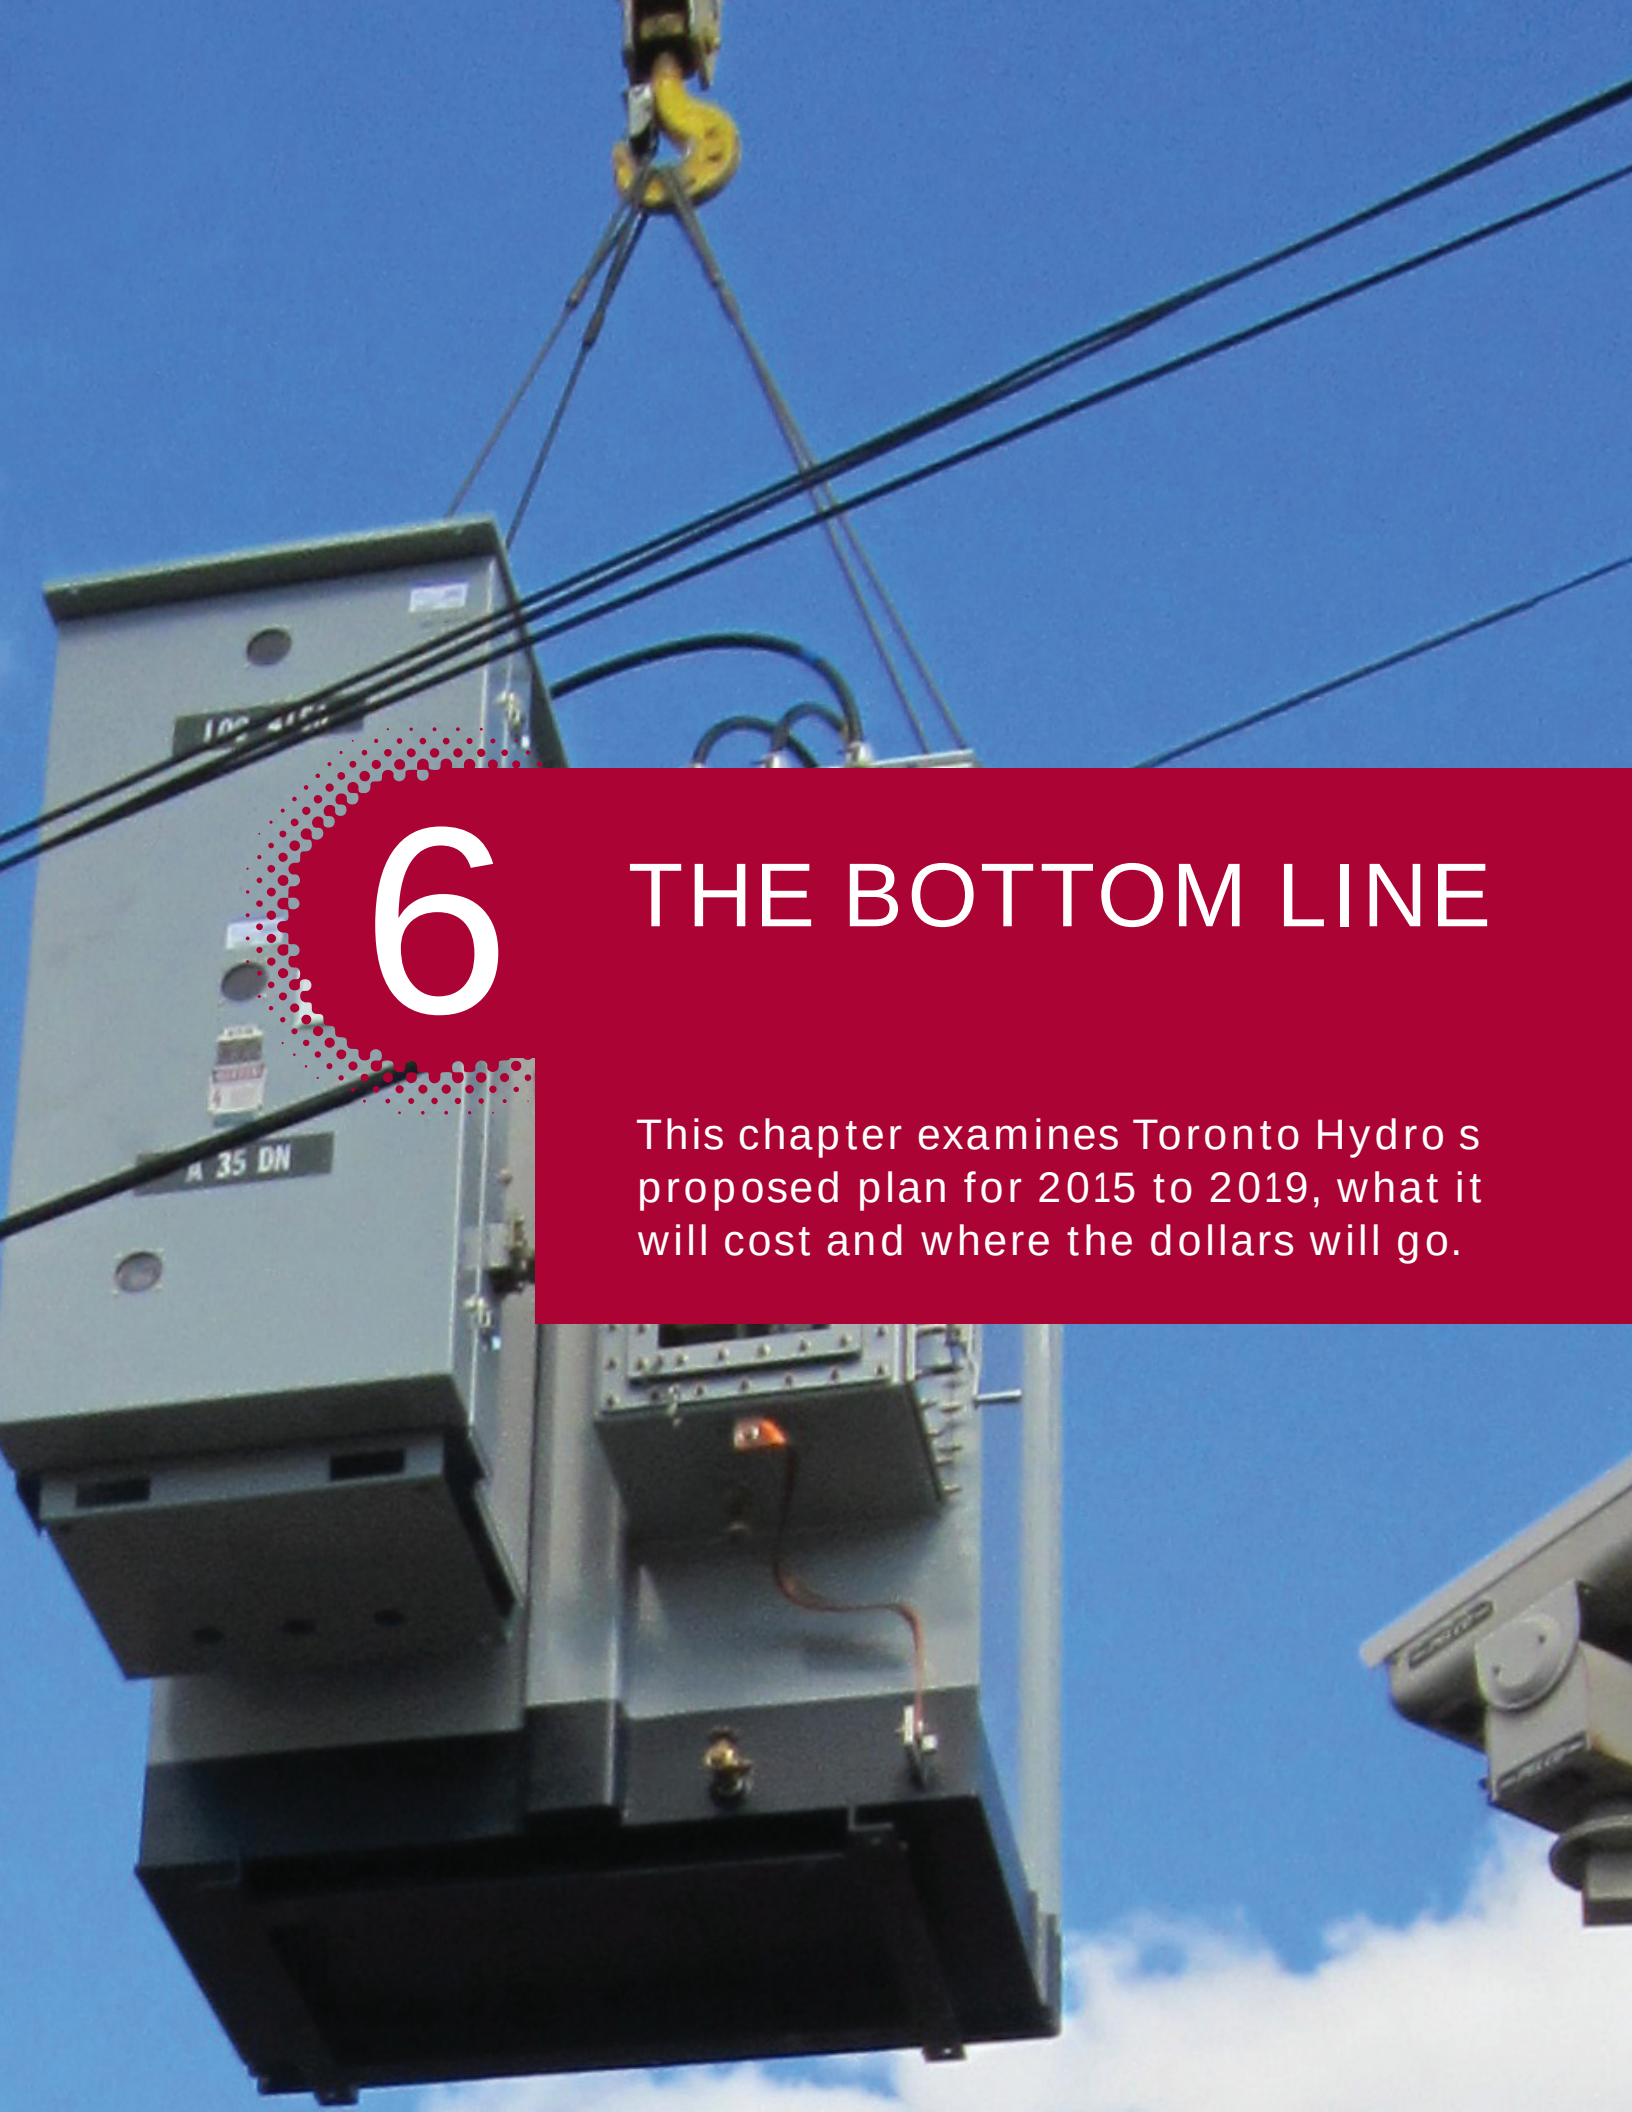
Total 2012 Results: 112,200 MWh and a total demand reduction of 61,088 MW

20. For conservation and demand management programs to slow the pace of renewal and expansion, they must provide an acceptable level of certainty. How likely is it that you would participate in Demand Response programs that would allow electricity system managers to turn o equipment you are using? For residential customers, this would involve automated devices to turn o your water heater and air conditioner for short periods during times of peak demand.
    _____Very likely
    _____Somewhat likely
    _____Not very likely
    _____Not at all likely

Smart Grid, Smart People, Smart Business

Toronto Hydro is trying to temper the cost of investment by improving the productivity and e ciency of its overall business. Here s how the utility is nding ways to do more with less:

- «Reducing employee headcount Toronto Hydro has reduced sta levels by 35% and senior executives by 65% since 1998.
- «Keeping absenteeism low According to Statistics Canada, Toronto Hydro s absentee rate is 15% below the average for public and private sector companies.
- «Working safely Toronto Hydro is avoiding injuries and staying productive on the job site. The utility has achieved 3.5 million hours without a lost-time injury.
- «Reducing operating costs Toronto Hydro is downsizing work centres and relocating sta from leased buildings to utility-owned facilities that are better suited to the business.
- «Improving coordination of capital projects Toronto Hydro is executing more cost-e cient projects by grouping high-priority projects with lower priority projects in the same neighbourhoods. This allows the utility to use its crews and equipment more e ciently, and reduces the set up time and number of permits required to complete work.



21. Given what you know and what you have read so far, how well do you feel you understand the challenges facing the Toronto Hydro grid and what they are planning to meet those challenges?
    _____ Very well
    _____ Somewhat well
    _____ Not very well

6 THE BOTTOM LINE

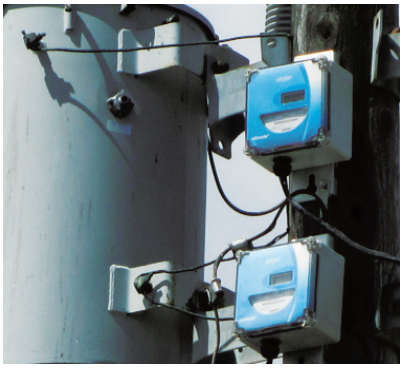
This chapter examines Toronto Hydro s proposed plan for 2015 to 2019, what it will cost and where the dollars will go.

Here s What We ve Covered so Far:

The Ontario Energy Board (OEB) requires that Toronto Hydro gather customer feedback on the utility s proposed investment plans. Toronto Hydro will present your feedback to the OEB as part of the rate setting process. The OEB and a number of public intervenors will hold Toronto Hydro accountable for both the way that you were consulted and the way that the utility s nal plan re ects what you said.

About a quarter of your electricity bill goes to Toronto Hydro. The money that Toronto Hydro receives is invested in the local distribution system and the people, buildings and vehicles that support it.

Much of Toronto s existing distribution system was built in the 1950s and 60s. Toronto Hydro s customers have bene ted from the longer than expected lifespan of this equipment.



Today, much of the system is at an age where it must be replaced to maintain the reliability that Torontonians expect. Renewing the system will help ensure that the next generation of electricity users enjoys the same long-term value-for-money as previous generations.

Toronto Hydro is also dealing with other pressures, like the need to build more system capacity to accommodate the city s growth and the need to upgrade outdated and unsupported IT systems.

At the same time, the industry is changing, and Toronto Hydro has the opportunity to explore innovative grid modernization technologies that will help the utility cost-e ectively improve system performance and reduce the risks and costs associated with aging equipment over the long-run.

Renewing the system for the next generation will take more than a decade, but delaying these investments is expected to gradually worsen reliability across the system and lead to even higher bill increases down the road.

In recognition of growing capital needs, Toronto Hydro has been working to reduce operating costs by reducing employee headcount, avoiding injuries, and downsizing work centres.

The Dollars and Cents

Toronto Hydro is preparing a 2015-2019 investment plan that will require an annual bill increase of approximately $2.35 on the monthly bill. This amounts to a total increase of approximately $11.75 per month by 2019 compared to 2014 electricity rates.

Here s how Toronto Hydro believes your electricity dollars should be invested during these years:

Replacing Aging and Obsolete Equipment
These investments are paced and prioritized to maintain reliability standards and to address the worst performing feeders rst. Introduction of modern equipment standards is expected to reduce the impact of storms.

47.1%

Expanding Capacity for Long-term Growth
Expanding the capacity and exibility of the local distribution network to accommodate forecasted growth in electricity demand.

14.3%

Connecting Customers
Bringing new customers onto the system; these investments are mandatory, but the cost is generally recovered through the additional revenue that new customers contribute.

11.2%

Improving Reliability by Recon guring Circuits
Targetted investments to cost-e ectively reduce the impact and frequency of outages. For example, converting main feeder sections from overhead to underground will help reduce the impact of future storms.

8.0%

Updating IT Infrastructure
Replacing outdated and unsupported software and communications systems that are critical to Toronto Hydro s planning, operations and outage response.

7.8%

Accommodating Construction Projects in the City
Relocating or recon guring distribution equipment that is on or near the path where other agencies are working.

3.3%

Modernizing the Grid
Introducing innovative technologies like intelligent switches and sensors that are expected to cost-e ectively improve the reliability of the system and reduce the risks and costs associated with aging equipment.

3.2%

Maintaining and Upgrading Customer Meters
Routine meter replacements and improvements to data quality.

1.9%

Building Maintenance
Routine capital investments to maintain Toronto Hydro s facilities.

1.3%

Connecting Renewable Generation
Installing protection and control equipment and energy storage facilities that allow for the e cient use of new renewable generation connections.

0.9%

Vehicles and Equipment for Crews
Routine capital investments in Toronto Hydro s eet of trucks, cars and equipment

0.7%

Accommodating Electric Vehicles
Accommodating electric vehicle connections to the grid and investing in ways to manage and optimize electric vehicle storage capacity on the system

0.1%

Have Your Say: Is Toronto Hydro Investing Wisely?

Let s Talk Priorities:

24. When you look at how much Toronto Hydro is spending on each of its investment priorities, do you think they have the balance right or would you change the relative priorities?

_____ The balance looks right
_____ They should change some of the priorities

25. What areas do you feel need more spending than planned?

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

26. What areas do you feel should have less spending than planned?

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

Let s Talk Pacing

Toronto Hydro s proposal is expected to lead to a total increase of approximately $11.75 on the average residential customer s monthly bill by 2019. A lower bill impact is possible in the short-term, but there are trade-o s: system performance will be worse and future bill impacts will be higher. The following table compares Toronto Hydro s plan to another likely utility management practice called run-to-failure. This approach is typical for smaller utilities with newer systems.

	"RUN-TO-FAILURE" APPROACH	TORONTO HYDRO'S PROPOSED PLAN
Description	With this approach, Toronto Hydro would only replace equipment as it fails (with the exception of critical assets such as stations equipment). This is a purely reactive approach using close to the minimum amount of funding that Toronto Hydro could receive from the Ontario Energy Board.	feeders rst. modern grid technologies and recon guring circuits.
Estimated increase in monthly bill	$6.18/month	$11.75/month
Reliability outcomes by 2019	customer: 1.6/year customer: 1.38 hours/year experiencing seven or more interruptions a year: 13 per cent	customer: 1.15/year customer: 0.65 hours/year experiencing seven or more interruptions a year: 6 per cent
Percentage of equipment past end-of-life in 2020	31 - 34 per cent	25 - 28 per cent

Why Does Toronto Hydro Think This Pace is Best?

As seen in the table above, Toronto Hydro estimates that a run-to-failure approach, when compared to the proposed plan, would result in double the average duration of outages across the system and more than double the percentage of customers on poor performing feeders. Because of the aging system, Toronto Hydro would expect reliability to continue worsening well beyond 2019 if the utility stuck with a run-to-failure approach.

Of course, the two plans presented here are <u>not</u> the only options for pacing system investment. Toronto Hydro can invest more or less capital to achieve a wide variety of outcomes.

So how did Toronto Hydro arrive at the proposed plan?
Since the utility is so large, Toronto Hydro s engineers rely on a software model to help calculate the year in which it is most cost-e ective to rebuild any given part of the system. The model suggests that Toronto Hydro should, in fact, be spending more than it is proposing in the years 2015 to 2019.

So why is Toronto Hydro proposing to invest less than the model recommends?
In reality, there are constraints that prevent the utility from spending above a certain amount. One such restriction is the limited number of skilled resources available to carry-out the work. Resource limitations are also and important reason why Toronto Hydro believes it is wise to invest now and not later: increasing the number of quali ed trades people takes time, and the industry will not train new workers unless there is a consistent and predictable amount of work. This means that the longer Toronto Hydro allows the system to age, the less likely it is that the utility will be able to keep up with investment needs.

Ultimately, Toronto Hydro believes that the proposed plan will deliver improved system performance at a pace that is sustainable for both the utility and the customer.

27. When you consider the options outlined in the table on the previous page, do you think Toronto Hydro s goals are too high, too low or about right?

_____ Too high _____ About right
_____ Too low _____ Not sure

28. What are the goals you feel are too high?

_____
_____
_____
_____
_____
_____
_____
_____

29. What are the goals you feel are too low?

_____
_____
_____
_____
_____
_____
_____
_____

30. Looking at the cost of the Toronto Hydro plan and the outcomes it is expected to achieve, which point of view is closest to your own?

_____ Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more.

_____ I am satis ed with the balance between outcomes and the proposed rate increase.

_____ I don t like the rate increase, but I think it is necessary to maintain the grid to a reasonable standard.

_____ I think the bill impact is too high and Toronto Hydro needs to scale back its plans.

_____ Not sure

What Do You Think About This Review?

Toronto Hydro values your feedback. This is the first time the utility has conducted a review about its upcoming investment plan in this type of format. What did you think about the workbook?

1. Volume of Information Did Toronto Hydro provide too much information, not enough, or just the right amount?

2. Content Covered Was there any content missing that you would have liked to have seen included?

3. Outstanding Questions Is there anything that you would still like answered?

4. Suggestions for Future Consultations How would you prefer to participate in these consultations?

Technical Glossary

Cable Chamber An opening to the underground duct system that facilitates the installation, removal, inspection and repair of cables.

Cable Fault A hole in a cable caused by a short circuit (due to corrosion, overloading over time, water, age) which can result in an explosion.

Circuit A continuous system of conductors providing a path for electricity.

Circuit Breaker A protective switch in a substation that automatically disconnects power to the circuit in the event of a fault. Performs the same function as a circuit breaker in a home.

Conductor An object that permits the ow of electricity, like a wire or cable that allows electricity to ow along its length.

Distribution Transformer A piece of equipment required to reduce voltage to a level that can be used by customers in their homes and businesses.

Feeder A distribution circuit carrying power from a substation to customers. Feeders consist of circuits and other electrical equipment supported by civil infrastructure like poles and ducts.

Kilovolt = 1,000 volts

Megawatt Equals 1,000 kilowatts or enough to power 10,000 100-watt light bulbs.

Primary Cables Cables that distribute electricity throughout the system at a higher (primary) voltage (i.e. greater than 750 volts).

Secondary Cables (or Mains) Low voltage cables that are connected to the secondary (low voltage) side of the distribution transformer and deliver current to customers.

Substations Large power transformers and miscellaneous protection and control equipment (e.g. circuit breakers) that transform electricity from a higher primary voltage to a lower primary voltage. Substations are part of generation, transmission and distribution systems.

Switch A device for isolating a piece of equipment or a section of feeder to allow repairs or replacements to be made on them while in a safe, de-energized state.

Transformer A device used to transform voltage levels to facilitate the transfer of power from the generating plant to the customer.

Transformer Vault A large room (above - or below-ground) that houses transformers, switches and protective equipment.

Volt A measure of electricity. The Standard International unit of electro-motive force, the di erence of potential that would carry one ampere of current against a resistance of one ohm.*

Watt A measure of the work electricity can do.

1,000 watts = 1 kilowatt (the amount of power used by 10 100-watt light bulbs)

1,000,000 watts = 1,000 kilowatts = 1 megawatt

Technical Glossary 36

Have your say about Toronto Hydro s proposed grid renewal plan and its impact on your rates

Toronto Hydro-Electric System (Toronto Hydro) is in the midst of modernizing a distribution system that was largely built in the 1950s and 1960s. The pace at which this is accomplished will inevitably impact your electricity rates and service reliability. The purpose of this consultation is to gather your feedback on Toronto Hydro s proposed ve-year grid renewal and modernization plan for 2015 to 2019.

About This Consultation

This consultation focuses speci cally on what Toronto Hydro does: taking electricity from the provincial grid and distributing it to people and businesses in Toronto.

The electricity industry in Ontario is regulated by the Ontario Energy Board, which recently developed a new framework requiring local distribution companies to gather customer preferences on electricity investments. Your feedback will be presented to the regulator when Toronto Hydro les its rate application for 2015 to 2019. During the rate hearing process, Toronto Hydro will be held accountable for the way you were consulted and the ways in which the utility s plans respond to what you said.

Will you be expected to answer technical questions about the grid?

Toronto Hydro does not expect you to make electrical engineering decisions. The utility is asking you about the electricity issues that matter most to you, and if you feel Toronto Hydro s priorities for investing your electricity dollars are reasonable.

Toronto s distribution system is aging, the city is facing unprecedented growth in the downtown core, and a variety of innovative grid technologies are providing new opportunities for electricity management. This workbook is designed to give you enough background about these issues to develop an informed opinion.

The most important parts of this workbook are the survey questions. By completing them, you can ensure that Toronto Hydro considers your views as they relate to future investments in the distribution grid.

Where are the survey questions located?

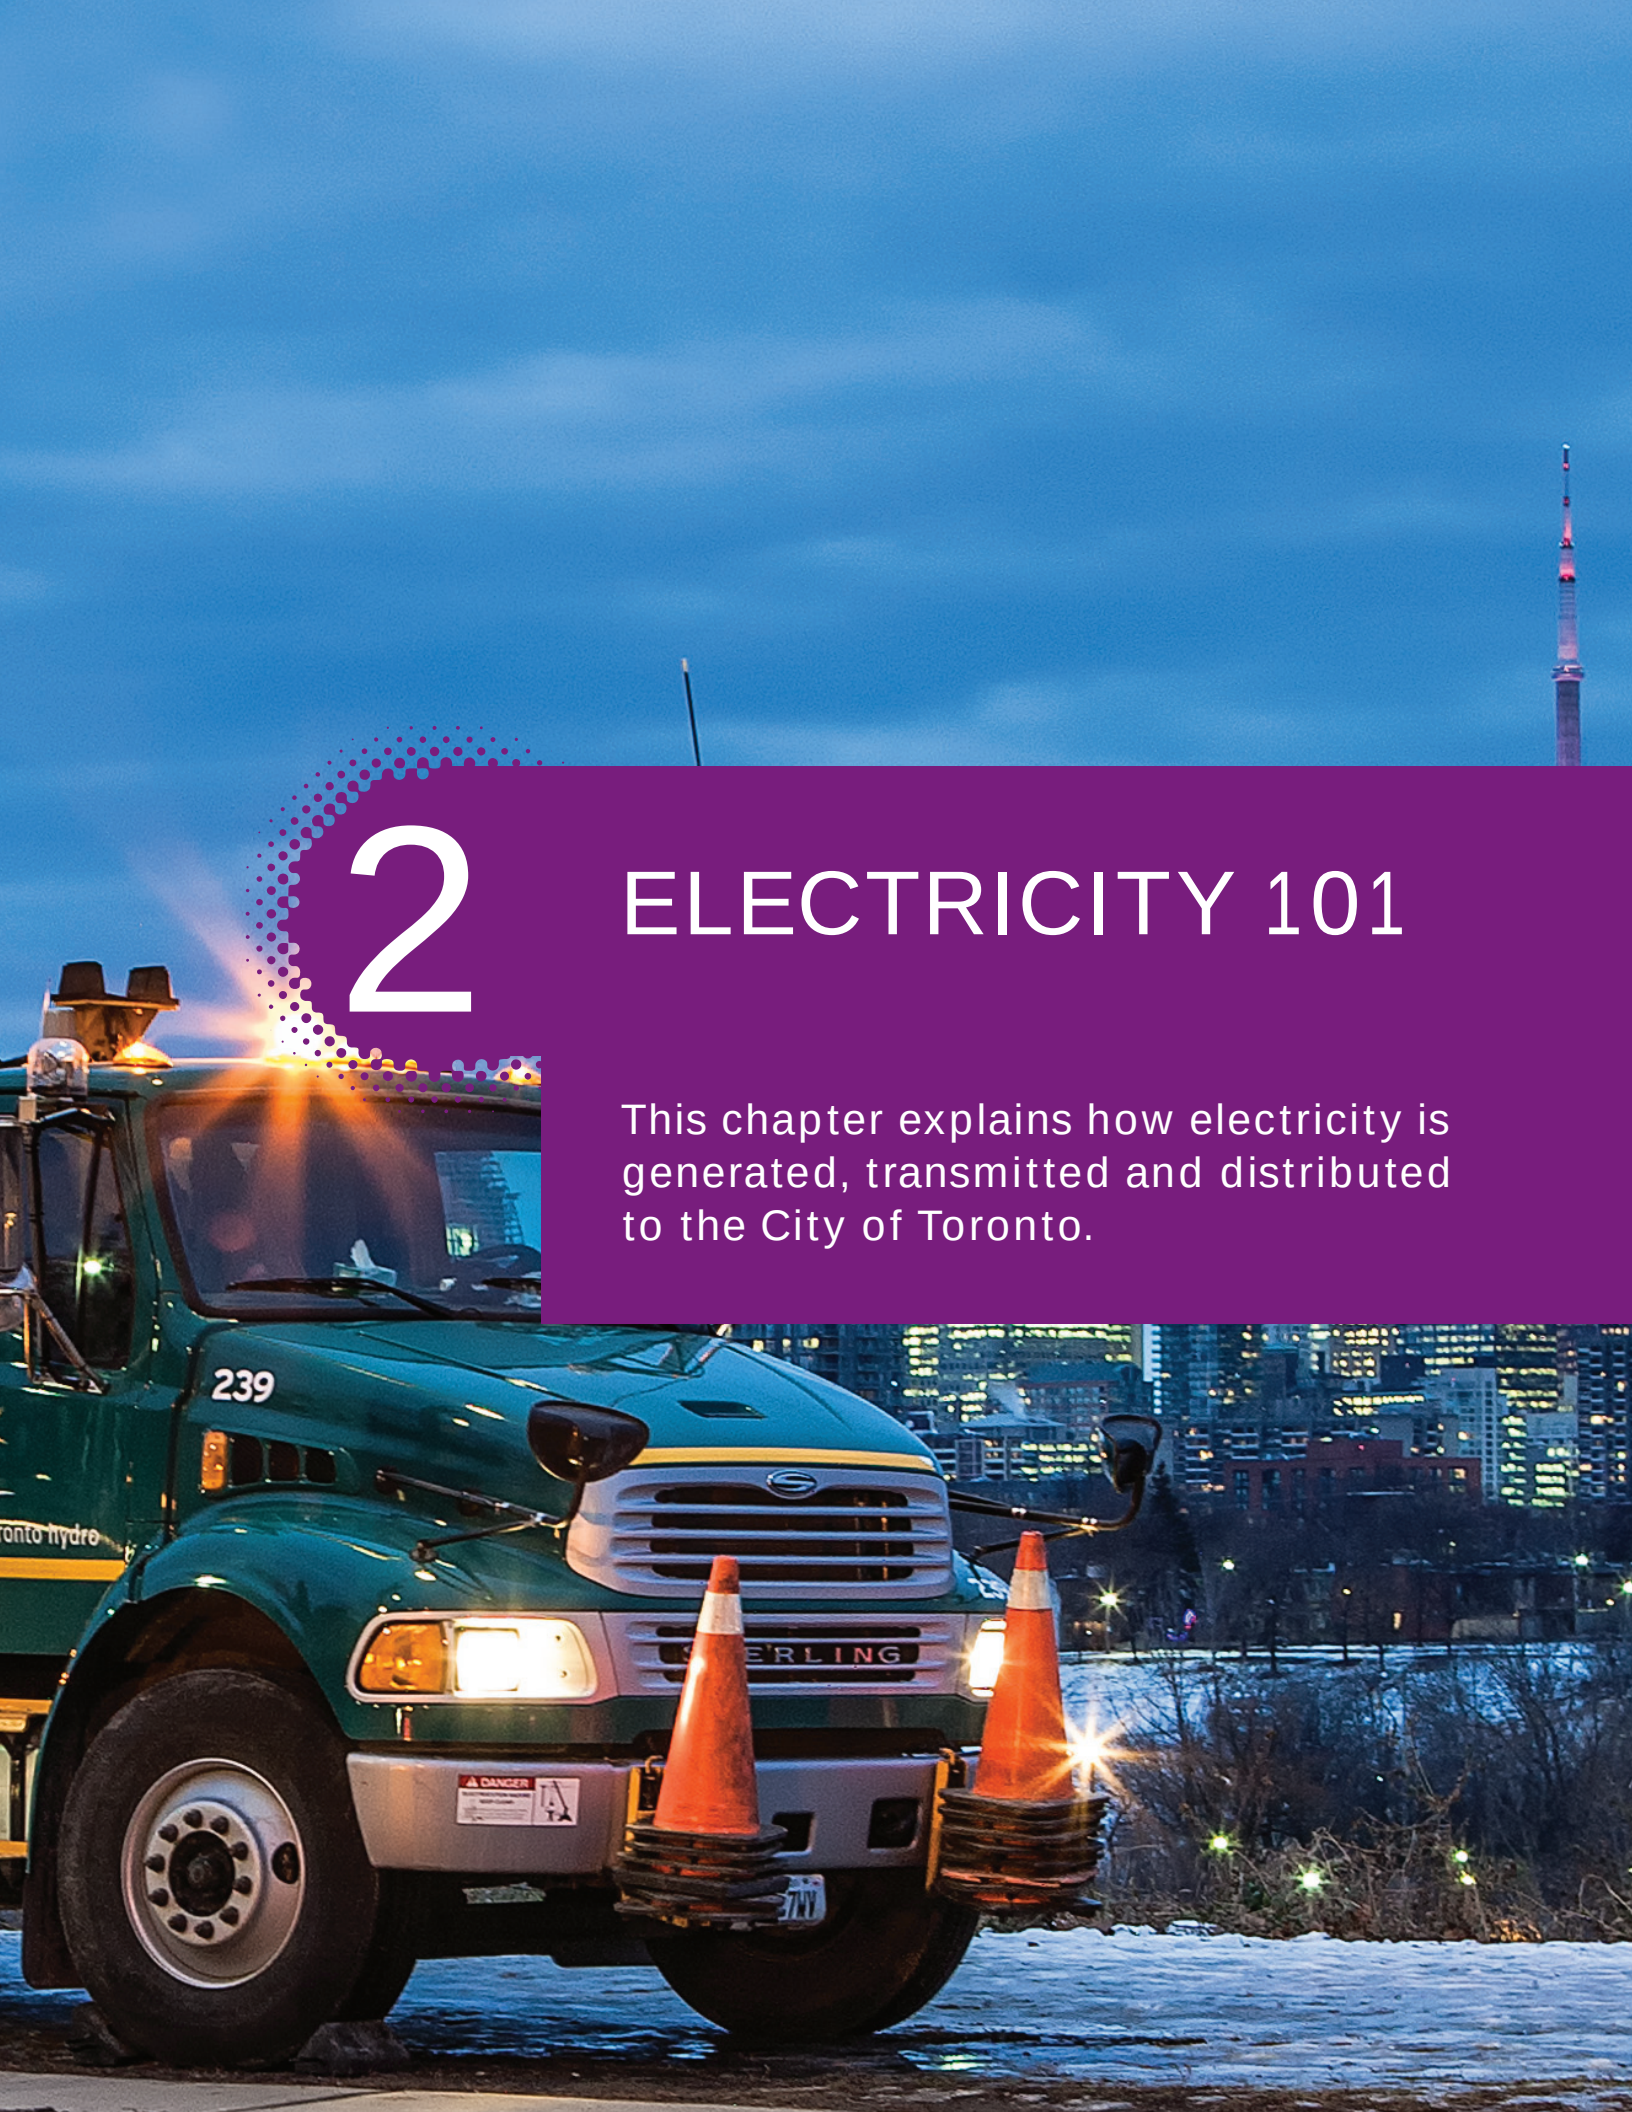
Questions are located on pages:

« « « « « « « « « « «
«« « « « « « « « « « «

How much will Toronto Hydro s proposed grid renewal plan cost me?

About one quarter of your electricity bill currently goes to Toronto Hydro. That s about $73 per month for the average small business owner. Toronto Hydro s proposed grid renewal plan will add:

- « ,,. 4%) 0(5« $6.10 each year to an average small business owner s monthly bill for the period of 2015 to 2019,
- «3$% $«)1*0/0 «0 (%* .! /
  approximately $30.50 per month by 2019compared to 2014.



These bill impacts include capital investments and operating expenses. Toronto Hydro is planning to keep increases in operating expenses below in ation for the duration of the plan, which is why this consultation focusses solely on capital investments in the system.

How This Consultation is Being Managed

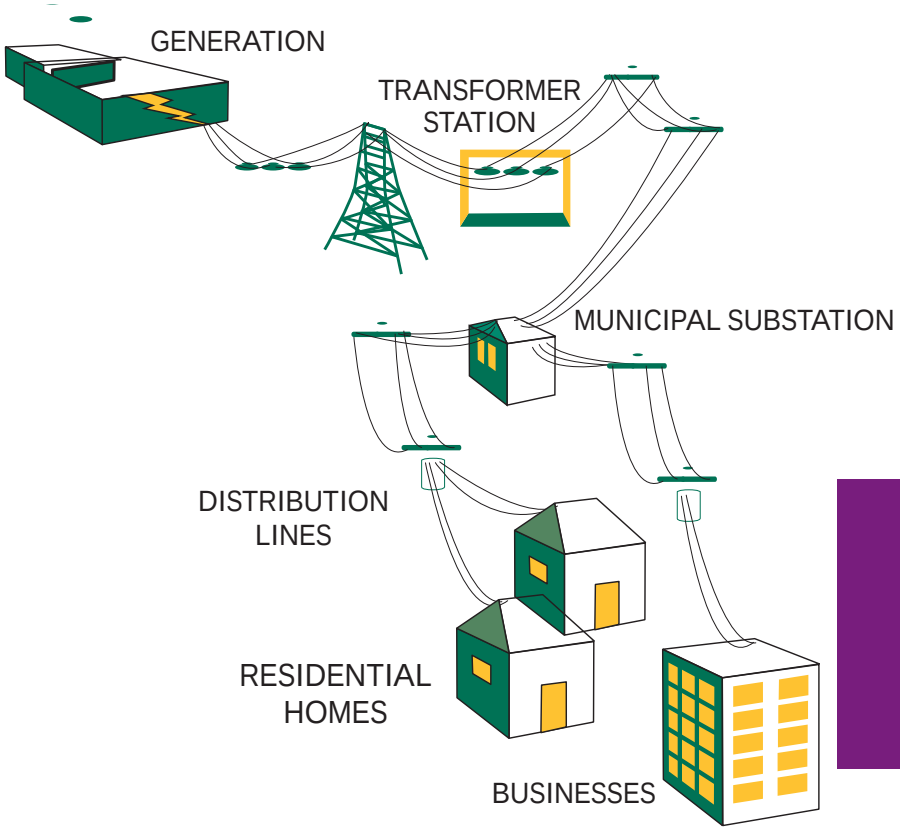
This public consultation process is being managed by a third-party research company. They will compile the results of all surveys and submit a report to Toronto Hydro. Your responses will be combined with others to protect your privacy.

You Can Participate in a Separate Conversation About Long-Term Energy Planning

Do we have enough electrical infrastructure to meet Toronto s needs? The Central Toronto Integrated Regional Resource Plan looks at where demand for electricity is growing and how this can be best managed over the next 25 years. Options considered include: conservation, local distributed generation, transmission and distribution infrastructure. You ll pay later for the choices being made today about your electricity system. Visit torontohydro.com/haveyoursay for more information.

2 ELECTRICITY 101

This chapter explains how electricity is generated, transmitted and distributed to the City of Toronto.



Understanding Toronto Hydro s Role in Ontario s Electricity System

There are three main components to all electricity systems: generation, transmission and distribution.

Where Electricity Comes From

In Ontario, 70 per cent of electricity is generated by Ontario Power Generation. This provincially-owned organization has generating stations across Ontario that produce electricity from hydroelectric, nuclear and fossil fuel sources.

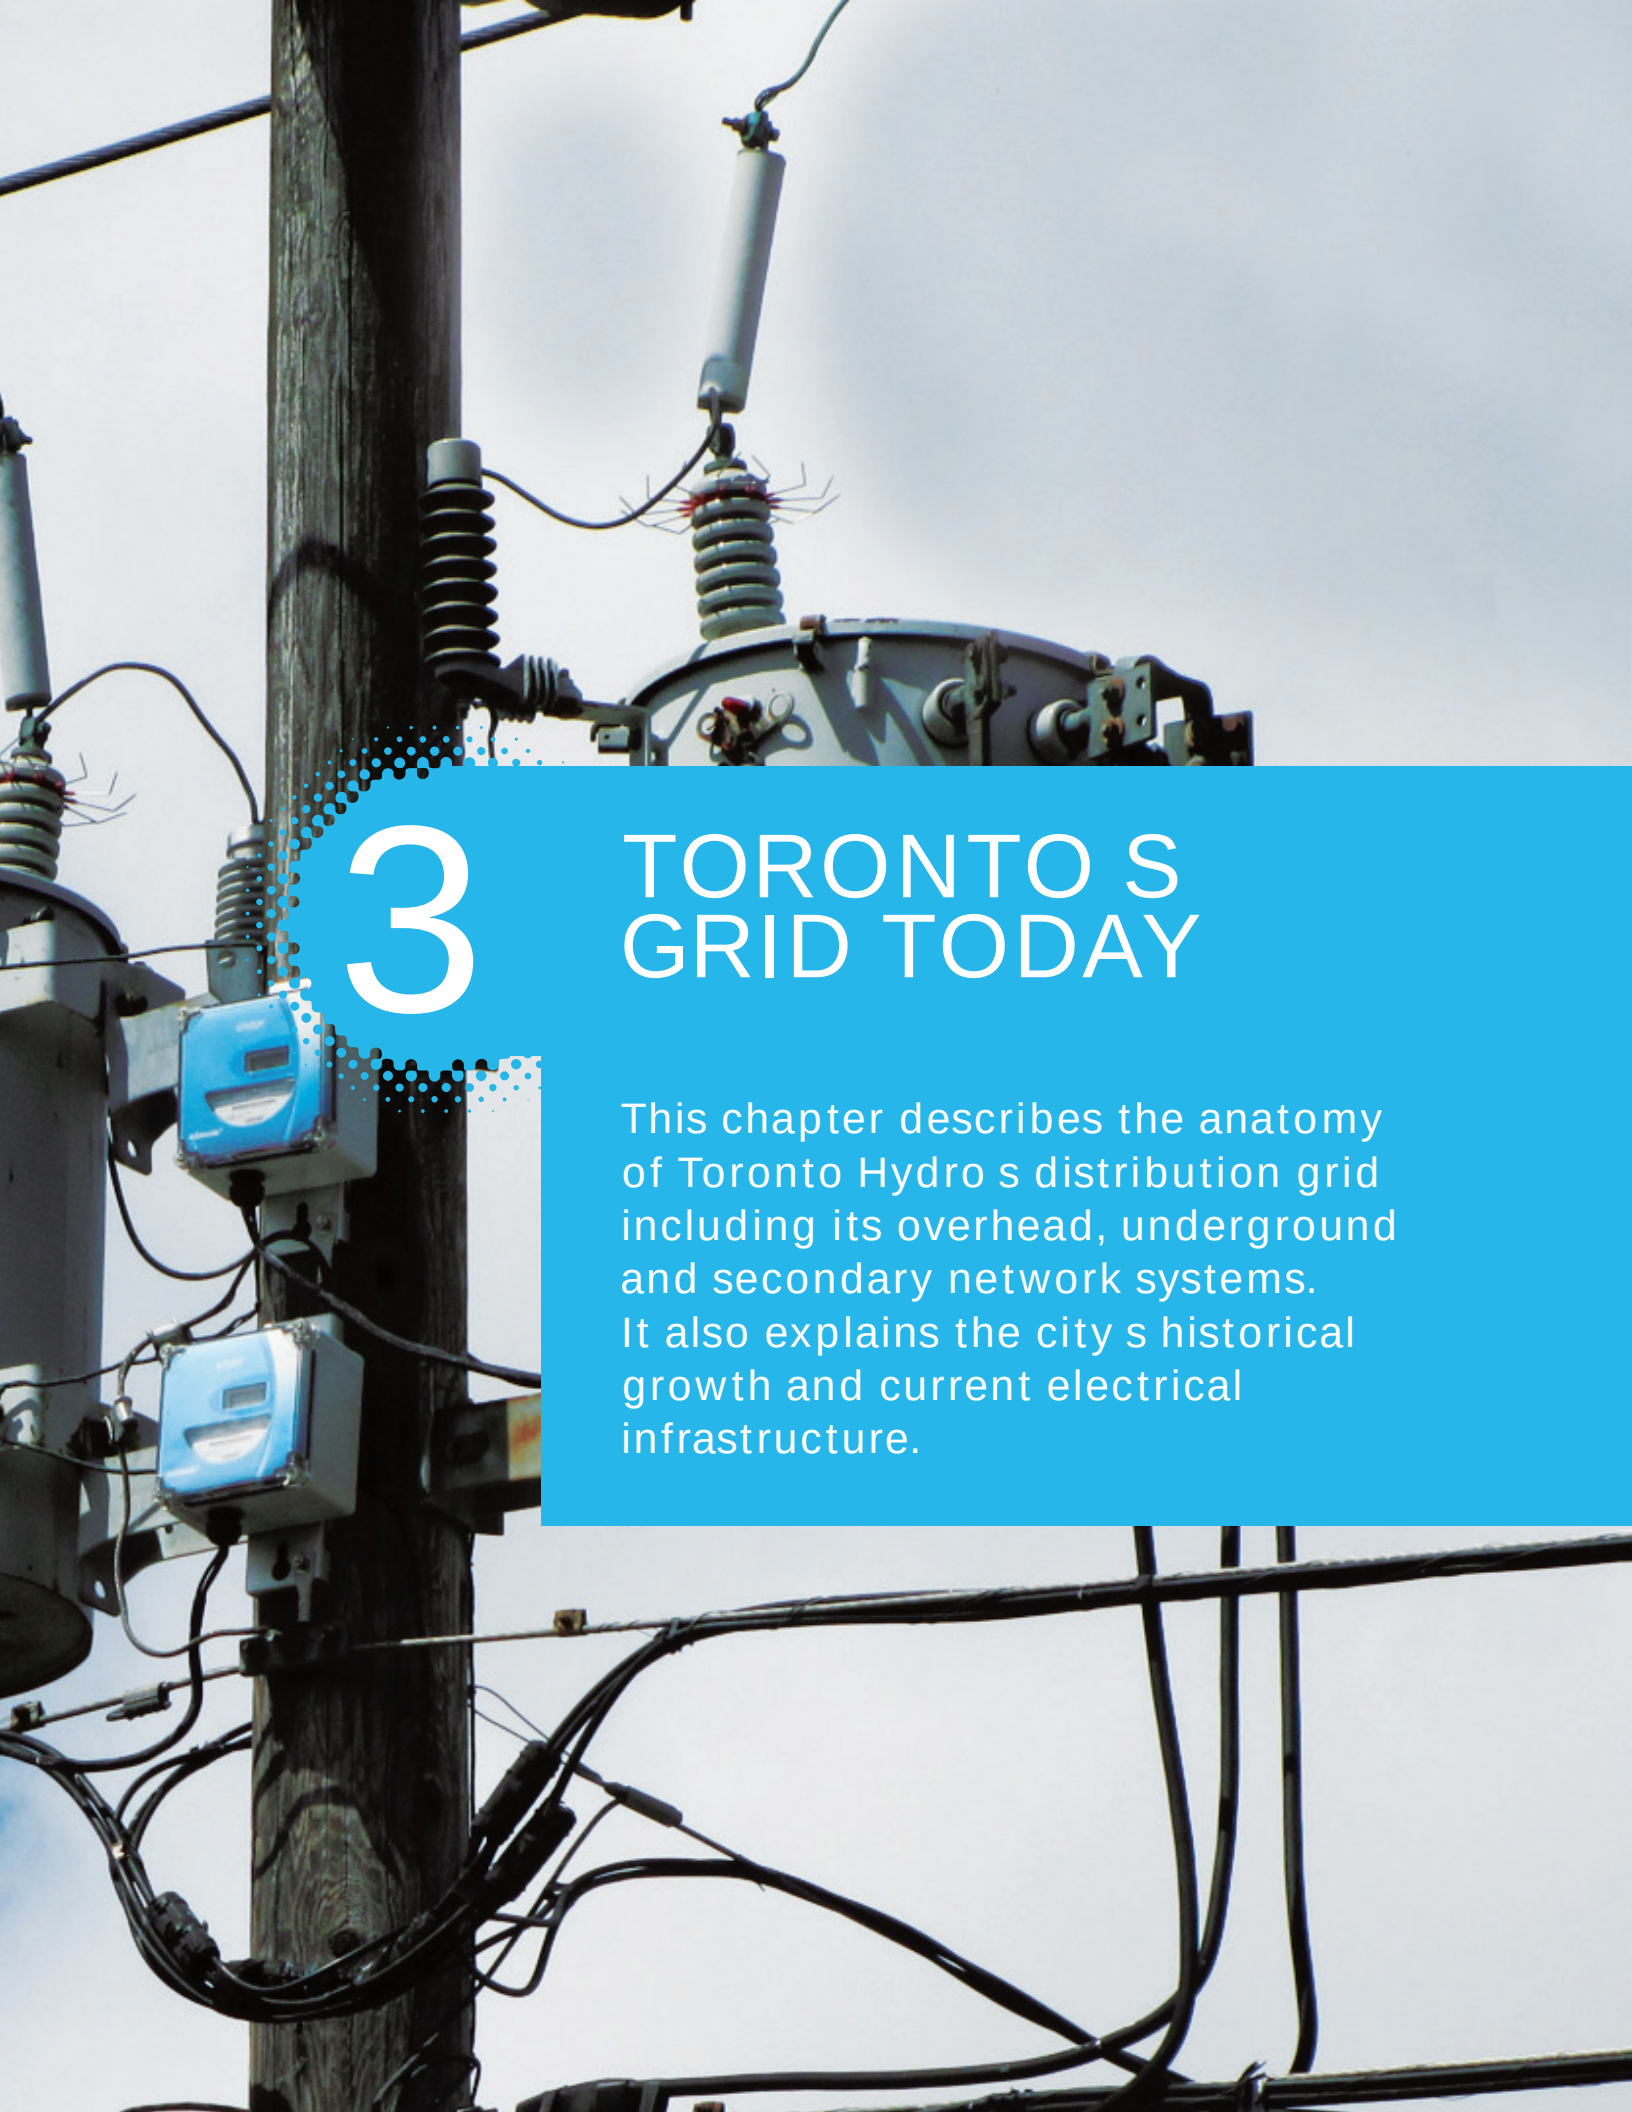
Once electricity is generated, it must be delivered to urban and rural areas in need of power. This happens by way of high voltage transmission lines that serve as highways for electricity. The province has more than 30,000 kilometres of transmission lines*, owned mostly by Hydro One.

Toronto Hydro

Toronto Hydro is responsible for the last step of the journey: distributing electricity to customers in Toronto.

The City of Toronto

The City of Toronto is Toronto Hydro s sole owner and shareholder. The Ontario Energy Board allows Toronto Hydro to earn a speci ed annual return, part of which is used to pay an annual dividend to the shareholder. The City uses this dividend to fund city services like snow removal and garbage collection. Toronto Hydro reinvests the remaining portion of this amount back into the utility.



How are Electricity Rates Determined?

Toronto Hydro is funded by the distribution rates paid by its customers. Periodically, Toronto Hydro is required to le an application with the Ontario Energy Board to determine the funding available to operate and maintain the distribution system. Toronto Hydro must submit evidence to justify the amount of funding it needs to safely and reliably distribute electricity.

Who Protects Consumer Interests?

Toronto Hydro s evidence is assessed in an open and transparent public process known as a rate hearing. A number of public intervenors with electricity industry expertise submit their own evidence challenging Toronto Hydro s plans and assumptions. At the end of the process, the Ontario Energy Board weighs the evidence and decides on the rates Toronto Hydro can charge for distribution.

3 TORONTO S GRID TODAY

This chapter describes the anatomy of Toronto Hydro s distribution grid including its overhead, underground and secondary network systems. It also explains the city s historical growth and current electrical infrastructure.

The Nuts and Bolts of Toronto Hydro s Distribution Grid

Toronto s electricity grid is comprised of overhead, underground and secondary network systems. The mix is largely due to the utility s amalgamation. In 1998, Toronto Hydro merged with North York Hydro, Scarborough Hydro, East York Hydro, York Hydro, and Etobicoke Hydro. Each utility operated independent distribution systems, and as a result, the infrastructure varies from region to region. Toronto Hydro has been working to gradually standardize this equipment, which will help improve reliability and safety across the city, and make system operation more e cient.

A Look at Toronto Hydro s Growth

Toronto Hydro has been serving the city since 1911 and has experienced many changes over the years.

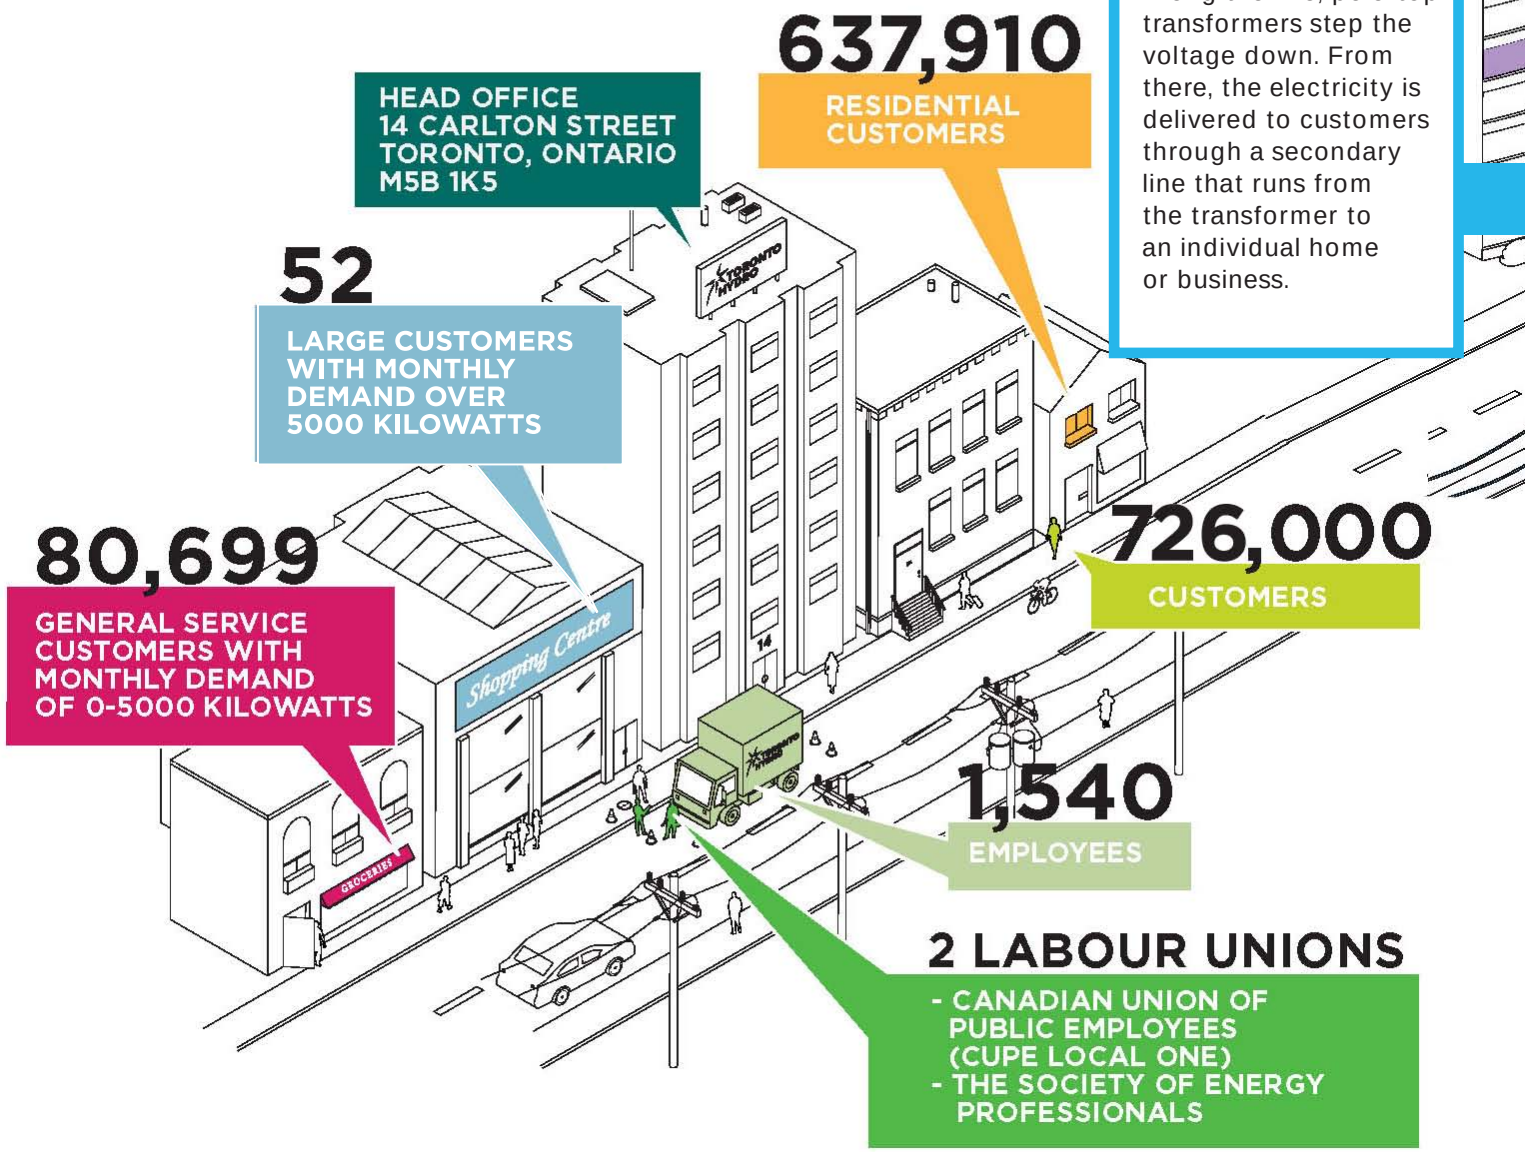
The rst electrically-powered trolley bus and electric tra c lights were introduced in the 1920s. Street lighting was introduced in the 1930s and was upgraded following World War II.

Between 1945 and 1955, the City s power consumption increased by 75 per cent thanks to the post-war baby boom and immigration. The dramatic growth created a need to expand the system. Toronto Hydro built 12 new municipal substations. Much of the equipment installed during this decade is still in operation today.

The 1970s saw dramatic skyline changes with the addition of the CN Tower, First Canadian Place, and the Royal Bank Plaza. As society started to become more environmentally conscious, Toronto Hydro introduced energy conservation programs and incentives to many of its customers.

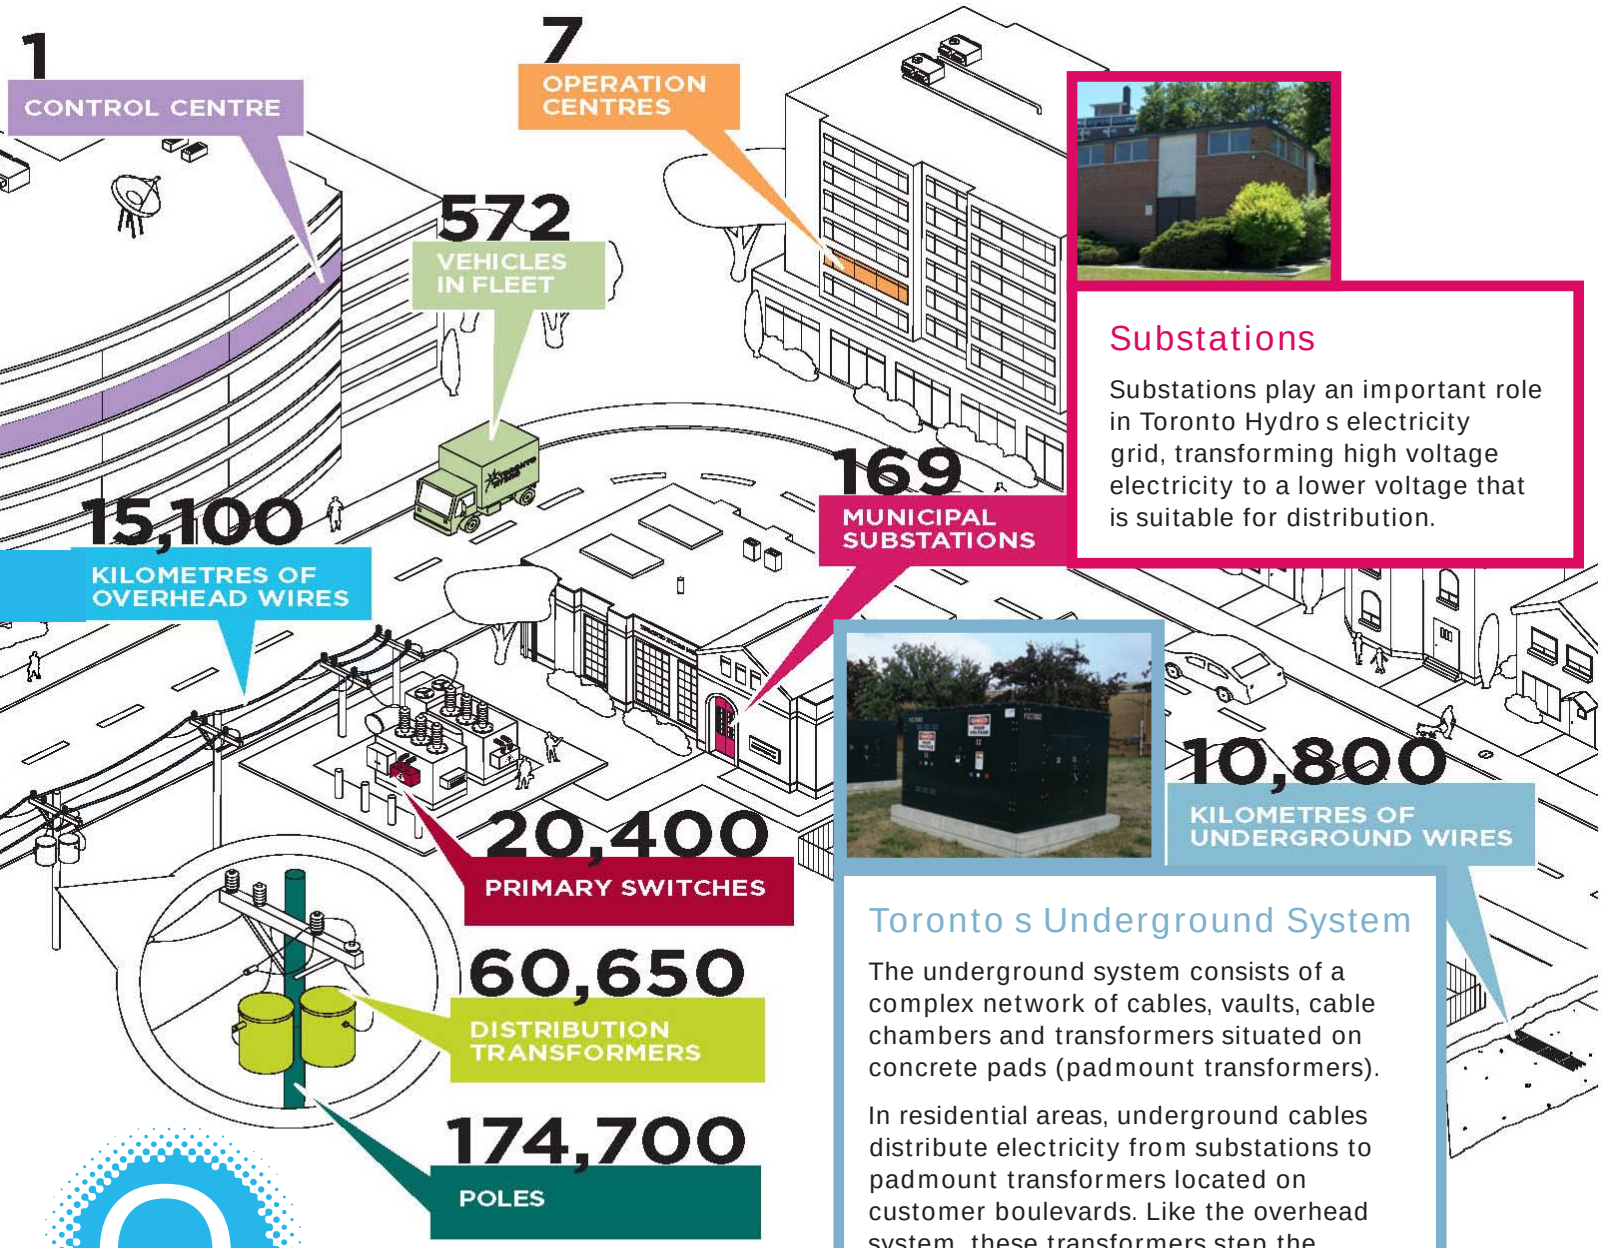
In the early 1980s, Toronto Hydro introduced a computerized control system to remotely monitor the distribution system and respond more quickly to emergencies.

In 2006, facing the challenges described in the following chapters, Toronto Hydro embarked on the largest infrastructure renewal program in its history.



About Toronto Hydro

Toronto Hydro owns and operates $2.6 billion in capital assets and is the largest municipal electrical utility in Canada. It distributes about 19 per cent of Ontario s electricity demand.



Toronto s Overhead System

The overhead system is made up of distribution lines that operate at either 4.16 kilovolts, 13.8 kilovolts or 27.6 kilovolts. These primary lines are strung across hydro poles. Along the line, pole-top transformers step the voltage down. From there, the electricity is delivered to customers through a secondary line that runs from the transformer to an individual home or business.

1. Given what you know and what you have read so far, how well do you feel you understand the important parts of the electricity system, how they work together and which services Toronto Hydro is responsible for?

   _____ Very well
   _____ Somewhat well
   _____ Not very well
   _____ I don t understand at all

Substations

Substations play an important role in Toronto Hydro s electricity grid, transforming high voltage electricity to a lower voltage that is suitable for distribution.

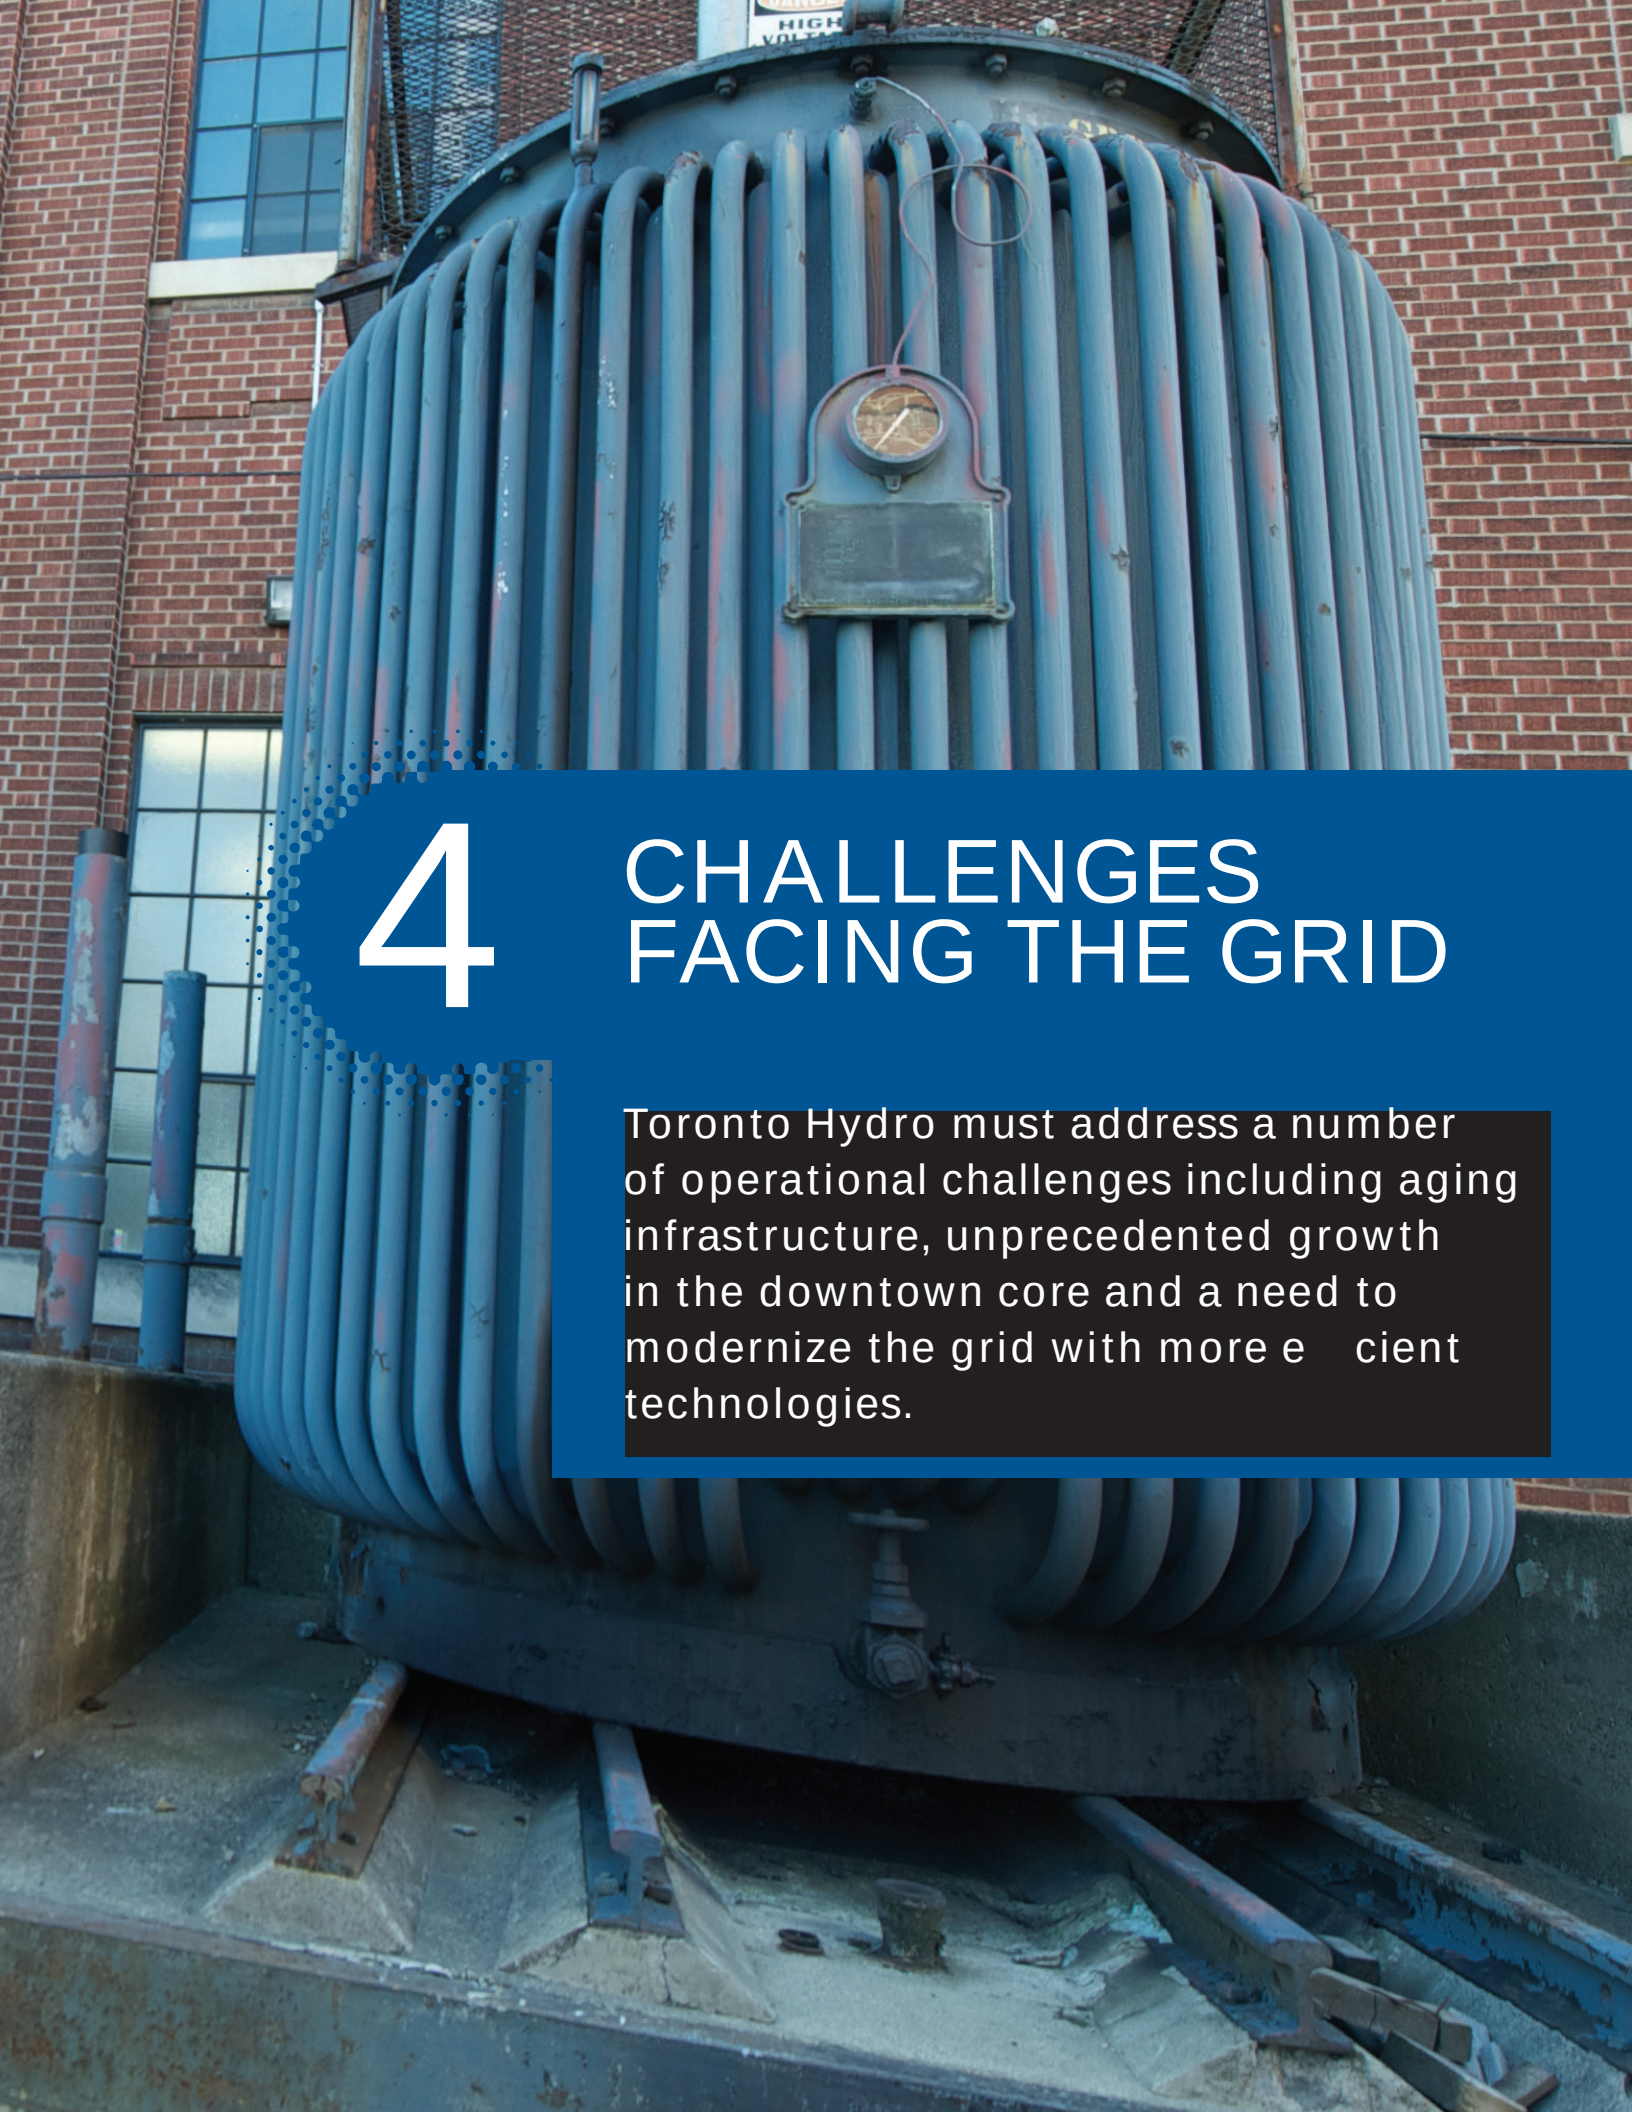
Toronto s Underground System

The underground system consists of a complex network of cables, vaults, cable chambers and transformers situated on concrete pads (padmount transformers).

In residential areas, underground cables distribute electricity from substations to padmount transformers located on customer boulevards. Like the overhead system, these transformers step the electricity down to a lower voltage, and current is delivered to customers through a secondary line. When distributing electricity to urban areas or larger customers, bigger vault transformers are used. Cable chambers are located throughout the underground system to provide crews with access to feeder cables.

2. How satis ed are you with the job Toronto Hydro is doing running your local distribution system?

____ Very satis ed
____ Somewhat satis ed
____ Somewhat dissatis ed
____ Very dissatis ed
____ Don t Know



3. Is there anything in particular that Toronto Hydro can do to improve its service to you?

_____

_____

_____

_____

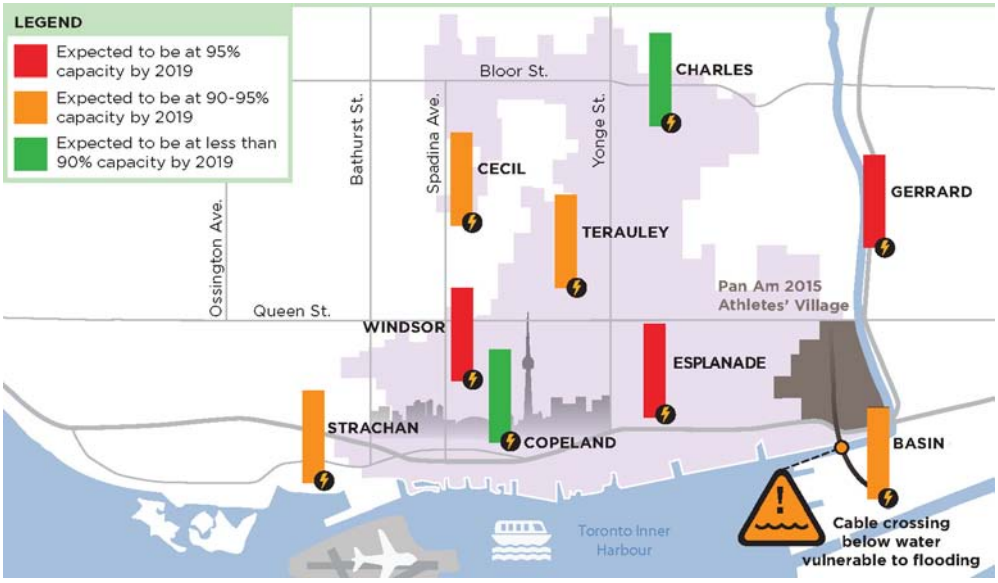
4 CHALLENGES FACING THE GRID

Toronto Hydro must address a number of operational challenges including aging infrastructure, unprecedented growth in the downtown core and a need to modernize the grid with more e cient technologies.

Toronto s Renaissance: Accommodating a City Under Construction

Recently crowned the fourth largest city by population in North America and a continued leader in high rise development, Toronto is a city under construction. Toronto Hydro plays an important role in this growth.

Toronto Hydro is required by law to:



« *+! 0*B«1/0)!/00$#%
« 1. 0(5)0!«1/0)!(! 0.% %05«*/1),0%*
«4, *)+ 2!%/0.% 10%*!1%,)!0(«)+ 0!!0 %*&! 0/%*%0% 0!«50$!%05«
of Toronto, TTC, Metrolinx and GO Transit

The rate of Toronto s growth is making it increasingly di cult to ful ll these responsibilities while maintaining system performance:

« $!!.)!5/ . ,!/1* !«*/0.1 0%*0$ *B«%05$% #* 4% %05
« $!!.)!0$ *&!*0% ((+ 0%*&! 0/!(0!!*/0.1 0%*«50$!*

Growth from high-rise construction is putting immediate and longer-term pressures on the existing grid.

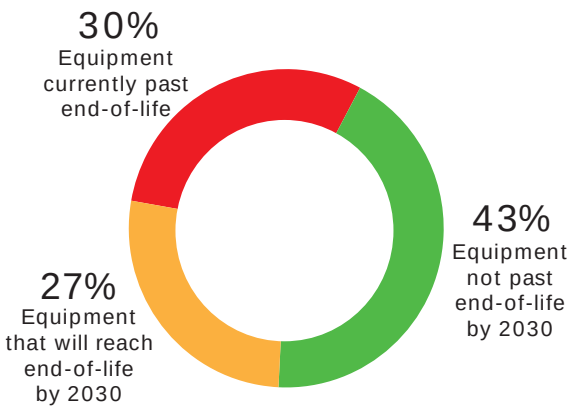
Downtown Stations are Overloaded

To help ensure the city s continued economic success and its ability to serve the growing population, Toronto Hydro is investing in expanding the capacity of its stations and feeders.

Under provincial legislation, there are several types of investments Toronto Hydro must make when the need presents itself. How reasonable do you feel it is to give each of these investments a priority over other investments (for example, replacing aging equipment)?

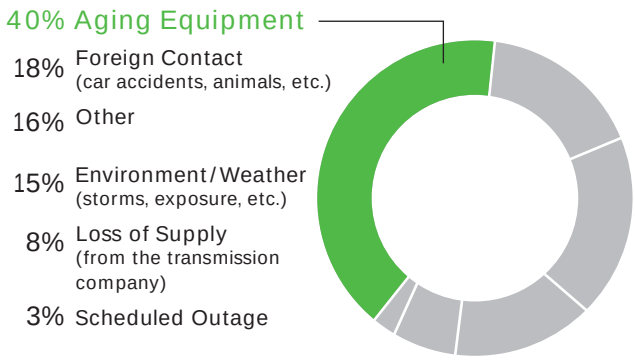
4. Connecting new customers such as new housing, condominiums or businesses. (Provincial regulations set connection fees which cover unusual costs).
   _____ Very reasonable _____ Somewhat reasonable
   _____ Not very reasonable _____ Not reasonable at all _____ Don t Know

5. Maintaining and upgrading customer meters to meet provincial standards.
   _____ Very reasonable _____ Somewhat reasonable
   _____ Not very reasonable _____ Not reasonable at all _____ Don t Know



6. Moving existing electricity infrastructure such as poles and transformers to enable other projects such as street widening or new developments. (Provincial regulations set fees which cover unusual costs).
   _____ Very reasonable _____ Somewhat reasonable
   _____ Not very reasonable _____ Not reasonable at all _____ Don t Know

Aging Equipment: All Good Things Must Come to an End



A large part of Toronto Hydro s distribution system was installed in the 1950s and 1960s. This infrastructure has served the city well beyond its expected lifespan. But now the grid is at a point where renewal investments can no longer be deferred without a ecting service reliability.

Almost 60% of the city s distribution infrastructure needs to be rebuilt over the next two decades. The price of these upgrades is approximately $5.6 billion overall.

How Fast is the System Aging?

Aging Equipment is Responsible for Approximately 40% of Outages

About 30 per cent of our distribution equipment is past its end of life and an additional 30 per cent will reach this state over the next 20 years.

7. Thinking about the aging equipment in the grid, do you feel it s best to wait until the equipment breaks down to get full value from each piece of equipment, even if it means power outages, or do you feel the best approach is to replace the equipment before it breaks down to avoid power outages, even if it means not getting all the use possible from each piece of equipment?

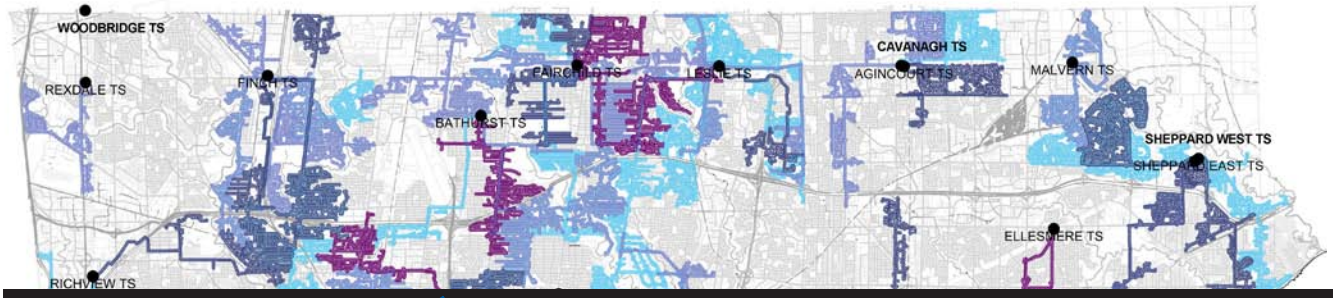
____ Wait until break down ____ Replace before break down

A Look at Toronto Hydro s Service Reliability

Aging infrastructure is a major challenge to service reliability. Toronto Hydro is managing this through grid renewal and modernization.

Toronto Hydro uses two main measures to evaluate service reliability: frequency and duration.

Over the past decade, the average customer has experienced:

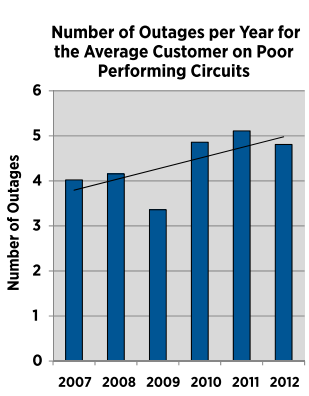


- 03 !« 1.4 and 2 outages per year.
- 03 !« 60 and 90 minutes without power per year.

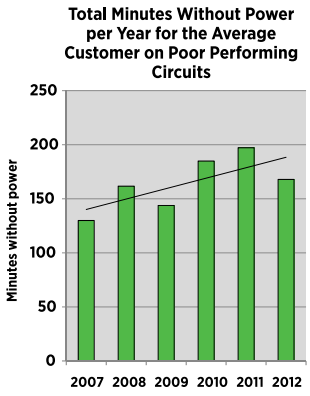
While outage frequency and duration averages are trending downwards, actual customer experiences vary. Some customers on newer parts of the system may not experience any outages while others are experiencing as many as 20 outages per year.

The Least Reliable Equipment on the Block

Toronto Hydro pays special attention to circuits with exceptionally poor performance. Engineers maintain a list of circuits experiencing seven or more outages in a year, and addressing this list is a continuous e ort. The system is aging at such a rate that new poor performing circuits are added to the list almost as fast as Toronto Hydro can deal with existing problem circuits.



Where are Poor Performing Circuits Located?



Customers Located in These Areas are Receiving Poor Service Reliability

Over the past decade, the average customer on a poor performing circuit has experienced:

- « ve outages per year (compared to the system average of two)
- «150 to 200 minutes without power per year (compared to the system average of 60 to 90 minutes for the year)

Without su cient investment in renewing and modernizing the distribution grid, Toronto Hydro expects service reliability of poor performing circuits to continue deteriorating.

8. Do you feel the current average number of electricity outages is acceptable or not acceptable?
   ____ Very acceptable ____ Somewhat acceptable
   ____ Not very acceptable ____ Not acceptable at all ____ Don t Know

9. Do you feel the current average amount of outage time is acceptable or not acceptable?
   ____ Very acceptable ____ Somewhat acceptable
   ____ Not very acceptable ____ Not acceptable at all ____ Don t Know

10. How many outages have you experienced over the past two years?
    ____ INSERT ACTUAL NUMBER

11. (IF 1 OR MORE OUTAGE) How long was the power out during your most recent power outage?
    ____ INSERT ACTUAL NUMBER

12. (IF 1 OR MORE OUTAGE) How did the power outage a ect your business?

    _____
    _____
    _____
    _____
    _____
    _____

13. Is there a certain length of time at which the costs and consequences of an outage become more serious for you?

    _____
    _____
    _____
    _____
    _____
    _____

No system delivers perfectly reliable electricity. Generally, the more reliable the system, the more expensive the system is to build and maintain. Please answer the following two questions.

14. How many power service interruptions are reasonable in a year?
    ____ No outage is acceptable
    ____ One ____ Two ____ Three ____ Four ____ More than four

15. What is a reasonable duration for a service interruption?
    ____ No outage is acceptable
    ____ 30 minutes ____ 1 hour ____ 2 hours ____ 3 hours
    ____ 4 hours or more

Changing Weather Patterns

Climate change is raising the risk of severe weather events impacting the system more frequently in the future. Toronto has experienced several major storms over the last year-and-a-half alone:

- 0@$# Hurricane Sandy (October 2012), 65,000 customers were without power.
- $ torrential downpour on July 8, 2013, caused severe ooding in stations and the underground system. Approximately 300,000 customers were a ected about half of all customers and thousands experienced extended outages.
-) 0 ice storm in its history. Freezing rain caused massive destruction to trees and power lines, leading to widespread and extended outages. About 300,000 customers were impacted and some people were without power for as long as 12 days. Many customers spent their holidays in City of Toronto warming stations.

Planning for the weather

Toronto Hydro is studying the results of these unusual weather events to determine whether changes are needed to any of the utility s best practices. In the meantime, Toronto Hydro anticipates that a number of the planned capital investments for 2015 to 2019 will help improve system performance during major weather events. For example, replacing box construction circuits (explained on page 20) with taller, higher-voltage circuits will help reduce the impact of falling trees and branches in certain areas.

Why not move everything underground?

There are pros and cons to both overhead and underground circuits. Underground circuits were hit harder than overhead circuits in the summer ooding, while overhead circuits were hit harder in the ice storm. Underground circuits can cost many times more than simply replacing the existing overhead lines; the cost for moving all circuits underground would be in the range of $15 billion. Toronto Hydro must consider these options in light of the other capital needs discussed in this workbook and the need to keep increases in customer bills as low as possible.

16. Over the past year, Toronto has experienced two unusual weather events the ooding in July and the ice storm in December. Thinking back to the two major storm events of 2013, were you a ected by either or both of these events?

____ Yes the ooding in July
____ Yes the ice storm in December
____ Yes Both
____ No neither weather event a ected my electricity

17. Whether you were personally a ected or not, how satis ed are you with Toronto Hydro s management of these events?

____ Very satis ed
____ Somewhat satis ed
____ Somewhat dissatis ed
____ Very dissatis ed
____ Don t Know

18. Is there anything in particular that Toronto Hydro could have done to improve its service to you during these events?

Grid Modernization

The pressures of economic growth and system aging are at the heart of Toronto Hydro s investment plan for 2015 and beyond. For the most part, responding to these pressures will involve rebuilding and expanding the system using tried and true distribution technology. At the same time, technological innovation in the industry has begun to change the way that utilities can manage the system and the way that customers can use the grid. The following section highlights some of the pressures and opportunities associated with the evolving technological landscape.

Here are some of the modern grid management technologies that Toronto Hydro is exploring:

Feeder Automation

« « (/ 0 +)0!3%0 $%0+0! 0« « «

system operators to address local capacity issues throughout the distribution system and to moderate peak power costs.

19. Modernizing the grid can allow Toronto Hydro to improve reliability. Investments such as automated switches may allow Toronto Hydro to minimize the number of people impacted by outages and to restore electricity to most customers in a matter of seconds. Given there are many other areas of needed investment, such as connecting new customers, replacing aging equipment and expanding capacity for long-term growth, how important do you feel it is for Toronto Hydro to invest now in modernizing the grid?

_____ Very important
_____ Somewhat important
_____ Not very important
_____ Not important at all
_____ Don t Know

Here are some of the new technologies that are changing the way that customers use the grid:

Electric Vehicles

allows Toronto Hydro to develop charging pro les for all vehicle models.

vehicles on the lifespan and performance of equipment and make proactive upgrades when necessary.

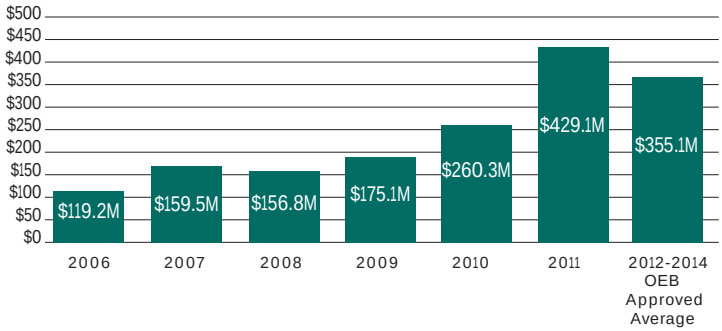
Making Room for Renewable Generation Projects

Solar power and energy-from-waste facilities are renewable forms of distributed generation that are growing in popularity and a ordability. Toronto Hydro is mandated to connect distributed generation as part of the province s Feed-in Tari program. Since 2012, Toronto Hydro has connected more than 375 distributed generation projects to the grid.

5 HOW WE RE MANAGING GRID PRESSURES

This chapter covers the work Toronto Hydro is doing to address grid challenges. It includes information about historical grid investments, ongoing capital projects and productivity improvements.

Working Hard to Improve Reliability



Since 2006, Toronto Hydro has invested approximately $2.5 billion in infrastructure renewal. This investment represents some of the largest construction programs in the utility s history, replacing approximately:

« «%(-0./ «+ « %*# «(%*/
« «(«(/
« «0. */!)!/

From 2006 to 2009, Toronto Hydro gradually increased its capital spending on poor performing feeders and underground cables that were negatively impacting reliability.

In 2010 and 2011, the utility increased spending to a level needed to execute a broader grid renewal and modernization program.

Toronto Hydro has increased capital spending

The following case studies provide a snapshot of major projects being executed across Toronto Hydro s distribution system. Feel free to read about whichever projects interest you.

Stretching your Electricity Dollars

Reducing Strain on the Grid

Toronto Hydro is reducing strain on the grid by supporting provincial conservation and demand management programs for residential, business and industrial customers. These programs are not generally an alternative to renewing the aging distribution system in the near-term, but they may help defer the need for capacity expansion and renewal investments over the longer-term.

Conservation Program Results from 2012

Here is a look at conservation programs provided to customers and the electricity savings they yielded.

saveONenergy℠ Conservation Programs	Results	MW Saved	MWH Saved
FRIDGE & FREEZER PICK-UP	2,802 refrigerators and freezers collected	0.2	1,092
COUPONS	Bi-annual customer events and coupons for energy e cient products held at participating retailers	0.2	3,606
DEMAND RESPONSE CONTRACTUAL DR3	48 commercial and industrial customers contracted to reduce energy use at speci ed times	14.7	312
SMALL BUSINESS LIGHTING	3,498 lighting retro ts installed	2.5	9,383
HEATING & COOLING INCENTIVE	13,047 participants received an incentive for installing an ENERGY STARfi quali ed central heating or cooling system	2.8	4,782
peaksaver PLUSfi	43,149 installation	22.9	169
RETROFIT PROGRAM	1,168 project applications	15.9	80,294

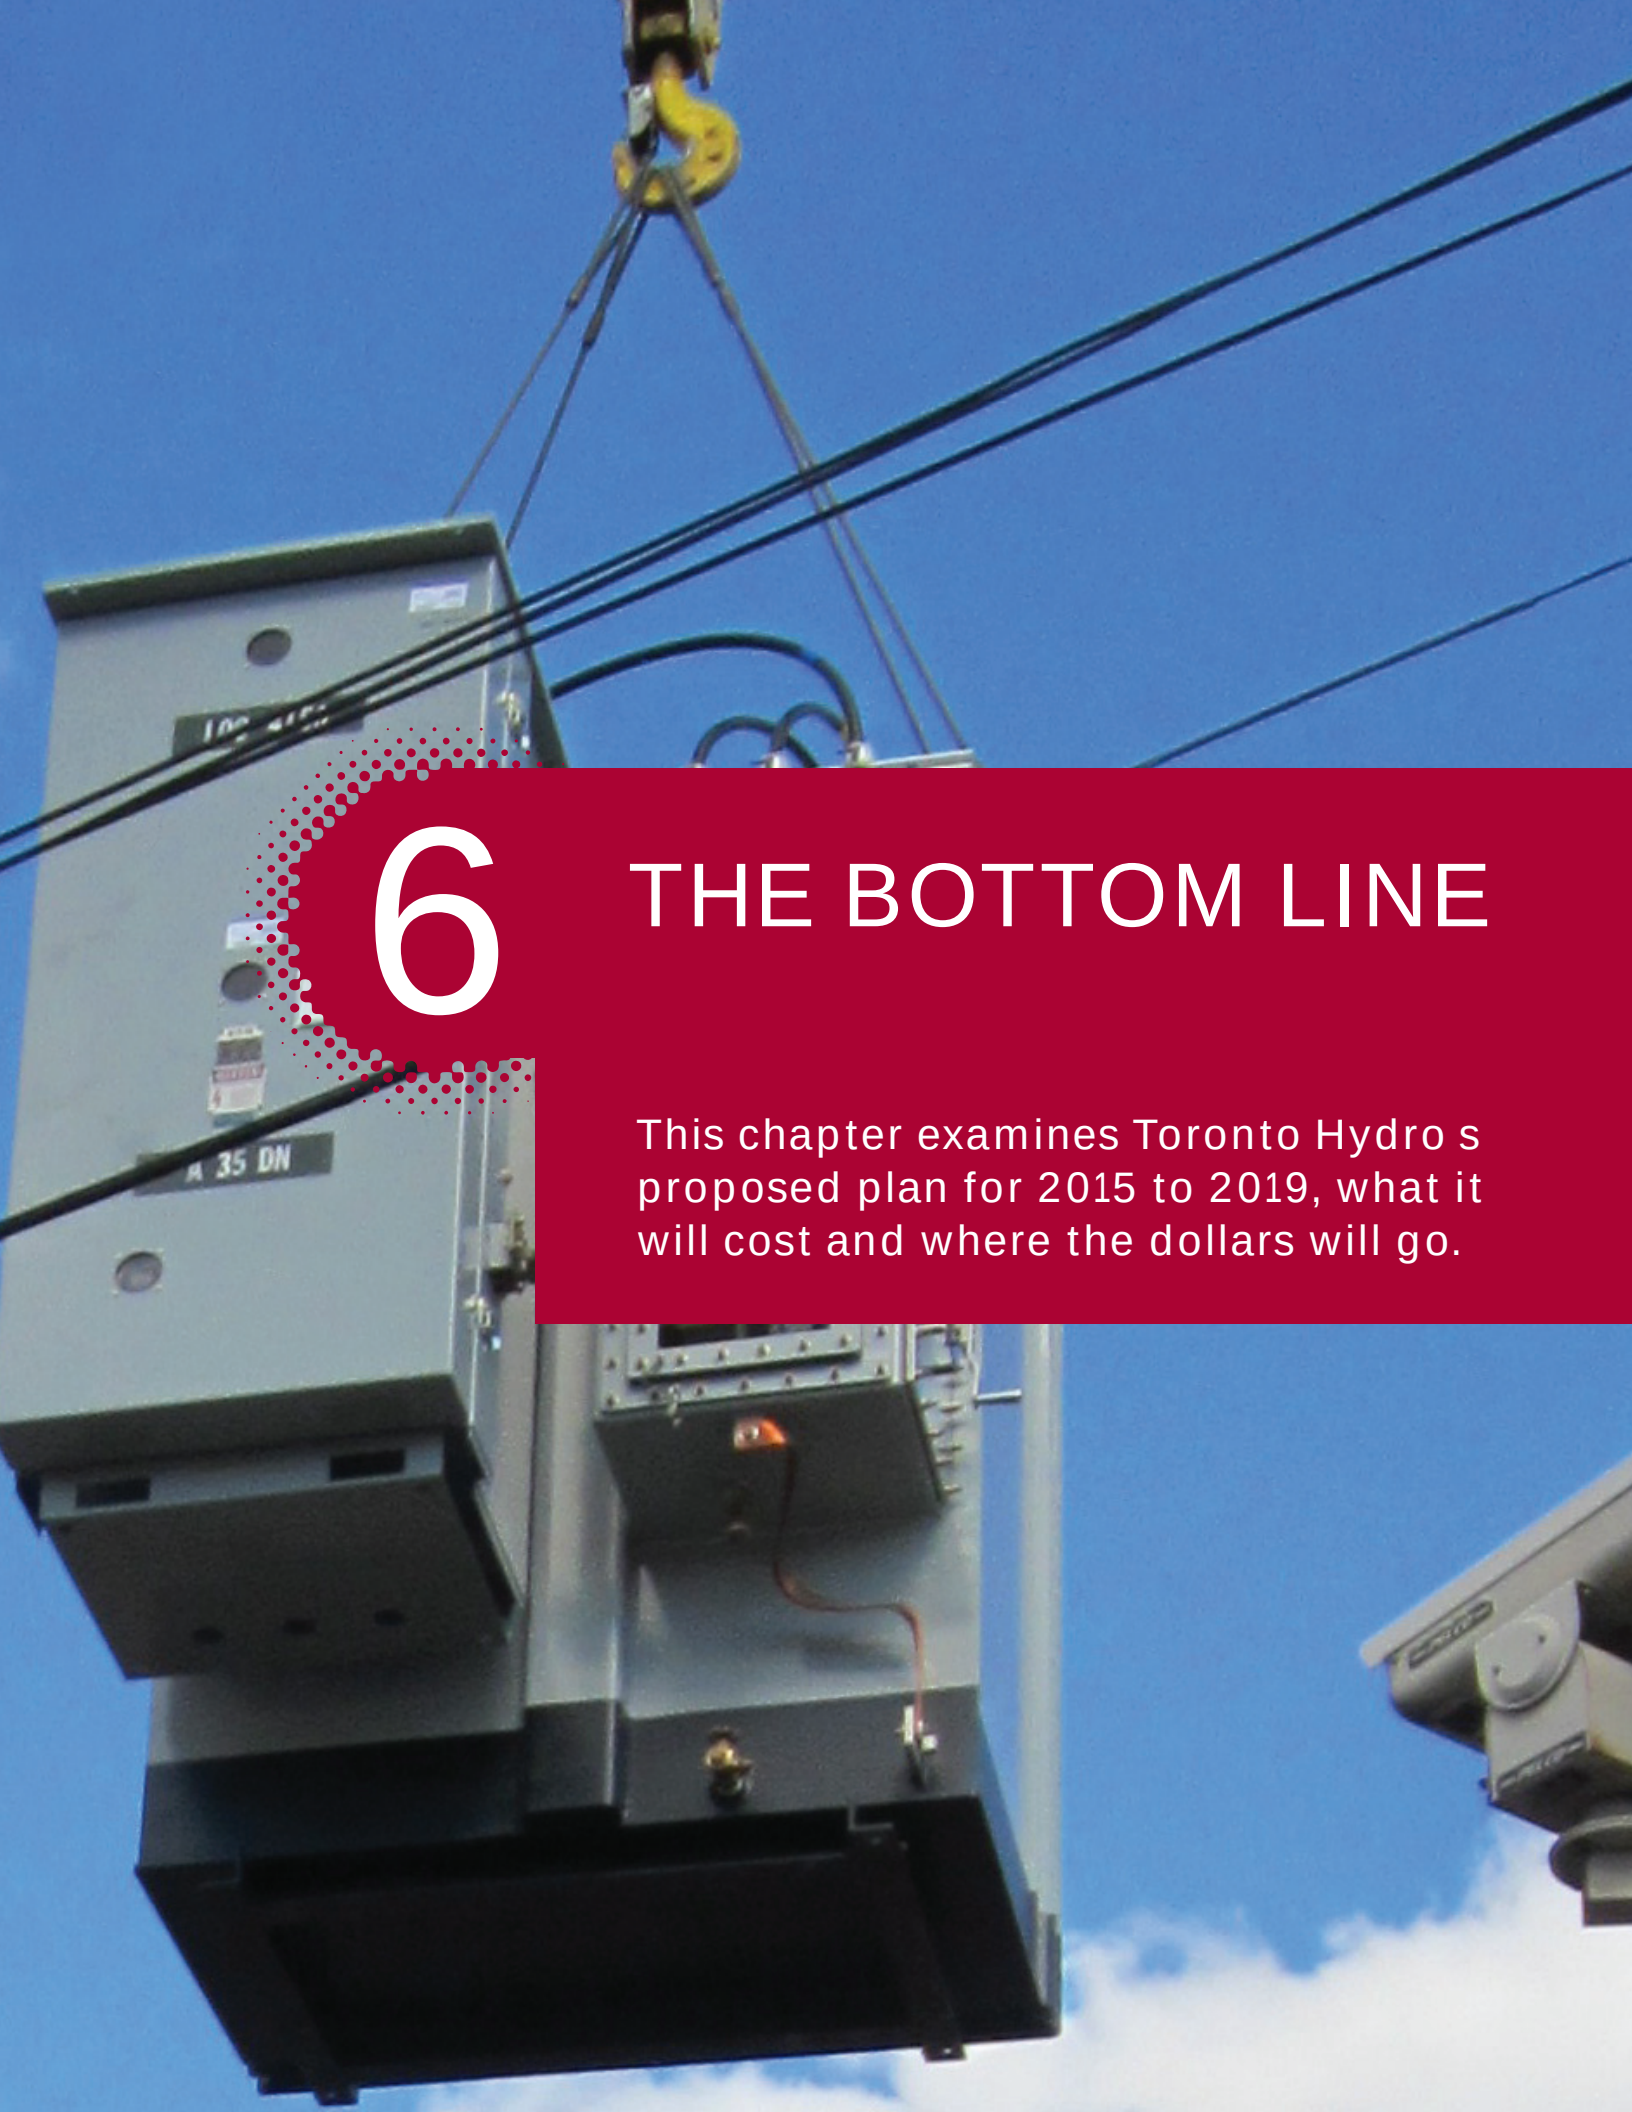
Total 2012 Results: 112,200 MWh and a total demand reduction of 61,088 MW

20. For conservation and demand management programs to slow the pace of renewal and expansion, they must provide an acceptable level of certainty. How likely is it that you would participate in Demand Response programs that would allow electricity system managers to turn o equipment you are using? For residential customers, this would involve automated devices to turn o your water heater and air conditioner for short periods during times of peak demand.
    _____Very likely
    _____Somewhat likely
    _____Not very likely
    _____Not at all likely

Smart Grid, Smart People, Smart Business

Toronto Hydro is trying to temper the cost of investment by improving the productivity and e ciency of its overall business. Here s how the utility is nding ways to do more with less:

- «Reducing employee headcount Toronto Hydro has reduced sta levels by 35% and senior executives by 65% since 1998.
- «Keeping absenteeism low According to Statistics Canada, Toronto Hydro s absentee rate is 15% below the average for public and private sector companies.
- «Working safely Toronto Hydro is avoiding injuries and staying productive on the job site. The utility has achieved 3.5 million hours without a lost-time injury.
- «Reducing operating costs Toronto Hydro is downsizing work centres and relocating sta from leased buildings to utility-owned facilities that are better suited to the business.
- «Improving coordination of capital projects Toronto Hydro is executing more cost-e cient projects by grouping high-priority projects with lower priority projects in the same neighbourhoods. This allows the utility to use its crews and equipment more e ciently, and reduces the set up time and number of permits required to complete work.



21. Given what you know and what you have read so far, how well do you feel you understand the challenges facing the Toronto Hydro grid and what they are planning to meet those challenges?
    _____ Very well
    _____ Somewhat well
    _____ Not very well
    _____ I don t understand at all

    _____
    _____
    _____
    _____
    _____
    _____
    _____
    _____
    _____

6 THE BOTTOM LINE

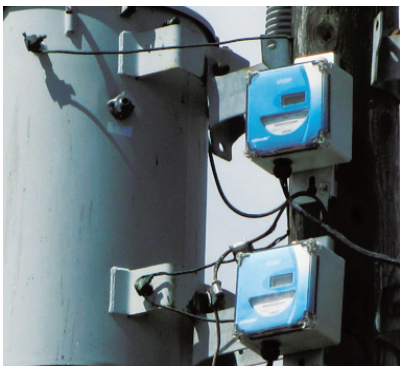
This chapter examines Toronto Hydro s proposed plan for 2015 to 2019, what it will cost and where the dollars will go.

Here s What We ve Covered so Far:

The Ontario Energy Board (OEB) requires that Toronto Hydro gather customer feedback on the utility s proposed investment plans. Toronto Hydro will present your feedback to the OEB as part of the rate setting process. The OEB and a number of public intervenors will hold Toronto Hydro accountable for both the way that you were consulted and the way that the utility s nal plan re ects what you said.

About a quarter of your electricity bill goes to Toronto Hydro. The money that Toronto Hydro receives is invested in the local distribution system and the people, buildings and vehicles that support it.

Much of Toronto s existing distribution system was built in the 1950s and 60s. Toronto Hydro s customers have bene ted from the longer than expected lifespan of this equipment.



Today, much of the system is at an age where it must be replaced to maintain the reliability that Torontonians expect. Renewing the system will help ensure that the next generation of electricity users enjoys the same long-term value-for-money as previous generations.

Toronto Hydro is also dealing with other pressures, like the need to build more system capacity to accommodate the city s growth and the need to upgrade outdated and unsupported IT systems.

At the same time, the industry is changing, and Toronto Hydro has the opportunity to explore innovative grid modernization technologies that will help the utility cost-e ectively improve system performance and reduce the risks and costs associated with aging equipment over the long-run.

Renewing the system for the next generation will take more than a decade, but delaying these investments is expected to gradually worsen reliability across the system and lead to even higher bill increases down the road.

In recognition of growing capital needs, Toronto Hydro has been working to reduce operating costs by reducing employee headcount, avoiding injuries, and downsizing work centres.

The Dollars and Cents

Toronto Hydro is preparing a 2015-2019 investment plan that will require an annual bill increase of approximately $2.35 on the monthly bill. This amounts to a total increase of approximately $11.75 per month by 2019 compared to 2014 electricity rates.

Here s how Toronto Hydro believes your electricity dollars should be invested during these years:

Replacing Aging and Obsolete Equipment
These investments are paced and prioritized to maintain reliability standards and to address the worst performing feeders rst. Introduction of modern equipment standards is expected to reduce the impact of storms.

47.1%

Expanding Capacity for Long-term Growth
Expanding the capacity and exibility of the local distribution network to accommodate forecasted growth in electricity demand.

14.3%

Connecting Customers
Bringing new customers onto the system; these investments are mandatory, but the cost is generally recovered through the additional revenue that new customers contribute.

11.2%

Improving Reliability by Recon guring Circuits
Targetted investments to cost-e ectively reduce the impact and frequency of outages. For example, converting main feeder sections from overhead to underground will help reduce the impact of future storms.

8.0%

Updating IT Infrastructure
Replacing outdated and unsupported software and communications systems that are critical to Toronto Hydro s planning, operations and outage response.

7.8%

Accommodating Construction Projects in the City
Relocating or recon guring distribution equipment that is on or near the path where other agencies are working.

3.3%

Modernizing the Grid
Introducing innovative technologies like intelligent switches and sensors that are expected to cost-e ectively improve the reliability of the system and reduce the risks and costs associated with aging equipment.

3.2%

Maintaining and Upgrading Customer Meters
Routine meter replacements and improvements to data quality.

1.9%

Building Maintenance
Routine capital investments to maintain Toronto Hydro s facilities.

1.3%

Connecting Renewable Generation
Installing protection and control equipment and energy storage facilities that allow for the e cient use of new renewable generation connections.

0.9%

Vehicles and Equipment for Crews
Routine capital investments in Toronto Hydro s eet of trucks, cars and equipment

0.7%

Accommodating Electric Vehicles
Accommodating electric vehicle connections to the grid and investing in ways to manage and optimize electric vehicle storage capacity on the system

0.1%

Have Your Say: Is Toronto Hydro Investing Wisely?

Let s Talk Priorities:

24. When you look at how much Toronto Hydro is spending on each of its investment priorities, do you think they have the balance right or would you change the relative priorities?

_____ The balance looks right
_____ They should change some of the priorities

25. What areas do you feel need more spending than planned?

_____
_____
_____
_____
_____
_____
_____
_____

_____
_____
_____

Let s Talk Pacing

Toronto Hydro s proposal is expected to lead to a total increase of approximately $30.50 on the average small business owner s monthly bill by 2019. A lower bill impact is possible in the short-term, but there are trade-o s: system performance will be worse and future bill impacts will be higher. The following table compares Toronto Hydro s plan to another likely utility management practice called run-to-failure. This approach is typical for smaller utilities with newer systems.

	"RUN-TO-FAILURE" APPROACH	TORONTO HYDRO'S PROPOSED PLAN
Description	With this approach, Toronto Hydro would only replace equipment as it fails (with the exception of critical assets such as stations equipment). This is a purely reactive approach using close to the minimum amount of funding that Toronto Hydro could receive from the Ontario Energy Board.	feeders rst. modern grid technologies and recon guring circuits.
Estimated increase in monthly bill	$17.25/month	$30.50/month
Reliability outcomes by 2019	customer: 1.6/year customer: 1.38 hours/year experiencing seven or more interruptions a year: 13 per cent	customer: 1.15/year customer: 0.65 hours/year experiencing seven or more interruptions a year: 6 per cent
Percentage of equipment past end-of-life in 2020	31 - 34 per cent	25 - 28 per cent

Why Does Toronto Hydro Think This Pace is Best?

As seen in the table above, Toronto Hydro estimates that a run-to-failure approach, when compared to the proposed plan, would result in double the average duration of outages across the system and more than double the percentage of customers on poor performing feeders. Because of the aging system, Toronto Hydro would expect reliability to continue worsening well beyond 2019 if the utility stuck with a run-to-failure approach.

Of course, the two plans presented here are not the only options for pacing system investment. Toronto Hydro can invest more or less capital to achieve a wide variety of outcomes.

So how did Toronto Hydro arrive at the proposed plan?
Since the utility is so large, Toronto Hydro s engineers rely on a software model to help calculate the year in which it is most cost-e ective to rebuild any given part of the system. The model suggests that Toronto Hydro should, in fact, be spending more than it is proposing in the years 2015 to 2019.

So why is Toronto Hydro proposing to invest less than the model recommends?
In reality, there are constraints that prevent the utility from spending above a certain amount. One such restriction is the limited number of skilled resources available to carry-out the work. Resource limitations are also and important reason why Toronto Hydro believes it is wise to invest now and not later: increasing the number of quali ed trades people takes time, and the industry will not train new workers unless there is a consistent and predictable amount of work. This means that the longer Toronto Hydro allows the system to age, the less likely it is that the utility will be able to keep up with investment needs.

Ultimately, Toronto Hydro believes that the proposed plan will deliver improved system performance at a pace that is sustainable for both the utility and the customer.

27. When you consider the options outlined in the table on the previous page, do you think Toronto Hydro s goals are too high, too low or about right?

_____ Too high _____ About right
_____ Too low _____ Not sure

28. What are the goals you feel are too high?

_____
_____
_____
_____
_____
_____
_____
_____

29. What are the goals you feel are too low?

_____
_____
_____
_____
_____
_____
_____
_____

30. Looking at the cost of the Toronto Hydro plan and the outcomes it is expected to achieve, which point of view is closest to your own?

_____ Toronto Hydro should plan to achieve higher outcomes, even if the rates need to go up even more.

_____ I am satis ed with the balance between outcomes and the proposed rate increase.

_____ I don t like the rate increase, but I think it is necessary to maintain the grid to a reasonable standard.

_____ I think the bill impact is too high and Toronto Hydro needs to scale back its plans.

_____ Not sure

What Do You Think About This Review?

Toronto Hydro values your feedback. This is the first time the utility has conducted a review about its upcoming investment plan in this type of format. What did you think about the workbook?

1. Volume of Information Did Toronto Hydro provide too much information, not enough, or just the right amount?

2. Content Covered Was there any content missing that you would have liked to have seen included?

3. Outstanding Questions Is there anything that you would still like answered?

4. Suggestions for Future Consultations How would you prefer to participate in these consultations?

Technical Glossary

Cable Chamber An opening to the underground duct system that facilitates the installation, removal, inspection and repair of cables.

Cable Fault A hole in a cable caused by a short circuit (due to corrosion, overloading over time, water, age) which can result in an explosion.

Circuit A continuous system of conductors providing a path for electricity.

Circuit Breaker A protective switch in a substation that automatically disconnects power to the circuit in the event of a fault. Performs the same function as a circuit breaker in a home.

Conductor An object that permits the ow of electricity, like a wire or cable that allows electricity to ow along its length.

Distribution Transformer A piece of equipment required to reduce voltage to a level that can be used by customers in their homes and businesses.

Feeder A distribution circuit carrying power from a substation to customers. Feeders consist of circuits and other electrical equipment supported by civil infrastructure like poles and ducts.

Kilovolt = 1,000 volts

Megawatt Equals 1,000 kilowatts or enough to power 10,000 100-watt light bulbs.

Primary Cables Cables that distribute electricity throughout the system at a higher (primary) voltage (i.e. greater than 750 volts).

Secondary Cables (or Mains) Low voltage cables that are connected to the secondary (low voltage) side of the distribution transformer and deliver current to customers.

Substations Large power transformers and miscellaneous protection and control equipment (e.g. circuit breakers) that transform electricity from a higher primary voltage to a lower primary voltage. Substations are part of generation, transmission and distribution systems.

Switch A device for isolating a piece of equipment or a section of feeder to allow repairs or replacements to be made on them while in a safe, de-energized state.

Transformer A device used to transform voltage levels to facilitate the transfer of power from the generating plant to the customer.

Transformer Vault A large room (above - or below-ground) that houses transformers, switches and protective equipment.

Volt A measure of electricity. The Standard International unit of electro-motive force, the di erence of potential that would carry one ampere of current against a resistance of one ohm.*

Watt A measure of the work electricity can do.

1,000 watts = 1 kilowatt (the amount of power used by 10 100-watt light bulbs)

1,000,000 watts = 1,000 kilowatts = 1 megawatt

Action Log

Note: If applicable, this slide contains information about customer-specific issues and outlines the action items undertaken by the parties to address those issues.

Agenda

1. Introduction
2. Improving Reliability and Services – Infrastructure Renewal Program
3. Key Account Management Services
4. Conservation and Demand Management (CDM)

Regulatory Infrastructure Renewal Up-date

- The Ontario Energy Board (OEB) has approved the Toronto Hydro 2013 Rate Application
  - Decision issued on April 2, 2013

- Toronto Hydro requested a rate increase to cover Incremental Capital for a variety of asset renewal projects
  - The capital program is intended to enhance safety and reliability of the distribution system for the benefit of customers and employees.
  - The decision provides for an increase in capital spending to address aging electricity distribution infrastructure, and allows for the construction of the new Copeland Transformer station in downtown Toronto to relieve existing stations and provide for future load growth in the area. Copeland Station will be the first transformer station built in downtown Toronto since the 1960s.

Regulatory Environment

Cost of Service

- To 2010
- Annual review of Operating and Capital Expenses to set rates
- LDC evidence tested through a public hearing process with Intervenors

Incentive Regulation + Incremental Capital

- 2012 – 2014
- Rates set by formula
- Operating expenses are fixed less a productivity factor
- Incremental capital is required to maintain asset renewal program; specific projects must be justified through the hearing process

Custom Incentive Regulation

- 2015 – 2019
- Rebase of OpEx and CapEx in 2015
- Regulatory goal of giving customers rate certainty for a 5 year period
- Risk to LDC of fixed budgets
- Opportunity for LDC to present evidence for unique needs for funding beyond the base formula

40% of Outages in Toronto are Due to Aging Equipment

- Some areas of the city are experiencing an unacceptable number of power outages. Thanks to our capital investment in infrastructure, equipment-related outages are down 10% since 2009. In 2013, we expect to invest approximately $327 million in infrastructure upgrades to help improve service reliability.

Investments to Improve Reliability

2013 Capital Investment by Ward (approximate)

	Capital Projects Category			
Ward	Overhead	Stations	Underground	Total Ward
1	5,740,767	507,036	3,449,452	$9,697,255
2	6,808,892			$6,808,892

Investments to Improve Reliability

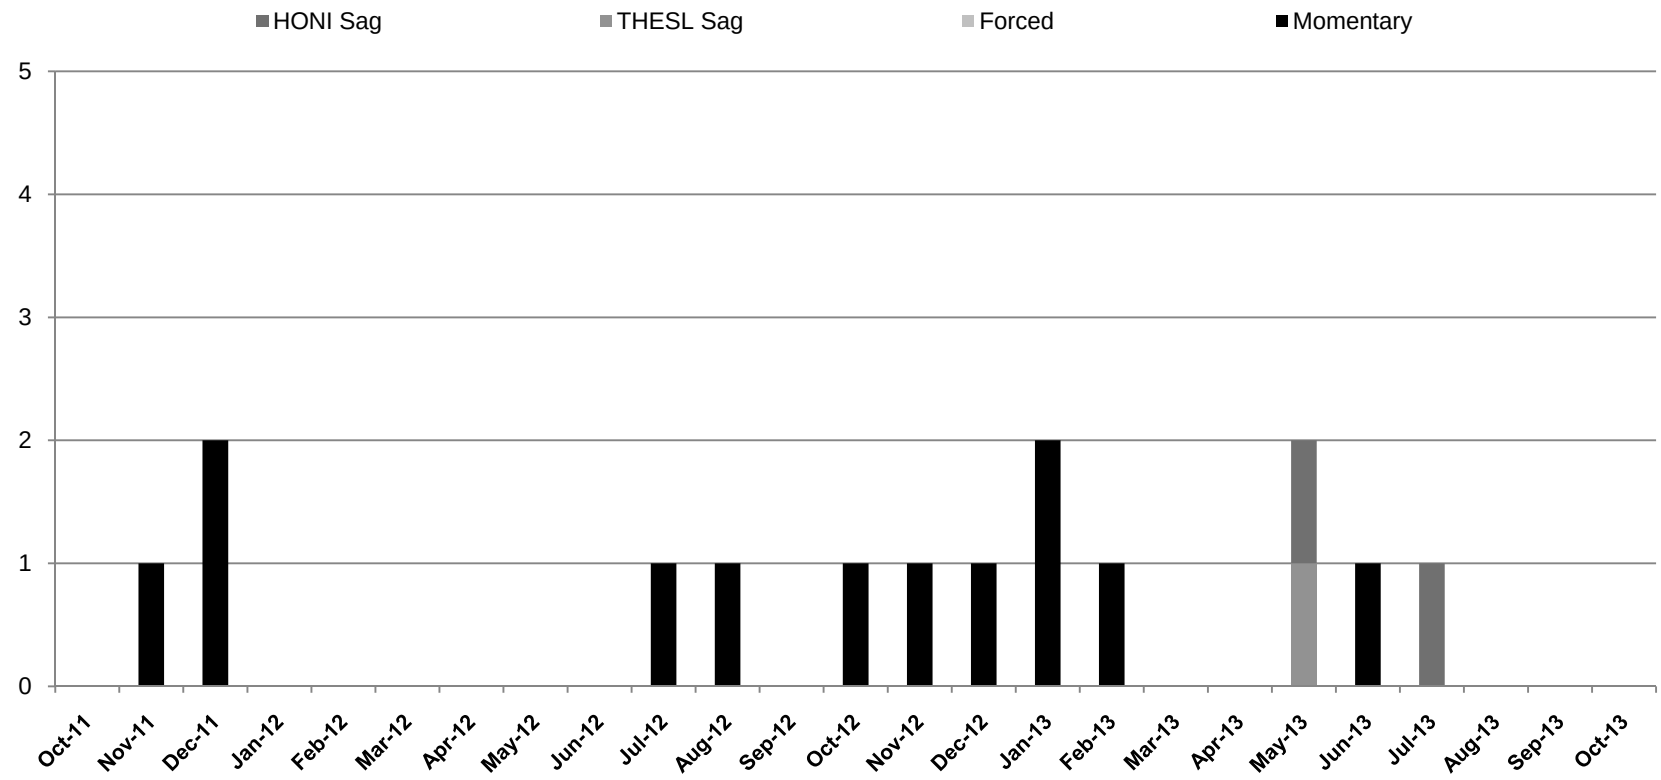
Provincial Measures for Reliability

- System Average Interruption Frequency Index (SAIFI)
- System Average Interruption Duration Index (SAIDI)

Note: Momentary interruptions, those less than 1 minute, are not included

DO YOU LIVE/WORK/TRAVEL HERE?

Toronto Hydro's Grid: Areas of In Need of Attention



Your Outage Experience

Note: If applicable, this slide includes customer-specific outage information for each of the customer's facilities.

Your Power Reliability/Quality Summary

Note: If applicable, this slide includes customer-specific power reliability information, which may be presented as follows:

Root Cause Analysis

Note: If applicable, this slide includes a root cause analysis of a particular power reliability/quality issue (i.e. momentary outages) that the customer is experiencing, and provides an explanation of the mitigation measures that Toronto Hydro has taken or proposes to undertake to address the issue.

Inspection Programs and Status

Note: If applicable, this slide includes a description of the inspection programs that apply to the specific customer, and an update with respect to the status of those program for the given year. For example:

1. Infrared Audit Program

   Infrared inspection of both primary and secondary overhead line components is performed. This identifies potential “hot spots” and allows corrective measures to be taken before they have an impact on system reliability.

2. Cable Chamber Inspection Program

   Cable chambers for underground feeders are inspected for electrical and civil deficiencies.

3. Other Feeder Asset Inspections

   Inspections performed on assets which are attached to the same feeder that supplies the Molson plant. Insulators are pressure washed to reduce the possibility of flashovers.

2013 Rate Impact

General Service, 50 kW to 1MW

(150,000 kWh/month 349 kW, 90% PF)

Year	Distribution	Transmission	Regulatory	Commodity	Total
Change	3.4%	12.5%	-5.4%	10.2%	7.7%

General Service, 1 MW – 5 MW

(800,000 kWh/month, 1,600 kW, 90% PF)

Year	Distribution	Transmission	Regulatory	Commodity	Total
Change	3.0%	12.4%	-5.4%	10.2%	7.7%

Large User, > 5MW

(4,500,000 kWh/month, 8,491 kW, 90% PF)

Year	Distribution	Transmission	Regulatory	Commodity	Total
Change	3.2%	12.5%	-5.3%	10.2%	7.7%

- Rates reflect current best estimates and are subject to change
- Rate Order approved by the OEB on May 9, 2013, file EB-2012-0064; rate increases effective June 1.
- Commodity cost based on HOEP+GA rates

Toronto Hydro's Key Account Management Service

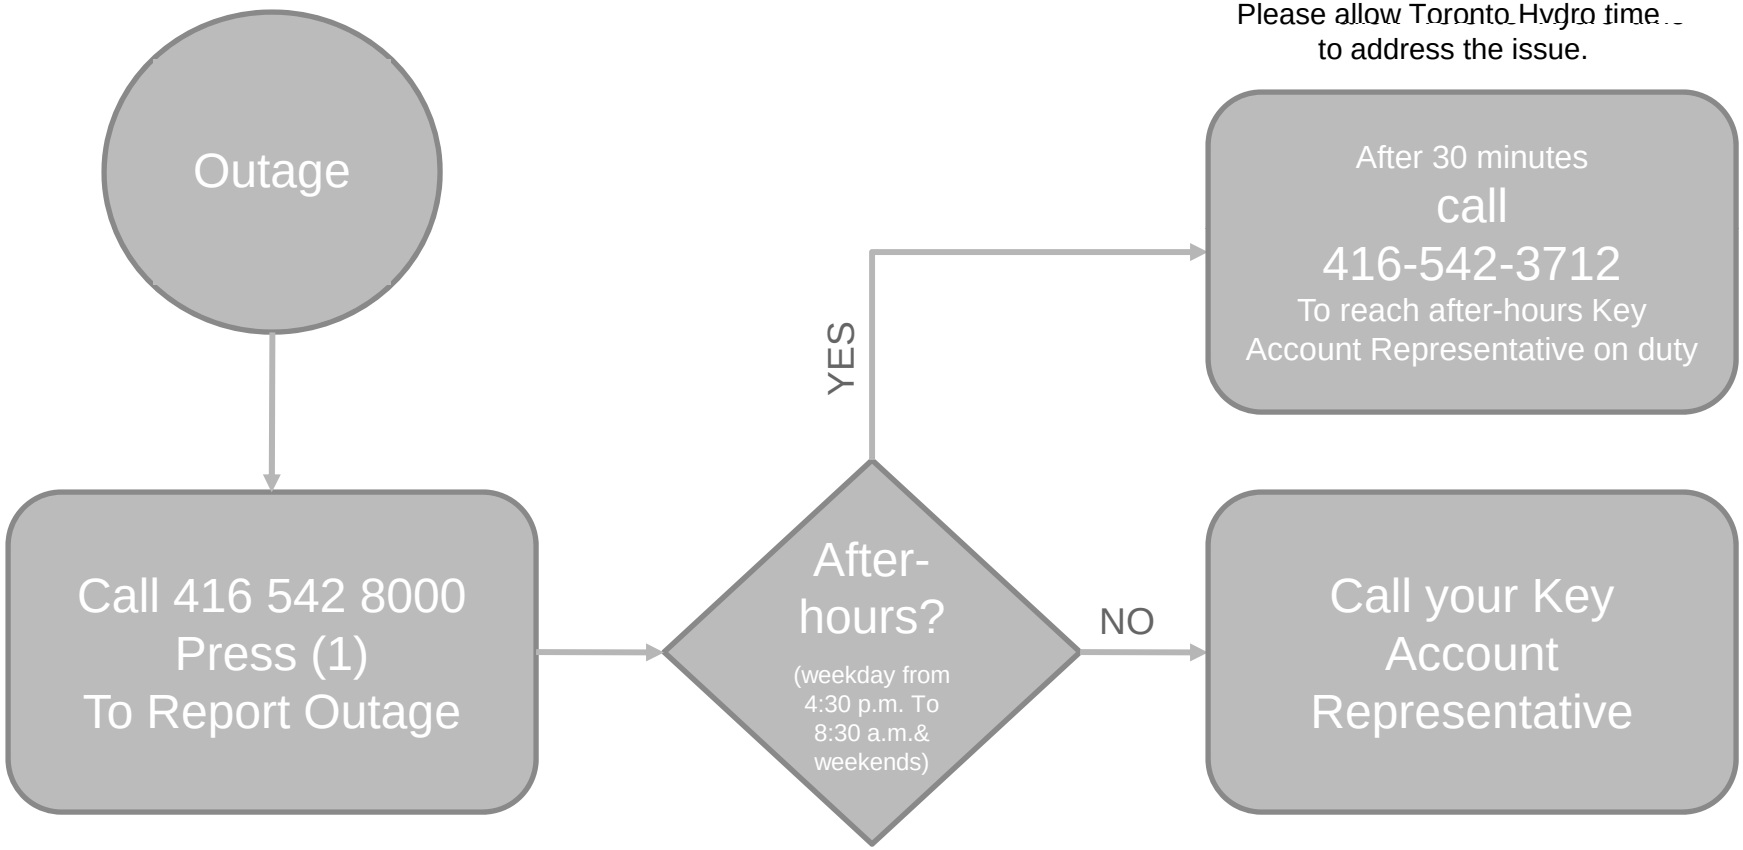
The Importance of Toronto Hydro's Business Customers

- Toronto Hydro has over 80,000 business customers
  - Representing all sectors – Municipal, Academic, Healthcare, Commercial, Industrial
  - 530 of these customers have a demand of over 1,000 kW – the Key Accounts
  - Customers with multiple sites, such as larger property management or institutional customers are also aggregated as a Key Account
- We recognize these customers as distinct from our residential customers:
  - Businesses support the economic development of the City and provide employment
  - You are important to THESL and the City - Substantial electricity revenue comes from THESL business sector – 12% of our customer base provides 80% of our revenue
  - We recognize that Business customers can be significantly affected by outages in lost productivity of goods and services produced and delivered, and human resource management to name a few
  - Business customers have sensitive technology. Power quality is essential to uninterrupted operations.
  - Communications is vital to outage management.

Key Account Customer Profile

Total Customers

530



Revenue per Customer

Customer Segment	Total Revenue	Total Customers	Revenue Per Customer
Large Business	>1,000kW	$728 million	530	$1,373,280
Medium Business	50 to 1,000kW	$1,089 million	12,129	$89,762
Small Business	<50kW	$273 million	68,431	$3,989
Residential	<50kW	$709 million	637,910	$1,111
		$2,799 million	719,000	

Key Account Management Services

- Account Management
  - Single point of contact for all aspects of the relationship with Toronto Hydro
  - To manage issues and ensure customer needs are met
  - Work with internal Departments to improve levels of customer service
    - Distribution System, Customer Information System, Conditions of Service, Metering Systems, Billing, Collections, Rates, Power Quality & Reliability, CDM programs, Ministry of Energy, Ontario Energy Board and Independent Electricity System Operator, Regulatory Information
- Outage Management
  - 24/7 After hours outage response service
- Data Management
  - MV90 online energy consumption data
  - Special energy consumption data requests
- Billing Services
  - eBills
  - Pre-authorized payment

Power Outage -
Key Account Call-in Process

New Proactive Outage Management..

- Severe weather during the month of July impacted Toronto Hydro service and caused several prolonged outages throughout the city.
- The outages generated significant amounts of feedback from customers, including more frequent outage status updates are needed for businesses.
  - Key contacts have a need for ongoing updates related to outages at their facilities in order to shift business operations accordingly.
- We are developing a commercial customer outage communication program whereby commercial customers will receive customized outage alerts during severe weather emergencies via the communication channel of their choice (email, phone, text).

Continuously Improving Our Service …

Communications

- Power outage email notification – 2014 launch
- Quarterly Newsletters – “eConnect for Biz”

Metering

- Power quality, data access, analytics

Self Service

- Enhanced energy data management (MV Web Replacement)
- On line transactions

CDM

- Incentives, training and support
- Post 2015 program development

Other …

CDM Programs

- Government
- Industrial
- Small Business
- Agricultural
- Commercial
- Institutional

Conservation and Demand Management Business Incentive Programs

Commercial & Institutional Pro grams

SMALL BUSINESS LIGHTING

- Up to $1,500 of free lighting upgrades (increase from $1,000) New!

AUDIT FUNDING

- Funding of up to 50% of the cost to conduct an energy audit New!
- Building Systems audit to promote systems balancing (hydronic, air)

RETROFIT PROGRAM

- Funding to install high-efficiency equipment and new control systems
- Cover up to 50% of the cost; $400/kW (or $0.05/kWh) for lighting and $800/kW (or $0.10/kWh) for non-lighting
- Monitoring and Targeting measure now eligible New!
- Property Managers and Facility Managers now eligible participants

EXISTING BUILDING COMMISSIONING (EBCx)

- Paid for evaluating and implementing retro-commissioning strategies of systems with chilled water plants New!
- Up to $30,000 of incentives available for investigation

New Program Opportunities

APPLICANT REPRESENTATIVE INITIATIVE

- Applicant representative receive incentive payments for successful projects - we pay you or your contractor
  - $20/KW for the first 300kW
  - $40/kW beyond 300kW

PILOT PROGRAMS UNDERWAY

- Multi-unit Residential Building Demand Response (“Suitesaver")
- Commercial Energy Management and Load Control (“Gridsaver")

Training and Support

- Energy into Action conference held spring and fall
- Dollars to $ense Workshops with NRCan
- Industry specific events: Compressed Air Workshop, Refrigeration
- Staff support on projects and process - to help identify CDM opportunities, develop business cases and file CDM applications
- eConnect for Biz Newsletter for program updates

CDM Projects Summary

Note: If applicable, this slide contains information about customer-specific CDM projects.

CDM Beyond 2014

- OPA working with LDCs to extend current programs in to 2015 based on Minister's Directive in December 2012
- Provincial Long Term Energy Plan
  - ¾Released December 3
  - ¾Commits to 6 years of stable funding
  - ¾Framework is under development between distributors, Ministry and OPA
  - ¾Recognizes Conservation First as a way to mitigate new investments in supply, transmission and distribution
    - ¾ A necessary component of regional and distributor planning processes
  - ¾IESO will evolve existing Demand Response programs
    - ¾Development of a capacity market

Summary

- Investments to improve reliability
- Key Account Management Services
  - Outage communications
  - Issue resolution
- Support available from Toronto Hydro to help identify CDM opportunities, develop business cases and file CDM applications
- Information and Training opportunities
  - Energy into Action conference held spring and fall
  - Dollars to $ense Workshops with NRCan

Disclaimer

The information in these materials is based on information currently available to Toronto Hydro Corporation and its affiliates (together hereinafter referred to as “Toronto Hydro”), and is provided for information purposes only. Toronto Hydro does not warrant the accuracy, reliability, completeness or timeliness of the information and undertakes no obligation to revise or update these materials. Toronto Hydro (including its directors, officers, employees, agents and subcontractors) hereby waives any and all liability for damages of whatever kind and nature which may occur or be suffered as a result of the use of these materials or reliance on the information therein. These materials may also contain forward-looking information within the meaning of applicable securities laws in Canada ("Forward-Looking Information"). The purpose of the Forward-Looking Information is to provide Toronto Hydro’s expectations about future results of operations, performance, business prospects and opportunities and may not be appropriate for other purposes. All Forward-Looking Information is given pursuant to the "safe harbour" provisions of applicable Canadian securities legislation. The words "anticipates", "believes", "budgets", "could", "estimates", "expects", "forecasts", "intends", "may", "might", "plans", "projects", "schedule", "should", "will", "would" and similar expressions are often intended to identify Forward-Looking Information, although not all Forward-Looking Information contains these identifying words. The Forward-Looking Information reflects the current beliefs of, and is based on information currently available to, Toronto Hydro’s management. The Forward-Looking Information in these materials includes, but is not limited to, statements regarding Toronto Hydro’s future results of operations, performance, business prospects and opportunities. The statements that make up the Forward-Looking Information are based on assumptions that include, but are not limited to, the future course of the economy and financial markets, the receipt of applicable regulatory approvals and requested rate orders, the receipt of favourable judgments, the level of interest rates, Toronto Hydro’s ability to borrow, and the fair market value of Toronto Hydro’s investments. The Forward-Looking Information is subject to risks, uncertainties and other factors that could cause actual results to differ materially from historical results or results anticipated by the Forward-Looking Information. The factors which could cause results or events to differ from current expectations include, but are not limited to, the timing and amount of future cash flows generated by Toronto Hydro's investments, market liquidity and the quality of the underlying assets and financial instruments, the timing and extent of changes in prevailing interest rates, inflation levels, legislative, judicial and regulatory developments that could affect revenues, and the results of borrowing efforts. Toronto Hydro cautions that this list of factors is not exclusive. All Forward-Looking Information in these materials is qualified in its entirety by the above cautionary statements and, except as required by law, Toronto Hydro undertakes no obligation to revise or update any Forward-Looking Information as a result of new information, future events or otherwise after the date hereof.

STAKEHOLDER CONSULTATION

1. INTRODUCTION

This schedule details Toronto Hydro's approach to the stakeholder consultations held in preparing this application. This process is distinct from the customer engagement activities described in Exhibit 1B, Tab 2, Schedule 7.

2. PURPOSE

Toronto Hydro is committed to fostering and maintaining constructive relationships with its stakeholders and believes that active, two-way engagement is critical to achieving this objective.

As part of this commitment, Toronto Hydro undertook two stakeholder consultations with respect to this application prior to filing. This was the first time Toronto Hydro has formally consulted on a pre-filing rate application.

Toronto Hydro viewed the consultations as a forum through which a number of positive outcomes for all parties could be achieved, including the opportunity for it to:

- share broad insight into Toronto Hydro's needs and business drivers, setting the basic context in which this application is being brought forward while allowing stakeholders access to subject matter experts;
- provide more specific details of, and approaches to, the structure and content of the application;
- receive helpful input and feedback on a range of related issues; and,
- address questions or concerns prior to filing the application.

Both sessions were, in Toronto Hydro's view, positive experiences. The utility firmly believes that the participation by all those involved will ultimately contribute to a more effective and efficient hearing process.

3. APPROACH

The remainder of this schedule outlines Toronto Hydro's approach to the stakeholder consultations.

3.1. Participants

Given the separate stream of customer engagement activities occurring concurrent to this process, the intended audience for the stakeholder consultation was the regulatory community. Invitations to participate were sent to interveners of Toronto Hydro's previous rate filings and to Ontario Energy Board ("OEB") staff. City of Toronto officials were also invited to attend.

3.2. Format

Toronto Hydro held two stakeholder consultations prior to filing. Invitations and follow-up correspondence were sent out by email at least three weeks before both sessions. Efforts were made to ensure that dates and times for both sessions were chosen to maximize attendance. For those unable to attend in person, arrangements were made for remote participation.

The first consultation was held at the Toronto Hydro Hearing Room of the OEB's offices on February 11, 2014. Seventeen participants representing seven stakeholder organizations attended this consultation. A complete list of attendees is included in Facilitator's Report in Appendix A. This session was primarily an opportunity for Toronto Hydro to receive input from stakeholders. This was achieved by:

- providing an overview of Toronto Hydro's primary business needs and drivers; and,
- actively engaging in a roundtable-style facilitated discussion on a range of policy and application-related issues.

Following the first consultation, Toronto Hydro invited all stakeholders to approach Toronto Hydro with any concerns, questions or other matters relevant to the rate application at any time during the process.

The second consultation was held at the NEB Hearing Room of the OEB's offices on July 3, 2014. Eighteen participants representing eight stakeholder organizations attended this consultation. This session was primarily an opportunity for Toronto Hydro to reply to the many ideas and questions shared during the discussion at the first session and to update stakeholders on the status of the rate application. This was achieved by:

- providing specific responses to inquiries heard at the February 11 consultation; and,
- presenting on specific elements that stakeholders could expect would form part of the application.

3.3. Principles

Toronto Hydro's participation in both stakeholder consultations was intended to seek early and substantive input on its rate application. To this end, Toronto Hydro held the first consultation nearly six months prior to the ultimate filing date and involved Toronto Hydro staff representing many of the utility's core functions as presenters or participants.

Toronto Hydro expressly sought to create an environment that supported open, candid and constructive dialogue with its stakeholders. Many actions were taken to achieve this result, including:

- retaining the services of a professional facilitator to aid in fostering discussion;
- building significant time into the consultation schedule for questions and answers; and,
- carrying out the discussion on an without prejudice basis.

In accordance with this approach, Toronto Hydro did not record formal notes from either session for the purpose of inclusion in this exhibit nor can it attribute any specific element of this application, be it of substance, structure or otherwise, to a particular stakeholder. Nevertheless, the mutual benefits of those collaborations are very much embedded throughout this application. Toronto Hydro thanks those who participated in one or both of those consultations for their helpful insights and contributions.

3.4. Appendices

Appended to this exhibit are two documents related to the consultations:

1) Appendix A, Facilitator's Report; and
2) Appendix B, Terms of Reference.

Facilitator's Report on Toronto Hydro-Electric System Limited Stakeholder Consultation

February 11, 2014
And
July 3, 2014

Reported By:
Bob Betts, P. Eng.
President & CEO

I. Background:

ThisStakeholderConsultationis the first of two establishedby TorontoHydroElectricSystemLimited ("THESLor "TorontoHydro") to gaininput from interestedstakeholdersinto the designof their Custom IncentiveRegulationMechanism("CIR") applicationfor the years2015to 2019.

In preparationfor this consultationTorontoHydrocirculatedcorrespondenceto stakeholdersindicating their interestto engageintervenorsand OEBstaff in a consultationon its CIR. Theyproposedto hold two consultationsessions.Thefirst wasdesignedto shareinformation about THESL'scurrent business needsand drivers,and to facilitate a dialogueabout potential approachesto addressthem in the 2015–2019CIRapplication. Thesecondconsultationsession,which I wasnot able to attend for personal reasons,washeld to allow THESLto reply to many of thingsit heardduring the first sessionand to providedetailson its pendingCIRapplication.

TorontoHydroindicatedthat it wasexplicitlyseekingearly,candidand substantiveinput on its CIR applicationin the hopesof achievinga more effectivehearingprocess.In proposingthis plan,THESL emphasizedits commitmentto foster and maintainconstructiverelationshipswith its stakeholders, believingthat activetwo wayengagementis criticalto achievingthis objective.

Thetwo consultationstook placeon February11, 2014and July3, 2014. In an effort to supportopen and candiddiscussiontheywere establishedon a "without prejudice"basis,with no attribution of commentsto participatingparties.

II. Facilitator's Summary:

Consultation1 – February11, 2014

Thiswasa veryeffectivestakeholderconsultation.

Thediscussionwasalwayson topic, yet free and open. Commentsfrom all partieswere constructive and well received. Commentsfrom all partiesshowedа reasonablebalance,respectingthe interestsof the utility and all of its stakeholders.

Consultation2 – July3,2014

Unfortunately I was unable to attend this session as planned due to a grave family matter. Toronto Hydro proceeded with the session without a facilitator.

Torys'	Crawford Smith
Facilitator	

Yonge Street), and each session will be scheduled for a full day. THESL has engaged a third-party facilitator to run and record minutes of the sessions – the details of these minutes will be held on a without prejudice basis and not be disclosed in the Consultation Report. Brief outlines of each session are set out below, and agendas for each day will be provided to participants one week in advance of the scheduled session. THESL seeks and encourages live dialogue during the sessions, however will also provide participants an opportunity to submit written questions and comments - which will be available to view by all participants - following each session.

Session #1: Designing THESL's CIR Plan: February 11, 2014

THESL views Session #1 as an opportunity to discuss principles, facts, concepts and perspectives relevant to its CIR application. General topics include THESL's business needs/drivers, regulatory concepts and models (as relevant) with a view towards developing potential approaches to THESL's CIR application. THESL proposes to consider input and feedback received from Session #1 as part of the process of designing its CIR plan.

Session #2: Refining THESL's CIR Plan: July 3, 2014

THESL views Session #2 as an opportunity to report back to participants regarding the status and evolution of its application, and in particular, discuss certain structural and methodological aspects of its CIR application plan. THESL proposes to consider input and feedback received from Session #2 as part of refining its CIR plan.

Additional Consultation Opportunities

THESL seeks to maintain open channels of dialogue and engagement. In addition to the two sessions outlined above, THESL invites participants to approach THESL with any concerns, questions or other matters relevant to this application.

What Will THESL File with the OEB Regarding this Consultation?

The third-party facilitator will prepare a final Consultation Report that may be submitted to the OEB. This report will include these Terms of Reference, identify attendees at each meeting, and include copies of agendas and generic correspondence sent to participants (e.g. covering emails that accompany agendas). No notes or characterizations of the actual consultations will form part of the Consultation Report, and stakeholders will be provided an opportunity to review and comment on the Consultation Report prior to its finalization.

How Do Participants Receive Funding for the Consultation?

THESL will fund intervenor participation at the OEB's approved tariff rates, on the basis of one attendee per stakeholder. To the extent that stakeholders are of the view that funding for additional participants is required, THESL will address these requests on a case-by-case basis.

Who is the Contact at THESL for this Consultation?

Please direct any questions or concerns of a general nature to:

regulatoryaffairs@torontohydro.com

OPERATING ENVIRONMENT

Toronto Hydro-Electric System Limited ("Toronto Hydro") is the electricity distributor licensed (ED-2002-0497) by the Ontario Energy Board ("OEB") to serve the City of Toronto. Toronto Hydro is the successor to the six former hydro-electric commissions of the municipalities which amalgamated on January 1, 1998 to form the City of Toronto. For information about Toronto Hydro's Corporate Structure and Governance, please refer to Exhibit 1C, Tab 2.

Toronto Hydro is the second largest municipal electrical distribution utility in North America and serves the largest city in Canada. In 2013, Toronto Hydro distributed 24.4 terawatt-hours of electricity, representing approximately 18 percent of the electricity consumed in the province of Ontario. It served a peak demand of 4,914 megawatts.

Toronto Hydro services two distinct customer demographic areas: an urban center in downtown Toronto, and a suburban area around downtown Toronto, which is often referred to as the Horseshoe area. In total, Toronto Hydro has a total of approximately 730,000 customers in various classes, ranging from residential to general service and large use.[1]

The utility's service area includes some of Canada's largest banks, stock exchanges, major manufacturers, and other large customers that are sensitive to service interruptions. This includes data centres, manufacturing facilities, numerous hospitals, healthcare and long-term care facilities, schools, colleges and universities. Toronto Hydro also supplies electricity to Ontario's Provincial Legislature and Ministries, as well as Toronto's municipal government.

[1] Toronto has over 2,900 high-rise multi-residential condominium and apartment building accounts, many of which are "bulk-metered". Taking these bulk-metered multi-residential buildings into account, Toronto Hydro's effective customer count exceeds 1 million customers.

Toronto Hydro's distribution system consists of a mix of overhead, underground, secondary network and stations infrastructure. These systems operate at voltages of 27.6kV, 13.8kV, or 4.16kV, and distribute power through a complex network of approximately 175,000 poles, 60,600 distribution transformers, 16,000 primary switches, 15,000 km of overhead conductors and 11,200 km of underground cables. This network is composed of assets of varying vintages and types, reflective of the historical standards employed by the six pre-amalgamated utilities.

1. SERVICE TERRITORY

The City of Toronto is bounded by Lake Ontario to the South, Steeles Ave to the North, Mississauga (mainly Highway 427) to the West, and Scarborough/Pickering Townline to the East. A service territory map is filed at Exhibit 1C, Tab 1, Schedule 2.

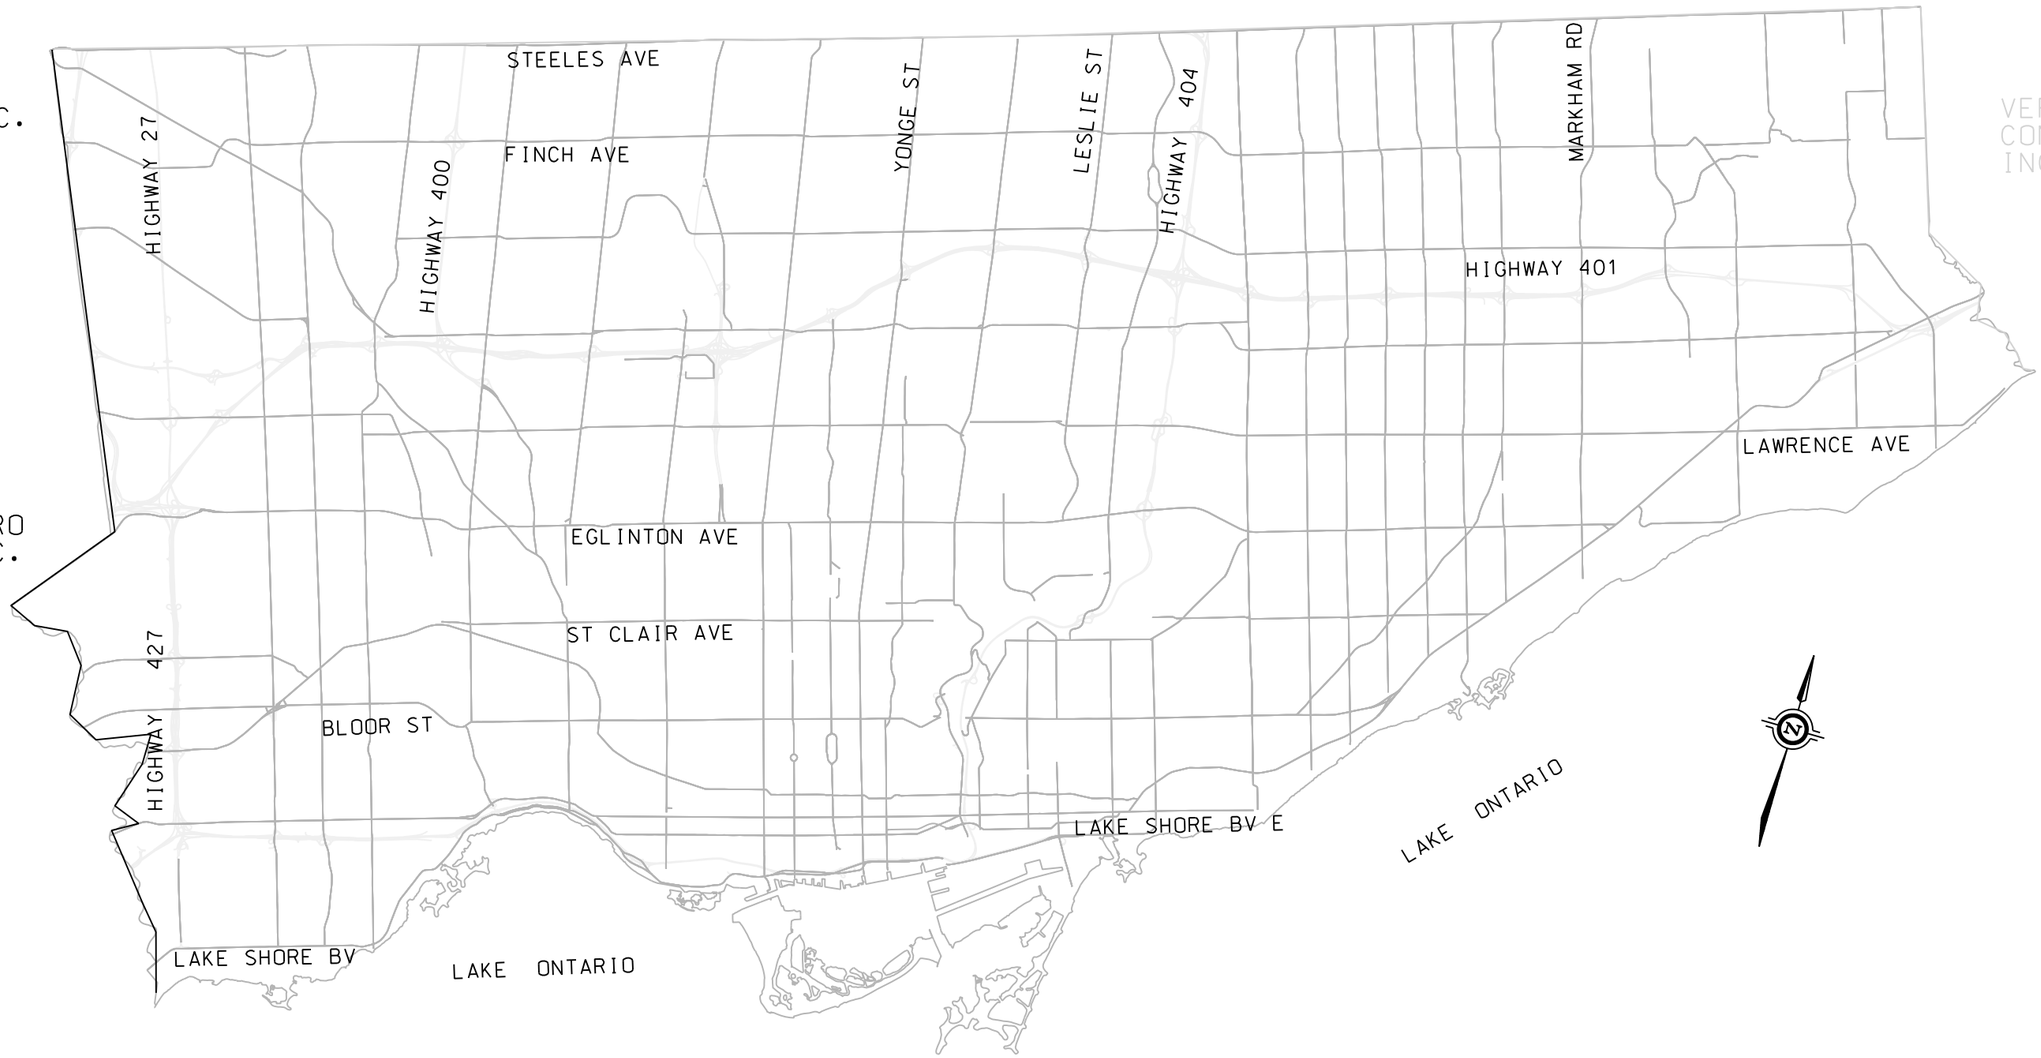
2. NEIGHBOURING UTILITIES

Toronto Hydro's neighbouring electricity distribution utilities are:

- To the west, Enersource Hydro Mississauga;
- To the north-west, Hydro One Brampton;
- To the north, PowerStream Inc.; and
- To the east, Veridian Connections Inc.

Toronto Hydro is not a host utility and there are no embedded utilities in Toronto Hydro's distribution service area.

3. TRANSMISSION ASSETS DEEMED DISTRIBUTION ASSETS



Toronto Hydro owns two transmission system terminal stations (one operational, one under construction) that have been deemed distribution assets, namely Cavanagh TS and Copeland TS, respectively. Toronto Hydro is not proposing any additional assets to be deemed as distribution assets as part of this application.

CORPORATE STRUCTURE AND GOVERNANCE

In accordance with s. 2.4.5 of the OEB's Filing Requirements for Electricity Distribution Rate Applications (July 17, 2013) (the "Filing Requirements"), this schedule provides information about Toronto Hydro's corporate structure organization and corporate governance framework. The schedule includes the following appendices:

- Appendix A: City of Toronto Shareholder Direction
- Appendix B: Mandate of the THC Board of Directors
- Appendix C: Mandate of the LDC Board of Directors
- Appendix D: Code of Business Conduct
- Appendix E: Audit Committee Charter
- Appendix F: Governance Committee Charter
- Appendix G: Human Resource Committee Charter

1. CORPORATE STRUCTURE

Toronto Hydro Corporation ("THC") is a holding company, the sole shareholder of which is the City of Toronto, and which wholly owns two subsidiaries (Figure 1): Toronto Hydro-Electric System Limited ("LDC"), a local distribution company which distributes electricity and engages in conservation and demand management ("CDM") activities; and Toronto Hydro Energy Services Inc. ("THE Energy"), a company which provides street lighting services in the City of Toronto.

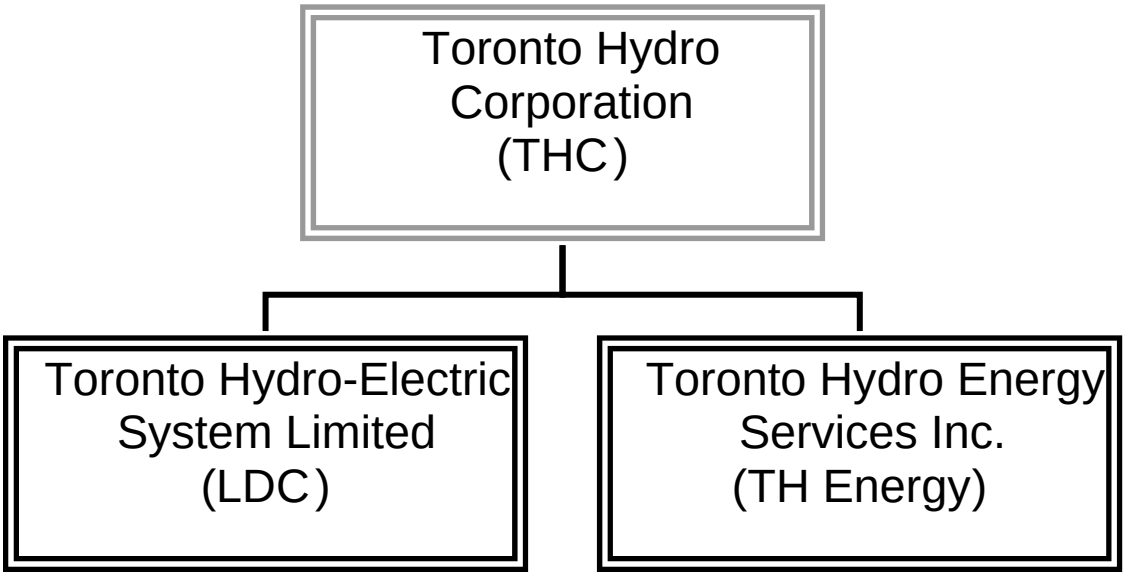

Figure 1: Toronto Hydro Corporate Organization Chart

The principal business of THC and its subsidiaries is the distribution of electricity by the LDC. THC was formed by amalgamation on January 1, 2011 as a wholly-owned subsidiary under the Business Corporations Act (Ontario) ("OBCA") on January 1, 2011. The predecessor corporation to THC was originally incorporated under the OBCA on June 23, 1999.

LDC owns and operates an electricity distribution system, which delivers electricity to approximately 730,000 customers located in the City of Toronto. LDC is the largest municipal electricity distribution utility in Canada and distributes approximately 18% of the electricity consumed in Ontario. LDC was formed by amalgamation with 1798594 Ontario Inc. under the OBCA on January 1, 2012. The predecessor corporation to LDC was originally incorporated under the OBCA on June 23, 1999.

TH Energy was incorporated under the OBCA on June 23, 1999, and currently holds electricity retailer and generator licences, and provides street lighting and expressway lighting services.

1.1. Executive Team

THC'S executive team is comprised of the Executive Vice-President and Chief Financial Officer ("CFO") and Executive Vice-President, Chief Regulatory Officer and General Counsel, both of whom are accountable to the President and Chief Executive Officer ("CEO") of THC. The CEO of THC is also the President and CEO of the LDC and of TH Energy.

The LDC's executive management team consists of the following positions that are overseen directly by the President and CEO:

- Executive Vice-President and Chief Financial Officer, who is also an executive member of THC and of TH Energy;
- Executive Vice-President and Chief Business Development Officer;
- Executive Vice-President and Chief Engineering and Construction Officer;
- Executive Vice-President and Chief Electric Operations and Procurement Officer;
- Executive Vice-President and Chief Information and Risk Officer;
- Executive Vice-President and Chief Customer Care and Conservation Officer;
- Executive Vice-President and Chief Human Resources and Safety Officer; and
- Executive Vice-President, Chief Regulatory Officer and General Counsel, who is also an executive member of THC and of TH Energy.

2. CORPORATE GOVERNANCE

2.1. Securities Law Requirements

As a venture issuer (i.e., a reporting issuer that does not have any of its securities listed or quoted on the TSX or other marketplace), THC must comply with certain corporate governance and public disclosure requirements under applicable securities legislation.

These requirements make THC's operations, practices and governance practices subject to scrutiny from both the Ontario Securities Commission ("OSC") and the public.

THC fulfills and routinely "over" complies with its securities law corporate governance and disclosure obligations. For example, as a venture issuer, THC is exempt from the requirements of Part 3 of National Instrument 52-110, which mandates the composition of an issuer's audit committee. Nonetheless, THC's audit committee meets all of the mandated requirements: it is composed of a minimum of three directors, and every audit committee member is a director of THC, is independent and is financially literate.

In addition, although THC is not required to file an Annual Information Form ("AIF") under National Instrument 51-102, THC has filed an AIF in respect of the financial years ended December 31, 2004 through December 31, 2013. THC's AIF discloses material information about THC and its business to the public, including information about operations, prospects, risks, governance and other factors that impact business. A copy of THC's 2013 AIF is filed at Exhibit 1C, Tab 4, Schedule 5.

In addition, to comply with National Instrument 58-101, THC provides extensive corporate governance disclosure in its AIF and annual Management Discussion and Analysis ("MD&A"). Such disclosure includes details about the following:

1) how the Board of Directors facilitates its exercise of independent supervision over management, including the identity and independence of its directors other reporting issuer directorships that its directors hold;
2) Board of Directors orientation and continuing education;
3) the promotion of ethical business conduct;
4) the process for nominating new directors;
5) the process of determining CEO and director compensation;
6) standing committees and their functions; and

7) how the Board of Directors assesses whether it is performing effectively.

The Board of Directors' decision to provide more extensive disclosure than required under securities legislation demonstrates the Board's commitment to providing effective, independent and rigorous oversight of the Company. The enhanced level of disclosure increases the transparency of the Company's operations and affairs, and facilitates effective monitoring of management by the Board and other stakeholders.

As a financial oversight measure, and to comply with certification requirements in National Instrument 52-109, all of THC's interim financial statements, interim MD&As, AIFs, annual financial statements and annual MD&As are certified by the CEO and CFO. The CEO and CFO certify that the filings do not contain any misrepresentations and fairly present the financial condition, results of operations and cash flows of THC as of the date of and for the periods presented in the filings. The certification process is one example of the Utility's system of internal checks and balances that fosters a culture of accountability amongst senior management.

2.2. Shareholder Direction

As the sole shareholder of THC, the City of Toronto (the "Shareholder" or the "City") has adopted a Shareholder Direction (see Appendix A to this schedule) which establishes, amongst other things, the following objectives and fundamental principles that govern the operations of the Company:

(a) to operate the Company on an efficient and commercially prudent basis;

(b) to optimize the Shareholder's return on equity and operate the Company with a view to meeting the financial performance objectives of the Shareholder as set out in the Shareholder Direction;

(c) to provide a reliable, effective and efficient electricity distribution system that supports the electricity demands of residents and businesses in the City;

(d) to operate the Company in an environmentally responsible manner consistent with the City's energy, climate change, urban forestry objectives and, as appropriate, utilizing emerging green technologies;

(e) to ensure that the business is managed in material compliance with all Law; and

(f) to engage in recruitment and procurement practices designed to attract employees and suppliers from the City's diverse community.

The Board of Directors is responsible for determining and implementing the appropriate balance among these principles. Ultimately, the City requires THC to operate on a commercially prudent and profitable basis, in compliance with law, and expects the Board of Directors to provide stewardship and independently oversee management and operations in accordance with best corporate governance practices.

2.3. Board of Directors

THC's Board of Directors consists of 11 directors, all of whom are appointed by THC's sole shareholder, the City. Of the 11 directors, one director is the Mayor of the City (or a member of City Council whom the Mayor recommends as his or her designate and who is appointed by City Council), two are members of City Council, and eight directors are independent residents of the City.

The LDC's Board of Directors currently consists of two directors. Of those two directors, one is a member of the Board of Directors of THC and one is an individual who is not a member of any affiliate of the LDC, in accordance with the independence requirements set out by the OEB in the Affiliate Relationships Code ("ARC").

2.3.1. Nomination of Directors

Pursuant to the Shareholder Direction, the City appoints directors who collectively represent a range of expertise including:

(a) experience on a public utility commission or board of a major corporation or other commercial enterprise;
(b) experience or knowledge with respect to:
    i. corporate finance;
    ii. corporate governance;
    iii. market development;
    iv. large system operation and management;
    v. urban energy industries;
    vi. public policy issues and the law relating to the Company and the electricity industry;
    vii. environmental matters;
    viii. labour relations;
    ix. occupational health and safety issues;
(c) commercial sensitivity and acumen;
(d) independence of judgment;
(e) personal integrity; and
(f) at least three directors with financial management expertise.

The City utilizes a board skills and competencies matrix, as reviewed and recommended to the City by the Board's Chair, in the evaluation of potential THESL Board of Directors members. The matrix's design reflects best practices for directors as recommended by the Institute of Corporate Directors.

THC appoints the LDC's Board of Directors from among the directors of THC and independent residents of the City. When appointing directors of the LDC, THC ensures that the directors have a mix of competencies and skills necessary to enable Toronto Hydro's Board of Directors to properly discharge their responsibilities.

2.3.2. Exercise of Independent Judgment

The Board of Directors for each of THC and LDC has a number of practices and policies in place to facilitate its ability to act independently of senior management and to ensure that its behaviour and decision-making processes are objective, responsible and effective.

- In Camera Board Meetings: Each of the Boards of Directors meets regularly in the absence of management to discuss the management of THC and LDC respectively.
- Outside Advisors: Under its mandate, each of the Board of Directors is authorized to retain independent legal counsel and other outside advisors if it considers this appropriate.
- Internal Audit Function: The internal audit department provides each of the Boards of Directors with an objective review of the Company's risk management, governance and internal control systems. The internal audit department's work is overseen by the Audit Committee of the Board of Directors of THC. To facilitate independence, the Director of Internal Audit has unrestricted access to any member of the Board of Directors of THC or LDC, as required. THC's external auditor reviews the competency and work of the internal audit department.
- Corporate Governance Committee: The Corporate Governance Committee of the Board of Directors of THC oversees and evaluates the exercise of independent judgment by the Board of Directors and its committees.

2.3.3. Board of Directors Mandate

The Board of Directors for each of THC and LDC has adopted a mandate on August 15, 2013 which is reviewed every two years and revised as required. The most recent Mandate of the Board of THC is filed at Appendix B to this schedule, and the Mandate of the Board of LDC is filed at Appendix C.

2.3.4. Schedule of Board of Directors Meetings

The schedule for THC's Board of Directors Meetings is as follows:

2013	2014
January 30, 2013	February 6, 2014
February 28, 2013	March 19, 2014
May 16, 2013	May 15, 2014
June 7, 2013	August 14, 2014
August 15, 2013	November 13, 2014
November 15, 2013	

The schedule for the LDC's Board of Directors Meetings is as follows:

2013	2014
February 28, 2013	March 19, 2014
August 15, 2013	March 24, 2014

2.3.5. Orientation and Continuing Education

Upon joining the Board of Directors of THC and/or LDC, each new director is given a set of materials designed to provide him/her with a summary of the key organizational, financial, regulatory, reporting and operational aspects of the Company. Directors have access to a variety of internal and external resources on topics related to THC's and LDC's businesses, as well as relating to the responsibilities of directors such as fiduciary obligations, issues of confidentiality and privilege, and public disclosure and whistle blowing requirements. Directors also have the opportunity to attend continuing education programs run by outside service providers such as the Institute of Corporate Directors designation program.

2.3.6. Ethical Business Conduct

All employees, officers and directors of THC and LDC are required to comply with the principles set out in the Code of Business Conduct (the "Code"), which is filed as Appendix D to this evidence. The Code was implemented in 2004, and is periodically

reviewed and re-approved by the Board of Directors of THC. The Code of Business Conduct is included in new directors' orientation materials and each director signs an acknowledgement that he or she will comply with the Code.

The Code provides for the appointment of an Ethics Officer and establishes a direct hotline to the Ethics Officer through which perceived violations of the principles set out in the Code may be raised, anonymously or otherwise. The Ethics Officer is accountable to the Audit Committee.

2.3.7. Board Committees

THC's Board of Directors has established three standing committees: the Audit Committee, the Corporate Governance Committee, and the Human Resources Committee.

- The Audit Committee oversees the adequacy and effectiveness of financial reporting, accounting systems, internal financial control structures and financial risk management systems. Among other things, the Audit Committee reviews THC's quarterly and annual financial statements (as well as financial statements prepared in connection with securities offerings or required by applicable regulatory authorities), reviews the audit plans of the external auditors, and oversees the internal audit of THC. All of the members of the Audit Committee are independent and financially literate in accordance with sections 1.4 and 3.1 of National Instrument 52-110 on Audit Committees. The Audit Committee Charter is attached as Appendix D to this schedule.
- The Corporate Governance Committee advises the Board of Directors with respect to matters relating to the corporate governance of the Company, including Board and committee composition and mandate, guidelines for assessing the effectiveness of the Board and its committees, and procedures to ensure that the Board functions independently from management. The Corporate Governance

Committee also reviews and approves all orientation and education materials and programs for new and current directors undertaken by management. The Governance Committee Charter is attached as Appendix E to this schedule.

X The Human Resources Committee assists the Board with the recruitment, assessment and compensation of the CEO, reviews and approves the compensation of the executive officer, oversees executive compensation disclosure under applicable securities laws, and advises the Board of Directors regarding the compensation structure, benefit plans and programs of Toronto Hydro, as well as collective bargaining and environmental and health and safety matters. The Human Resource Committee Charter is attached as Appendix F to this schedule.

GOVERNANCE – BOARD MANDATE

TORONTO HYDRO CORPORATION

Mandate – Board of Directors

---

1. General

(1) The board of directors (Board) of Toronto Hydro Corporation (Corporation) is responsible for supervising the management of the business and affairs of the Corporation and its subsidiary entities (Group).

(2) The composition, responsibilities, and authority of the Board are set out in this Mandate.

(3) This Mandate, the Shareholder Direction issued by the City of Toronto (Shareholder) and the by-laws of the Corporation and such other procedures, not inconsistent therewith, as the Board may adopt from time to time shall govern the meetings and procedures of the Board.

2. Composition

(1) The directors of the Corporation (Directors) should have a mix of competencies and skills necessary to enable the Board and any Board committees to properly discharge their responsibilities.

(2) All of the Directors shall be residents of Canada.

(3) The Shareholder shall appoint Directors every 2 years.

(4) In appointing Directors the Shareholder shall give due regard to the qualifications of the candidates including:

a) experience on a public utility commission or board of a major corporation or other commercial enterprise;

b) experience or knowledge with respect to:

i) corporate finance;

ii) corporate governance;

iii) market development;

iv) large system operation and management;

v) urban energy industries;

vi) public policy issues and laws relating to the Corporation and its subsidiary entities and the electricity industry;

vii) environmental matters;

viii) labour relations;

ix) occupational health and safety issues;

c) commercial sensitivity and acumen;

d) independence of judgement;

e) personal integrity; and

f) at least three directors with financial management expertise.

(5) For the purposes of determining whether a Director is independent, the Board shall use the definition of independence within the meaning of National Instrument 52-110 Audit Committees adopted by the Canadian Securities Administrators.

(6) The Shareholder shall appoint a Chair of the Board.

(7) The Secretary of the Corporation shall be secretary of the Board (the Secretary).

3. Responsibilities

(1) The Board is responsible for supervising the management of the business and affairs of the Group, including the following specific matters:

a) establishing sound financial principles and performance objectives;

b) approving any dividend payment or distribution of capital;

c) appointing the officers of the Corporation;

d) approving the overall business strategy and related business plan;

e) approving the financing strategy, including the selection of financial institutions and related banking authorities;

f) directing labour and employee relations matters; and

g) approving the financial statements in accordance with the requirements of the Business Corporations Act (Ontario).

(2) In discharging their responsibilities, the Directors owe the following fiduciary duties to the Corporation:

- a fiduciary duty – they must act honestly and in good faith with a view to the best interests of the Corporation; and
- a duty of care – they must exercise the care, diligence and skill that a reasonably prudent person would exercise in comparable circumstances.

In discharging their responsibilities, the Directors are entitled to rely on the honesty and integrity of the senior officers of the Corporation and the auditors and other professional advisors of the Corporation.

In discharging their responsibilities, the Directors are also entitled to directors and officers liability insurance purchased by the Corporation and indemnification from the Corporation to the fullest extent permitted by law and the constating documents of the Corporation.

(3) The Board has specifically recognized its responsibilities for:

(a) to the extent feasible, satisfying itself as to the integrity of the Chief Executive Officer (CEO) and other senior officers of the Corporation and that the CEO and other senior officers of the Corporation create a culture of integrity throughout the Group;

(b) adopting a strategic planning process and approving annually (or more frequently if appropriate) a strategic plan which takes into account, among other things, the opportunities and risks of the business of the Group;

(c) overseeing the identification of the principal risks of the business of the Group and overseeing the implementation of appropriate systems to manage these risks;

(d) overseeing the integrity of the internal control and management information systems of the Group;

(e) succession planning (including appointing, training and monitoring the senior officers of the Corporation);

(f) recruiting and assessing the performance of the CEO, the compensation of the CEO and other officers of the Group, executive compensation disclosure and oversight of the compensation structure and benefit plans and programs of the Group;

(g) assessing the effectiveness of the Board;

(h) adopting a disclosure policy for the Group;

(i) developing and overseeing the orientation of new Directors, and the continuing education of existing Directors, of the Group; and

(j) developing the approach of the Corporation to corporate governance including a periodic review of the Code of Business Conduct of the Group.

(4) In addition to those matters which must by law be approved by the Board, the Board oversees the development of, and reviews and approves, significant corporate plans and initiatives, including the annual business plan and budget, major acquisitions and dispositions and other significant matters of corporate strategy or policy, including the Environmental Policy, Occupational Health and Safety Policy, Code of Business Conduct, Disclosure Policy, Signing Policy and Treasury Policy.

(5) The Board shall periodically review the Shareholder Direction and make recommendations to the Shareholder to facilitate and clarify interaction and communication between the Shareholder and the Board.

(6) The Board shall periodically review the performance of the Board against the Shareholder Direction.

(7) The Board shall periodically review the structure and mandate of each Board committee, the effectiveness of each committee, and the appointment and removal of committee members.

(8) The Board shall periodically review performance under the Environmental Stewardship Policy with management.

(9) To assist the Directors in discharging their responsibilities, the Board expects management of the Corporation to:

(a) review and update annually (or more frequently if appropriate) the strategic plan and report regularly to the Board on the implementation of the strategic plan in light of evolving conditions;

(b) prepare and present to the Board annually (or more frequently if appropriate) a business plan and budget and report regularly to the Board on the Corporation's performance against the business plan and budget; and

(c) report regularly to the Board on the Corporation's business and affairs and on any matters of material consequence to the Corporation and its Shareholder.

Additional expectations are developed and communicated during the annual strategic planning and budgeting process and during regular Board and Board committee meetings.

(10) The Board considers that generally management should speak for the Corporation in its communications with securityholders and the public. The Corporation's investor relations personnel are required to respond to inquiries from securities holders and the public after review and discussion, as appropriate, by senior management and the Board and Board committees. The Corporation's investor relations personnel are available to the securities holders by telephone, fax and e-mail. The Corporation maintains an investor relations section on its website. Presentations at investor conferences are posted promptly on the Corporation's website. They are also available on request. The Board

reviews the Corporation's major communications with securities holders and the public. All disclosures on behalf of the Corporation are to be made in compliance with the Corporation's disclosure policy.

(11) Directors are expected to attend Board meetings and meetings of Board committees of which they are members. Directors are also expected to spend the time needed, and to meet as frequently as necessary, to discharge their responsibilities.

(12) Directors are expected to undertake such activities as are required from them to remain current in their knowledge of issues relating to the business of the Group and matters relating to any Board committee of which they are members.

(13) Directors are expected to comply with the Code of Business Conduct of the Group.

4. Authority

(1) The Board is authorized to carry out its responsibilities as set out in this Mandate.

(2) The Board is authorized to retain, and set and pay the compensation of, independent legal counsel and other advisors if it considers this appropriate.

(3) The Board is authorized to invite officers and employees of the Corporation and others to attend or participate in its meetings and proceedings if it considers this appropriate.

(4) The Directors have unrestricted access to the officers of the Corporation. The Directors will use their judgment to ensure that any such contact is not disruptive to the operations of the Corporation and, except for the chair of any committee established by the Board, will, to the extent not inappropriate, advise the Chair and the Chief Executive Officer of the Corporation of any direct communications between them and the officers of the Corporation.

(5) The Board and the Directors have unrestricted access to the advice and services of the Secretary.

(6) The Board may delegate certain of its functions to Board committees, each of which will have its own charter.

5. Meetings and Proceedings

(1) The Board shall meet as frequently as is determined to be necessary, but not less than four times each year.

(2) Any Director or the Secretary may call a meeting of the Board.

(3) The Chair is responsible for the agenda for each meeting of the Board, including input from other Directors and the officers and employees of the Corporation as appropriate. Meetings will include presentations by management and others when appropriate and allow sufficient time to permit a full and open discussion of agenda items.

(4) Unless waived by all Directors, a notice of each meeting of the Board confirming the date, time, place and agenda of the meeting, together with any supporting materials, shall be forwarded to each Director at least ten days before the date of the meeting.

(5) The quorum for each meeting of the Board is a majority of the Directors. In the absence of the Chair, the other Directors shall appoint one of their number as chair of a meeting. The chair of a meeting shall not have a second or casting vote.

(6) The Secretary or his delegate shall keep minutes of all meetings of the Board, including all resolutions passed by the Board. Minutes of meetings shall be distributed to the Directors.

(7) An individual who is not a Director may be invited to attend a meeting of the Board for all or part of the meeting.

(8) The Directors shall meet regularly on one to facilitate full communication.

6. Review

(1) This Mandate shall be reviewed by the Corporate Governance Committee of the Corporation every 2 years and any recommended changes shall be brought to the Board of the Corporation for consideration and disposition.

August 2013

TORONTO HYDRO -ELECT RIC SYSTEM LIMITED.

Mandate – Board of Directors

---

1. General

(1) The board of directors (Board) of Toronto Hydro-Electric System Limited (Corporation) is responsible for supervising the management of the business and affairs of the Corporation.

(2) The composition, responsibilities, and authority of the Board are set out in this Mandate.

(3) This Mandate and the by-laws of the Corporation and such other procedures, not inconsistent therewith, as the Board may adopt from time to time shall govern the meetings and procedures of the Board.

2. Composition

(1) The directors of the Corporation (Directors) should have a mix of competencies and skills necessary to enable the Board and Board committees, if established, to properly discharge their responsibilities.

(2) A majority of the Directors shall be residents of Canada. At least one third of the Directors shall be independent Directors. For the purposes of determining whether a Director is independent, the Board shall use the definition of independence adopted by the Ontario Energy Board from time to time.

(3) The shareholder of the Corporation (Shareholder) shall appoint Directors every two years. Except for independent Directors, a Director shall cease to be a director of the Corporation if he or she ceases to be a director of the Shareholder.

(4) The Shareholder shall appoint a Chair of the Board.

(5) The Corporate Secretary of the Corporation shall be secretary of the Board (Secretary).

3. Responsibilities

(1) The Board is responsible for supervising the management of the business and affairs of the Corporation.

(2) In discharging their responsibilities, the Directors owe the following fiduciary duties to the Corporation:

- a fiduciary duty they must act honestly and in good faith with a view to the best interests of the Corporation; and

- a duty of care they must exercise the care, diligence and skill that a reasonably prudent person would exercise in comparable circumstances.

In discharging their responsibilities, the Directors are entitled to rely on the honesty and integrity of the senior officers of the Corporation and the auditors and other professional advisors of the Corporation.

In discharging their responsibilities, the Directors are also entitled to directors and officers liability insurance purchased by the Corporation and indemnification from the Corporation to the fullest extent permitted by law and the constating documents of the Corporation.

(3) The Board has specifically recognized its responsibilities for:

(a) to the extent feasible, satisfying itself as to the integrity of the President and other senior officers of the Corporation and that the President and other senior officers of the Corporation create a culture of integrity throughout the Corporation;

(b) overseeing a strategic plan which (i) takes into account, among other things, the opportunities and risks of the business of the Corporation and (ii) is consistent with the overall strategic plan approved by the Toronto Hydro Corporation (THC) Board of Directors (THC Directors) for THC and its subsidiary entities (Group);

(c) overseeing the identification of the principal risks of the business of the Corporation and overseeing the implementation of appropriate systems to manage these risks;

(d) overseeing the integrity of the internal control and management information systems of the Corporation; and

(e) except to the extent any policy is not considered appropriate or relevant for the Corporation, adopting all policies, including the disclosure policy, adopted by the THC Directors for the Group and any amendments thereto and ensuring compliance with such policies.

(4) In addition to those matters which must by law be approved by the Board, the Board oversees the development of, and reviews and approves, in a manner consistent with the overall business plan and budget approved by the THC Directors for the Group, significant corporate plans and initiatives, major acquisitions and dispositions and other significant matters of corporate strategy or policy.

(5) To assist the Directors in discharging their responsibilities, the Board expects management of the Corporation to:

(a) review and update annually (or more frequently if appropriate) the strategic plan and report regularly to the Board on the implementation of the strategic plan in light of evolving conditions; and

(b) report regularly to the Board on the Corporation's business and affairs and on any matters of material consequence for the Corporation and its shareholder.

Additional expectations are developed and communicated during the annual planning and budgeting process and during regular Board and Board committee meetings.

(6) Directors are expected to attend Board meetings and meetings of Board committees of which they are members. Directors are also expected to spend the time needed, and to meet as frequently as necessary, to discharge their responsibilities.

(7) Directors are expected to undertake such activities as are required from them to remain current in their knowledge of issues relating to the business of the Group and matters relating to any Board committee of which they are members.

(8) Directors shall adopt the Code of Business Conduct of the Group and any amendments thereto and comply with the Code as amended.

4. Authority

(1) The Board is authorized to carry out its responsibilities as set out in this Mandate.

(2) The Board is authorized to retain, and set and pay the compensation of, independent legal counsel and other advisors if it considers this appropriate.

(3) The Board is authorized to invite officers, employees of the Corporation and others to attend or participate in its meetings and proceedings if it considers this appropriate.

(4) The Directors have unrestricted access to the officers of the Corporation. The Directors will use their judgment to ensure that any such contact is not disruptive to the operations of the Corporation and, except for the chair of any committee established by the Board, will advise the Chair and the President of the Corporation of any direct material communications between them and officers of the Corporation.

5. Meetings and Proceedings

(1) The Board shall meet as frequently as is determined to be necessary.

(2) Any Director or the Secretary may call a meeting of the Board.

(3) The Chair is responsible for the agenda for each meeting of the Board, including input from other Directors and the officers and employees of the Corporation as appropriate. Meetings will include presentations by management and others when appropriate and allow sufficient time to permit a full and open discussion of agenda items.

(4) Unless waived by all Directors, a notice of each meeting of the Board confirming the date, time, place and agenda of the meeting, together with any supporting materials, shall be forwarded to each Director at least ten days before the date of the meeting.

(5) The quorum for each meeting of the Board is a majority of the Directors. In the absence of the Chair, the other Directors shall appoint one of their number as chair of a meeting. The chair of a meeting shall not have a second or casting vote.

(6) The Secretary or his delegate shall keep minutes of all meetings of the Board, including all resolutions passed by the Board. Minutes of meetings shall be distributed to the Directors.

(7) An individual who is not a Director may be invited to attend a meeting of the Board for all or part of the meeting.

(8) The Directors shall meet regularly on-line to facilitate full communication.

6. Review

(1) This Mandate shall be reviewed by the Corporate Governance Committee of THC every 2 years and any recommended changes shall be brought to the Board of the Corporation for consideration and disposition.

3 INTRODUCTION

As a reputable utility organization delivering electricity distribution and energy services to the City of Toronto, Toronto Hydro always strives to be a responsible business enterprise and corporate citizen, with strong and shared commitments to our stakeholders. We work to achieve the following strategic pillars:

People (fully-engaged, safe and healthy workforce that meets the changing business requirements)
Finance (meet financial objectives of the Shareholder)
Operations (improve reliability through optimal and sustainable system management)
Customer (provide value for money)

This requires us to execute our duties with highest standards of integrity and professionalism at all times. This Code of Business Conduct sets the basic principles on how Toronto Hydro and Toronto Hydro's employees should conduct the business activities to reach our business goals and fulfill commitments to our stakeholders.

4 POLICY OVERVIEW

This Code of Business Conduct sets forth the basic principles of business conduct Toronto Hydro expects its employees, officers and directors to follow.

It is expected that we will at all times exercise honesty and integrity in our duties, and live up to our commitments to society and our stakeholders. Our stakeholders include our customers and other business partners, our employees, the communities in which we operate, and our shareholder, the City of Toronto.

This Code outlines general principles of appropriate business conduct rather than attempting to cover every situation we may possibly encounter. It is not a substitute for the use of sound judgment and moral integrity in assessing such situations, and it does not supersede existing or subsequent Toronto Hydro policies issued in respect of specific matters. A failure by us to comply with the principles of appropriate business conduct set forth in this Code could result in damage to Toronto Hydro's economic well being or to its reputation and credibility with its stakeholders. The Code is designed to alert Toronto Hydro employees, officers, directors, consultants, suppliers and contractors to major legal and ethical issues that frequently arise. It also serves to establish appropriate channels for obtaining guidance and reporting Code violations.

The Vice President, Organizational Effectiveness and Environment, Health & Safety has been appointed to serve as Toronto Hydro's Ethics Officer.

All consultants, suppliers and contractors are to be made aware of the content of this Code. Each consultant, supplier and contractor shall either be provided with a copy of the Code or referred to the dedicated page on Toronto Hydro's website (www.torontohydro.com) each time an agreement to provide goods or services is executed with them or upon any change to the Code.

In this Code, "Toronto Hydro" means Toronto Hydro Corporation and all of its subsidiaries and related corporations.

Ethical Decision Making

One of the primary goals of this Code is to help all of us make ethical business decisions. The Code establishes principles to govern conduct in some general areas that pose ethical or legal concerns. No book of hard-and-fast rules, however long and detailed, could ever adequately cover all the dilemmas we face given the complexity and constantly changing nature of our work and our world.

Therefore, we may find it helpful to ask the following questions before taking action in specific situations:

- Am I adhering to the letter and spirit of the laws and regulations that may be involved?
- Is my action consistent with the overall values set forth in the Code?
- Would my action compromise my integrity or credibility, or that of Toronto Hydro?
- Does my action conform to Toronto Hydro's company policies?
- How would my actions appear to my supervisors, peers, subordinates, family, close personal friends, or to the public if reported in the news media?
- Does it make me feel uncomfortable?

Ultimately, employees are personally responsible for their decisions and should discuss ethical concerns, issues and questions with their supervisor or other contacts referred to under the "Compliance, Discipline and Reprisal" section below.

5 COMMITMENT TO SOCIETY

We believe that we have responsibilities to society because ultimately it is only with its implicit permission that the economy in which we participate is allowed to flourish. We therefore make the following commitments to society.

Obey the Law

5.1 We act in accordance with both the letter and the spirit of all laws and regulations applicable to the conduct of our business wherever we operate. To achieve this, Toronto Hydro provides us with the training required to obtain an understanding of the laws which apply to the carrying out of our responsibilities. With this training, we are expected to be sufficiently familiar, and act in accordance, with any laws that apply to our work, to recognize potential liabilities, and to know when to seek legal advice. If in doubt, we promptly seek clarification from Toronto Hydro's General Counsel.

5.2 We never commit or condone an illegal or improper act relating to Toronto Hydro's affairs, or instruct another employee, business partner or contractor to do so.

5.3 We acknowledge the importance to Toronto Hydro of complying with the Affiliate Relationships Code. We comply with, and ensure that all parties who provide services on behalf of Toronto Hydro comply with, the Affiliate Relationships Code.

5.4 We do not offer or make any payment (in money, property, services or any other form), directly or indirectly, through an agent or consultant, to any government official, political party, political party official, or candidate for political office for the purpose of persuading that person to exert influence in order to assist Toronto Hydro in obtaining or retaining business. We take measures reasonably within our power to ensure that any payment made to an agent is appropriate remuneration for legitimate services rendered and that no part is passed on by the agent as a bribe. We ensure that proper systems of control are in place to prevent and detect the payment of bribes.

5.5 We never request any payment (in money, property, services or any other form), directly or indirectly, to influence a decision or otherwise, nor do we accept any offered payment for any purpose other than as permitted in strict compliance with this Code.

5.6 We avoid all actions that are anti-competitive or otherwise contrary to laws that govern competitive practices in the marketplace.

5.7 We do not engage in, or give the appearance of being engaged in, any illegal or improper conduct that is in violation of this Code.

Confidentiality

5.8 We do not use for personal advantage any information that is obtained in the course of our employment and is not available to the public at large.

Examples of such information include:

(a) information concerning a proposed or existing business transaction with Toronto Hydro (e.g., a contract to purchase new transformers);
(b) the proposed acquisition or disposal of investments or other assets; and
(c) the pending award or change of contract for the supply of materials, goods or services to Toronto Hydro.

5.9 We do not inform anyone of any material fact or change relating to Toronto Hydro before it has been generally disclosed by Toronto Hydro in accordance with its Disclosure Policy except as may be required in the ordinary course of business. If it is necessary to inform any persons in the ordinary course of business, we ensure that the recipients of the information understand that it must be kept confidential. Where such recipients are from outside of Toronto Hydro we request, where appropriate, that they confirm their commitment to non-disclosure in the form of a written confidentiality agreement.

5.10 We will comply at all times with the privacy policies approved by Toronto Hydro (see Toronto Hydro website www.torontohydro.com).

6 COMMITMENT TO STAKEHOLDERS

Maintaining the trust and confidence of our stakeholders is crucial to Toronto Hydro's economic wellbeing and to its reputation and credibility with its stakeholders. If such trust and confidence is lost, we will lose their support and the valuable contribution which each makes to Toronto Hydro's success. It is in recognition of this that we make the following commitments to our stakeholders.

TO ALL OF OUR STAKEHOLDERS

We are committed to protecting their interest in Toronto Hydro's economic well-being

We acknowledge that all stakeholders have an interest in Toronto Hydro's economic well-being to provide employment opportunities, purchase goods and services, contribute to economic partnerships, contribute to the quality of life in communities where we operate, and to enhance the value of our shareholder's investment. To protect these interests, we will act in accordance with the following standards:

6.1 Protect Toronto Hydro's Assets

Each of us has a responsibility to safeguard Toronto Hydro's assets.

6.1.1 *With respect to corporate funds we will:*

(a) Exercise integrity, prudence and judgment in incurring and approving business expenses.
(b) Ensure that business expenses are reasonable and serve Toronto Hydro's business interests.
(c) Ensure that all transactions and expenses are properly authorized.
(d) Record all transactions and expenses accurately, completely and promptly.
(e) Ensure that the acquisition, use, disposal or movement of funds is made known, clearly identified, and not diverted for any other use than that for which they were approved.
(f) Not conceal any fund or transaction from finance, management or Toronto Hydro's auditors.
(g) Not enter into any transaction for the purpose of unlawfully evading any tax, duty or other levy imposed by a government, either for ourselves or for our counterparties.

6.1.2 *With respect to physical assets (including corporate property involved in carrying out duties) we will:*

(a) Use these assets prudently and with due care.

(b) Exercise reasonable safeguards to protect them against theft, damage, loss and waste.
(c) Ensure that the acquisition, use, disposal or movement of assets is made known, clearly identified, and not diverted for any other use than that for which they were approved.
(d) Not take, sell, loan, destroy or give away assets without proper authorization.

6.1.3 ***With respect to intellectual capital we will:***

(a) Treat any information that has not been publicly disclosed in accordance with Toronto Hydro's disclosure policy as confidential.
(b) Take precautions to avoid inadvertent disclosure, for instance, by not discussing such information in public and using extra care in transmitting such information by fax or electronic mail.
(c) Enter into confidentiality agreements to ensure those to whom we must disclose such information will not disclose it to others.
(d) Not release information to the media without proper authorization.
(e) Use only properly licensed computer software.
(f) Not reproduce, distribute or alter materials such as computer software or videotapes without the permission of the copyright owner or authorized agent but instead obtain additional copies of needed materials by purchasing them through the appropriate channels.
(g) Employ ethical means in conducting research by being honest in obtaining, interpreting, using and disclosing data.
(h) Use Toronto Hydro intellectual property --brand names, logos, trademarks – only in an authorized manner and in accordance with all laws.
(i) Comply with internal policies, procedures and guidelines relating to internal computer systems, including "Toronto Hydro Technology Use Guidelines". We acknowledge that Toronto Hydro reserves the broadest possible rights to ensure that Toronto Hydro's computer data base and all electronic communications systems, including electronic mail ("e-mail"), voice mail, the intranet and internet, and electronically created or stored data are used in compliance with internal policies, procedures and guidelines that guide the use, storage and transmission of information through this medium.

6.1.4 ***With respect to business records and reports we will****:*

(a) Ensure honest and accurate recording, reporting and retention of information (including all business records, including financial reports, research reports, marketing information, sales reports, tax refunds, time sheets, claims and other documents including those submitted to governmental agencies) since almost all business records may become subject to public disclosure in the course of litigation or governmental investigations and records are also often obtained by outside parties or the media.
(b) Ensure that all records and accounts accurately and truthfully reflect transactions and events, and conform both to generally accepted accounting principles and to the Toronto Hydro system of internal controls.
(c) Ensure that no entry is made in any record that intentionally hides or disguises the true nature of any transaction.
(d) Never withhold, or fail to communicate, information that should be brought to the attention of higher levels of management.
(e) Attempt to be as clear, concise, truthful and accurate as possible when recording any information and avoid exaggeration, inappropriate language, guesswork, legal conclusions, and derogatory characterizations of people and their motives.
(f) Not destroy or condone the destruction of records, except in accordance with internal document management, retention and disposition policies.

6.1.5 ***With respect to Toronto Hydro's image and reputation:***

(a) When presenting ourselves on behalf of Toronto Hydro, we must not conduct ourselves in any way that would negatively impact Toronto Hydro's image and reputation, and must comply with any relevant Toronto Hydro policies, procedures, and standards.
(b) Ensure that our communication via social networks and digital media is consistent with the directions laid out in the Toronto Hydro Social Media and Digital Communication Guidelines.

6.2 Avoid Conflicts of Interest

A "conflict of interest" occurs when our direct or indirect personal interests, activities or influences could compromise, or could reasonably appear to compromise, our ability to perform our responsibilities objectively and in the best interests of Toronto Hydro. Conflicts of interest, no matter how innocent the intention, threaten Toronto Hydro's economic interests (including its reputation) by potentially leading us to make decisions based on personal interests rather than in the best interests of Toronto Hydro. Even if we do not allow our personal interests to influence our decisions, the existence of the conflict will jeopardize the trust of our stakeholders if they perceive that we may not be acting solely with Toronto Hydro's best interests in mind. We must therefore exercise common sense, sound judgment and moral integrity to avoid any conflict of interest. We must also make any situation that might constitute a potential conflict of interest known to management and seek approval to proceed in accordance with this Code.

We are to seek guidance from our supervisors, or otherwise in accordance with this Code, whenever there is a question concerning a possible conflict of interest between our personal interest and the interests of Toronto Hydro. Conflicts include any activity (even when it is unpaid), interest or association that might compromise, or appear to compromise, the independent exercise of our judgment in the best interests of the Company.

To avoid the appearance of a conflict of interest, any request by a director or senior representative of the Shareholder related to the material use or handling of Toronto Hydro assets or resources or requesting actions to be taken by an officer or employee of Toronto Hydro other than those actions directed by the individual(s) to whom that officer or employee directly or indirectly reports shall be reviewed by the Corporate Governance Committee. If an officer or employee of Toronto Hydro receives such a request from a director such request shall be referred to the Chair, Corporate Governance Committee for a review by that Committee prior to such action being taken.

Our responsibility to avoid conflicts of interest means that we must always act in the best interests of Toronto Hydro.

6.2.1 ***With respect to outside business interests we will not, without approval:***

(a) Operate, serve as directors, officers, or partners of, or perform work or services as employees, consultants or advisors for, any competitor or any actual or potential "business partner" (including suppliers and customers) or any other entity that could lead to a conflict of interest or situation prejudicial to Toronto Hydro's interests (including any situation where our performance of duties for Toronto Hydro is adversely affected).
(b) Use Toronto Hydro time or resources (including equipment, tools, materials, supplies, facilities, personnel and information) to run our own business or engage in work for another organization, or to further the private interests of our family members, close personal friends or associates.

(c) Take part in a Toronto Hydro corporate decision which might confer any benefit, monetary or otherwise, on a business partner or competitor of Toronto Hydro in which we, our family members, close personal friends or associates hold a direct or indirect business or ownership interest. For example, we will not award a contract to, or obtain goods or services from, an entity in which we or such family members, friends or associates have a private interest, except where the interest is solely in the form of insignificant stock interests held in public companies.

(d) Take part in outside employment which creates the appearance of a, or an actual, conflict of interest.

(e) While performing duties as a Toronto Hydro representative, solicit customers for any outside employment. We will not recommend or refer customers to businesses, including those businesses operated by ourselves or other Toronto Hydro employees. For the purpose of interpretation, "solicit" includes any inquiry or request made by a customer for an employee's "off-duty" services.

6.2.2 ***With respect to property transactions we will not:***

(a) Use our position at Toronto Hydro to influence any corporate decision involving real estate or personal property in which we, our family members, close personal friends or associates have a direct or indirect business or ownership interest. For example, we will not participate in a decision concerning the location of a Toronto Hydro facility that would directly or indirectly benefit lands owned by any such individuals.

(b) Deal knowingly in real estate for the direct or indirect personal gain of ourselves, family members, close personal friends or associates, based on knowledge of any proposed or pending Toronto Hydro transaction such as the proposed location of a transmission line or other facility.

(c) Influence the settlement of a claim against Toronto Hydro to the advantage of a private interest held by us, our family members, close personal friends or associates.

6.2.3 ***With respect to political activity we acknowledge that:***

Each of us has the right to participate in the political process and to engage in political activities of our own choosing. However, while involved in such political activities we must at all times make clear that any views and actions are our own, and not those of Toronto Hydro. As in other activities, we must consider whether our political activity could adversely affect our performance of duties for Toronto Hydro or conflict with Toronto Hydro's responsibilities and, if so, avoid those activities. To determine if the political activity may create a potential conflict, we may contact the Ethics Officer, who will review the case and inform us of any action considered necessary to avoid the conflict.

6.2.4 ***With respect to gifts, gratuities, entertainment or benefits offered to us, our family members, close personal friends or associates (or to a third party receiving benefits for us or them) for less than full market value we will conduct ourselves as follows:***

We will only accept gifts, entertainment and benefits in the normal exchanges common to business relationships. The following criteria will guide our judgment:

(a) the gift, entertainment or benefit would be considered to be within the bounds of propriety taking into account all the circumstances of the occasion;

(b) it does not, nor is it expected to, create a sense of obligation;

(c) it would not appear to improperly influence a business decision or result in compromising objectivity;

(d) it occurs infrequently; and

(e) it would be valid for reimbursement on a Toronto Hydro expense statement if offered rather than received.

We will return inappropriate gifts or other benefits to the donor, accompanied by an explanation of Toronto Hydro's policy on this matter or, if considered appropriate, a copy of this Code. Perishable gifts can instead be donated to a charity and the donor notified. We will promptly advise our Ethics Officer of the circumstances of an inappropriate gift.

In some business settings, the return of a gift or refusal of a favour, benefit or entertainment would be offensive; in these cases, we should refer the circumstances to the Ethics Office for guidance.

Full and immediate disclosure in accordance with this Code of borderline cases will always be taken as good faith compliance with this Code.

6.3 TO OUR CUSTOMERS AND OTHER BUSINESS PARTNERS

We are committed to being fair and honest

6.3.1 To fulfill this commitment we:

(a) Treat our business partners courteously, respectfully and in a professional and helpful manner.
(b) Commit only to what we honestly believe we can deliver.
(c) Honour the commitments we make.
(d) Protect any information shared with us on a confidential basis by a business partner.
(e) Do not release customer information to any third party without proper authorization from the customer or Toronto Hydro management.
(f) Do not attempt to improperly influence the decisions of existing or potential business partners or attempt to secure preferential treatment for Toronto Hydro by offering gifts, entertainment or benefits which we ourselves would not be able to accept.
(g) Do not use our position at Toronto Hydro to obtain personal favors or special consideration for ourselves, our family members, close personal friends or associates.
(h) Select our suppliers objectively, based on fairness and the long-term best interests of Toronto Hydro.

6.4 TO OUR EMPLOYEES

We are committed to treating all employees with dignity and respect.

6.4.1 To fulfill this commitment we create a safe and healthy work environment where employees have opportunities for professional development, are treated with dignity and respect and are recognized for their contributions to Toronto Hydro and its customers.

6.5 TO THE COMMUNITIES WHERE WE OPERATE

We are committed to protecting the environment and enhancing the quality of life.

To fulfill this commitment we will act in accordance with the following standards:

6.5.1 Protect the Environment

We acknowledge that environmental protection is one of Toronto Hydro’s fundamental

values and to demonstrate such value we will:

(a) Ensure that we understand the environmental impact of our activities and treat it as an integral factor in all of our decisions.
(b) Report immediately any environment mishaps.
(c) Be open about and accountable for our environmental performance.
(d) Strive to find business partners which conduct their business in an environmentally responsible manner.

6.5.2 Enhance the Quality of Life

We believe that a fundamental responsibility is to conduct our business on a sound commercial basis in a socially responsible manner. This is, we believe, the greatest contribution we can make to the communities where we operate. We also believe we have a responsibility to contribute to the well-being of these communities in other ways. While this commitment will take different forms in different communities, we will:

(a) Support health, education and environmental initiatives.
(b) Support and work with voluntary and charitable organizations that respond to community needs.
(c) Get involved in and work with the community to assist in solving community problems.
(d) Encourage our employees to contribute to their communities through involvement with charitable, community service and professional organizations. However, employees must consider whether their activities could pose a conflict of interest or adversely affect their performance of duties for Toronto Hydro, and should only use Toronto Hydro time or resources for such activities with the prior approval of management.
(e) Encourage, support and seek partnerships with organizations which need our help, whether they be schools or social service organizations.
(f) Involve local communities in decision making for issues that affect them.

6.6 TO OUR SHAREHOLDER

We are committed to enhancing value for our shareholder, the City of Toronto.

All of our ethical commitments are directed at protecting Toronto Hydro's well-being. Through these commitments, we will seek to enhance the value of our shareholder's investment.

7 POLICY OWNERSHIP, ADMINISTRATION, APPROVAL AND RESPONSIBILITIES

7.1 This policy is owned by the Vice President, Organizational Effectiveness, Environment, Health and Safety.

7.2 The Vice President, Organizational Effectiveness, Environment, Health and Safety is responsible for:

(a) ensuring that this policy is comprehensive, clear and current;
(b) ensuring that this policy is implemented and communicated to the departments and staff that are impacted;
(c) ensuring ongoing compliance with this policy;
(d) approving any exceptions to this policy, as required;
(e) reviewing this policy as often as necessary, but at least annually;
(f) modifying, amending or rescinding this policy at any time.

7.3 This policy is approved by the President & CEO of Toronto Hydro.

8 COMPLIANCE, DISCIPLINE AND REPRISAL

8.1 All Toronto Hydro employees, officers and directors must adhere to and actively support the principles and standards described in this Code, and adhere to the standards set out in applicable policies, guidelines and legislation.

8.2 Regardless of the approach used, the person or office contacted will handle your request promptly, discreetly and professionally. Discussions and inquiries will be strictly confidential to the fullest extent possible or permitted by policy or law.

8.3 Violations of the Code will not be tolerated. Any employee who fails to comply with the Code, or who withholds information during the course of an investigation regarding a possible violation of the Code, is subject to disciplinary action up to and including dismissal. Depending on the nature of the non-compliance, Toronto Hydro may have legal obligation to report the non-compliance to the appropriate authorities, which may lead to criminal prosecution or civil action.

8.4 Any situation or transaction that may violate, or could appear to violate, the letter or intent of the Code must be reported immediately to your supervisor or if this is uncomfortable or seems inappropriate, must be reported immediately to the next level of your management; or if preferred, Toronto Hydro's Ethics Officer.

8.5 The Ethics Officer may be contacted by regular mail addressed to the Ethics Officer, 14 Carlton St., Toronto, Ontario M5B 1K5 and marked CONFIDENTIAL, in person, or by way of a dedicated phone line established solely for this purpose [416.542.2767]. All issues raised with, and reported to, the Ethics Officer will be handled promptly, discreetly and professionally.

8.6 The Ethics Officer shall have the discretion to determine how any reported matter will be handled. This discretion shall include deciding, in each instance, with whom she should or should not discuss the details of the reported matter. She shall not have any obligation to discuss the matter with the Chair of the Board of Directors or any of the other directors or officers of Toronto Hydro, except, if the reported matter involves the conduct of any of the directors, the CEO or any other officer of Toronto Hydro, then the Ethics Officer shall immediately report the matter to the Chair of the Audit Committee of Toronto Hydro and comply with any directives received from the Chair. It is important to note that it is hoped that all callers will identify themselves when contacting the Ethics Officer since that will facilitate resolving any issues. However, we will respond to anonymous contacts.

8.7 All disclosures to the Ethics Officer will be kept strictly confidential to the fullest extent possible or permitted by policy or law unless, in the sole opinion of the Ethics Officer, the matter disclosed constitutes an actual or potential threat of harm to Toronto Hydro, its employees or the general public. In that event, the Ethics Officer will act in accordance with any disclosure procedure issued by Toronto Hydro's General Counsel.

8.8 Management is responsible for ensuring that no retaliatory action will be taken against anyone for making in good faith a report of an ethical or legal concern or violation. However, anyone who takes part in a prohibited activity may be disciplined even if they report it. An employee's decision to report will, in all cases, be given due consideration in the event any disciplinary action is necessary.

8.9 Any employee found to be retaliating against an individual who, in good faith, reports a known or suspected violation or supplies information about a concern will be subject to disciplinary action up to and including dismissal. Employees who knowingly submit false reports will also be subject to disciplinary action.

TORONTO HYDRO CORPORATION

Charter – Audit Committee

---

1. General

(1) The board of directors (Board) of Toronto Hydro Corporation (Corporation) has established the Audit Committee (Committee) to assist the Board in fulfilling its corporate governance and oversight responsibilities with respect to financial reporting, internal financial control structure, financial risk management systems, internal audit and external audit functions.

(2) The composition, responsibilities and authority of the Committee are set out in this Charter.

(3) This Charter and the by-laws of the Corporation and such other procedures, not inconsistent therewith, as the Committee may adopt from time to time shall govern the meetings and procedures of the Committee.

2. Composition

(1) The Committee shall be composed of at least three directors of the Corporation (Members).

(a) all Members shall be independent (as determined by the Board in accordance with the rules of the Canadian Securities Administrators with respect to the role and composition of audit committees); and

(b) at least one of whom, including the chair of the Committee (Chair), is financially literate (ie, have the ability to read and understand a set of financial statements that present a breadth and level of complexity of accounting issues that are generally comparable to the breadth and complexity of the accounting issues that can reasonably be expected to be raised by the financial statements of the Corporation).

(2) Members shall be appointed by the Board on the recommendation of the Chair of the Board and shall serve until they resign, cease to be a Director or are removed or replaced by the Board.

(3) The Board shall designate one of the Members as Chair.

(4) The Secretary of the Corporation shall be secretary of the Committee (Secretary).

3. Responsibilities

The Committee shall assist the Board in fulfilling its corporate governance and oversight responsibilities with respect to financial reporting, internal financial control structure, financial risk management systems, internal audit functions and external audit functions.

The Committee shall have the responsibilities set out below.

(1) Managing the Relationship between the Corporation and its External Auditors

The Committee shall be responsible for managing the relationship between the Corporation and its external auditors, including:

(a) appointing and replacing the external auditors, subject to shareholder approval;

(b) setting the compensation of the external auditors subject to the approval of the board of directors or shareholder, as applicable;

(c) overseeing the work of the external auditors, including resolving disagreements between management and the external auditors with respect to financial reporting;

(d) pre-approving all audit services and permitted non-audit services to be provided to the Corporation and its subsidiary entities by the external auditors in accordance with the "Policy on the Provision of Services by the External Auditors";

(e) having the external auditors report to the Committee in a timely manner with respect to all required matters, including those set out in paragraph 3(2);

(f) reviewing and approving the hiring policies of the Corporation with respect to present and former partners and employees of the external auditors;

(g) ensuring the rotation of the audit partner having primary responsibility for the external audit of the Corporation, the audit partner responsible for reviewing the external audit and the external auditors as such intervals as may be required; and

(h) reviewing and assessing the performance, independence and objectivity of the external auditors.

(2) Overseeing the External Audit

The Committee shall be responsible for overseeing the external audit of the Corporation, including:

(a) reviewing and approving the engagement letter and the audit plan, including financial risk areas identified by the external auditors and management;

(b) reviewing and assessing the accounting and reporting practices and principles used by the Corporation in preparing its financial statements, including:

(1) all significant accounting policies and practices used, including changes from preceding years and any proposed changes for future years;

(2) all significant financial reporting issues, estimates and judgments made;

(3) all alternative treatments of financial information discussed by the external auditors and management, the results of such discussions and the treatments preferred by the external auditors;

(4) any major issues identified by the external auditors with respect to the adequacy of internal control systems and procedures and any special audit steps adopted in light of material deficiencies and weaknesses;

(5) the effect of regulatory and accounting initiatives and off-balance sheet transactions or structures on the financial statements;

(6) any errors or omissions in, and any required restatement of, the financial statements for preceding years;

(7) all significant tax issues;

(8) the reporting of all material contingent liabilities; and

(9) any material written communications between the external auditors and management;

(c) reviewing and assessing the results of the external audit and the external auditors' opinion on the financial statements;

(d) reviewing and discussing with the external auditors and management any management or internal control letters issued or proposed to be issued by the external auditors;

(e) reviewing and discussing with the external auditors any problems or difficulties encountered by them in the course of the audit work and management's response (including any restrictions on the scope of activities or access to requested information and any significant disagreements with management); and

(f) reviewing and discussing with legal counsel any legal matters that may have a material impact on the financial statements, operations, assets or compliance policies of the Corporation and any material reports or enquiries received by the Corporation and its subsidiary entities from regulators or government agencies.

3. Overseeing the Internal Audit

The Committee shall be responsible for overseeing the internal audit of the Corporation, including:

(a) periodically reviewing the Internal Audit Charter and making recommendations to the Board;

(b) reviewing and approving the audit plan, including significant risk exposures identified by the internal auditor and management;

(c) reviewing and discussing with the internal auditor and management the results of any internal audits;

(d) reviewing and discussing with the internal auditors any problems or difficulties encountered by them in the course of the audit work and management's response (including any restrictions on the scope of activities or access to requested information and any significant disagreements with management);

(e) appointing and replacing the internal auditor;

(f) reviewing and assessing the performance of the internal auditor;

(g) ensure the Committee is kept informed of emerging trends and successful practices in internal auditing; and

(h) confirm there is effective and efficient coordination of activities between internal and external auditors.

(4) Reviewing and Approving and Recommending to the Board for Approval the Financial Statements, MD&A and Interim Reports of the Corporation

The Committee shall review and approve, and where required recommend to the Board for approval, the financial statements, management's discussion and analysis of financial condition and results of operations (MD&A) and interim financial reports of the Corporation, annual information form (AIF) and other public disclosure of financial information extracted from the financial statements of the Corporation with particular focus on:

(a) the quality and appropriateness of accounting and reporting practices and principles and any changes thereto;

(b) major estimates or judgments, including alternative treatments of financial information discussed by management and the external auditors, the results of such discussions and the treatment preferred by the external auditors;

(c) material financial risks;

(d) material transactions;

(e) material adjustments;

(f) compliance with loan agreements;

(g) material off-balance sheet transactions and structures;

(h) compliance with accounting standards;

(i) compliance with legal and regulatory requirements; and

(j) disagreements with management.

(5) Overseeing Internal Financial Control Structure and Financial Risk Management Systems

The Committee shall be responsible for overseeing the internal financial control structure and financial risk management systems of the Corporation, including:

(a) reviewing and discussing with management and the external auditors the quality and adequacy of internal control over financial reporting structures of the Corporation, including any major deficiencies or weakness and the steps taken by management to rectify these deficiencies or weaknesses;

(b) reviewing and discussing with management, the internal auditor and the external auditors the risk assessment and risk management policies of the Corporation, the major financial risk exposures of the Corporation and the steps taken by management to monitor and control these exposures;

(c) reviewing and discussing with the Chief Executive Officer and the Chief Financial Officer of the Corporation the procedures undertaken by them in connection with the certifications required to be given by them in connection with annual and other filings required to be made by the Corporation under applicable securities laws; and

(d) periodically reviewing the Treasury Policy and signing policies for the Corporation and its subsidiaries, making recommendations to the Board in respect of such policies and reviewing performance under these polices with Management.

(6) Establish and Review Certain Procedures

The Committee shall establish adequate policies and procedures, or require that adequate policies and procedures are established, with respect to the following and shall annually assess the adequacy of these procedures:

(a) the review of the public disclosure of financial information extracted from the financial statements of the Corporation;

(b) the receipt, retention and treatment of complaints received by the Corporation with respect to accounting, internal controls or auditing matters; and

(c) the confidential, anonymous submission by employees of the Corporation of concerns regarding questionable accounting or auditing matters.

4. Authority

(1) The Committee is authorized to carry out its responsibilities as set out in this Charter and to make recommendations to the Board arising therefrom.

(2) The Committee may delegate by written policy to the Chair and the Chief Financial Officer of the Corporation (CFO) the authority, within specified limits, to authorize in advance all engagements of the external auditors to provide pre-approved services to the Corporation and its subsidiary entities. The Chair and the CFO shall report all engagements authorized by them to the Committee at its next meeting.

(3) The Committee shall have direct and unrestricted access to the external and internal auditors, officers and employees and information and records of the Corporation.

(4) The Committee is authorized to retain, and to set and pay the compensation of, independent legal counsel and other advisors if it considers this appropriate.

(5) The Committee is authorized to invite officers and employees of the Corporation and outsiders with relevant experience and expertise to attend or participate in its meetings and proceedings if it considers this appropriate.

(6) The external auditors shall have direct and unrestricted access to the Committee and shall report directly to the Committee.

(7) The Corporation shall pay directly or reimburse the Committee for the expenses incurred by the Committee in carrying out its responsibilities.

5. Meetings and Proceedings

(1) The Committee shall meet as frequently as required but not less frequently than four times each year.

(2) Any Member or the Secretary may call a meeting of the Committee. The external auditors or the CFO may ask a Member to call a meeting of the Committee.

(3) The Chair shall approve the agenda of each meeting of the Committee, including input from the officers and employees of the Corporation, external auditors, other Members and other directors of the Corporation as appropriate. Meetings will include presentations by management or professional advisors and consultants when appropriate and allow sufficient time to permit a full and open discussion of agenda items.

(4) Unless waived by all Members, a notice of each meeting of the Committee confirming the date, time, place and agenda of the meeting, together with any supporting materials, shall be forwarded to each Member at least three days before the date of the meeting.

(5) The quorum for each meeting of the Committee is two Members. In the absence of the Chair, the other Members may appoint one of their number as chair of a meeting. The Chair of a meeting shall not have a second or casting vote.

(6) The Chair or a delegate of the Chair shall report to the Board following each meeting of the Committee.

(7) The Secretary or a delegate of the Secretary shall keep minutes of all meetings of the Committee, including all resolutions passed by the Committee. Minutes of all meetings shall be distributed to the Members. The minutes shall be available for review by the other directors of the Corporation after approval thereof by the Committee.

(8) An individual who is not a Member may be invited to attend a meeting of the Committee for all or part of the meeting. A standing invitation to all meetings shall be given to the Chairman of the Board, the President and Chief Executive Officer of the Corporation, the CFO except where the meeting, or part of the meeting, is for Members only or a private session with the internal auditor or the external auditors. A standing invitation should be given to the internal auditor and the engagement partners of the external auditors for all meetings where financial information is reviewed and approved..

(9) The Committee shall meet regularly alone and in private sessions with the internal audit leader, the external auditors and management of the Corporation to facilitate full communication.

6. Review

(1) This Charter shall be reviewed by the Corporate Governance Committee of the Corporation every 2 years and any recommended changes shall be referred first to the Audit Committee for review and comment and second, after consideration of the input from the Audit Committee, to the Board of the Corporation for consideration and disposition.

TORONTO HYDRO CORPORATION

Charter – Corporate Governance Committee

---

1. General

(1) The board of directors (Board) of Toronto Hydro Corporation (Corporation) has established the Corporate Governance Committee (Committee) to assist the Board in fulfilling its responsibilities with respect to the operation of the Board, Board committees, boards of its subsidiaries and corporate governance standards and practices.

(2) The composition, responsibilities and authority of the Committee are set out in this Charter.

(3) This Charter and the by-laws of the Corporation and such other procedures, not inconsistent therewith, as the Committee may adopt from time to time shall govern the meetings and procedures of the Committee.

2. Composition

(1) The Committee shall be composed of at least two directors of the Corporation (Members).

(2) Members shall be appointed by the Board upon the recommendation of the Chair of the Board and shall serve until they resign, cease to be a Director or are removed or replaced by the Board.

(3) The Board shall designate one of the Members as chair of the Committee (Chair).

(4) The Secretary of the Corporation shall be secretary of the Committee (Secretary).

3. Responsibilities

The Committee shall assist the Board in fulfilling its responsibilities with respect to the operation of the Board and Board committees and corporate governance standards and practices. The Committee shall have the responsibilities set out below.

3.1 Responsibilities with respect to the Operation of the Board and Board Committees

The Committee shall:

(a) facilitate the periodic review of the operation of the Board and Board committees, including the agenda for and reports and other information provided at, meetings and the conduct of meetings, and make recommendations to the Board;

(b) facilitate the periodic assessment of the performance of the Board and Board committees and report the results of that assessment to the Board;

(c) facilitate the periodic assessment of the effectiveness of the relationship between the Board and the Chief Executive Officer and other senior officers of the Corporation and report the results of that assessment to the Board; and

(d) facilitate the effective orientation and continuing education of the new and existing directors of the Corporation.

3.2 Responsibilities with respect to Corporate Governance

The Committee shall:

(a) review with Management corporate governance standards, practices and new laws applicable to the Corporation and make recommendations to the Board;

(b) annually review the Shareholder relationship with the City and make recommendations to the Board to facilitate and clarify interactions and communication between the Shareholder and the Board;

(c) periodically review the articles and by-laws of the Corporation, the Code Of Business Conduct, the mandates of the Board and the boards of its subsidiaries, charters of the Board committees, the shareholder directions for the subsidiaries, and the Disclosure Policy, and make recommendations to the Board;

(d) periodically review performance under the Disclosure Policy with Management;

(e) review and approve the disclosure with respect to corporate governance practices required to be included in the annual and other filings required to be made by the Corporation under applicable securities laws;

(f) review and approve any other disclosure of corporate governance practices before public disclosure by the Corporation; and

(g) periodically review the Shareholder Direction and make recommendations regarding Board compensation to the Board for delivery to the Shareholder to ensure compensation of the Board is comparable to that of similar Boards in order to attract and retain competent Board members.

4. Authority

(1) The Committee is authorized to carry out its responsibilities as set out in this Charter and to make recommendations to the Board arising therefrom.

(2) The Committee is authorized to retain, and to set and pay the compensation of, independent legal counsel and other advisors if it considers this appropriate.

(3) The Committee is authorized to invite officers and employees of the Corporation and others with relevant experience and expertise to attend or participate in its meetings and proceedings if it considers this appropriate.

(4) The Corporation shall pay directly or reimburse the Committee for the expenses incurred by the Committee in carrying out its responsibilities.

5. Meetings and Proceedings

(1) The Committee shall meet as frequently as required but not less frequently than twice each year.

(2) Any Member or the Secretary may call a meeting of the Committee.

(3) The Chair is responsible for the agenda of each meeting of the Committee, including input from the officers and employees of the Corporation, other Members and other directors of the Corporation as appropriate. Meetings will include presentations by management and others when appropriate and allow sufficient time to permit a full and open discussion of agenda items.

(4) Unless waived by all Members, a notice of each meeting of the Committee confirming the date, time, place and agenda of the meeting, together with any supporting materials, shall be forwarded to each Member at least three days before the date of the meeting.

(5) The quorum for each meeting of the Committee is two Members. In the absence of the Chair, the other Members may appoint one of their number as chair of a meeting. The chair of a meeting shall not have a second or casting vote.

(6) The Chair or his delegate shall report to the Board following each meeting of the Committee.

(7) The Secretary or his delegate shall keep minutes of all meetings of the Committee, including all resolutions passed by the Committee. Minutes of meetings shall be distributed to the Members. The minutes shall be available for review by the other directors of the Corporation after approval thereof by the Committee.

(8) An individual who is not a Member may be invited to attend a meeting of the Committee for all or part of the meeting. The Chair of the Board has a standing invitation to attend all meetings of the Committee except for those meetings or parts of meetings where the Committee meets alone.

(9) The Committee shall meet regularly alone to facilitate full communication.

6. Review

(1) This Charter shall be reviewed every two years by the Committee and any recommended changes shall be referred to the Board of the Corporation for consideration and disposition.

GOVERNANCE – BOARD COMMITTEES

TORONTO HYDRO CORPORATION

Charter – Human Resources Committee

---

1. General

(1) established a Compensation Committee to assist the Board in fulfilling its responsibilities with respect to the recruitment and assessment of the performance of the Chief Executive Officer (CEO) of the Corporation, the compensation of the CEO and the other officers (Executive Officers) of the Corporation and its subsidiary entities (Group), the review and approval of executive compensation disclosure and the oversight of the compensation structure and benefit plans and programs of the Group.

(2) The Board also previously established a Health and Safety Committee to advise and assist the Board with respect to health and safety matters arising out of the activities of the Group.

(3) The Board has determined that it was in the best interests of the Corporation to combine the activities and responsibilities of the Compensation Committee and the Health and Safety Committee under a single Human Resources Committee (Committee) of the Board and to eliminate the separate Compensation Committee and Health and Safety Committees.

(4) The composition, responsibilities and authority of the Committee are set out in this Charter.

(5) This Charter and the by-laws of the Corporation and such other procedures, not inconsistent therewith, as the Committee may adopt from time to time shall govern the meetings and procedures of the Committee.

2. Composition

(1) The Committee shall be composed of at least three (3) directors of the Corporation (Members)

(2) All Members shall be independent (as determined by the Board in accordance with the guidelines of the Canadian Securities Administrators), except as provided for in Subsection 2(3).

(3) In accordance with the City of Toronto Amended and Restated Shareholder Direction to the Corporation, the Committee shall include one director of the Corporation who is also a City of Toronto Councillor in its membership.

(4) Members shall be appointed by the Board upon the recommendation of the Chair of the Board and shall serve until they resign, cease to be a director or are removed or replaced by the Board. Where possible, the Board shall appoint Members who have skills and experience with respect to executive compensation matters and other human resources related matters, with a view to establishing a Committee that has the skills and experience to make decisions on the suitability of the Group's compensation policies and practices and other human resources-related policies and practices.

(5) The Board shall designate one of the Members as chair of the Committee (the Chair). Where possible, the Chair shall have direct skills and experience with respect to executive compensation matters.

(6) The Secretary of the Corporation shall be the secretary of the Committee (the Secretary).

3. Responsibilities

The Committee shall assist the Board in fulfilling its responsibilities with respect to the recruitment and assessment of the performance of the CEO, the compensation of the CEO and the Executive Officers, the review and approval of executive compensation disclosure, the oversight of the compensation structure and benefit plans and programs of the Group and in respect of the environmental and health and safety matters that arise from the activities of the Group. The Committee shall have the responsibilities set out in the following:

3.1 Responsibilities with respect to the CEO

The Committee shall:

(a) periodically review the position description of the CEO and make recommendations to the Board;

(b) when requested by the Board, oversee the process of identifying and recruiting new candidates for appointment as CEO, including assessing the competencies and skills of identified individuals, reporting the results of that assessment to the Board and making a recommendation for appointment of the CEO to the Board;

(c) annually, and more frequently if appropriate, make recommendations to the Board with respect to the compensation and benefits of the CEO, including:

(i) the review and approval of the base salary of the CEO;

(ii) the review and approval of the corporate and individual performance objectives relative to the performance-based incentive compensation of the CEO;

(iii) the assessment of the performance of the CEO in light of those corporate and individual performance objectives; and

(iv) the review and approval of the performance-based incentive compensation payable to the CEO for the attainment of those corporate and individual performance objectives; and

(d) review and approve the terms of the employment agreement and severance arrangements of the CEO for recommendation to the Board.

3.2 Responsibilities with respect to the Executive Officers

The Committee shall:

(a) annually, and more frequently if appropriate, review and approve the CEO's proposals with respect to the compensation and benefits of the Executive Officers, including:

(i) the base salaries of the Executive Officers; and

(ii) the performance-based incentive compensation payable to the Executive Officers; and

(b) review and approve the CEO's proposals with respect to the terms of the employment agreements and severance arrangements of the Executive Officers.

3.3 Responsibilities with respect to Executive Compensation Disclosure

The Committee shall:

(a) review and approve the statement of executive compensation required to be filed by the Corporation in connection with annual and other filings under applicable securities laws; and

(b) review and approve any other executive compensation disclosure before it is publicly disclosed by the Corporation.

3.4 Responsibilities with respect to the Group's Compensation Structure and Benefit Plans and Programs

The Committee shall be responsible to periodically review and assess the Group's compensation structure and benefit plans and programs and make recommendations to the Board with respect thereto.

Annually, and more frequently if appropriate, the Committee shall review and approve the corporate performance objectives of the Group and make recommendations to the Board with respect thereto.

3.5 Responsibilities with respect to Succession Planning

The Committee shall periodically, and at least annually, review with the Chair and the CEO succession planning for the CEO and the Executive Officers and report the results of that review to the Board.

3.6 Responsibility with respect to Collective Bargaining

The Committee shall review the recommendations of the Corporation's management in respect of collective bargaining negotiations and approve the parameters for such negotiations.

3.7 Responsibility with respect to Health and Safety Matters.

The Committee shall:

(a) periodically reviewing the Environmental Policy and the Occupational Health and Safety Policy and making recommendations to the Board;

(b) periodically reviewing performance under the Occupational Health and Safety Policy with Management;

(c) reviewing new health and safety legislation with Management and informing the Board of its responsibilities under such legislation; and

(d) reviewing significant health and safety issues.

4. Authority

(1) The Committee is authorized to carry out its responsibilities as set out in this Charter and to make recommendations to the Board arising therefrom.

(2) The Committee is authorized to retain, and to set and pay the compensation of, independent legal counsel and other advisors if it considers this appropriate.

(3) The Committee is authorized to invite officers and employees of the Corporation and others with relevant experience and expertise to attend or participate in its meetings and proceedings if it considers this appropriate.

(4) The Corporation shall pay directly or reimburse the Committee for the expenses incurred by the Committee in carrying out its responsibilities.

5. Meetings and Proceedings

(1) The Committee shall meet as frequently as required but not less frequently than twice each year.

(2) Any Member, the CEO or the Secretary may call a meeting of the Committee.

(3) The Chair is responsible for the agenda of each meeting of the Committee, including input from the officers and employees of the Corporation, other Members and other directors of the Corporation as appropriate. Meetings will include presentations by

management and others when appropriate and allow sufficient time to permit a full and open discussion of agenda items.

(4) Unless waived by all Members, a notice of each meeting of the Committee confirming the date, time, place and agenda of the meeting, together with any supporting materials, shall be forwarded to each Member at least three (3) days before the date of the meeting.

(5) The quorum for each meeting of the Committee is a majority of the Members. In the absence of the Chair, the other Members may appoint another Member as chair of a meeting. The chair of a meeting shall not have a second or casting vote.

(6) The Chair or his delegate shall deliver a report to the directors at the next meeting of the Board following each meeting of the Committee.

(7) The Secretary or his delegate shall keep minutes of all meetings of the Committee, including all resolutions passed by the Committee. Minutes of all meetings shall be distributed to the Members. The minutes shall be available for review by the other directors of the Corporation after approval thereof by the Committee.

(8) An individual who is not a Member may be invited to attend a meeting of the Committee for all or part of the meeting. The Chair of the Board, the President and Chief Executive Officer of the Corporation and the Vice President Organizational Effectives and Environment, Health & Safety of Toronto Hydro-Electric System Limited have a standing invitation to attend all meetings of the Committee except for those meetings or parts of meetings where the Committee meets alone. The Committee shall meet regularly alone to facilitate full communication.

6. Review

(1) This Charter shall be reviewed by the Corporate Governance Committee of the Board every two (2) years and any recommended changes shall be referred first to the Human Resources Committee for review and comment and second, after consideration of the input from the Human Resources Committee, to the Board of the Corporation for consideration and disposition.

(2) In addition to the bi-annual review, the Human Resources Committee may at any time review the Charter and make recommendations to the Corporate Governance Committee for their review and recommendations to the Board with respect thereto.

STRATEGIC PLANNING

This schedule provides an overview of Toronto Hydro's strategic planning framework.

The strategic planning framework is at the core of Toronto Hydro's governance practices, helping the utility run in such a way that it achieves its objectives in an effective and transparent manner. Strategic planning aids Toronto Hydro's management to govern the utility more efficiently, to allocate resources more strategically, and enables improved outcomes for the organization and, ultimately, for our ratepayers. Toronto Hydro's approach to strategic planning is governed through frameworks including:

1) Corporate Strategy;
2) Business Planning ;
3) Enterprise Risk Management ("ERM"); and
4) Corporate Disaster Preparedness ("CDP").

The strategic planning framework allows Toronto Hydro's leadership to:

- identify its strategic direction;
- better focus its resources on desired results;
- better understand and consider stakeholder needs and interests;
- control and mitigate risks through consistent and disciplined methods; and,
- better prepare for, respond to, and recover from, large-scale events facing the utility.

1. CORPORATE STRATEGY

Corporate Strategy is one of the key components of the Strategic Planning process. Toronto Hydro's Corporate Strategy guides the process of establishing strategic goals for

the utility. Strategic goals reflect the utility's efforts to optimize the financial, human, social, and technological resources of the organization.

Toronto Hydro's strategic vision is to continuously improve ratepayer satisfaction by operating in a safe, reliable and environmentally responsible manner at optimal costs. To realize this vision, Toronto Hydro employs a framework consisting of four strategic pillars as illustrated in Figure 1 below.

Figure 1: Toronto Hydro Strategic Pillars

The pillars are aligned with the Ontario Energy Board's ("OEB") performance outcomes described in the RRFE Report[1] and the other regulatory instruments adopted by the OEB from time to time. The pillars focus the organization on:

1) providing value to its ratepayers;
2) building a safe, reliable and efficient distribution system;
3) maintaining a fully- engaged, safe and healthy workforce; and

[1] Report of the Board "Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach" (October 18, 2012) [the "RRFE Report"].

4) providing a financially stable and sustainable business model through efficient run of operations and a productive workforce.

Within in each of Toronto Hydro's pillars are a series of strategic objectives. Those objectives are shown in Figure 2.

Figure 2: Toronto Hydro's Strategic Objectives

Toronto Hydro reviews its corporate strategy annually using the four strategic pillars as guidance. The corporate strategy is developed by the utility's leadership for approval by the Board of Directors.

2. BUSINESS PLANNING

Upon approval, Toronto Hydro translates the updated corporate strategy and objectives into a Business Plan.

As with any enterprise business planning is an important element in the success of Toronto Hydro. Good business planning addresses major issues facing the organization and the industry. It engages and aligns Toronto Hydro business units on major initiatives

in support of achieving the strategy. It enables the respective business units to execute their programs with a view to meeting the broad corporate objectives outlined in the strategy and encourages them to keep on track of achievement. Business planning is also used as a means for deciding how to utilize limited resources and capabilities. Like all utilities regulated by the OEB, Toronto Hydro produces and publishes detailed financial reporting pursuant to the Electricity Reporting and Recordkeeping Requirements (the "RRR"). For more information about the budgeting process, please refer to Exhibit 4A, Tab 1, Schedule 1.

Leadership and managers are obligated to track divisional progress toward the goals adopted by the Board of Directors, and to provide remedial action plans where achievement is lagging.

This process is intended to create a sense of urgency within the organization with respect to the Strategic Objectives (Figure 2, above). Achievement is a priority of every level of the company and every effort is made to ensure that the organization as a whole has a firm grasp of expectations. This is a demanding process, requiring a level of commitment and focus that is significant. The utility takes the view that the development of the Corporate Strategy is integral to success and with a major, ongoing focus at every level.

As part of its performance-driven culture, Toronto Hydro uses a Balanced Scorecard framework to track the effects of the implementation of the business plan against its strategic goals.

The Balanced Scorecard approach is a commonly used framework to aid in the successful execution of a corporate strategy.[2] Applying a Balanced Scorecard approach at Toronto Hydro provides a number of benefits, including:

- aligning strategic objectives across all levels of the organization to improve outcomes;
- short interval control, which provides management with a comprehensive picture of business operations throughout the year and the ability to direct corrective actions to achieve desired results;
- facilitating communication and reinforce the utility's goals and strategies to all employees;
- encouraging dialogue within the organization about strategic goals and expectations; and
- strengthening good governance practices through the use of a consistent and systematic approach to measure and report results across the organization.

The Balanced Scorecard aligns the strategic pillars with operational outcomes by monitoring progress using a series of metrics. These metrics are referred to as Key Performance Indicators ("KPIs").

3. ENTERPRISE RISK MANAGMENT ("ERM")

ERM provides Toronto Hydro with a systematic, disciplined approach towards identifying, evaluating, treating, monitoring and reporting on risks. ERM is an integral part of the utility's strategic planning that embeds risk considerations in forecasting, planning and program execution.

3.1. Approach to ERM

To manage risk prudently and systematically, Toronto Hydro employs an ERM framework based on industry best practices and the International Organization for Standardization ("ISO") 31000 guidelines, illustrated in Figure 3 below.

Figure 3: ISO 31000 Relationships between the Risk Management Principles, Framework and Process.

The ISO 31000 establishes principles and provides generic guidelines on risk management. The guideline recommends that organizations develop, implement and continuously improve a risk framework that is integrated into their overall governance, strategy, planning, management, reporting processes, policies, values and culture.

Accordingly, Toronto Hydro's ERM framework:

- provides a consistent, disciplined methodology for identifying, assessing, treating, monitoring and reporting risks;
- facilitates training and awareness on risk management; and
- integrates reporting of all levels of risk through risk metrics and other indicators.

Toronto Hydro's ERM framework has been recognized for its level of sophistication and accomplishments and as an example of best practices.

3.2. ERM governance

Toronto Hydro's risk governance structure helps the utility fulfill the ERM framework objectives. Figure 4 illustrates the four levels of risk governance that Toronto Hydro uses to identify and ultimately mitigate key risks.

Figure 4: Toronto Hydro's risk governance structure

The Board of Directors reviews Toronto Hydro's risk profile to confirm that the greatest risks to the organization are being addressed and managed.

The responsibility of the Risk Oversight Committee ("ROC") is to assess the appropriateness and consistent application of the risk management systems that are in place to identify, manage, and monitor risks. The ROC is also responsible for bringing key risks to the attention of the Board of Directors and assisting management in addressing them.

Risk Management Forums and Working Groups oversee the execution of risk management in Toronto Hydro's operations and support the ROC and the Board of Directors by enabling effective, efficient, complete and transparent risk reporting.

3.3. Risk Assessment

Risk Assessment provides a framework through which risks are identified, evaluated and compared in support of determining appropriate risk tolerances. Toronto Hydro's Risk Assessment framework is based on the ISO 31000 risk management guideline illustrated in Figure 5 and has three phases.

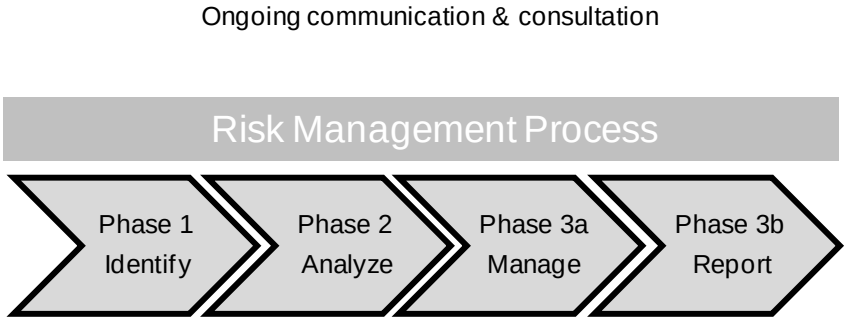

Figure 5: Toronto Hydro's Risk Management Process

Phase 1 (Risk Identification) is performed at an enterprise level and considers both internal and external factors. Key risks facing the organization are identified and then broken down into their constituent parts at the business unit level. Risks identified here are called component risks. Such risks are more closely aligned to a business unit's activities and are typically more specific.

In Phase 2, a risk analysis is performed on the component risks using a standard risk assessment and reporting schedule maintained through this framework. Upon

completion, component risk assessments are aggregated back to the enterprise level, but now with more granular information about how the risks can affect Toronto Hydro's operations.

Phase 3 includes the management of risk on an ongoing basis. Here risk mitigation plans are developed and reported on regularly. The framework provides a common risk reporting process. Consistency in reporting is essential to ensure that risks are easily comparable and can be aggregated.

Collectively, these three phases provide Toronto Hydro with the best information available at a given point in time to make informed, risk-based decisions. Accordingly, this approach has the following benefits to the utility:

- facilitating the engagement and support of staff at all levels in assessing risk and building a risk-aware culture;
- providing a consistent approach (i.e., processes, tools, methodologies and taxonomy) for the organization to talk about and compare risks;
- facilitating the allocation of accountability and responsibility for risk at the appropriate level of the organization; and
- allowing risks to be considered when making resource decisions.

3.4. Quantifying Risks

Toronto Hydro employs a risk quantification model in assessing risk. This model uses two main concepts: qualitative analysis and risk indicator scoring.

Qualitative analysis is composed of key concepts such as impact, likelihood and velocity. "Likelihood" is used to refer to the chance of a risk occurring something happening, whether defined, measured or determined objectively or subjectively, qualitatively or quantitatively, and described using general terms. "Impact" is defined as the degree to

which the outcomes of an event would affect the utility and its objectives. "Velocity" refers to defining how quickly the Risk impact will be realized in the utility. Risk impact is measured on a five-level scale (minor, moderate, major, severe and catastrophic). Risk likelihood is also measured on a five-level scale (remote, unlikely, likely, very likely, virtually certain). The higher the combined scores (i.e. impact multiplied by likelihood) the greater the risk exposure.

Supporting this is the use of risk indicators, a set of measures that demonstrates if risks are increasing, decreasing or remaining steady. These indicators are typically "leading" in nature. A leading indicator is a metric that can indicate a potential change in risk prior to that change occurring. This assists in forecasting potential future risk exposure. Collectively the risk indicators and the qualitative analysis are reviewed to quantify risks facing the utility.

3.5. Risk Tolerance

Toronto Hydro's Risk Appetite Statement ("RAS") supports the tools described above. The RAS establishes a common framework between Toronto Hydro and the Board of Directors regarding the utility's tolerance for risk in the execution of its corporate strategy.

Toronto Hydro's corporate RAS is broken down into two pieces. The first part is the Board of Director's risk philosophy statement that sets general guidance on risk tolerance. The risk philosophy statement is then broken down into more manageable risk limits. Toronto Hydro identifies the specific strategic drivers and establishes the risk tolerance along five levels (low to catastrophic) per strategic driver.

Toronto Hydro developed its RAS using a bottom-up approach, basing its risk acceptance on both internal and external factors. The utility uses the RAS to inform and guide decision making in its operations.

3.6. Risk Reporting

Risk reporting is an additional tool within the ERM framework used to ensure good governance and to inform decision makers about risk.

Regular risk reporting provides management and the Board of Directors with the assurance that established controls and risk treatment initiatives are functioning properly. At the ROC, risk information is received and reviewed following a risk assessment and risk reporting schedule. Key risk information is reviewed and decisions made regarding risk management activities. At the Board of Director level, enterprise risks are reviewed on a quarterly basis.

4. CORPORATE DISASTER PREPAREDNESS

The last piece of the Toronto Hydro strategic planning framework is the Corporate Disaster Preparedness ("CDP") framework. The CDP framework sets out an enterprise-wide standard to manage corporate disasters. A corporate disaster is an event which exceeds the organization's regular response capabilities and requires a fundamentally different set of operating procedures for effective corporate response. This framework is an overarching management system and corporate standard for the development, implementation and continuous improvement of all disaster preparedness functions, namely emergency management, business continuity and contingency planning.

As an example, Toronto Hydro has experienced more frequent, large scale, rapid on-set weather disasters that have impacted the reliable operation of Toronto Hydro's

distribution system and has exceeded its regulatory response capability. Events such as the recent Ice Storm (2013), July 8 Flash Floods (2013) and Hurricane Sandy (2012) are examples of the types of weather events that exceed Toronto Hydro's standard response practices and require additional planning and response resources for effective management. Other potential disasters such as, but not limited to, terrorist attack, pandemics also pose a potential disruption beyond the normal response capabilities of the corporation and also fall into the scope of this CDP framework.

The CDP framework is based on best practices and international standards (CSA Z1600, Emergency Management and Business Continuity and ISO 22301 Business Continuity Management). In addition, Toronto Hydro follows other international best practices such as the Incident Management System ("IMS") and Incident Command System ("ICS") to ensure effective emergency response during an emergency. The IMS and ICS frameworks are currently in the early stages of development and the utility plans to significantly expand their implementation across the company, as discussed in the Disaster Preparedness Management program.[3]

Training and scenario-based exercises are conducted throughout the year to help ensure that the disaster management system is understood and roles and responsibilities under emergencies are entrenched. As with the ICS and IMS framework, Toronto Hydro plans to substantially expand the scope and frequency of emergency-related training exercises to facilitate optimal preparedness to major contingency events by Toronto Hydro's workforce, as further discussed in Exhibit 4B, Tab 2, Schedule 4. Expanding training and other exercises over the 2015 to 2019 period would allow Toronto Hydro to rehearse the use of disaster preparedness plans and protocols to assist in providing a more efficient response.

[3] Exhibit 4B, Tab 2, Schedule 4.

In addition to building and implementing this framework, Toronto Hydro enables the utility to continuously improve its planning, response and coordination with municipal and provincial emergency agencies. During an emergency, engagement and cooperation between Toronto Hydro, the City and Province may be required for effective response actions to be taken. To allow the utility to respond effectively in an emergency, Toronto Hydro is available to liaise with these agencies twenty-four hours a day.

FINANCIAL PLANNING PROCESS

1. OVERVIEW

Currently, financial planning at Toronto Hydro is conducted annually and results in a three-year Plan – a detailed plan for the first year and a directional plan for the next two years. Given the requirements of the five-year Custom Incentive Rate ("CIR") application, the term of the planning activities for the period beginning 2015 was extended to five years (the "planning activity").

2. APPROACH

Toronto Hydro's corporate plans are informed by a number of operational needs such as asset investment requirements, maintenance requirements, staffing requirements and legislative and regulatory obligations. The plans are also informed by other important considerations such as customer needs and preferences (including service levels and consumption-management tools), rate impacts, value-for-money, productivity, and maintaining the financial health and viability of the utility.

In other words, the utility considers a number of input considerations and objectives in order to generate its plans. No one of these considerations is determinative of the utility's ultimate plan, but they all inform it. For example, while Toronto Hydro views that a capital investment approach well above $500 million per year over the 2015-2019 period is optimal from an assets-needs perspective, in light of rate impacts and execution constraints, it has constrained its actual plan (and corresponding funding request to the OEB) to approximately $500 million per year over the 2015-2019 period.

Toronto Hydro synthesizes these input considerations into a strategic planning philosophy called its four pillars, which are:

Toronto Hydro`s planning activity is guided by its Strategic Pillars and compliance requirements.

In executing its planning activities, the utility employs a combination of ‘top-down’ and ‘bottom-up’ planning models with an iterative planning process. That is, the overall business strategy outlining the general direction of the organization is communicated from the ‘top’ (senior management) ‘down’ to the operational teams. Subject matter experts then incorporate this direction into their different functional areas and operational realities, needs and strategies.

Finally, as operational plans incorporating the strategic direction are formed, they are proposed to the senior leadership at Toronto Hydro for review, impact assessments and approval.

In general, the planning process consists of four stages: 1. Corporate strategy establishment; 2. Operational plan proposals; 3. Proposal reviews and selection; and 4. Detailed development of projects and programs.

During the process, multiple planning activities are being concurrently conducted, and inputs and outcome considerations are being refined. An iterative planning approach is used in order to facilitate robust decision-making and prudent planning.

The results of the planning activity are reflected in this CIR application and include:

- A detailed OM&A plan for 2015; and
- Detailed annual capital investment plans for 2015 to 2019.

Further details of these results are in Exhibit 2B (DSP) and 4A (OM&A).

INTRODUCTION

In accordance with section 2.4.3 of the OEB's Filing Requirements (July 17, 2013), Exhibit 1C, Tab 4 provides the following financial information:

- Consolidated Audited Financial Statements for 2011-2013 (Schedule 2);
- Reconciliation of the financial results shown in the Audited Financial Statements with regulatory financial results (Schedule 3);
- Management's Discussion & Analysis for 2013 (Schedule 4);
- Annual Information From (Schedule 5);
- Public Offering Information (Schedule 6); and
- Rating Agency Reports (Schedule 7).

AUDITED FINANCIAL STATEMENTS

In accordance with section 2.4.3 of the OEB's Filing Requirements (July 17, 2013), this schedule includes the following materials:

- 2011 Audited Financial Statements (Appendix A);
- 2012 Audited Financial Statements (Appendix B); and
- 2013 Audited Financial Statements (Appendix C).

INDEPENDENT AUDITORS' REPORT

To the Shareholder of Toronto Hydro-Electric System Limited

We have audited the accompanying financial statements of Toronto Hydro-Electric System Limited, which comprise the balanc sheet as at December 31, 2011, the statements of income, retained earnings and cash flows for the year then ended, and notes, comprising a summary of significant accounting policies and other explanatory information.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with Canadian generally accepted accounting principles, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditors' Responsibility

Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statemen The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the financ statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements present fairly, in all material respects, the financial position of Toronto Hydro-Elec System Limited as at December 31, 2011, and its financial performance and its cash flows for the year then ended in accordance with Canadian generally accepted accounting principles.

Other matter

The financial statements of Toronto Hydro-Electric System Limited as at and for the year ended December 31, 2010 were audited by another auditor who expressed an unmodified opinion on those statements on March 11, 2011.

NOTES TO FINANCIAL STATEMENTS
[all tabular amounts in thousands of dollars]

December 31, 2011

1. INCORPORATION

On June 23, 1999, Toronto Hydro-Electric System Limited ["LDC"] was incorporated under the Business Corporations Act (Ontario) and is wholly-owned by Toronto Hydro Corporation [the "Corporation"]. The incorporation was required in accordance with the provincial government's Electricity Act, 1998 (Ontario) ["Electricity Act"].

LDC distributes electricity to customers located in the City of Toronto [the "City"] and is subjected to rate regulation. LDC is also engaged in the delivery of Conservation and Demand Management ["CDM"] activities.

2. REGULATION

In April 1999, the government of Ontario began restructuring the Province of Ontario ["Ontario"]'s electricity industry. Under regulations passed pursuant to the restructuring, LDC and other electricity distributors have been purchasing their electricity from the wholesale market administered by the Independent Electricity System Operator ["IESO"] and recovering the costs of electricity and certain other costs at retail rates in accordance with procedures mandated by the Ontario Energy Board [the "OEB"].

The OEB has regulatory oversight of electricity matters in Ontario. The Ontario Energy Board Act, 1998 (Ontario) [the "OEB Act"] sets out the OEB's authority to issue a distribution licence which must be obtained by owners or operators of an electricity distribution system in Ontario. The OEB prescribes licence requirements and conditions including, among other things, specified accounting records, regulatory accounting principles, separation of accounts for separate businesses and filing requirements for rate-setting purposes.

The OEB's authority and responsibilities include the power to approve and fix rates for the transmission and distribution of electricity, the power to provide continued rate protection for rural and remote electricity customers and the responsibility for ensuring that electricity distribution companies fulfill their obligations to connect and service customers.

Regulatory developments in Ontario's electricity industry, including current and possible future consultations between the OEB and interested stakeholders, may affect LDC's electricity distribution rates and other permitted recoveries in the future.

LDC is required to charge its customers for the following amounts (all of which, other than distribution charges, represent a pass through of amounts payable to third parties):

[i] Distribution Charges Distribution charges are designed to recover the costs incurred by LDC in delivering electricity to customers and the OEB-allowed rate of return. Distribution charges are regulated by the OEB and are comprised of a fixed charge and a usage-based (consumption) charge. The volume of electricity consumed by LDC's customers during any period is governed by events largely outside LDC's control (principally, sustained periods of hot or cold weather which increase the consumption of electricity and sustained periods of moderate weather which decrease the consumption of electricity).

[ii] Electricity Price and Related Regulated Adjustments. The electricity price and related regulated adjustments represent a pass through of the commodity cost of electricity.

[iii] Retail Transmission Rate. The retail transmission rate represents a pass through of wholesale costs incurred by distributors in respect of the transmission of electricity from generating stations to local areas. Retail transmission rates are regulated by the OEB.

[iv] Wholesale Market Service Charge. The wholesale market service charge represents a pass through of various wholesale market support costs. Retail rates for the recovery of wholesale market service charges are regulated by the OEB.

LDC is required to satisfy and maintain prudential requirements with the IESO, which include credit support with respect to outstanding market obligations in the form of letters of credit, cash deposits or guarantees from third parties with prescribed credit ratings.

a) Electricity Distribution Rates

LDC's electricity distribution rates are typically effective from May 1 to April 30 of the following year. Accordingly, LDC's distribution revenue for the first four months of 2011 was based on the electricity distribution rates approved for the May 1, 2010 to April 30, 2011 rate year [the "2010 Rate Year"], and the distribution revenue for the remainder of 2011 and for the first four months of 2012 are and will be based on electricity distribution rates approved for the May 1, 2011 to April 30, 2012 rate year [the "2011 Rate Year"].

LDC's electricity distribution rates for the 2010 Rate Year and the 2011 Rate Year were determined through an application under the cost of service framework. The cost of service framework sets electricity distribution rates using a detailed examination of evidence and an assessment of the costs incurred by an electricity distributor to provide its service to its customers.

On April 9, 2010, the OEB issued its decision regarding LDC's electricity distribution rates for the 2010 Rate Year. The decision provided for a distribution revenue requirement and rate base of $518,700,000 and $2,140,700,000, respectively. In addition, the decision provided for capital program spending levels and operating, maintenance and administration spending levels of $350,000,000 and $204,100,000, respectively.

On July 7, 2011, the OEB issued its decision regarding LDC's electricity distribution rates for the 2011 Rate Year. The decision provided for a distribution revenue requirement and rate base of $522,044,000 and $2,298,227,000, respectively. In addition, the decision provided for capital program spending levels and operating, maintenance and administration spending levels of $378,800,000 and $238,000,000, respectively.

On August 26, 2011, LDC filed a rate application, following the cost of service framework, with the OEB seeking approval of separate and successive revenue requirements and corresponding electricity distribution rates for three rate years commencing on May 1, 2012, May 1, 2013 and May 1, 2014 [the "2012-2014 Rate Application"]. The requested distribution revenue requirements for these rate years were $571,369,000, $639,492,000, and $712,777,000, respectively, and the expected rate bases for these rate years were $2,636,291,000, $3,053,499,000, and $3,503,165,000, respectively.

Pursuant to the incentive regulation mechanism framework, the OEB established, as a preliminary issue in the 2012-2014 Rate Application, that it would consider the question of whether the application filed by LDC was acceptable or whether it should be dismissed. In particular, the OEB established that in order for it to find that LDC's 2012-2014 Rate Application was acceptable, LDC would be required to show why and how LDC cannot adequately manage its resources and financial needs under the incentive regulation mechanism framework. The incentive regulation mechanism framework provides for an annual adjustment to an electricity distributor's rates based on a formulaic calculation with no direct examination of evidence regarding the electricity distributor's actual costs and infrastructure needs.

LDC filed evidence supporting its position for electricity distribution rates to be set under the cost of service framework as part of its 2012-2014 Rate Application. In particular, LDC provided evidence that it cannot adequately manage its resources and financial needs under the incentive regulation mechanism framework. The OEB established a process by which a portion of LDC's evidence was tested during an oral hearing held in November 2011 [note 23[b]].

b) Street Lighting Activities

On June 15, 2009, LDC filed an application with the OEB seeking an electricity distribution licence for a new wholly-owned legal entity to which the Corporation intended to transfer the street lighting assets of Toronto Hydro Energy Services Inc. ["TH Energy"]. Concurrently, LDC filed another application with the OEB seeking approval for the merger of LDC and the new legal entity. The major objective of these applications was to transfer the street lighting assets to the regulated electricity distribution activities of LDC to increase the overall safety of the related infrastructure.

On February 11, 2010, the OEB issued its decision in regard to these applications. In its decision, the OEB agreed that, under certain conditions, the treatment of certain types of street lighting assets as regulated assets is justified. The OEB ordered the Corporation to provide a detailed valuation of the street lighting assets and to perform an operational review to determine which street lighting assets could become regulated assets. The Corporation performed a detailed asset operational review and final valuation of the street lighting assets, which was submitted to the OEB on January 31, 2011.

On August 3, 2011, the OEB issued its final decision allowing the transfer of a portion of the street lighting assets to the new wholly-owned legal entity, and for LDC to amalgamate with the new legal entity [note 23[a]].

c) Conservation and Demand Management Activities

On March 31, 2010, the Minister of Energy and Infrastructure of Ontario, under the guidance of sections 27.1 and 27.2 of the OEB Act, directed the OEB to establish CDM targets to be met by electricity distributors. Accordingly, on November 12, 2010, the OEB amended LDC's distribution licence to require LDC, as a condition of its licence, to achieve 1,304 Gigawatt-Hours of energy savings and 286 Megawatts of summer peak demand savings, over the period beginning January 1, 2011 through December 31, 2014.

Effective January 1, 2011, LDC entered into an agreement with the Ontario Power Authority ["OPA"] to deliver CDM programs in the amount of approximately $50,000,000 extending from January 1, 2011 to December 31, 2014. As at December 31, 2011, LDC received approximately $19,875,000 from the OPA for the delivery of CDM

programs. All programs to be delivered are fully funded and paid in advance by the OPA. These programs are expected to support the achievement of the mandatory CDM targets described above.

On January 10, 2011, LDC filed an application with the OEB seeking an order granting approval of funding for CDM programs specific to its customer base. LDC requested funding for eight specific CDM programs amounting to $50,700,000. On July 12, 2011, the OEB issued its decision regarding the CDM programs of LDC. In its decision, the OEB approved with modifications two of the eight programs for a total funding of $5,320,000. The modifications directed by the OEB included changes to the term and nature of those two programs. The OEB did not approve the other six programs as it considered them to be duplicative of existing CDM programs already funded by the OPA.

On August 3, 2011, LDC filed a letter with the OEB informing them that, due to the modified terms and nature of the two approved programs, LDC's revised economic assessment showed these two programs to be uneconomic, and that they would not be implemented. Accordingly, LDC expects to continue to work with the OPA to expand the roster of current CDM programs in order to achieve its mandated CDM targets.

d) Contact Voltage

On December 10, 2009, the OEB issued an initial decision in regard to the costs incurred in 2009 for the remediation of safety issues related to contact voltage relating to LDC's electricity distribution infrastructure. The decision provided for the recovery of allowable actual expenditures incurred above the amount deemed as controllable expenses in LDC's 2009 approved electricity distribution rates. At the time of the decision, LDC estimated the allowable recovery of costs at $9,050,000.

On October 29, 2010, the OEB issued a second decision in the matter, following further review of costs incurred by LDC. In this decision, the OEB deemed the balance allowable for recovery at $5,296,000. The variance from LDC's original estimate is mainly due to the OEB's interpretation of the definition of controllable expenses used to determine the final allowable recovery. In connection with this decision from the OEB, LDC revised its recovery estimate for contact voltage costs, resulting in an increase in operating expenses of $3,754,000 in 2010. On November 18, 2010, LDC filed a motion to review the decision with the OEB seeking an amendment to allow for recovery in accordance with the initial decision rendered on December 10, 2009. On March 25, 2011, the OEB issued its decision on the LDC motion, denying the requested additional recovery.

3. SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

The financial statements of LDC have been prepared in accordance with Canadian generally accepted accounting principles ["GAAP"], including accounting principles prescribed by the OEB in the handbook "Accounting Procedures Handbook for Electric Distribution Utilities" ["AP Handbook"], are presented in Canadian dollars and reflect the significant accounting policies summarized below:

a) Regulation

The following regulatory treatments have resulted in accounting treatments which differ from Canadian GAAP for enterprises operating in an unregulated environment:

Regulatory Assets and Liabilities

In accordance with Canadian GAAP, LDC currently follows specific accounting policies unique to a rate-regulated business. Under rate-regulated accounting ["RRA"], the timing and recognition of certain expenses and revenues may differ from those otherwise expected under Canadian GAAP in order to appropriately reflect the economic impact of regulatory decisions regarding LDC's regulated revenues and expenditures. These timing differences are recorded as regulatory assets and regulatory liabilities on LDC's balance sheets and represent current rights and obligations regarding cash flows expected to be recovered from or refunded to customers, based on decisions and approvals by the OEB. These assets and liabilities can be recognized for rate-setting and financial reporting purposes only if the OEB directs the relevant regulatory treatment or if future OEB direction is judged to be probable. In the event that the disposition of these balances was assessed to no longer be probable, the balances would be recorded in LDC's statement of income in the period that the assessment is made. The measurement of regulatory assets and liabilities is subject to certain estimates and assumptions, including assumptions made in the interpretation of the regulation and the OEB's decisions.

Contributions in aid of construction

Capital contributions received from outside sources are used to finance additions to property, plant and equipment of LDC. According to the AP Handbook, capital contributions received are treated as a "credit" to property, plant and equipment. The amount is subsequently depreciated by a charge to accumulated depreciation and a credit to depreciation expense at an equivalent rate to that used for the depreciation of the related property, plant and equipment.

Allowance for funds used during construction

The AP Handbook provides for the inclusion of an Allowance for Funds Used During Construction ["AFUDC"] when capitalizing construction-in-progress assets, until such time as the asset is substantially complete. A concurrent credit of the same amount is made to net financing charges when the allowance is capitalized. The interest rate for capitalization is prescribed by the OEB and modified on a periodic basis, and is applied to the balance of the construction-in-progress asset on a simple interest basis. The interest rate for capitalization, for the period from January 1 to September 30, 2011, was 4.29% and from October 1, 2011 to December 31, 2011, was 3.92%. AFUDC is included in property, plant and equipment, intangible assets, and construction-in-progress assets for financial reporting purposes, charged to operations through depreciation and amortization expense over the service life of the related assets and recovered through future revenue.

b) Cash and cash equivalents

Cash and cash equivalents include cash in bank accounts and short-term investments with terms to maturity of 90 days or less from their date of acquisition.

c) Inventories

Inventories consist primarily of small consumable materials mainly related to the maintenance of the electricity distribution infrastructure. LDC classifies all major construction related components of its electricity distribution system infrastructure to property, plant and equipment. Once capitalized, these items are not depreciated until they are put into service. Inventories are carried at the lower of cost and net realizable value, with cost determined on an average cost basis net of a provision for obsolescence.

d) Property, plant and equipment

Property, plant and equipment are stated at cost and are removed from the accounts at the end of their estimated average service lives, except in those instances where specific identification allows their removal at retirement or disposition.

In the event that facts and circumstances indicate that property, plant and equipment may be impaired, an evaluation of recoverability is performed. For purposes of such an evaluation, the estimated future undiscounted cash flows associated with the asset are compared to the carrying amount of the asset to determine if a write-down is required. The impairment loss is measured as an amount by which the carrying amount of the asset exceeds its fair value, which is determined by the estimated future discounted cash flows.

Effective January 1, 2011, LDC revised its estimates of useful lives of certain items of property, plant and equipment following a detailed review and analysis supported by external third-party evidence. These changes in estimates have been accounted for on a prospective basis in the financial statements effective January 1, 2011.

Effective January 1, 2011, LDC revised its estimates of burden rates of certain items of property, plant and equipment following a detailed review and analysis of all the components included in such burden rates. These changes in estimates of burden rates include changes in the allocation of engineering and administration costs, changes in the calculation of standard labour rates, and changes in the calculation of materials handling costs. These changes in estimates have been accounted for on a prospective basis in the financial statements effective January 1, 2011.

The changes discussed above were reflected in the 2011 electricity distribution rates approved by the OEB on July 7, 2011 [note 2[a]]. Accordingly, these changes decreased distribution revenues by approximately $24,600,000, increased operating expenses by approximately $22,000,000, decreased depreciation expenses by approximately $33,000,000 and decreased Payments in Lieu of Corporate Taxes ["PILs"] by approximately $13,600,000 for the year ended December 31, 2011 and are expected to impact depreciation expenses proportionately in future periods.

Depreciation is provided on a straight-line basis over the estimated service lives at the following annual rates:

	2011	2010
Distribution lines	2.0% to 5.0%	2.5% to 4.0%
Transformers	3.3% to 5.0%	3.3% to 4.0%
Stations	2.5% to 10.0%	2.5% to 6.7%
Meters	2.5% to 6.7%	2.9% to 6.7%
Buildings	1.3% to 5.0%	2.0%
Rolling stock	12.5% to 25.0%	12.5% to 33.3%
Other capital assets	4.0% to 20.0%	4.0% to 20.0%
Assets under capital lease	14.3% to 25.0%	25.0%
Equipment and tools	10.0% to 16.7%	10.0% to 16.7%
Computer hardware	16.7% to 25.0%	20.0% to 25.0%
Communications	10.0% to 20.0%	10.0% to 20.0%

Construction in progress relate to assets not currently in use and therefore are not depreciated.

e) Intangible assets

Intangible assets are stated at cost. Amortization is provided on a straight-line basis over their estimated service lives at the following annual rates:

	2011	2010
Computer software	20.0% to 25.0%	20.0%
Contributions	4.0%	4.0%

Software in development and contributions for work in progress relate to assets not currently in use and therefore are not amortized.

f) Workplace Safety and Insurance Act

LDC is a Schedule 1 employer for workers' compensation under the Workplace Safety and Insurance Act, 1997 (Ontario) [the "WSIA"]. As a Schedule 1 employer under the WSIA, LDC is required to pay annual premiums into an insurance fund established under the WSIA and recognizes expenses based on funding requirements.

g) Revenue recognition

Revenues from the sale of electricity are recorded on the basis of cyclical billings and also include unbilled revenues accrued in respect of electricity delivered but not yet billed.

Other income, which includes revenues from electricity distribution related services, is recognized as the services are rendered.

h) Financial instruments

At inception, all financial instruments which meet the definition of a financial asset or financial liability are to be recorded at fair value, unless fair value cannot be reliably determined. Gains and losses related to the measurement of financial instruments are reported in the statements of income. Subsequent measurement of each financial instrument will depend on the balance sheet classification elected by LDC. The fair value of a financial instrument is the amount of consideration that would be agreed upon in an arm's length transaction between willing parties.

The following summarizes the accounting classification LDC has elected to apply to each of its significant categories of financial instruments:

Cash equivalents and short-term investments	Investments Held to Maturity
Accounts receivable and unbilled revenue	Loans and Receivables
Accounts payable and accrued liabilities	Other Financial Liabilities
Obligations under capital lease	Other Financial Liabilities
Customers' advance deposits	Other Financial Liabilities
Short-term and long-term debt	Other Financial Liabilities

LDC uses the following methods and assumptions to estimate the fair value of each class of financial instruments for which carrying amounts are included in the balance sheet:

- Cash equivalents, comprising short-term investments, are classified as "Investments Held to Maturity" and are measured at amortized cost, which, upon initial recognition, is considered equivalent to fair value. The carrying amounts approximate fair value because of the short maturity of these instruments.
- Accounts receivable and unbilled revenue are classified as "Loans and Receivables" and are measured at amortized cost, which, upon initial recognition, are considered equivalent to fair value. Subsequent measurements are recorded at amortized cost using the effective interest rate method. The carrying amounts approximate fair value because of the short maturity of these instruments.
- Accounts payable and accrued liabilities are classified as "Other Financial Liabilities" and are initially measured at their fair value. Subsequent measurements are recorded at amortized cost using the effective interest rate method. The carrying amounts approximate fair value because of the short maturity of these instruments.
- Obligations under capital lease are classified as "Other Financial Liabilities" and are initially measured at their fair value. Subsequent measurements are based on discounted cash flow analysis and approximate their carrying values as management believes that the fixed interest rates are representative of current market rates.
- Customers' advance deposits are classified as "Other Financial Liabilities" and are initially measured at their fair value. Subsequent measurements are recorded at amortized cost using the effective interest rate method. The carrying amounts approximate fair value because of the short maturity of the current portion, and the discounted long-term portion approximates the carrying value, taking into account interest accrued on the outstanding balance.
- Short-term debt and long-term debt are classified as "Other Financial Liabilities" and are initially measured at their fair value. The carrying amounts are carried at amortized cost, based on the initial fair value as determined

at the time using quoted market price for similar debt instruments. The fair value of the long-term debt is calculated by discounting the related cash flows at the estimated yield to maturity of similar debt instruments [note 15].

i) Fair value measurements

LDC utilizes valuation techniques that maximize the use of observable inputs and minimize the use of unobservable inputs when measuring fair value. A fair value hierarchy exists that prioritizes observable and unobservable inputs used to measure fair value. Observable inputs reflect market data obtained from independent sources, while unobservable inputs reflect LDC's assumptions with respect to how market participants would price an asset or liability. The fair value hierarchy includes three levels of inputs that may be used to measure fair value:

- Level 1 – Unadjusted quoted prices in active markets for identical assets or liabilities. An active market for the asset or liability is a market in which transactions for the asset or liability occur with sufficient frequency and volume to provide pricing information on an ongoing basis;
- Level 2 – Observable inputs other than level 1 prices, such as quoted prices for similar assets or liabilities; quoted prices in markets that are not active; or other inputs that are observable or can be corroborated by observable market data for substantially the full term of the assets or liabilities; and
- Level 3 – Unobservable inputs that are supported by little or no market activity and that are significant to the fair value of the assets or liabilities.

j) Employee future benefits

Pension plan

LDC provides a pension plan for its full-time employees through the Ontario Municipal Employees Retirement System ["OMERS"]. OMERS is a multi-employer, contributory, defined benefit pension plan established in 1962 by Ontario for employees of municipalities, local boards and school boards. Both participating employers and employees are required to make plan contributions based on participating employees' contributory earnings. LDC recognizes the expense related to this plan as contributions are made.

Employee future benefits other than pension

Employee future benefits other than pension provided by LDC include medical, dental and life insurance benefits, and accumulated sick leave credits. These plans provide benefits to employees when they are no longer providing active service. Employee future benefit expense is recognized in the period in which the employees render services on an accrual basis.

The accrued benefit obligations and the current service costs are calculated using the projected benefit method prorated on service and based on assumptions that reflect management's best estimate. The current service cost for a period is equal to the actuarial present value of benefits attributed to employees' services rendered in the period. Past service costs arising from plan amendments are recognized on a straight-line basis over the average remaining service period of employees active at the date of amendment. The excess of the net actuarial gains or losses over 10% of the accrued benefit obligation is amortized in excess over the average remaining service period of active

employees to full eligibility. The effects of a curtailment gain or loss are recognized in income in the year of the event giving rise to the curtailment. The effects of a settlement gain or loss are recognized in the period in which a settlement occurs.

k) Asset retirement obligations

LDC recognizes a liability for the future removal and handling costs for contamination in distribution equipment in service and in storage and for the future environmental remediation of certain properties. Initially, the liability is measured at present value and the amount of the liability is added to the carrying amount of the related asset. In subsequent periods, the asset is depreciated and the liability is adjusted quarterly for the discount applied upon initial recognition of the liability ["accretion expense"] and for changes in the underlying assumptions. The liability is recognized when the asset retirement obligation ["ARO"] is incurred and when the fair value is determined.

l) Customers' advance deposits

Customers' advance deposits are cash collections from customers to guarantee the payment of energy bills. The customers' advance deposits liability includes interest credited to the customers' deposit accounts, with the debit charged to net financing charges. Deposits expected to be refunded to customers within the next fiscal year are classified as a current liability.

m) Payments in lieu of corporate taxes

LDC is exempt from tax under the Income Tax Act (Canada) ["ITA"] provided that all of its capital is owned by the Corporation, a Municipal Electricity Utility ["MEU"], and not more than 10% of its respective income is derived from activities carried on outside the municipal geographical boundaries of the City. A corporation exempt from tax under the ITA is also exempt from tax under the Taxation Act, 2007 (Ontario) ["TA"] and the Corporations Tax Act (Ontario) ["CTA"].

LDC is a MEU for purposes of the PILs regime contained in the Electricity Act. The Electricity Act provides that a MEU that is exempt from tax under the ITA, the CTA and the TA is required to make, for each taxation year, a PILs payment to the Ontario Electricity Financial Corporation in an amount equal to the tax that it would be liable to pay under the ITA and the TA (for years ending after 2008) or the CTA (for years ending prior to 2009) if it were not exempt from tax. The PILs regime came into effect on October 1, 2001, at which time LDC was deemed to have commenced a new taxation year for purposes of determining its respective liability for PILs payments.

LDC uses the liability method of accounting for income taxes. Under the liability method, future income tax assets and liabilities are determined based on differences between the accounting and tax bases of assets and liabilities and measured using the substantively enacted tax rates and laws that will be in effect when the differences are expected to reverse. The effect on future income tax assets and liabilities of a change in tax rates is included in income in the period the change is substantively enacted. Future income tax assets are evaluated and if realization is not considered more likely than not, a valuation allowance is established. In accordance with the Canadian Institute of Chartered Accountants ["CICA"] Handbook Section 3465 – "Income Taxes", LDC recognizes future income taxes associated with its rate-regulated operations and records an offsetting regulatory asset or liability for the future income taxes that are expected to be recovered or refunded through future regulated prices charged to customers.

n) Use of estimates

The preparation of LDC's financial statements in accordance with Canadian GAAP requires management to make estimates and assumptions which affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses for the year. The estimates are based on past experience, current conditions and various other assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgments about the carrying values of assets and liabilities as well as identifying and assessing the accounting treatment with respect to commitments and contingencies. Significant areas requiring the use of management estimates relate to unbilled revenue, regulatory assets and liabilities, environmental liabilities and AROs, employee future benefits, and revenue recognition. Actual results could differ from those estimates, including changes as a result of future decisions made by the OEB, the Ministry of Energy, or the Ministry of Finance of Ontario ["Ministry of Finance"].

o) Future Accounting Pronouncements

Adoption of New Accounting Standards

Publicly accountable enterprises in Canada were required to adopt International Financial Reporting Standards ["IFRS"] in place of Canadian GAAP for interim and annual reporting purposes for fiscal years beginning on or after January 1, 2011. On September 10, 2010, the Accounting Standards Board granted an optional one-year deferral for IFRS adoption for entities subject to rate regulation due to the uncertainty created by the International Accounting Standards Board ["IASB"] in regard to RRA. To date, the IASB has not approved any temporary exemption or finalized a RRA standard under IFRS. LDC elected to take the optional one-year deferral of its adoption of IFRS; therefore, it continues to prepare its financial statements in accordance with Canadian GAAP accounting standards in Part V of the CICA Handbook in 2011.

LDC's IFRS conversion project was proceeding as planned to meet the January 1, 2011 conversion date. In the absence of a definitive plan to consider the issuance of a RRA standard by the IASB, LDC decided to evaluate the option of adopting United States ["US"] GAAP effective January 1, 2012 as an alternative to IFRS. LDC's current application of Canadian GAAP for RRA is generally consistent with US GAAP. Under US GAAP, LDC's financial reporting is expected to be more comparable with its current Canadian GAAP results than it would be under IFRS and is expected to facilitate comparability with other large North American utilities.

On July 8, 2011, the Corporation filed an application with the applicable Canadian securities regulatory authorities pursuant to section 5.1 of National Instrument 52-107 "Acceptable Accounting Principles and Auditing Standards", to permit the Corporation to prepare its consolidated financial statements in accordance with US GAAP without qualifying as a US Securities and Exchange Commission issuer.

On July 21, 2011, the applicable Canadian securities regulatory authorities issued a decision which gave the Corporation the option to prepare its consolidated financial statements in accordance with US GAAP for its fiscal years beginning on or after January 1, 2012 but before January 1, 2015. The decision is similar to that obtained by other Canadian rate-regulated utilities.

On August 19, 2011, LDC filed a letter with the OEB stating its intention to adopt US GAAP as the basis for the calculation of electricity distribution rates starting in 2012 in accordance with the guidelines provided by the OEB. In the OEB guidelines, the OEB indicated to Ontario utilities that it would permit the use of US GAAP for the calculation of electricity distribution rates if such utilities receive approval from the Ontario Securities Commission and if it benefits electricity distribution consumers.

On August 26, 2011, the board of directors of the Corporation approved the adoption of US GAAP for financial reporting purposes for the year beginning on January 1, 2012. Accordingly, LDC plans to commence reporting under US GAAP in its first quarterly financial statements in 2012. As a result of this decision, LDC's IFRS conversion project efforts have been reduced. However, the work has been managed in such a way that it can effectively be restarted when a future transition to IFRS is required.

LDC's interim financial statements for the first quarter of 2012 are expected to be prepared in accordance with US GAAP and applied retrospectively to LDC's opening US GAAP balance sheet as at January 1, 2011. Based on the results of the detailed assessment of the differences between US GAAP and Canadian GAAP as it applies to its business, LDC does not believe that the adoption of US GAAP will have a material impact on its financial statements in the future.

4. INVENTORIES

Inventories consist of the following:

	2011 $	2010 $
Consumables, tools and other maintenance items	1,745	2,077
Fuses	1,625	1,731
Drums and reels	938	1,092
Other	2,583	2,601
	6,891	7,501

For the year ended December 31, 2011, LDC recognized operating expenses of $6,507,000, related to inventory used to service electrical distribution assets [2010 - $4,727,000].

NOTES TO FINANCIAL STATEMENTS
[all tabular amounts in thousands of dollars]

December 31, 2011

5. PROPERTY, PLANT AND EQUIPMENT, NET

Property, plant and equipment consist of the following:

	2011			2010		
	Cost $	Accumulated depreciation $	Net book value $	Cost $	Accumulated depreciation $	Net book value $
Land	16,761	—	16,761	9,560	—	9,560
Distribution lines	2,755,344	1,404,998	1,350,346	2,517,584	1,353,037	1,164,547
Transformers	652,102	360,398	291,704	609,702	341,706	267,996
Stations	277,905	137,246	140,659	259,337	128,254	131,083
Meters	238,459	124,117	114,342	214,859	114,808	100,051
Buildings	154,932	62,403	92,529	151,543	55,609	95,934
Rolling stock	78,016	43,154	34,862	73,749	43,208	30,541
Other capital assets	68,282	43,805	24,477	58,700	35,177	23,523
Assets under capital leas	14,269	1,251	13,018	886	351	535
Equipment and tools	44,208	31,785	12,423	41,604	29,732	11,872
Computer hardware	44,625	35,602	9,023	40,634	31,228	9,406
Communications	31,537	23,912	7,625	26,818	21,013	5,805
Construction in progress	226,524	—	226,524	214,089	—	214,089
	4,602,964	2,268,671	2,334,293	4,219,065	2,154,123	2,064,942

For the year ended December 31, 2011, AFUDC in the amount of $3,786,000 [2010 - $1,158,000] was capitalized to property, plant and equipment and credited to net financing charges.

As at December 31, 2011, the net book value of stranded meters related to the deployment of smart meters amounting to $20,366,000 [December 31, 2010 - $23,120,000] was included in property, plant and equipment. In the absence of rate regulation, property, plant and equipment would have been $20,366,000 lower as at December 31, 2011 [December 31, 2010 - $23,120,000 lower].

For the year ended December 31, 2011, LDC recognized a gain of $3,885,000 [2010 - $3,650,000] on disposals of surplus properties, of which $1,375,000 [2010 - $2,750,000] relates to surplus properties for which the OEB reduced electricity distribution rates in 2010. LDC began recognizing the actual gain realized on the sale of these properties over a one-year period from May 1, 2010 to mirror the actual timing of the reduction in 2010 electricity distribution rates.

For the year ended December 31, 2011, LDC recorded depreciation expense of $120,690,000 [2010 - $148,744,000] of which $1,177,000 [2010 - $204,000] related to assets under capital lease.

6. INTANGIBLE ASSETS, NET

Intangible assets consist of the following:

	2011			2010		
	Cost $	Accumulated amortization $	Net book value $	Cost $	Accumulated amortization $	Net book value $
Computer software	222,598	154,186	68,412	172,692	129,293	43,399
Contributions	14,059	1,440	12,619	2,043	524	1,519
Software in development	3,582	—	3,582	39,191	—	39,191
Contributions for work in progress	28,369	—	28,369	1,878	—	1,878
	268,608	155,626	112,982	215,804	129,817	85,987

For the year ended December 31, 2011, LDC acquired $52,805,000 of intangible assets [2010 - $28,387,000]. All intangible assets are subject to amortization when they become available for use. Software in development and contributions for work in progress relate to assets not currently available for use and therefore are not amortized.

For the year ended December 31, 2011, $49,907,000 of software in development were transferred to computer software [2010 - $29,266,000].

For the year ended December 31, 2011, AFUDC in the amount of $1,419,000 [2010 - $1,568,000] was capitalized to intangible assets and credited to net financing charges.

For the year ended December 31, 2011, LDC recorded amortization expense on intangible assets of $25,809,000 [2010 - $16,215,000].

7. REGULATORY ASSETS AND LIABILITIES

Regulatory assets consist of the following:

	2011 $	2010 $
Smart meters	61,422	67,719
Late payment penalties settlement	—	7,750
IFRS conversion project	—	6,089
Settlement variances	14,119	—
Special purpose charge variance	572	3,555
Other	1,209	—
	77,322	85,113

Regulatory liabilities consist of the following:

	2011 $	2010 $
Future income taxes	200,436	224,570
Regulatory assets recovery account	6,361	40,275
PILs variances	2,365	5,675
Settlement variances	—	2,277
Other	1,118	909
	210,280	273,706

For the year ended December 31, 2011, LDC disposed of approved net regulatory liabilities amounting to $34,528,000 through permitted distribution rate adjustments [2010 - $23,003,000].

The regulatory assets and liabilities of LDC are as follows:

a) Smart Meters

The smart meters regulatory asset account relates to Ontario's decision to install smart meters throughout Ontario. LDC substantially completed its smart meter project as at December 31, 2010. In connection with this initiative, the OEB ordered LDC to record all expenditures and related revenues from 2008 to 2010 to a regulatory asset account and allowed LDC to keep the net book value of the stranded meters in property, plant and equipment. Starting on January 1, 2011, LDC began recording smart meter costs in property, plant and equipment and intangible assets as a regular distribution activity as directed by the OEB. LDC expects to apply to the OEB to transfer the 2008 to 2010 smart meter costs from regulatory assets to property, plant and equipment and intangible assets, as well as to transfer the net book value of the stranded meters from property, plant and equipment to regulatory assets in 2012.

LDC incurred smart meter capital expenditures amounting to $19,799,000 for the year ended December 31, 2011 [2010 - $19,799,000]. As at December 31, 2011, smart meter capital expenditures, net of accumulated depreciation, totalling $59,227,000 were recorded to regulatory assets [December 31, 2010 - $65,588,000]. These expenditures would otherwise have been recorded as property, plant and equipment and intangible assets under Canadian GAAP for unregulated businesses. In the absence of rate regulation, property, plant and equipment and intangible assets would have been $54,825,000 and $4,402,000 higher, respectively, as at December 31, 2011 [December 31, 2010 - $59,416,000 and $6,172,000 higher, respectively].

For the year ended December 31, 2011, deferred smart meter operating expenses were reduced by $490,000 which would have reduced expenses under Canadian GAAP for unregulated businesses [2010 – were increased by $3,109,000]. For the year ended December 31, 2011, smart meter depreciation expense of $6,361,000 [2010 - $5,357,000] were deferred which would have been expensed under Canadian GAAP for unregulated businesses. In the absence of rate regulation, for the year ended December 31, 2011, operating expenses would have been $490,000 lower [2010 - $3,109,000 higher], and depreciation expense would have been $6,361,000 higher [2010 - $5,357,000 higher].

For the year ended December 31, 2011, smart meter customer revenues of $5,866,000 were deferred [2010 - $5,774,000]. In the absence of rate regulation, for the year ended December 31, 2011, revenue would have been $5,866,000 higher [2010 - $5,774,000 higher].

b) Late Payment Penalties Settlement

The late payment penalties settlement regulatory asset account was related to the settlement costs associated with the late payment charges class action. All of the MEUs involved in the settlement, including LDC, requested an order from the OEB allowing for the future recovery from customers of all costs related to the settlement. On February 22, 2011, the OEB approved the recovery of the costs of $7,526,000. The recovery is occurring over a 21-month period which commenced on August 1, 2011. Accordingly, the balance approved for recovery was transferred to the Regulatory Assets Recovery Account ["RARA"].

c) IFRS Conversion Project

This regulatory asset account included the incremental costs incurred by LDC for its initially planned conversion to IFRS. On July 7, 2011, the OEB reduced the allowable recoverable costs from $6,134,000 to $3,050,000 as it appeared that a portion of the costs claimed for recovery by LDC were included in prior period electricity distribution rates. In connection with this decision from the OEB, LDC revised its estimate for IFRS conversion costs recovery, resulting in an increase in operating expenses of $3,017,000 in the second quarter of 2011. The remaining regulatory asset balance of $3,050,000, which included carrying charges, was transferred to the RARA and is being recovered over a nine-month period which commenced on August 1, 2011. Under Canadian GAAP for unregulated businesses, these costs would have been recorded to operating expenses. In the absence of rate regulation, for the year ended December 31, 2011, operating expenses would have been $3,017,000 lower [2010 - $3,108,000 higher].

d) Settlement Variances

This account is comprised of the variances between amounts charged by LDC to customers, based on regulated rates, and the corresponding cost of non-competitive electricity service incurred by LDC. The settlement variances relate primarily to service charges, non-competitive electricity charges, imported power charges and the global adjustment. Accordingly, LDC has deferred the variances between the costs incurred and the related recoveries in accordance with the criteria set out in the accounting principles prescribed by the OEB in the AP Handbook.

The balance for settlement variances continues to be tracked and attract carrying charges in accordance with the OEB's direction. For the year ended December 31, 2011, settlement variances of $34,938,000 were disposed through rate adjustments [2010 - $20,016,000].

e) Special Purpose Charge Variance

On April 9, 2010, the OEB informed electricity distributors of a Special Purpose Charge ["SPC"] assessment under Section 26.1 of the OEB Act, for the Ministry of Energy and Infrastructure conservation and renewable energy program costs. The OEB assessed LDC the amount of $9,698,000 for its apportioned share of the total provincial amount of the SPC of $53,695,000 in accordance with the rules set out in Ontario Regulation 66/10 [the "SPC Regulation"]. In accordance with Section 9 of the SPC Regulation, LDC was allowed to recover this balance. The recovery was completed as at April 30, 2011.

As at December 31, 2011, the balance in this account consists of LDC's assessment of $9,698,000 less the recoveries received from customers. In the absence of rate regulation, revenue for the year ended December 31, 2011, would have been $3,050,000 higher [2010 - $6,123,000 higher] and operating expenses for the year ended December 31, 2011 would have $nil impact [2010 - $9,698,000 higher].

f) Future Income Taxes

This regulatory liability account relates to the expected future electricity distribution rate reduction for customers arising from timing differences in the recognition of future tax assets [note 3[m]].

As at December 31, 2011, LDC recorded a future income tax asset and a corresponding regulatory liability of $200,436,000 [December 31, 2010 - $224,570,000] with respect to its rate-regulated activities. The future income tax asset and the corresponding regulatory liability as at December 31, 2010 have been recast to reflect an adjustment of $30,247,000 resulting from a change in methodology used to determine the timing differences between the tax value and book value of the assets for accounting purposes.

g) Regulatory Assets Recovery Account

The RARA consists of balances of regulatory assets or regulatory liabilities approved for disposition by the OEB through rate riders. The RARA is subject to carrying charges following the OEB prescribed methodology and related rates.

On April 16, 2009, the OEB approved the disposition of regulatory liabilities of $7,582,000, for amounts arising from the extended effectiveness of certain rate riders into the 2008 rate year, over a one-year period commencing on May 1, 2009 and ending on April 30, 2010.

On April 9, 2010, the OEB approved the disposition of net regulatory liabilities of $68,140,000, consisting of credit balances for settlement variances and PILs variances of $58,225,000 and $11,900,000, respectively, and intangible assets debit balance of $1,985,000, over a two-year period commencing on May 1, 2010 and ending on April 30, 2012.

On October 29, 2010, the OEB approved the disposition of regulatory assets of $5,296,000, for amounts in connection with the contact voltage remediation activities, for the period commencing on November 1, 2010 and ending on April 30, 2012 [note 2[d]].

On February 22, 2011, the OEB approved the disposition of the Late Payment Penalties Settlement regulatory asset of $7,526,000, over a 21-month period commencing on August 1, 2011 and ending on April 30, 2013.

On July 7, 2011, the OEB approved the disposition of net regulatory liabilities of $8,572,000, consisting of credit balances for settlement variances, PILs variances and 2008 RARA residual of $7,460,000, $3,373,000, and $789,000, respectively, and an IFRS cost debit balance of $3,050,000, over a nine-month period commencing on August 1, 2011 and ending on April 30, 2012.

h) PILs Variances

The PILs variances regulatory liability account relates to the differences that have resulted from a legislative or regulatory change to the tax rates or rules assumed in the rate adjustment model. As at December 31, 2011, the balance in this account consisted of an over-recovery from customers of $2,365,000 [December 31, 2010 - $5,675,000].

8. OTHER ASSETS

Other assets consist of the following:

	2011 $	2010 $
Prepaid leases	7,279	7,368
Other	52	150
	7,331	7,518

NOTES TO FINANCIAL STATEMENTS

Promissory note payable to the Corporation	245,058	245,058

All long-term debt of LDC ranks equally.

NOTES TO FINANCIAL STATEMENTS
[all tabular amounts in thousands of dollars]

December 31, 2011

a) Long-term notes payable to the Corporation

Long-term notes payable to the Corporation are comprised of the following:

[i] $180,000,000, which bears interest at a rate of 6.16% per annum, with a maturity date of May 6, 2013, extendable upon mutual consent.

[ii] $245,058,000, which bears interest at a rate of 5.20% per annum, with a maturity date of November 14, 2017, extendable upon mutual consent.

[iii] $245,058,000, which bears interest at a rate of 4.54% per annum, with a maturity date of November 12, 2019, extendable upon mutual consent.

[iv] $200,000,000, which bears interest at a rate of 5.59% per annum, with a maturity date of May 21, 2040, extendable upon mutual consent.

[v] $300,000,000, which bears interest at a rate of 3.59% per annum, with a maturity date of November 18, 2021, extendable upon mutual consent.

b) Promissory note payable to the Corporation

On July 1, 1999, LDC issued a promissory note to the City ["Initial Note"] in the principal amount of $947,000,000 in partial consideration for the assets in respect of the electricity distribution system transferred by the Toronto Hydro-Electric Commission and the City to LDC effective July 1, 1999. The Initial Note was non-interest bearing until December 31, 1999 and interest bearing thereafter at the rate of 6% per annum. Pursuant to the terms of By-law No. 374-1999 of the City made under section 145 of the Electricity Act, the principal amount of the Initial Note was adjusted effective January 1, 2000 to $980,231,000 to reflect the deemed debt to equity structure of LDC permitted by the OEB. At the same time, the Initial Note was replaced by a promissory note ["Replacement Note"] issued by LDC, which was interest bearing at the rate of 6.8% per annum. At December 31, 2002, the Replacement Note was payable on the earlier of demand and December 31, 2003.

Concurrent with the closing of the Corporation's debenture offering on May 7, 2003, the City transferred the Replacement Note to the Corporation in consideration for the issuance by the Corporation to the City of a new promissory note in the principal amount of $980,231,000. Following the issuance of the new promissory note to the City, on May 7, 2003, LDC issued a promissory note payable on demand to the Corporation in the principal amount of $980,231,000.

On September 5, 2006, LDC amended and restated the promissory note payable to the Corporation effective May 1, 2006 by fixing the interest rate at 6.16% and establishing an agreed repayment schedule. LDC is required to pay the principal amount of the note as follows: $245,057,000 on the last business day before each of December 31, 2007, December 31, 2009, December 31, 2011 and on May 6, 2013. On December 31, 2007, LDC made the first scheduled payment of $245,057,000 to the Corporation. On December 31, 2009, LDC made the second scheduled payment of $245,057,000 to the Corporation. On December 30, 2011, LDC made the third scheduled payment of

$245,057,000 to the Corporation. Interest is calculated and payable quarterly in arrears on the last business day of March, June, September and December of each year.

11. EMPLOYEE FUTURE BENEFITS

Pension

For the year ended December 31, 2011, LDC's OMERS current service pension costs were $13,813,000 [2010 - $11,519,000]. For the year ended December 31, 2011, OMERS contributions were 7.4% up to the year's maximum pensionable earnings ["YMPE"] and 10.7% over YMPE for normal retirement age ["NRA"] of 65 [December 31, 2010 - 6.4% up to YMPE and 9.7% over YMPE for NRA of 65].

Employee future benefits other than pension

LDC has a number of unfunded benefit plans providing retirement and post-employment benefits (excluding pension) to most of its employees. LDC pays certain medical, dental and life insurance benefits under unfunded defined benefit plans on behalf of its retired employees. LDC pays accumulated sick leave credits, up to certain established limits based on service, in the event of retirement, termination or death of certain employees.

LDC measures its accrued benefits obligation for accounting purposes as at December 31 of each year. The latest actuarial valuation was performed as at January 1, 2010.

a) Accrued benefit obligation

	2011 $	2010 $
Balance, beginning of year	198,630	172,280
Experience loss at beginning of year	—	7,547
Adjustment due to reorganization	478	4,235
Current service cost	3,820	3,407
Interest cost	11,307	10,911
Benefits paid	(7,383)	(7,083)
Actuarial losses	35,809	7,333
Balance, end of year	242,661	198,630

b) Reconciliation of the accrued benefit obligation to the balance sheet accrued benefit liability

	2011 $	2010 $
Accrued benefit obligation	242,661	198,630
Unamortized net actuarial losses	(65,425)	(30,094)
Unamortized past service costs	(866)	(1,746)
Post-employment benefits liability	176,370	166,790

c) Components for net periodic defined benefit costs

	2011 $	2010 $
Current service cost	3,820	3,407
Interest cost	11,307	10,911
Actuarial losses	35,809	14,880
Cost incurred in the year	50,936	29,198
Differences between costs incurred and costs recognized in the year in respect of:		
Actuarial gains	(35,022)	(14,514)
Past service costs	873	745
	(34,149)	(13,769)
Defined benefit costs recognized	16,787	15,429
Capitalized as part of property, plant and equipment	6,758	7,388
Charged to operations	10,029	8,041

d) Significant assumptions

	2011 %	2010 %
Accrued benefit obligation as at December 31:		
Discount rate	4.8	5.8
Rate of compensation increase	4.0	4.0
Benefit costs for years ended December 31:		
Discount rate	5.8	6.0
Rate of compensation increase	4.0	4.0
Assumed health care cost trend rates as at December 31:		
Rate of increase in dental costs	4.0	4.0

For December 31, 2011, medical costs are assumed to increase at 7.0% [2010 - 7.5%] graded down by 0.5% [2010 - 0.5%] annual decrements to 5.0% [2010 - 5.0%] in 2016 and thereafter.

e) Sensitivity analysis

Assumed health and dental care cost trend rates have a significant effect on the amounts reported for health and dental care plans. A one-percentage-point change in assumed health and dental care cost trend rates would have the following effects for 2011:

	Increase $	Decrease $
Total of current service and interest cost (at 5.8%)	2,675	(1,835)
Accrued benefit obligation as at December 31, 2011 (at 4.8%)	36,693	(28,227)

Assumed interest rates have a significant effect on the amounts reported for the total accrued benefit obligation and expense. A one-percentage-point change in assumed interest rates would have the following effects for 2011:

	Increase $	Decrease $
Accrued benefit obligation as at December 31, 2011	(32,872)	42,630
Estimated expense for fiscal 2012	(2,972)	3,378

12. OTHER LIABILITIES

Other long-term liabilities consist of the following:

	2011 $	2010 $
Obligations under capital lease [note 20]	11,301	369
Other	—	310
	11,301	679

For the year ended December 31, 2011, LDC acquired property, plant and equipment through capital lease transactions totalling $13,717,000 [2010 - $176,000]. These non-cash transactions have been excluded from the statements of cash flows.

13. ASSET RETIREMENT OBLIGATIONS

Reconciliation between the opening and closing ARO liability balances is as follows:

	2011 $	2010 $
Balance, beginning of year	4,939	7,490
ARO liabilities settled in the year	(688)	(2,290)
Accretion expense	168	190
Revision in estimated cash flows	412	(451)
Balance, end of year	4,831	4,939

As at December 31, 2011, LDC estimates the undiscounted amount of cash flows required over the next one to 45 years to settle the ARO liabilities is $5,676,000 [December 31, 2010 - $6,425,000]. Discount rates ranging from 1.39% to 5.29% [December 31, 2010 – 1.39% to 5.89%] were used to calculate the carrying value of the ARO liabilities. No assets have been legally restricted for settlement of the liability.

14. CAPITAL DISCLOSURES

LDC's main objectives when managing capital are to:

- ensure ongoing access to funding to maintain and refurbish its electricity distribution system; and
- align its capital structure for regulated activities with the deemed debt to equity structure set by the OEB.

As at December 31, 2011, LDC's definition of capital includes long-term debt and obligations under capital lease, including the current portion thereof, and shareholder's equity, and has remained unchanged from December 31, 2010. As at December 31, 2011, shareholder's equity amounted to $985,993,000 [December 31, 2010 -

$892,662,000] and long-term debt, including the current portion thereof, amounted to $1,422,513,000 [December 31, 2010 - $1,355,654,000]. LDC's capital structure as at December 31, 2011 was 59% debt and 41% equity [December 31, 2010 - 60% debt and 40% equity]. There were no changes in LDC's approach to capital management during the year.

15. FINANCIAL INSTRUMENTS

a) Recognition and measurement

The carrying value and fair value of LDC's financial instruments consist of the following:

	2011 $		2010 $	
	Carrying value	Fair value	Carrying value	Fair value
Cash and cash equivalents	66,744	66,744	175,513	175,513
Accounts receivable, net of allowance for doubtful accounts	191,456	191,456	184,645	184,645
Unbilled revenue	262,289	262,289	283,141	283,141
Accounts payable and accrued liabilities	402,607	402,607	363,970	363,970
Obligations under capital lease	13,172	13,172	551	551
Customers' advance deposits	56,038	56,038	64,252	64,252
Long-term notes payable to the Corporati				
6.16% due May 6, 2013	179,456	190,682	179,100	196,236
5.20% due November 14, 2017	244,186	278,458	244,062	268,272
4.54% due November 12, 2019	243,814	270,077	243,686	254,620
5.59% due May 21, 2040	198,708	244,838	198,691	217,091
3.59% due November 18, 2021	298,119	306,680	—	—
Promissory note payable to the Corporation due May 6, 2013	245,058	259,650	490,115	521,312

b) Risk Factors

The following is a discussion of risks and related mitigation strategies that have been identified by LDC for financial instruments. This is not an exhaustive list of all risks, nor will the mitigation strategies eliminate all risks listed.

LDC's activities provide for a variety of financial risks, particularly credit risk, interest rate risk and liquidity risk.

Credit risk

LDC is exposed to credit risk from financial instruments as a result of the risk of counterparties defaulting on their obligations. LDC monitors and limits its exposure to credit risk on a continuous basis.

NOTES TO FINANCIAL STATEMENTS
[all tabular amounts in thousands of dollars]

December 31, 2011

LDC's credit risk associated with accounts receivable is primarily related to electricity bill payments from customers. LDC has approximately 709,000 customers, the majority of which are residential. LDC collects security deposits from customers in accordance with directions provided by the OEB. As at December 31, 2011, LDC held security deposits in the amount of $58,000 [December 31, 2010 - $64,252,000].

The carrying amount of accounts receivable is reduced through an allowance for doubtful accounts and the amount of the related impairment loss is recognized in the statements of income. Subsequent recoveries of receivables previously provisioned are credited to the statements of income.

Credit risk associated with accounts receivable is as follows:

	2011 $	2010 $
Total accounts receivable	204,266	196,381
Less: Allowance for doubtful accounts	(12,810)	(11,736)
Total accounts receivable, net	191,456	184,645
Of which:		
Outstanding for not more than 30 days	163,675	163,618
Outstanding for more than 30 days but not more than 120 days	24,671	21,495
Outstanding for more than 120 days	15,920	11,268
Less: Allowance for doubtful accounts	(12,810)	(11,736)
Total accounts receivable, net	191,456	184,645

Reconciliation between the opening and closing allowance for doubtful accounts balances is as follows:

	2011 $	2010 $
Balance, beginning of year	(11,736)	(12,387)
Provision for doubtful accounts	(10,158)	(6,966)
Write-offs	9,741	9,224
Recoveries	(657)	(1,607)
Balance, end of year	(12,810)	(11,736)

Unbilled revenue represents amounts for which LDC has a contractual right to receive cash through future billings but are unbilled at period-end. As at December 31, 2011, total unbilled revenue was $262,289,000 [December 31, 2010 - $283,141,000]. Unbilled revenue is considered current.

As at December 31, 2011, there were no significant concentrations of credit risk with respect to any class of financial assets or counterparties. LDC's maximum exposure to credit risk is equal to the carrying value of its financial assets.

NOTES TO FINANCIAL STATEMENTS
[all tabular amounts in thousands of dollars]

December 31, 2011

Interest rate risk

LDC is exposed to interest rate risk through holding certain financial instruments, and short-term borrowings which may be obtained under the Corporation's revolving credit facility may expose LDC to fluctuations in short-term interest rates (borrowings in the form of prime rate loans in Canadian dollars and Bankers' Acceptance ["BAs"] and letters of credit). LDC attempts to minimize interest rate risk by borrowing in long-term fixed rate debt, and by extending or shortening the term of its short-term money market investments by assessing the monetary policy stance of the Bank of Canada, while ensuring that all payment obligations are met on an ongoing basis. The fee payable for BAs and letters of credit is based on a margin determined by reference to the Corporation's credit rating.

Cash balances, which are not required to meet day-to-day obligations of LDC, are either held in bank accounts or invested in Canadian money market instruments, exposing LDC to fluctuations in short-term interest rates. These fluctuations could impact the level of interest income earned by LDC.

LDC is exposed to fluctuations in interest rates as its regulated rate of return is derived using a formulaic approach, which is based in part on a forecast of long-term Government of Canada bond yields and A-rated Canadian utility bond spreads. LDC estimates that a 1% (100 basis point) reduction in long-term Government of Canada bond yields, used in determining its regulated rate of return would reduce LDC's annual net income, as at December 31, 2011, by approximately $4,600,000.

LDC is also exposed to fluctuations in interest rates for the valuation of its post-employment benefit obligations [note 11[e]].

Liquidity risk

LDC is exposed to liquidity risk related to commitments associated with financial instruments. LDC monitors and manages its liquidity risk to ensure access to sufficient funds to meet operational and investing requirements. LDC's objective is to ensure that sufficient liquidity is on hand to meet obligations as they fall due while minimizing net financing charges. LDC has access to credit facilities through the Corporation and monitors cash balances daily to ensure that sufficient levels of liquidity are on hand to meet financial commitments as they come due. Liquidity risks associated with financial commitments are as follows:

NOTES TO FINANCIAL STATEMENTS
[all tabular amounts in thousands of dollars]

December 31, 2011

notes payable to the Corporation			
	476,870	627,131	1,354,268

Hedging and Derivative risk

As at December 31, 2011 and December 31, 2010, LDC has not entered into hedging and derivative financial instruments.

Foreign exchange risk

As at December 31, 2011, LDC had limited exposure to the changing values of foreign currencies. While LDC purchases goods and services which are payable in US dollars, and purchases US currency to meet the related payables commitments when required, the impact of these transactions is not material to the financial statements.

16. FINANCIAL GUARANTEES

LDC is required to satisfy prescribed prudential requirements with the IESO for the purchase of electricity.

As at December 31, 2011, $40,000,000 [December 31, 2010 - $45,000,000] was utilized under the Corporation's bilateral credit facility in the form of letters of credit to support the prudential requirements of LDC.

17. PAYMENTS IN LIEU OF CORPORATE TAXES

The provision for PILs differs from the amount that would have been recorded using the combined Canadian federal and Ontario statutory income tax rate. Reconciliation between the statutory and effective tax rates is set out below:

NOTES TO FINANCIAL STATEMENTS
[all tabular amounts in thousands of dollars]

December 31, 2011

Statements of Income

	2011 $	2010 $
Rate reconciliation		
Income before PILs	102,363	87,964
Statutory Canadian federal and provincial income tax rate	28.25%	31.00%
Expected provision for PILs	28,918	27,269
Temporary differences not benefited	(16,032)	(1,303)
Other	(3,854)	(2,020)
Provision for PILs	9,032	23,946
Effective tax rate	8.82%	27.22%
Components of provision for PILs		
Current tax provision	8,753	23,946
Future income tax provision related to the origination and reversal of temporary differences	279	—
Provision for PILs	9,032	23,946

Balance Sheets

Significant components of LDC's future income tax assets are as follows:

	2011 $	2010 $
Property, plant and equipment and intangible assets	100,933	121,872
Regulatory adjustments	50,109	56,142
Post-employment benefits liability	44,093	41,698
Other taxable temporary differences	5,022	4,858
Future income tax assets	200,157	224,570

18. SHARE CAPITAL

Share capital consists of the following:

	2011 $	2010 $
Authorized The authorized share capital of LDC consists of an unlimited number of common shares		
Issued and outstanding 1,000 common shares	527,817	527,817

19. RELATED PARTIES

For LDC, transactions with related parties include transactions with the City, the Corporation and TH Energy. All transactions with related parties are in the ordinary course of business and measured at exchange amounts and normal trade terms.

2011	City $	Corporation $	TH Energy $
Revenues	131,691	—	1,850
Operating expenses and capital expenditures	28,946	2,837	—
Net financing charges	—	77,609	—
Accounts receivable, net of allowance for doubtful accounts	6,761	—	20,978
Other Assets	7,279	—	—
Accounts payable and accrued liabilities	24,235	7,926	—
Long-term notes and promissory note payable	—	1,409,341	—
Customers' advance deposits	8,714	—	—

NOTES TO FINANCIAL STATEMENTS
[all tabular amounts in thousands of dollars]

December 31, 2011

2010	City $	Corporation $	TH Energy $
Revenues	128,931	—	2,018
Operating expenses and capital expenditures	14,019	3,784	—
Net financing charges	—	72,006	—
Accounts receivable, net of allowance for doubtful accounts	4,065	—	25,166
Other Assets	7,368	—	—
Accounts payable and accrued liabilities	12,164	6,473	—
Long-term notes and promissory note payable	—	1,355,654	—
Customers' advance deposits	10,953	—	—

Revenues represent amounts charged to the City primarily for electricity, and TH Energy for the provision of goods and services. Operating expenses and capital expenditures represent amounts charged by the City for purchased road cut repairs, property taxes and other services, and the Corporation for purchased corporate and management services. Net financing charges represent interest paid to the Corporation on the long-term notes and promissory note payable [note 10].

Accounts receivable, net of allowance for doubtful accounts represent receivables from the City primarily for relocation services and sale of electricity, and TH Energy for the provision of goods and services. Other assets represent amounts for prepaid land leases from the City. Accounts payable and accrued liabilities represent amounts payable to the City relating to road cut repairs and other services, as well as funds received from the City for the construction of electricity distribution assets, and the Corporation for purchased corporate and management services. Long-term notes and promissory note payable represent amounts borrowed from the Corporation [note 10]. Customers' advance deposits represent funds received from the City for future expansion projects.

20. COMMITMENTS

Operating lease obligations and future commitments

As at December 31, 2011, the future minimum annual lease payments under property operating leases and future commitments with remaining terms from one to five years and thereafter were as follows:

	$
2012	27,713
2013	23,441
2014	7,490
2015	6,486
2016	6,307
Thereafter	4,755
Total amount of future minimum payments	76,192

During the first quarter of 2011, LDC entered into an agreement with Hydro One Networks Inc. to reinforce the 115 kilovolt transmission system between Leaside Transformer Station ["TS"] and Bridgman TS under the Toronto Midtown Transmission Reinforcement Project, which terminates on the 25th anniversary of the in service date. LDC is expected to pay the estimated capital contributions and work chargeable by making progress payments based on various payment milestone dates, with $17,600,000 and $15,278,000 payable in 2012 and 2013, respectively, and any difference from the estimated costs to be settled at a later date. These commitments have been reflected in the table above.

Capital lease obligations

As at December 31, 2011, the future minimum annual lease payments under capital leases with remaining lease terms from one to five years and thereafter were as follows:

	$
2012	2,454
2013	2,445
2014	2,404
2015	2,327
2016	2,267
Thereafter	3,380
Total amount of future minimum payments	15,277
Less interest and executory costs	2,105
	13,172
Current portion [note 9]	1,871
Long-term portion [note 12]	11,301

Included in the capital lease obligations is an equipment lease entered into by LDC in the third quarter of 2011 which expires in June 2018 and bears interest at a rate of 4.7%.

21. CONTINGENCIES

a) Legal Proceedings

In the ordinary course of business, LDC is subject to various litigation and claims with customers, suppliers, former employees and other parties. On an ongoing basis, LDC assesses the likelihood of any adverse judgments or outcomes as well as potential ranges of probable costs and loss. A determination of the provision required, if any, for these contingencies is made after analysis of each individual issue. The provision may change in the future due to new developments in each matter or changes in approach, such as a change in settlement strategy. LDC is subject to various legal actions that arise in the normal course of business and if damages were awarded under these actions, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with these actions.

December 31, 2011

Christian Helm Class Action

On December 6, 2010, a statement of claim in a proposed class action was issued against LDC. The claim seeks general and special damages in the amount of $100,000,000 for disgorgement of unjust gains allegedly resulting from the receipt of interest on overdue accounts at a rate exceeding 5% per annum in contravention of the Interest Act (Canada) ["Interest Act"]. A statement of defence has been filed. Prior to any certification of the action as a class proceeding, cross summary judgment motions were heard in June 2011 to determine whether the Interest Act has been breached [note 23[c]].

2 Secord Avenue

An action was commenced against LDC in September 2008 in the Ontario Superior Court of Justice under the Class Proceedings Act, 1992 (Ontario) ["Class Proceedings Act"] seeking damages in the amount of $30,000,000 as compensation for damages allegedly suffered as a result of a fire and explosion in an underground vault at 2 Secord Avenue on July 20, 2008. This action is at a preliminary stage. The statement of claim has been served on LDC, a statement of defence and third party claim have been served by LDC and a third party defence and counterclaim against LDC seeking damages in the amount of $51,000,000 have been filed. A certification order has been issued. Affidavits of documents have been produced by LDC and the other parties and examinations for discovery have commenced and are continuing. Given the preliminary status of this action, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

On December 20, 2010, LDC was served with a statement of claim by the City seeking damages in the amount of $2,000,000 as a result of the fire at 2 Secord Avenue. A statement of defence and third party claim have been served. Given the preliminary status of this action, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

By order of the court, the above actions and a smaller non-class action commenced in April 2009 involving the same incident will be tried at the same time or consecutively.

2369 Lakeshore Boulevard West

A third party action was commenced against LDC in October 2009 in the Ontario Superior Court of Justice under the Class Proceedings Act seeking damages in the amount of $30,000,000 as compensation for damages allegedly suffered as a result of a fire in the electrical room at 2369 Lakeshore Boulevard West on March 19, 2009. Subsequently, in March 2010, the plaintiff in the main action amended its statement of claim to add LDC as a defendant. The plaintiff in the main action seeks damages in the amount of $10,000,000 from LDC. Both actions are at a preliminary stage and the certification hearing is scheduled for September 2012. Statements of defence to the main action and to the third party claim have not been filed. Accordingly, given the preliminary status of these actions, it is not possible at this time to reasonably quantify the effect, if any, of these actions on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with these actions.

Another third party action was commenced against LDC in October 2009 in the Ontario Superior Court of Justice seeking damages in the amount of $30,000,000 as compensation for damages allegedly suffered as a result of the fire at 2369 Lakeshore Boulevard West. Subsequently, in March 2010, the plaintiff in the main action amended its statement of claim to add LDC as a defendant. The plaintiff in the main action seeks damages in the amount of $400,000 from LDC. LDC has filed a statement of defence, crossclaim and counterclaim. Examinations for discovery have not taken place but are to be completed by February 29, 2012 pursuant to a court ordered timetable. Accordingly, given the preliminary status of these actions, it is not possible at this time to reasonably quantify the effect, if any, of these actions on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with these actions.

On August 29, 2011, LDC was served with a statement of claim by the owner of the building and the property management company for the building seeking damages in the amount of $2,000,000 as a result of the fire at 2369 Lakeshore Boulevard West. LDC has filed a statement of defence and counterclaim. Given the preliminary status of this action, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

Adamopoulos

An action was commenced against LDC in November 2004 in the Ontario Superior Court of Justice seeking damages in the amount of $7,750,000 as compensation for damages allegedly suffered as a result of a motor vehicle accident involving an LDC vehicle on January 9, 2001. The plaintiff's motion increasing its claim for damages to $23,790,000 was granted on July 7, 2010. This matter has been settled and a court order has been issued dismissing the action and all related claims by payment of all to an amount of approximately $450,000. LDC's liability insurance covered the settlement amount.

b) OEB PILs Proceeding

The OEB conducted a review of the PILs variances accumulated in regulatory variance accounts for the period from October 1, 2001 to April 30, 2006 for certain MEUs. On June 24, 2011, the OEB issued its decision for these MEUs and provided guidelines for the calculation and further disposition of the balances accumulated in the PILs regulatory variance accounts.

LDC has reviewed the balances of its PILs regulatory variance accounts and applied the guidelines provided by the OEB. As at December 31, 2011, LDC estimated its liability at approximately $2,779,000. This balance has been recorded in LDC's financial statements. LDC intends to apply for disposition of this balance in 2012. The amount to be approved by the OEB will be based on the OEB's interpretation and application of its guidelines and the final balance which is yet to be approved by the OEB could differ materially from LDC's estimation of its liability.

c) Payments in Lieu of Additional Municipal and School Taxes

The Ministry of Finance has issued assessments in respect of payments in lieu of additional municipal and school taxes under section 92 of the Electricity Act that are in excess of the amounts LDC believes are payable. The

dispute arose as a result of inaccurate information incorporated into Ontario Regulation 224/00. LDC has worked with the Ministry of Finance to resolve this issue, and as a result the Ministry of Finance issued Ontario Regulation 423/11 on August 31, 2011. The new regulation revoked Ontario Regulation 224/00 and corrected inaccurate information retroactively to 1999.

The balance assessed by the Ministry of Finance on its most recent statement of account amounts to approximately $10,043,000 above the balance accrued by LDC. While LDC expects that reassessments will be issued as a consequence of the change in regulation, there can be no assurance that LDC will not have to pay the full assessed balance in the future.

22. COMPARATIVE FINANCIAL STATEMENTS

Certain comparative amounts of the financial statements have been reclassified from statements previously presented to conform to the presentation of the 2011 financial statements.

23. SUBSEQUENT EVENTS

a) Street Lighting Activities

On January 1, 2012, the Corporation completed the transfer of street lighting assets to LDC for a purchase price of $28,460,000, subject to post closing adjustment and transaction costs [note 2[b]].

b) Electricity Distribution Rates

On January 5, 2012, the OEB rendered its decision on the preliminary issue and dismissed LDC's cost of service 2012-2014 Rate Application. In its decision, the OEB found that LDC was not permitted to deviate from the standard incentive regulation mechanism framework cycle, and LDC will therefore be required to file its request for electricity distribution rates commencing on May 1, 2012 pursuant to the formulaic adjustment and the incremental capital module provided for under the incentive regulation mechanism framework [note 2[a]].

On January 25, 2012, LDC filed with the OEB a motion to review the OEB's January 5, 2012 decision.

On February 6, 2012, LDC filed a notice of appeal with the Ontario Divisional Court regarding the OEB's January 5, 2012 decision.

Pursuant to the OEB's decision of January 5, 2012, LDC is currently preparing an application for electricity distribution rates using the incentive regulation mechanism framework, including the filing of an incremental capital module. The quantum of this application is consistent with the capital program spending levels previously approved by the OEB for the 2011 Rate Year.

Under the incentive regulation mechanism framework, LDC has to significantly reduce its costs structure, and in particular its operating expenses, in order to meet its financial obligations. Accordingly, in the first quarter of 2012, LDC began implementing a restructuring program aimed at reducing its operating costs in the future. The main component of this restructuring program is a workforce reduction plan targeting both union and management

employees. As at March 2, 2012, the costs incurred as a result of the restructuring program amounted to approximately $19,300,000, which were mainly related to employee severance and buy-out costs.

LDC continues to assess all of the impacts related to the imposition by the OEB of the incentive regulation mechanism framework, which impacts may include additional restructuring costs. The incremental restructuring costs could have a material impact on LDC's financial statements in the future.

c) Christian Helm Class Action

On February 1, 2012, prior to the release of the decisions on the summary judgment motions, the parties reached a settlement of the matter, which settlement now requires court approval. The Settlement Approval Hearing is scheduled for April 30, 2012. If the settlement receives court approval, damages and costs of approximately $6,000,000 shall be paid by LDC. In 2010, LDC accrued a liability to cover the expected settlement.

If the settlement does not receive court approval, the decision on the cross summary judgment motions will be released. In this event, if the court finds a breach of the Interest Act, subject to appeals, the proceeding will continue, and LDC will rely on other defences. While LDC believes it has a defence to this claim, there is no guarantee that it will be successful defending the action and therefore, the outcome of this proceeding could have a material impact on LDC's financial statements and results of operations [note 21[a]].

INDEPENDENT AUDITORS' REPORT

To the Shareholder of Toronto Hydro-Electric System Limited

We have audited the accompanying financial statements of Toronto Hydro-Electric System Limited, which comprise the balance sheets as at December 31, 2012 and December 31, 2011, the statements of net income and comprehensive income, shareholder's equity and cash flows for the years ended December 31, 2012 and December 31, 2011, and notes, comprising a summary of significant accounting policies and other explanatory information.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with United States Generally Accepted Accounting Principles, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditors' Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained in our audits is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements present fairly, in all material respects, the financial position of Toronto Hydro-Electric System Limited as at December 31, 2012 and December 31, 2011 and its statements of net income and comprehensive income, shareholder's equity and cash flows for the years ended December 31, 2012 and December 31, 2011 in accordance with United States Generally Accepted Accounting Principles

The accompanying notes are an integral part of the financial statements.

1. INCORPORATION

On June 23, 1999, Toronto Hydro-Electric System Limited ["LDC"] was incorporated under the Business Corporations Act (Ontario), and is wholly-owned by Toronto Hydro Corporation [the "Corporation"]. The incorporation was required in accordance with the provincial government's Electricity Act, 1998 (Ontario) ["Electricity Act"].

LDC distributes electricity to customers located in the City of Toronto [the "City"] and is subject to rate regulation. LDC is also engaged in the delivery of Conservation and Demand Management ["CDM"] activities.

2. BASIS OF PRESENTATION

These audited financial statements of LDC have been prepared in accordance with United States ["US"] Generally Accepted Accounting Principles ["GAAP"] with respect to the preparation of annual financial information, and are presented in Canadian dollars. These are LDC's first US GAAP annual financial statements. LDC's financial statements were prepared in accordance with Part V of Canadian GAAP until December 31, 2011. The comparative financial statements have been adjusted retroactively from the financial statements previously presented to conform to the presentation of LDC's 2012 financial statements prepared in accordance with US GAAP.

A reconciliation of the balance sheets between Canadian GAAP and US GAAP as at January 1, 2011 and December 31, 2011 and a reconciliation of net income for the year ended December 31, 2011 accompany the financial statements [note 23].

LDC has evaluated the events and transactions occurring after the balance sheet date through February 28, 2013 when LDC's financial statements were available to be issued after the approval by the Corporation's Board of Directors, and did not identify any events or transactions which required recognition in the financial statements and/or disclosure in the notes to the financial statements.

3. REGULATION

In April 1999, the Government of Ontario began restructuring Ontario's electricity industry. Under regulations passed pursuant to the restructuring, LDC and other electricity distributors have been purchasing their electricity from the wholesale market administered by the Independent Electricity System Operator ["IESO"] and recovering the costs of electricity and certain other costs at a later date in accordance with procedures mandated by the Ontario Energy Board [the "OEB"].

The OEB has regulatory oversight of electricity matters in Ontario. The Ontario Energy Board Act, 1998 (Ontario) sets out the OEB's authority to issue a distribution licence that must be obtained by owners or operators of an electricity distribution system in Ontario. The OEB prescribes licence requirements and conditions including, among other things, specified accounting records, regulatory accounting principles, separation of accounts for separate businesses, and filing processes and requirements for rate-setting purposes.

The OEB's authority and responsibilities include the power to approve and fix rates for the transmission and distribution of electricity, the power to provide continued protection for rural and remote electricity customers, and the responsibility for ensuring that electricity distribution companies fulfill their obligations to connect and service customers.

LDC is required to charge its customers for the following amounts (all of which, other than distribution charges, represent a pass through of amounts payable to third parties):

[i] Distribution Charges. Distribution charges are designed to recover the costs incurred by LDC in delivering electricity to customers and the OEB-allowed rate of return. Distribution charges are regulated by the OEB and are comprised of a fixed charge and a usage-based (consumption) charge. The volume of electricity consumed by LDC's customers during any period is governed by events largely outside LDC's control (principally, sustained periods of hot or cold weather which increase the consumption of electricity, and sustained periods of moderate weather which decrease the consumption of electricity).

[ii] Electricity Price and Regulated Adjustments. The electricity price and regulated adjustments represent the pass through of the commodity and other costs of electricity.

[iii] Retail Transmission Rate. The retail transmission rate represents a pass through of wholesale costs incurred by distributors in respect of the transmission of electricity from generating stations to local areas. Retail transmission rates are regulated by the OEB.

[iv] Wholesale Market Service Charge. The wholesale market service charge represents a pass through of various wholesale market support costs. Retail rates for the recovery of wholesale market service charges are regulated by the OEB.

LDC is required to satisfy and maintain prudential requirements with the IESO, which include credit support with respect to outstanding market obligations in the form of letters of credit, cash deposits or guarantees from third parties with prescribed credit ratings.

a) Electricity Distribution Rates

Regulatory developments in Ontario's electricity industry, including current and possible future consultations between the OEB and interested stakeholders, may affect LDC's electricity distribution rates and other permitted recoveries in the future.

LDC's electricity distribution rates for 2011 were determined through an application under the Cost of Service ["COS"] framework. The COS framework sets electricity distribution rates using a detailed examination of evidence and an assessment of the costs incurred by an electricity distributor to provide services to its customers.

On July 7, 2011, the OEB issued its decision regarding LDC's electricity distribution rates for 2011. The decision provided for a distribution revenue requirement and rate base of $522,044,000 and $2,298,227,000, respectively. In addition, the decision provided for capital program spending levels and operating, maintenance and administration spending levels of $378,800,000 and $238,000,000, respectively.

On August 26, 2011, LDC filed a rate application, following the COS framework, with the OEB seeking approval of separate and successive revenue requirements and corresponding electricity distribution rates for 2012, 2013 and 2014. Pursuant to the Incentive Regulation Mechanism ["IRM"] framework, the OEB established, as a preliminary issue in this application, that it would consider the question of whether the application filed by LDC under the COS framework was acceptable or whether it should be dismissed. The IRM framework provides for a standard adjustment to an electricity distributor's rates based on a formulaic calculation with the possibility to request an Incremental Capital Module ["ICM"] to address specific capital expenditure needs that occur during the IRM term, and are not otherwise funded by the formulaic calculation. In order to determine whether a distributor is eligible for the ICM, the OEB conducts a review of the application by way of a detailed examination of a distributor's evidence and consideration of a number of criteria, such as materiality, need and prudence.

LDC filed evidence supporting its position for electricity distribution rates to be set under the COS framework for 2012, 2013 and 2014. The OEB established a process by which a portion of LDC's evidence was tested during an oral hearing held in November 2011.

On January 5, 2012, the OEB rendered its decision on the preliminary issue and dismissed LDC's COS framework application for 2012, 2013 and 2014. In its decision, the OEB found that LDC was not permitted to deviate from the standard IRM framework cycle. Accordingly, LDC was required to file its request for electricity distribution rates for 2012, 2013, and 2014 pursuant to the IRM framework and to use the ICM to request the capital needed for infrastructure renewal.

On January 25, 2012, LDC filed a motion with the OEB to review the OEB's January 5, 2012 decision [the "Motion"].

On February 6, 2012, LDC filed a notice of appeal with the Ontario Divisional Court regarding the OEB's January 5, 2012 decision [the "Appeal"].

On May 10, 2012, LDC filed an application for electricity distribution rates for 2012, 2013, and 2014 using the IRM framework, including the filing of an ICM application [the "IRM/ICM Application"]. The formulaic adjustment, requested by LDC, follows the guidelines provided by the OEB and seeks to increase the current revenue requirement by 0.68% to $525,500,000 for 2012, $529,100,000 for 2013 and $532,700,000 for 2014. The 2013 and 2014 formulaic adjustment may be subject to change depending on future inflation and market data.

The IRM/ICM Application proposed by LDC requests rates that is to enable the recovery of capital expenditures. Accordingly, the amount of capital expenditures included in LDC's proposed IRM/ICM Application amounts to $448,700,000 for 2012, $534,500,000 for 2013 and $439,500,000 for 2014.

On August 16, 2012, the OEB issued its decision on the issues list for the application filed May 10, 2012. In that decision, the OEB stated that further procedural steps would be determined pending LDC's response to the OEB as to whether LDC would continue to pursue the Motion and the Appeal. On August 20, 2012, LDC filed a notice of abandonment with the Ontario Divisional Court thereby terminating the Appeal. On the same date, LDC advised the OEB that it would withdraw its Motion for review.

While the IRM/ICM Application proposed by LDC has been under consideration by the OEB, capital spending in 2012 has been maintained at a reduced amount. As it was no longer practical to achieve the previously requested capital spending of $448,700,000 in 2012, an update to the IRM/ICM Application was submitted by LDC on October 31, 2012 modifying the requested capital expenditures for 2012 and 2013 to $283,000,000 and $579,100,000, respectively, and requesting that consideration for 2014 be deferred to a second phase of the proceeding, once LDC has received a decision from the OEB in respect of phase one. On November 3, 2012, the OEB accepted LDC's request for a two phase proceeding: phase one comprising LDC's 2012 and 2013 work program proposals and phase two comprising LDC's 2014 work program proposal.

The current application is expected to be subject to an in-depth review by the OEB. There can be no assurance that the OEB will allow for the total or partial recovery of the capital expenditure balances requested in the current application. The financial effect of the OEB decision will be recorded in the period it becomes known and could be material to LDC's financial performance.

b) Street Lighting Activities

On June 15, 2009, LDC filed an application with the OEB seeking an electricity distribution licence for a new wholly-owned legal entity to which the Corporation intended to transfer the street lighting assets of Toronto Hydro Energy Services Inc. ["TH Energy"]. Concurrently, LDC filed another application with the OEB seeking approval for the merger of LDC and the new legal entity. The main objective of these applications was to transfer the street lighting assets to the regulated electricity distribution activities of LDC to increase the overall safety of the related infrastructure.

On February 11, 2010, the OEB issued its decision in regard to these applications. In its decision, the OEB agreed that, under certain conditions, the treatment of certain types of street lighting assets as regulated assets is justified.

The OEB ordered the Corporation to provide a detailed valuation of the street lighting assets and to perform an operational review to determine which street lighting assets could become regulated assets. The Corporation performed a detailed asset operational review and filed a valuation of the street lighting assets, which was submitted to the OEB on January 31, 2011.

On August 3, 2011, the OEB issued its final decision allowing the transfer of a portion of the street lighting assets to the new wholly-owned legal entity (1798594 Ontario Inc.), and for LDC to amalgamate with the new legal entity. On January 1, 2012, the Corporation completed the asset transfer and amalgamation. The purchase price for such assets, including a post-closing adjustment, was $42,473,000, subject to transaction costs [note 19].

c) CDM Activities

On March 31, 2010, the Minister of Energy and Infrastructure of Ontario, under the guidance of sections 27.1 and 27.2 of the Ontario Energy Board Act, 1998 (Ontario), directed the OEB to establish CDM targets to be met by electricity distributors. Accordingly, on November 12, 2010, the OEB amended LDC's distribution licence to require LDC, as a condition of its licence, to achieve 1,304 Gigawatt-Hours of energy savings and 286 Megawatts of summer peak demand savings, over the period beginning January 1, 2011 through December 31, 2014.

Effective January 1, 2011, LDC entered into an agreement with the Ontario Power Authority ["OPA"] in the amount of approximately $50,000,000 to deliver CDM programs extending from January 1, 2011 to December 31, 2014. As at December 31, 2012, LDC received approximately $35,036 [December 31, 2011 - $19,875,000] from the OPA for the delivery of CDM programs. All programs to be delivered are fully funded and paid in advance by the OPA. Amounts received but not yet spent are presented under current liabilities as deferred conservation credit. Upon the expiration of the agreement, LDC is required to return to the OPA any excess funding received for program administration less any cost efficiency incentives. These programs are expected to support the achievement of the mandatory CDM targets described above.

On December 21, 2012, the Minister of Energy of Ontario issued a direction to the OPA under subsection 25.32(4.1) of the Electricity Act to extend the funding time period for OPA-contracted province-wide CDM initiatives under the Green Energy Act, 2009 (Ontario) framework to December 31, 2015.

4. SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

a) Regulation

The following regulatory treatments have resulted in accounting treatments which differ from US GAAP for enterprises operating in an unregulated environment:

Regulatory Assets and Liabilities

LDC has determined that its assets and liabilities arising from rate-regulated activities qualify for the application of regulatory accounting treatment in accordance with Financial Accounting Standards Board Accounting Standards Codification 980 – "Regulated Operations" ["ASC 980"], which includes accounting principles prescribed by the OEB in the "Accounting Procedures Handbook for Electricity Distributors". Under rate-regulated accounting, the timing and recognition of certain expenses and revenues may differ from those otherwise expected under US GAAP in order to appropriately reflect the economic impact of regulatory decisions regarding LDC's regulated revenues and expenditures. These timing differences are recorded as regulatory assets and regulatory liabilities on LDC's balance sheets and represent existing rights and obligations regarding cash flows expected to be recovered from or refunded to customers, based on decisions and approvals by the OEB. Regulatory assets and liabilities can be recognized for rate-setting and financial reporting purposes only if the OEB directs the relevant regulatory treatment or if future OEB direction is judged to be probable. In the event that the disposition of these balances was assessed to no longer be probable, the balances would be recorded in LDC's statements of net income and comprehensive

income in the period that the assessment is made. The measurement of regulatory assets and liabilities is subject to certain estimates and assumptions, including assumptions made in the interpretation of the regulation and the OEB's decisions.

Regulatory assets and liabilities are classified as current if they are expected to be recovered from, or refunded to, customers within 12 months after each reporting period. All other regulatory asset and liability balances are classified as long-term on the balance sheets.

Allowance for funds used during construction

The OEB provides for the inclusion of an Allowance for Funds Used During Construction ["AFUDC"] when capitalizing construction-in-progress assets, until such time as the asset is substantially complete. A concurrent credit of the same amount is made to net financing charges when the allowance is capitalized. The interest rate for capitalization is prescribed by the OEB and modified on a periodic basis, and is applied to the balance of the construction-in-progress assets on a simple interest basis. The interest rate for capitalization for the period from January 1, 2012 to March 31, 2012 was 3.92%, from April 1, 2012 to September 30, 2012 was 3.51%, and from October 1, 2012 to December 31, 2012 was 3.23% [January 1, 2011 to September 30, 2011 - 4.29%; October 1, 2011 to December 31, 2011 - 3.92%]. AFUDC is included in property, plant and equipment and intangible assets for financial reporting purposes, charged to operations through depreciation and amortization expense over the useful lives of the related assets and recovered through future revenue.

b) Cash and cash equivalents

Cash and cash equivalents include cash in bank accounts and short-term investments with terms to maturity of 90 days or less from their date of acquisition.

c) Accounts receivable

Accounts receivable are recorded at the invoiced amount and overdue amounts bear interest at OEB-approved rates. The carrying amount of accounts receivable is reduced through an allowance for doubtful accounts and the amount of the related impairment loss is recognized in the statements of net income and comprehensive income. Subsequent recoveries of receivables previously provisioned and written off are credited to the statements of net income and comprehensive income. Management estimates uncollectible accounts receivable after considering historical loss experience and the characteristics of existing accounts.

d) Inventories

Inventories consist primarily of small consumable materials mainly related to the maintenance of the electricity distribution infrastructure. LDC classifies all major construction related components of its electricity distribution system infrastructure to property, plant and equipment. Once capitalized, these items are not depreciated until they are put into service. Inventories are valued at the lower of cost and market, with cost determined on an average cost basis net of a provision for obsolescence.

e) Property, plant and equipment

Property, plant and equipment are stated at cost and are removed from the accounts at the end of their estimated average useful lives, except in those instances where specific identification allows their removal at retirement or disposition. The cost of property, plant and equipment represents the original cost, consisting of direct materials and labour, contracted services, AFUDC, and overheads directly attributable to the capital project.

Capital contributions received are used to finance additions to property, plant and equipment. According to the accounting principles prescribed by the OEB, capital contributions received are treated as a credit to property, plant

and equipment. The amount is subsequently depreciated by a charge to accumulated depreciation and a credit to depreciation expense at an equivalent rate to that used for the depreciation of the related property, plant and equipment.

In the event that facts and circumstances indicate that property, plant and equipment may be impaired, an evaluation of recoverability is performed. For purposes of such an evaluation, the estimated future undiscounted cash flows associated with the asset are compared to the carrying amount of the asset to determine if a write-down is required. The impairment loss is measured as the amount by which the carrying amount of the asset exceeds its fair value, which is determined by the estimated future discounted cash flows.

Depreciation is provided on a straight-line basis over the estimated useful lives at the following annual rates:

Distribution lines	2.0% to 5.0%
Transformers	3.3% to 5.0%
Stations	2.5% to 10.0%
Meters	2.5% to 6.7%
Buildings	1.3% to 5.0%
Rolling stock	12.5% to 25.0%
Other capital assets	4.0% to 20.0%
Equipment and tools	10.0% to 16.7%
Assets under capital lease	14.3% to 25.0%
Computer hardware	16.7% to 25.0%
Communications	10.0% to 20.0%

Construction in progress relates to assets not currently in use and therefore is not depreciated.

f) Intangible assets

Effective January 1, 2012, LDC revised its estimate of useful life of its Customer Care and Billing Customer Information System from five years to ten years as a result of an analysis completed related to the useful life assessment. This change has been accounted for on a prospective basis in the financial statements effective January 1, 2012. The change in estimate reduced amortization expense by approximately $4,000,000 for the year ended December 31, 2012 with an offsetting increase in the carrying value of intangible assets. The change in estimate will decrease future amortization expense by $4,000,000 per year over the term of the original useful life with no impact to the final year of the original useful life, and thereafter increase future amortization expense by $4,000,000 per year.

Intangible assets are stated at cost. Amortization is provided on a straight-line basis over the estimated useful lives at the following annual rates:

Computer software	10.0% to 25.0%
Contributions	4.0%

Software in development and contributions for work in progress relate to assets not currently available for use and therefore are not amortized. Contributions represent payments made to Hydro One Networks Inc. for dedicated infrastructure pursuant to an agreement in order to receive contributions to transmission facilities.

g) Restructuring

Restructuring charges are recorded based upon planned employee termination dates, site closure and consolidation plans, and contract terminations. Restructuring charges can include severance costs to eliminate a specified number of employee positions, infrastructure charges to vacate facilities and consolidate operations, and contract

cancellation costs. The timing of associated cash payments is dependent upon the type of restructuring charge and can extend over a multi-year period.

h) Workplace Safety and Insurance Act

LDC is a Schedule 1 employer for workers' compensation under the Workplace Safety and Insurance Act, 1997 (Ontario) [the "WSIA"]. As a Schedule 1 employer under the WSIA, LDC is required to pay annual premiums into an insurance fund established under the WSIA and recognizes expenses based on funding requirements.

i) Revenue recognition

Revenue from the sale of electricity is recorded on the basis of cyclical billings and includes an estimated amount for electricity delivered and not yet billed, the amount of which is impacted by energy demand, customer class usage patterns and composition, and weather conditions.

Other income, which includes revenues from electricity distribution related services and revenues from demand billable activities, is recognized as the services are rendered.

In the course of its operations, LDC collects Harmonized Sales Tax ["HST"] from its customers. When customers are billed, a current liability for HST is recognized which corresponds to the revenue derived from the services provided by LDC. When expenses are incurred by LDC, a current asset for HST is recorded which corresponds to the expenditures derived from the goods or services received by LDC. LDC's revenues and expenses exclude HST. This net asset or liability is settled with the appropriate government authority.

j) Financial instruments

At inception, all financial instruments which meet the definition of a financial asset or financial liability are recorded at fair value, unless fair value cannot be reliably determined. Gains and losses related to the measurement of financial instruments are reported in the statements of net income and comprehensive income. Subsequent measurement of each financial instrument will depend on the balance sheet classification elected by LDC. The fair value of a financial instrument is the amount of consideration that would be agreed upon in an arm's length transaction between willing parties.

The following summarizes the accounting classification LDC has elected to apply to each of its significant categories of financial instruments:

Cash equivalents and short-term investments	Held for Trading
Accounts receivable and unbilled revenue	Loans and Receivables
Accounts payable and accrued liabilities	Other Financial Liabilities
Obligations under capital lease	Other Financial Liabilities
Customers' advance deposits	Other Financial Liabilities
Short-term and long-term debt	Other Financial Liabilities

LDC uses the following methods and assumptions to estimate the fair value of each class of financial instruments for which carrying amounts are included in the balance sheets:

- Cash equivalents, comprising short-term investments, are classified as "Held for Trading" and are measured at fair value. The carrying amounts approximate fair value because of the short maturity of these instruments.

- Accounts receivable and unbilled revenue are classified as "Loans and Receivables" and are measured at amortized cost, which, upon initial recognition, are considered equivalent to fair value. Subsequent

measurements are recorded at amortized cost using the effective interest rate method. The carrying amounts approximate fair value because of the short maturity of these instruments.

- Accounts payable and accrued liabilities are classified as "Other Financial Liabilities" and are initially measured at fair value. Subsequent measurements are recorded at amortized cost using the effective interest rate method. The carrying amounts approximate fair value because of the short maturity of these instruments.

- Obligations under capital lease are classified as "Other Financial Liabilities" and are initially measured at fair value. Subsequent measurements are based on a discounted cash flow analysis and approximate the carrying value as management believes that the fixed interest rates are representative of current market rates.

- Customers' advance deposits are classified as "Other Financial Liabilities" and are initially measured at fair value. Subsequent measurements are recorded at cost plus accrued interest. The carrying amounts approximate fair value because of the short maturity of the current portion, and the long-term portion approximates the carrying value, taking into account interest accrued on the outstanding balance.

- Short-term debt and long-term debt are classified as "Other Financial Liabilities" and are initially measured at fair value. The carrying amounts are carried at amortized cost, based on an initial fair value as determined at the time using quoted market price for similar debt instruments. The fair value of the debt is calculated by discounting the related cash flows at the estimated yield to maturity of similar debt instruments [note 15[a]].

k) Fair value measurements

LDC utilizes valuation techniques that maximize the use of observable inputs and minimize the use of unobservable inputs when measuring fair value. A fair value hierarchy exists that prioritizes observable and unobservable inputs used to measure fair value. Observable inputs reflect market data obtained from independent sources, while unobservable inputs reflect LDC's assumptions with respect to how market participants would price an asset or liability. The fair value hierarchy includes three levels of inputs that may be used to measure fair value:

- Level 1: Unadjusted quoted prices in active markets for identical assets or liabilities. An active market for the asset or liability is a market in which transactions for the asset or liability occur with sufficient frequency and volume to provide pricing information on an ongoing basis;

- Level 2: Other than quoted prices included within level 1 that are observable for the assets or liabilities, either directly or indirectly; and

- Level 3: Unobservable inputs, supported by little or no market activity, used to measure the fair value of the assets or liabilities to the extent that observable inputs are not available.

l) Employee future benefits

Multi-employer pension plan

LDC provides a pension plan for its full-time employees through the Ontario Municipal Employees Retirement System ["OMERS"]. OMERS is a multi-employer, contributory, defined benefit pension plan established in 1962 by Ontario for employees of municipalities, local boards and school boards. Both participating employers and employees are required to make plan contributions based on participating employees' contributory earnings. The OMERS plan is accounted for as a defined contribution plan where LDC recognizes the expense related to this plan as contributions are made, since it is not practicable to determine LDC's portion of pension obligations or the fair value of plan assets. LDC is not responsible for any other contractual obligations other than the contributions.

Post-retirement benefits other than pension

LDC has a number of unfunded benefit plans providing post-retirement benefits (other than pension) to its employees. LDC pays certain medical, dental and life insurance benefits under unfunded defined benefit plans on behalf of its retired employees. LDC pays accumulated sick leave credits, up to certain established limits based on service, in the event of retirement, termination or death of certain employees.

LDC periodically measures its accumulated benefit obligation for accounting purposes as at December 31 of the applicable year. The latest actuarial valuation was performed as at January 1, 2012.

The cost of providing benefits under the defined benefit plans is determined using the projected unit credit method and based on assumptions that reflect management's best estimates. All actuarial gains and losses and prior service costs are recognized in other comprehensive income ["OCI"] as they arise and subsequently reclassified to a regulatory asset on the balance sheets. This results in full recognition of the benefit obligation as a liability on the balance sheets.

Actuarial gains or losses are amortized into net periodic benefit cost for the current period when the net cumulative unrecognized actuarial gains or losses in the regulatory asset at the end of the previous reporting period exceed 10% of the accumulated benefit obligation at that date. These gains or losses are recognized over the expected average remaining service period of active employees participating in the plans.

The prior service costs in the regulatory asset are recognized as an expense on a straight-line basis over the average remaining service period of employees active at the date of amendment.

The effects of a curtailment loss are recognized in the statements of net income and comprehensive income when its occurrence is probable and reasonably estimable. The effects of a curtailment gain are recognized in the statements of net income and comprehensive income when the related employees terminate or the plan suspension or amendment is adopted. The effects of a settlement gain or loss are recognized in the statements of net income and comprehensive income in the period in which a settlement occurs.

m) Asset retirement obligations

LDC recognizes a liability for the future removal and handling costs for contamination in distribution equipment and for the future environmental remediation of certain properties. Initially, the liability is measured at present value and the amount of the liability is added to the carrying amount of the related asset. In subsequent periods, the capitalized amount is depreciated over the useful life of the related asset and the liability is adjusted quarterly for the discount applied upon initial recognition of the liability ["accretion expense"] and for changes in the underlying assumptions. The liability is recognized when the asset retirement obligation ["ARO"] is incurred and when the fair value can be reasonably estimated.

LDC has not recorded a liability related to certain AROs as a reasonable estimate of fair value could not be made. LDC does not recognize an ARO for those properties which support LDC's distribution operations since it cannot reasonably determine the amount of any remediation costs related to possible contamination, and a reliable estimate cannot be made until environmental site assessments have been completed. LDC expects to use the majority of its installed assets in perpetuity. If, at some future date, a particular asset is shown not to meet the perpetuity assumption, it will be reviewed to determine if an ARO exists.

n) Customers' advance deposits

Security deposits from electricity customers are cash collections to guarantee the payment of electricity bills. The electricity customer security deposits liability includes accrued interest amounts owed to the customers with the debit charged to net financing charges. Deposits that are refundable upon demand are classified as a current liability.

Security deposits on Offers to Connect are cash collected from specific customers to guarantee the payment of additional costs relating to expansion projects. This liability includes related interest amounts owed to the customers with the debit charged to net financing charges. Deposits are classified as a current liability when LDC no longer has an unconditional right to defer payment of the liability for at least 12 months after the reporting period.

o) Income Taxes

Under the Electricity Act, LDC is required to make Payments In Lieu of Corporate Taxes ["PILs"] to the Ontario Electricity Financial Corporation. These payments are calculated in accordance with the Income Tax Act (Canada) and the Taxation Act, 2007 (Ontario) as modified by regulations made under the Electricity Act and related regulations. This effectively results in LDC paying taxes similar to what would be imposed under the Federal and Ontario Tax Acts.

LDC uses the liability method of accounting for income taxes. Under the liability method, current income taxes payable are recorded based on taxable income. LDC recognizes deferred income tax assets and liabilities for the future tax consequences of events that have been included in the financial statements or income tax returns. Deferred income tax assets and liabilities are determined based on the difference between the carrying value of assets and liabilities on the balance sheets and their respective tax basis using the enacted tax rates by the balance sheet date in effect for the year in which the differences are expected to reverse. Tax benefits associated with income tax positions taken, or expected to be taken, in a tax return are recorded only when it is more likely than not that they will be realized, and are measured at the largest amount of the benefit that has a likelihood greater than 50 percent of being realized upon settlement. Deferred income tax assets are evaluated and unless realization is considered more likely than not, a valuation allowance is established.

ASC 980 requires the recognition of deferred income tax assets and liabilities and related regulatory liabilities and assets for the amount of deferred income taxes expected to be refunded to, or recovered from, customers in future electricity distribution rates. As at December 31, 2012, LDC recorded a deferred income tax asset and a corresponding regulatory liability of $193,276,000 with respect to its rate-regulated activities that will be included in the rate-setting process [note 9]. These amounts include a gross up to reflect the income tax benefits associated with reduced revenues resulting from the recognition of deferred tax assets. Deferred income taxes that are not included in the rate-setting process are charged or credited to the statements of net income and comprehensive income.

The benefits of the refundable apprenticeship and co-operative investment tax credits ["ITCs"] are credited against the related expense in the statements of net income and comprehensive income. All other types of ITCs are recorded as a reduction to income tax expense in the current period to the extent that realization of such benefit is more likely than not.

p) Use of estimates

The preparation of LDC's financial statements in accordance with US GAAP requires management to make estimates and assumptions which affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses for the year. The estimates are based on historical experience, current conditions and various other assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgments about the carrying values of assets and liabilities as well as identifying and assessing the accounting treatment with respect to commitments and contingencies. Significant areas requiring the use of management estimates relate to unbilled revenue, regulatory assets and liabilities, environmental liabilities and AROs, employee future benefits, income taxes (including deferred income taxes), and revenue recognition. Actual results could differ from those estimates, including changes as a result of future decisions made by the OEB, the Ministry of Energy of Ontario, or the Ministry of Finance of Ontario ["Ministry of Finance"].

q) Future Accounting Pronouncements

A number of new standards and interpretations are not yet effective for the year ended December 31, 2012, and have not been applied in preparing these financial statements. LDC continues to analyze these standards and had initially determined that the following could have a significant effect on the financial statements.

In December 2011, the Financial Accounting Standards Board issued Accounting Standards Update ["ASU"] No. 2011-11, "Balance Sheet (Topic 210) Disclosures about Offsetting Assets and Liabilities" ["ASU 2011-11"]. The amendments require an entity to disclose both gross and net information about financial instruments and transactions eligible for offset in the balance sheets. ASU 2011-11 is effective for fiscal years, and interim periods within those years, beginning on or after January 1, 2013. Retrospective application is required. The ASU No. 2013-01, "Balance Sheet (Topic 210): Clarifying the Scope of Disclosures about Offsetting Assets and Liabilities", was issued in January 2013 to amend the scope of ASU 2011-11 to clarify that the disclosure requirements are limited to derivatives, repurchase and reverse repurchase agreements, and securities borrowing and lending transactions that are either offset in the balance sheets or subject to enforceable master netting arrangements or similar agreements. Based on LDC's analysis, the adoption of these amendments are not expected to have an impact on LDC's balance sheets or significantly impact disclosures.

5. INVENTORIES

Inventories consist of the following:

	2012 $	2011 $
Fuses	2,137	1,625
Consumables, tools and other maintenance items	1,968	1,745
Drums and reels	1,115	938
Other	2,335	2,583
	7,555	6,891

For the year ended December 31, 2012, LDC recognized operating expenses of $9,334,000 related to inventory used to service electrical distribution assets [2011 - $9,196,000].

6. CURRENT PORTION OF OTHER ASSETS

Current portion of other assets consists of the following:

	2012 $	2011 $
Prepaid expenses	4,369	4,006
Deferred financing costs	311	398
	4,680	4,404

7. PROPERTY, PLANT AND EQUIPMENT

Property, plant and equipment consist of the following:

	2012			2011		
	Cost $	Accumulated depreciation $	Net book value $	Cost $	Accumulated depreciation $	Net book value $
Land	16,747	—	16,747	16,761	—	16,761
Distribution lines	2,930,296	1,460,979	1,469,317	2,755,344	1,404,998	1,350,346
Transformers	672,981	377,900	295,081	652,102	360,398	291,704
Stations	286,229	145,601	140,628	277,905	137,246	140,659
Meters	243,152	133,789	109,363	238,459	124,117	114,342
Buildings	160,368	69,248	91,120	154,932	62,403	92,529
Rolling stock	73,239	43,834	29,405	78,016	43,154	34,862
Other capital assets	70,291	47,561	22,730	68,282	43,805	24,477
Equipment and tools	45,611	33,936	11,675	44,208	31,785	12,423
Assets under capital lease	13,538	2,948	10,590	14,269	1,251	13,018
Computer hardware	50,511	40,003	10,508	44,625	35,602	9,023
Communications	32,082	26,597	5,485	31,537	23,912	7,625
Construction in progress	291,779	—	291,779	226,524	—	226,524
	4,886,824	2,382,396	2,504,428	4,602,964	2,268,671	2,334,293

For the year ended December 31, 2012, AFUDC in the amount of $994,000 [2011 - $376,000] was capitalized to property, plant and equipment and credited to net financing charges.

As at December 31, 2012, the net book value of smart meters related to the deployment of smart meters amounting to $17,647,000 [December 31, 2011 - $20,366,000] was included in property, plant and equipment. In the absence of rate regulation, property, plant and equipment would have been $17,647,000 lower as at December 31, 2012 [December 31, 2011 - $20,366,000 lower].

For the year ended December 31, 2012, capital contributions in the amount of $26,261,000 [2011 - $36,381,000] were credited to property, plant and equipment.

For the year ended December 31, 2012, LDC recorded depreciation expense of $119,393,000 [2011 - $120,696,000] of which $1,985,000 [2011 - $1,177,000] related to assets under capital lease.

8. INTANGIBLE ASSETS

Intangible assets consist of the following:

	2012			2011		
	Cost $	Accumulated amortization $	Net book value $	Cost $	Accumulated amortization $	Net book value $
Computer software	242,254	174,410	67,844	222,598	154,186	68,412
Contributions	19,649	2,175	17,474	14,059	1,440	12,619
Software in development	14,210	—	14,210	15,598	—	15,598
Contributions for work in progress	34,552	—	34,552	16,353	—	16,353
	310,665	176,585	134,080	268,608	155,626	112,982

For the year ended December 31, 2012, LDC acquired $42,057,000 of intangible assets [2011 - $52,805,000]. Contributions for work in progress relate to payments for connection projects to increase electricity distribution system capacity. All intangible assets are subject to amortization when they become available for use. Software in development and contributions for work in progress relate to assets not currently available for use and therefore are not amortized.

For the year ended December 31, 2012, $29,656,000 of software in development was transferred to computer software [2011 - $49,907,000].

For the year ended December 31, 2012, AFUDC in the amount of $1,331,000 [2011 - $1,149,000] was capitalized to intangible assets and credited to net financing charges.

For the year ended December 31, 2012, LDC recorded amortization expense on intangible assets of $20,959,000 [2011 - $25,809,000].

As at December 31, 2012, estimated future amortization expense related to intangible assets is as follows:

	$
2013	17,940
2014	17,741
2015	16,815
2016	13,850
2017	11,481

9. REGULATORY ASSETS AND LIABILITIES

Regulatory assets consist of the following:

	2012 $	2011 $ [note 23]
Accounting policy changes	61,499	64,785
Smart meters	55,599	61,422
Regulatory assets recovery account	2,466	931
Settlement variances	1,071	14,119
Other	579	1,781
Total regulatory assets	121,214	143,038
Less: Current portion of regulatory assets	1,658	—
Long-term portion of regulatory assets	119,556	143,038

Regulatory liabilities consist of the following:

	2012 $	2011 $ [note 23]
Deferred income taxes	193,276	200,436
Income and other taxes variance account	2,398	2,365
Regulatory assets recovery account	—	7,293
Other	1,135	1,118
Total regulatory liabilities	196,809	211,212
Less: Current portion of regulatory liabilities	—	7,293
Long-term portion of regulatory liabilities	196,809	203,919

For the year ended December 31, 2012, LDC disposed of approved net regulatory liabilities amounting to $8,838,000 through permitted distribution rate adjustments [2011 - $34,528,000].

The regulatory assets and liabilities of LDC are as follows:

a) Accounting Policy Changes

This regulatory asset account relates to the accounting policy changes upon adoption of US GAAP, primarily related to the expected future electricity distribution charges to customers arising from timing differences in the recognition of actuarial losses and prior service costs of other post-retirement benefits [note 23]. The amount is amortized over the same period as the corresponding actuarial losses and prior service costs. The period in which recovery is expected cannot be determined at this time.

b) Smart Meters

The smart meters regulatory asset account relates to Ontario's decision to install smart meters throughout Ontario. LDC substantially completed its smart meter project as at December 31, 2010. In connection with this initiative, the OEB ordered LDC to record all expenditures and related revenues from 2008 to 2010 to a regulatory asset account and allowed LDC to keep the net book value of the stranded meters in property, plant and equipment. Effective January 1, 2011, LDC has recorded smart meter costs in property, plant and equipment and intangible assets as a

regular distribution activity as directed by the OEB. LDC expects to apply to the OEB in the future for both the transfer of the 2008 to 2010 smart meter costs from regulatory assets to property, plant and equipment and intangible assets, and the transfer of the net book value of the stranded meters from property, plant and equipment to regulatory assets.

As at December 31, 2012, smart meter capital expenditures, net of accumulated depreciation, totalling $52,865,000 were recorded to regulatory assets [December 31, 2011 - $51,227,000]. These expenditures would otherwise have been recorded as property, plant and equipment and intangible assets under US GAAP for unregulated businesses. In the absence of rate regulation, property, plant and equipment and intangible assets would have been $50,234,000 and $2,631,000 higher, respectively, as at December 31, 2012 [December 31, 2011 - $54,825,000 and $4,402,000 higher, respectively].

For the year ended December 31, 2012, smart meter depreciation expense of $6,360,000 [2011 - $6,361,000] were deferred which would have been expensed under US GAAP for unregulated businesses. In the absence of rate regulation, for the year ended December 31, 2012, depreciation expense would have been $6,361,000 higher [2011 - $6,361,000 higher].

For the year ended December 31, 2012, smart meter customer revenues of $5,889,000 were deferred [2011 - $5,866,000]. In the absence of rate regulation, for the year ended December 31, 2012, revenue would have been $5,889,000 higher [2011 - $5,866,000 higher].

c) Regulatory Assets Recovery Account

The Regulatory Assets Recovery Account ["RARA"] consists of balances of regulatory assets or regulatory liabilities approved for disposition by the OEB through rate orders. The RARA is subject to carrying charges following the OEB prescribed methodology and related rates.

On April 9, 2010, the OEB approved the disposition of net regulatory liabilities of $68,140,000, consisting of credit balances for settlement variances and income and other taxes variances of $58,225,000 and $11,900,000, respectively, and intangible assets debit balance of $1,985,000, over a two-year period commencing on May 1, 2010 and ending on April 30, 2012.

On October 29, 2010, the OEB approved the disposition of regulatory assets of $5,296,000, for amounts in connection with the contact voltage remediation activities, for the period commencing on November 1, 2010 and ending on April 30, 2012

On February 22, 2011, the OEB approved the disposition of the Late Payment Penalties Settlement regulatory asset of $7,526,000, over a 21-month period commencing on August 1, 2011 and ending on April 30, 2013.

On July 7, 2011, the OEB approved the disposition of net regulatory liabilities of $8,572,000, consisting of credit balances for settlement variances, income and other taxes variances and 2008 RARA residual of $7,460,000, $3,373,000, and $789,000, respectively, and an International Financial Reporting Standards ["IFRS"] cost debit balance of $3,050,000, over a nine-month period commencing on August 1, 2011 and ending on April 30, 2012.

d) Settlement Variances

This account is comprised of the variances between amounts charged by LDC to customers, based on regulated rates, and the corresponding cost of non-competitive electricity service incurred by LDC. The settlement variances relate primarily to service charges, non-competitive electricity charges and the global adjustment. Accordingly, LDC has deferred the variances between the costs incurred and the related recoveries in accordance with the criteria set out in the accounting principles prescribed by the OEB.

The balance for settlement variances continues to be calculated and attracts carrying charges in accordance with the OEB's direction. For the year ended December 31, 2012, settlement variances of $12,249,000 were disposed through rate adjustments [2011 - $34,938,000].

e) Deferred Income Taxes

This regulatory liability account relates to the expected future electricity distribution rate reduction for customers arising from timing differences in the recognition of deferred income tax assets [note 4[o]].

As at December 31, 2012, LDC recorded a deferred income tax asset and a corresponding regulatory liability of $193,276,000 [December 31, 2011 - $200,436,000] in respect to its rate-regulated activities that will be included in the rate-setting process.

f) Income and Other Taxes Variance Account

The income and other taxes variance regulatory liability account relates to the differences that have resulted from a legislative or regulatory change to the tax rates or rules assumed in the rate adjustment model. As at December 31, 2012, the balance in this account consisted of an over-recovery from customers of $298,000 [December 31, 2011 - $2,365,000].

10. OTHER ASSETS

Other long-term assets consist of the following:

	2012 $	2011 $
Prepaid expenses	7,191	7,279
Deferred financing costs	907	52
	8,098	7,331

11. RESTRUCTURING

In the first quarter of 2012, the Corporation's Board of Directors approved a workforce restructuring program aimed at reducing operating expenditures for LDC. The program was approved following the decision by the OEB to deny the request of LDC to set its electricity distribution rates for 2012, 2013 and 2014 under the COS framework. In preparing its revised application using the IRM framework, LDC concluded that significant cost reductions were necessary to manage its business within the confines of the expected allowed electricity distribution rates provided by the IRM framework [note 3[a]]. The main component of these operating cost reduction initiatives was a workforce restructuring program, which included the severance of management employees and a voluntary exit incentive program for targeted unionized positions.

For the year ended December 31, 2012, costs incurred as a result of these operating cost reduction initiatives amounted to $27,796,000 and were comprised of ongoing termination charges of $23,668,000 and one-time termination incentive charges of $4,128,000, of which $11,954,000 remains unpaid as at December 31, 2012.

12. LONG-TERM DEBT

Long-term debt consists of the following:

	2012 $	2011 $
Notes payable to related party:		
6.16% Long-term note payable to the Corporation due May 6, 2013	179,835	179,456
5.20% Long-term note payable to the Corporation due November 14,	244,316	244,186
4.54% Long-term note payable to the Corporation due November 12,	243,948	243,814
5.59% Long-term note payable to the Corporation due May 21, 2040	198,727	198,708
3.59% Long-term note payable to the Corporation due November 18,	298,352	298,119
6.16% Promissory note payable to the Corporation due May 6, 2013	245,058	245,058
6.16% Promissory note payable to the Corporation due on demand	45,000	—
3.32% Promissory note payable to the Corporation due on the earlier demand and January 1, 2022	15,000	—
3.09% Promissory note payable to TH Energy due on the earlier of demand and July 1, 2022	14,013	—
Total notes payable to related party	1,484,249	1,409,341
Less: Current portion of long-term notes payable	179,835	—
Less: Current portion of promissory notes payable	319,071	—
Long-term debt	985,343	1,409,341
Comprising:		
Long-term notes payable to related party	985,343	1,164,283
Promissory note payable to related party	—	245,058

All long-term debt of LDC ranks equally.

a) Long-term notes payable to the Corporation

Long-term notes payable to the Corporation are comprised of the following:

[i] $180,000,000, which bears interest at a rate of 6.16% per annum, with a maturity date of May 6, 2013, extendable upon mutual consent.

[ii] $245,058,000, which bears interest at a rate of 5.20% per annum, with a maturity date of November 14, 2017, extendable upon mutual consent.

[iii] $245,058,000, which bears interest at a rate of 4.54% per annum, with a maturity date of November 12, 2019, extendable upon mutual consent.

[iv] $200,000,000, which bears interest at a rate of 5.59% per annum, with a maturity date of May 21, 2040, extendable upon mutual consent.

[v] $300,000,000, which bears interest at a rate of 3.59% per annum, with a maturity date of November 18, 2021, extendable upon mutual consent.

b) Promissory notes payable to the Corporation

On July 1, 1999, LDC issued a promissory note to the City ["Initial Note"] in the principal amount of $947,000,000 in partial consideration for the assets in respect of the electricity distribution system transferred by the Toronto Hydro-Electric Commission and the City to LDC effective July 1, 1999. The Initial Note was non-interest bearing until December 31, 1999 and interest bearing thereafter at the rate of 6% per annum. Pursuant to the terms of By-law No. 374-1999 of the City made under section 145 of the Electricity Act, the principal amount of the Initial Note was adjusted effective January 1, 2000 to $980,231,000 to reflect the deemed debt to equity structure of LDC permitted by the OEB. At the same time, the Initial Note was replaced by a promissory note ["Replacement Note"] issued by LDC, which was interest bearing at the rate of 6.8% per annum. At December 31, 2002, the Replacement Note was payable on the earlier of demand and December 31, 2003.

Concurrent with the closing of the Corporation's debenture offering on May 7, 2003, the City transferred the Replacement Note to the Corporation in consideration for the issuance by the Corporation to the City of a new promissory note in the principal amount of $980,231,000. Following the issuance of the new promissory note to the City, on May 7, 2003, LDC issued a promissory note payable on demand to the Corporation in the principal amount of $980,231,000.

On September 5, 2006, LDC amended and restated the promissory note payable to the Corporation effective May 1, 2006 by fixing the interest rate at 6.16% and establishing an agreed repayment schedule. LDC is required to pay the principal amount of the note as follows: $245,058,000 on the last business day before each of December 31, 2007, December 31, 2009, December 31, 2011 and May 6, 2013. LDC made the first three scheduled payments on the respective due dates. Interest is calculated and payable quarterly in arrears on the last business day of March, June, September and December of each year.

On January 1, 2012, LDC issued a promissory note to the Corporation for general purposes. The principal amount of the promissory note is $45,000,000, which bears interest at a rate of 6.16% per annum, payable on demand. Interest is calculated and payable semi-annually in arrears on July 1 and January 1 of each year.

On January 1, 2012, LDC issued a promissory note to the Corporation for general purposes. The principal amount of the promissory note is $15,000,000, which bears interest at a rate of 3.32% per annum, payable on the earlier of demand and January 1, 2022. Interest is calculated and payable semi-annually in arrears on July 1 and January 1 of each year.

c) Promissory note payable to TH Energy

On July 1, 2012, LDC issued a promissory note to TH Energy in the principal amount of $14,013,000 [note 19], which bears interest at a rate of 3.09% per annum, payable on the earlier of demand and July 1, 2022. Interest is calculated and payable semi-annually in arrears on January 1 and July 1 of each year.

13. EMPLOYEE FUTURE BENEFITS

Pension

LDC provides a pension plan for its full-time employees through OMERS. Details of the plan are as follows:

Pension Plan	Funded Status as at December 31, 2012	Contributions	
		2012 $	2011 $
OMERS	86%	16,374	13,813

The OMERS plan assets are pooled together to provide benefits to plan participants and the plan assets are not segregated in separate accounts for each member entity. As at December 31, 2012, the OMERS plan financial statements disclosed an actuarial deficit of approximately $9,900,000, which is being addressed through increases in contribution rates for participating employers and employees. For the year ended December 31, 2012, the total contributions of all participating employers and employees were approximately $2,030,000,000. LDC's contributions represent less than five percent of total contributions to the plan.

For 2012, OMERS contribution rates were 8.3% up to the year's maximum pensionable earnings ["YMPE"] and 12.8% over YMPE for normal retirement age of 65 [2011 - 7.4% up to YMPE and 10.7% over YMPE for normal retirement age of 65].

As at December 31, 2012, OMERS had approximately 266,000 active members, of which approximately 1,700 members had a current relationship with LDC.

Post-retirement benefits other than pension

a) Benefit Obligations

	2012 $	2011 $
Balance, beginning of year	244,326	198,630
Adjustment due to reorganization	781	2,143
Service cost	5,035	3,820
Interest cost	11,454	11,307
Benefits paid	(7,960)	(7,383)
Actuarial loss	254	35,809
Balance, end of year	253,890	244,326

b) Amounts recognized in regulatory assets

	2012 $	2011 $
Actuarial loss	61,477	63,698
Prior service cost	22	1,087
Total recognized in regulatory assets [note 9]	61,499	64,785

As at December 31, 2012, the estimated actuarial loss and prior service cost that are expected to be amortized from regulatory asset to net periodic benefit cost in 2013 are $2,064,000 and $2,000, respectively.

c) Components of net periodic benefit costs

	2012 $	2011 $
Service cost	5,035	3,820
Interest cost	11,454	11,307
Amortization of actuarial loss	3,146	787
Amortization of prior service cost	840	873
Net periodic benefit cost	20,475	16,787
Capitalized as part of property, plant and equipment	7,305	6,758
Charged to operations	13,170	10,029

d) Expected benefit payments

The following benefit payments (net of recoveries from related companies), which reflect expected future service, as appropriate, are expected to be paid over the next five years, and in the aggregate for the five fiscal years thereafter:

	Post-retirement Benefits $
2013	10,015
2014	8,061
2015	8,263
2016	8,940
2017	9,384
2018-2022	55,001

e) Significant assumptions

	2012 %	2011 %
Accrued benefit obligation as at December 31:		
Discount rate	4.25	4.75
Rate of compensation increase	4.00	4.00
Benefit costs for years ended December 31:		
Discount rate	4.75	5.75
Rate of compensation increase	4.00	4.00
Assumed health care cost trend rates as at December 31:		
Rate of increase in dental costs assumed for next year	4.00	4.00
Rate of increase in medical costs assumed for next year		
For pre July 2000 retirements	6.50	7.00
For other retirements	8.00	8.50
Rate that medical cost trend rate gradually declines to		
For pre July 2000 retirements	5.00	5.00
For other retirements	5.00	5.00
Year that the medical cost trend rate reaches the ultimate trend rate		
For pre July 2000 retirements	2016	2016
For other retirements	2019	2019

f) Sensitivity analysis

Assumed health and dental care cost trend rates have a significant effect on the amounts reported for health and dental care plans. A one-percentage-point change in assumed health and dental care cost trend rates would have the following effects for 2012:

	Increase $	Decrease $
Total of current service and interest cost (at 4.75%)	2,483	(2,181)
Accrued benefit obligation as at December 31, 2012 (at 4.25%)	32,347	(28,380)

Assumed interest rates have a significant effect on the amounts reported for the total accrued benefit obligation and expense. A one-percentage-point change in assumed interest rates would have the following effects:

	Increase $	Decrease $
Accrued benefit obligation as at December 31, 2012	(39,382)	48,344
Estimated net periodic benefit cost for fiscal 2013	(2,563)	4,629

14. ASSET RETIREMENT OBLIGATIONS

The reconciliation between the opening and closing ARO liability balances is as follows:

	2012 $	2011 $
Balance, beginning of year	4,831	4,939
ARO liabilities settled in the year	(313)	(688)
Accretion expense	170	168
Revision in estimated cash flows	316	412
Balance, end of year	5,004	4,831

15. FINANCIAL INSTRUMENTS

a) Recognition and measurement

The fair values of cash and cash equivalents, net accounts receivable, unbilled revenue, accounts payable and accrued liabilities, and customers' advance deposits approximate their carrying values as at December 31, 2012 and December 31, 2011 [note 4[j]] .

The carrying value and fair value of LDC's other financial instruments consist of the following:

	2012 $		2011 $	
	Carrying value	Fair value [(1)]	Carrying value	Fair value [(1)]
Obligations under capital lease	11,235	11,235	13,172	13,172
Long-term notes payable to the Corporation				
6.16% due May 6, 2013	179,835	182,999	179,456	190,682
5.20% due November 14, 2017	244,316	278,314	244,186	278,458
4.54% due November 12, 2019	243,948	274,786	243,814	270,077
5.59% due May 21, 2040	198,727	256,357	198,708	244,838

[(1)] The fair value measurement of financial instruments for which the fair value has been disclosed is included in Level 2 of the fair value hierarchy.

b) Financial Risks

The following is a discussion of financial risks and related mitigation strategies that have been identified by LDC for financial instruments. This is not an exhaustive list of all risks, nor will the mitigation strategies eliminate all risks listed.

LDC's financial activities provide for a variety of financial risks, particularly credit risk, interest rate risk and liquidity risk.

Credit risk

LDC is exposed to credit risk from financial instruments as a result of the risk of counterparties defaulting on their obligations. LDC monitors and limits its exposure to credit risk on a continuous basis.

LDC's credit risk associated with accounts receivable is primarily related to electricity bill payments from customers. LDC has approximately 719,000 customers, the majority of which are residential. LDC collects security deposits from certain customers in accordance with direction provided by the OEB. As at December 31, 2012, LDC held security deposits in the amount of $46,838,000 [December 31, 2011 - $56,038,000], of which $25,666,000 [December 31, 2011 - $22,700,000] were related to security deposits on Offers to Connect to guarantee the payment of additional costs relating to expansion projects.

LDC did not have any single customer that generated more than 10% of total revenues for the years ended December 31, 2012 and December 31, 2011.

Credit risk associated with accounts receivable is as follows:

	2012 $	2011 $
Total accounts receivable	196,509	204,266
Less: Allowance for doubtful accounts	(10,568)	(12,810)
Total accounts receivable, net	185,941	191,456
Of which:		
Outstanding for not more than 30 days	164,523	163,675
Outstanding for more than 30 days and not more than 120 days	18,214	24,671
Outstanding for more than 120 days	13,772	15,920
Less: Allowance for doubtful accounts	(10,568)	(12,810)
Total accounts receivable, net	185,941	191,456

Reconciliation between the opening and closing allowance for doubtful accounts balances is as follows:

	2012 $	2011 $
Balance, beginning of year	(12,810)	(11,736)
Provision for doubtful accounts	(6,590)	(10,158)
Write-offs	9,242	9,741
Recoveries	(410)	(657)
Balance, end of year	(10,568)	(12,810)

Unbilled revenue represents amounts for which LDC has a contractual right to receive cash through future billings and are unbilled at period-end. As at December 31, 2012, total unbilled revenue was $274,272,000 [December 31, 2011 - $262,289,000]. Unbilled revenue is considered current.

As at December 31, 2012, there were no significant concentrations of credit risk with respect to any class of financial assets or counterparties. LDC's maximum exposure to credit risk is equal to the carrying value of its financial assets.

Interest rate risk

LDC is exposed to interest rate risk through holding certain financial instruments, and short-term borrowings which may be obtained under the Corporation's revolving credit facility may expose LDC to fluctuations in short-term interest rates (borrowings in the form of prime rate loans in Canadian dollars and Bankers' Acceptance and letters of credit). LDC attempts to minimize interest rate risk by borrowing in long-term fixed rate debt, and by extending or shortening the term of its short-term money market investments by assessing the monetary policy stance of the Bank of Canada, while ensuring that all payment obligations are met on an ongoing basis. The fee payable for bankers' acceptances and letters of credit is based on a margin rate determined by reference to the Corporation's credit rating.

Cash balances, which are not required to meet day-to-day obligations of LDC, are either held in bank accounts or invested in Canadian money market instruments, exposing LDC to fluctuations in short-term interest rates. These fluctuations could impact the level of interest income earned by LDC.

As at December 31, 2012, LDC has limited exposure to interest rate risk since its significant obligations are either non-interest bearing or bear fixed interest rates, its financial assets are predominately short-term in nature and mostly non-interest bearing, and its revenue is governed by a specified rate of return pricing structure set by the OEB. LDC estimates that a 100 basis point increase (decrease) in short-term interest rates, with all other variables held constant, would result in a decrease (increase) of approximately $200,000 per annum to net financing charges.

LDC is also exposed to fluctuations in interest rates for the valuation of its post-retirement benefit obligations [note 13[f]] .

Liquidity risk

LDC is exposed to liquidity risk related to commitments associated with financial instruments. LDC monitors and manages its liquidity risk to ensure access to sufficient funds to meet operational and investing requirements. LDC's objective is to ensure that sufficient liquidity is on hand to meet obligations as they fall due while minimizing net financing charges. LDC has access to credit facilities and borrowings through the Corporation and monitors cash balances daily to ensure that sufficient levels of liquidity are on hand to meet financial commitments as they come due.

Liquidity risks associated with financial commitments are as follows:

December 31, 2012						
	2013 $	2014 $	2015 $	2016 $	2017 $	Due after 5 years $
Financial liabilities						
Accounts payable and accrued liabilities	377,948	—	—	—	—	—
Obligations under capital lease	2,338	2,329	2,322	2,310	2,310	1,157
Long-term notes payable to the Corporatio						
6.16% due May 6, 2013	180,000	—	—	—	—	—
5.20% due November 14, 2017	—	—	—	—	245,058	—
4.54% due November 12, 2019	—	—	—	—	—	245,058
5.59% due May 21, 2040	—	—	—	—	—	200,000
3.59% due November 18, 2021	—	—	—	—	—	300,000
Promissory note payable to the Corporat due May 6, 2013	245,058	—	—	—	—	—
Promissory note payable to the Corporat due on demand	45,000	—	—	—	—	—
Promissory note payable to the Corporat due on the earlier of demand and Janu 1, 2022	15,000	—	—	—	—	—
Promissory note payable to TH Energy c on the earlier of demand and July 1, 202	14,013	—	—	—	—	—
Interest payments on long-term not payable and promissory notes payable	56,612	45,819	45,819	45,819	45,819	316,881
	935,969	48,148	48,141	48,129	293,187	1,063,096

Hedging and Derivative risk

As at December 31, 2012 and December 31, 2011, LDC has not entered into hedging and derivative financial instruments.

Foreign exchange risk

As at December 31, 2012, LDC had limited exposure to the changing values of foreign currencies. While LDC purchases goods and services which are payable in US dollars, and purchases US currency to meet the related payables commitments when required, the impact of these transactions is not material to the financial statements.

16. FINANCIAL GUARANTEES

As at December 31, 2012, $3,488,000 [December 31, 2011 - $45,000,000] was utilized under the Corporation's demand credit facility in the form of letters of credit to satisfy the prescribed prudential requirements of LDC with the IESO for the purchase of electricity. An additional amount of $761,000 was utilized for the Ministry of Finance.

17. INCOME TAXES

LDC's effective tax rate for the year ended December 31, 2012 was 26.62% [2011 - 26.52%]. Income tax expense for the year ended December 31, 2012 was $3,125,000 [2011 - $6,509,000]. The effective tax rate and income tax

expense for the year ended December 31, 2012 was lower than the year ended December 31, 2011 due to a reduction in the statutory tax rate from 28.25% to 26.50% and changes in permanent and temporary differences between accounting and tax treatments.

Income tax expense differs from the amount that would have been recorded using the combined statutory Canadian federal and Ontario income tax rate. Reconciliation of income tax expense computed at the statutory income tax rate to the income tax provision is set out below:

Statements of Net Income and Comprehensive Income

	2012 $	2011 $
Rate reconciliation		
Income before income taxes	86,314	99,840
Statutory Canadian federal and provincial income tax rate	26.50%	28.25%
Expected income tax expense	22,873	28,205
Temporary differences not benefited	(16,133)	(16,032)
Impact of change in expected future tax rate on existing deferred incon balances	(923)	—
Other	(2,692)	(5,664)
Income tax expense	3,125	6,509
Effective tax rate	3.62%	6.52%
Components of income tax expense		
Current tax	6,011	8,753
Deferred income tax related to the origination and reversal of temporary differences	(245)	279
Non-refundable ITCs	(2,641)	(2,523)
Income tax expense	3,125	6,509

Balance Sheets

Significant components of LDC's deferred tax assets are as follows:

	2012 $	2011 $
Property, plant and equipment and intangible assets	82,604	100,933
Regulatory adjustments	51,218	50,109
Post-retirement benefits liability	50,667	44,093
Other taxable temporary differences	8,753	5,022
Deferred income tax assets	193,242	200,157

A reconciliation of the beginning and ending amount of unrecognized tax benefits is as follows:

	2012 $	2011 $
Balance, beginning of year	7,045	(574)
Increases for tax positions taken in the current year	248	374
Increases for tax positions taken in prior years	—	6,633
Decreases for tax positions taken in prior years	(38)	—
Settlements with tax authorities	(1,981)	612
Reductions resulting from the expiry of limitation periods	—	—
Balance, end of year	5,274	7,045

As at December 31, 2012, $5,274,000 of unrecognized tax benefits [December 31, 2011 - $7,045,000] would have a favourable effect on the effective tax rate if recognized. No interests and penalties have been accrued, since LDC is of the view that none are expected to be payable. During the next 12 months, unrecognized tax benefits are not expected to significantly change.

As at December 31, 2012, LDC's tax years still open to examination by taxing authorities include 2007 and subsequent years. Other than in respect of the fair market revaluation of LDC's assets on October 1, 2001 pursuant to Section 7 of Ontario Regulation 162/01 of the Electricity Act, tax years prior to 2007 are closed to further examination.

18. SHARE CAPITAL

Share capital consists of the following:

	2012 $	2011 $
Authorized The authorized share capital of LDC consists of an unlimited number of common shares		
Issued and outstanding 1,000 common shares	556,278	527,817

On January 1, 2012, LDC amalgamated with 1798594 Ontario Inc., a wholly-owned entity of the Corporation, with an initial share capital of $1,000 and a further share capital of $28,460,000 associated with the transfer of certain electricity distribution assets [note 19], whose shares were cancelled upon completion of the amalgamation.

19. RELATED PARTIES

For LDC, transactions with related parties include transactions with the City, the Corporation and TH Energy. All transactions with related parties are in the ordinary course of business and measured at exchange amounts and normal trade terms.

2012	City $	Corporation $	TH Energy $
Revenues	210,835	—	—
Operating expenses (recoveries) and capital expenditures	26,232	3,035	(1,530)
Net financing charges	—	75,303	433
Accounts receivable	5,603	—	14,271
Unbilled revenue	17,016	—	—
Other Assets	7,279	—	—
Accounts payable and accrued liabilities	38,013	11,426	433
Short-term notes and promissory notes payable	—	484,893	14,013
Long-term notes payable	—	985,343	—
Advance deposits	8,926	—	—

2011	City $	Corporation $	TH Energy $
Revenues	194,671	—	—
Operating expenses (recoveries) and capital expenditures	28,946	2,837	(1,850)
Net financing charges	—	77,609	—
Accounts receivable	6,761	—	10,494
Unbilled revenue	12,439	—	—
Other Assets	7,279	—	—
Accounts payable and accrued liabilities	24,235	7,926	—
Long-term notes and promissory note payable	—	1,409,341	—
Advance deposits	8,714	—	—

Revenues represent amounts charged to the City primarily for electricity, street lighting and ancillary services. Operating expenses and capital expenditures represent amounts charged by the City for purchased road cut repairs, property taxes and other services, and the Corporation for purchased corporate and management services. Operating expense recoveries represent amounts charged to TH Energy for the provision of goods and services. Net financing charges represent interest charged by the Corporation and TH Energy on the notes and promissory notes payable [note 12].

Accounts receivable represent receivables from the City primarily for electricity and ancillary services, and TH Energy for the provision of goods and services, including consolidated billing services. Unbilled revenue represents receivables from the City related to the provision of electricity not yet billed. Other assets represent amounts for prepaid land leases from the City. Accounts payable and accrued liabilities represent amounts payable to the City relating to road cut repairs and other services, as well as funds received from the City for the construction of electricity distribution assets. Included in the Accounts payable and accrued liabilities are amounts payable to the Corporation for purchased corporate and management services and interest accruing on notes and promissory notes payable to the Corporation and TH Energy. Notes and promissory notes payable represent amounts borrowed from the Corporation and TH Energy [note 12]. Advance deposits represent funds received from the City for future expansion projects.

On January 1, 2012, certain electricity distribution assets of TH Energy were transferred to LDC through a newly created wholly-owned legal entity (1798594 Ontario Inc.) of the Corporation. Immediately thereafter, the new legal entity was amalgamated with LDC. The transfer was completed for a purchase price of $28,460,000, with a post closing adjustment of $14,013,000. The transfer was initially funded with share capital issued by the new wholly-owned legal entity to the Corporation. Subsequently, LDC issued an intercompany promissory note payable to TH Energy for the increase in the purchase price.

20. COMMITMENTS

Future capital commitments and operating lease obligations

As at December 31, 2012, the future minimum annual lease payments under property operating leases and future commitments with remaining terms from one to five years and thereafter were as follows:

	Future capital commitments[2]	Operating lease obligations and other
	$	$
2013	15,278	9,091
2014	—	8,999
2015	—	8,052
2016	—	6,666
2017	—	1,992
Thereafter	—	—
Total amount of future minimum payments[1]	15,278	34,800

[1] Refer to note 15 for repayments of long-term debt excluded from the table above.
[2] Reflect estimated capital contributions payable to Hydro One Networks Inc. under the Toronto Midtown Transmission Reinforcement Project.

LDC has the option to renew its two major property operating leases at the end of the current lease term for an additional five years at the then fair rental value.

Operating lease expense for the year ended December 31, 2012 was $6,547,000 [2011 - $5,271,000].

Capital lease obligations

As at December 31, 2012, the future minimum annual lease payments under capital leases with remaining lease terms from one to five years and thereafter were as follows:

	$
2013	2,338
2014	2,329
2015	2,322
2016	2,310
2017	2,310
Thereafter	1,157
Total amount of future minimum lease payments	12,766
Less: interest and executory costs	1,531
	11,235
Current portion included in Other liabilities	1,850
Long-term portion included in Other liabilities	9,385

21. CONTINGENCIES

a) Legal Proceedings

In the ordinary course of business, LDC is subject to various litigation and claims with customers, suppliers, former employees and other parties. On an ongoing basis, LDC assesses the likelihood of any adverse judgments or outcomes as well as potential ranges of probable costs and losses. A determination of the provision required, if any, for these contingencies is made after an analysis of each individual issue. The provision may change in the future due to new developments in each matter or changes in approach such as a change in settlement strategy. LDC is subject to various legal actions that arise in the normal course of business and if damages were awarded under these actions, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with these actions.

Christian Helm Class Action

On December 6, 2010, a statement of claim in a proposed class action was issued against LDC. The claim sought general and special damages in the amount of $100,000,000 for disgorgement of unjust gains allegedly resulting from the receipt of interest on overdue accounts in contravention of the Interest Act (Canada). On April 30, 2012, a settlement reached by the parties was approved by Order of the Ontario Superior Court of Justice. Pursuant to the terms of the Order, LDC was required to pay the amount of $5,836,000 plus costs in settlement of all claims, substantially all of which had been paid as at December 31, 2012. LDC accrued a liability to cover the expected settlement in 2010. The action has been dismissed, and the claims by all class members have been released.

2 Secord Avenue

An action was commenced against LDC in September 2008 in the Ontario Superior Court of Justice under the Class Proceedings Act, 1992 (Ontario) seeking damages in the amount of $30,000,000 as compensation for damages allegedly suffered as a result of a fire and explosion in an underground vault at 2 Secord Avenue on July 20, 2008. This action is at a preliminary stage. The statement of claim has been served on LDC, a statement of defence and third party claim have been served by LDC and a third party defence and counterclaim against LDC seeking damages in the amount of $51,000,000 have been filed. A certification order has been issued. Affidavits of

documents have been produced by LDC to the other parties and examinations for discovery have commenced and are continuing. Given the preliminary status of this action, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

On December 20, 2010, LDC was served with a statement of claim by the City seeking damages in the amount of $2,000,000 as a result of the fire at 2 Secord Avenue. A statement of defence and a third party claim have been served. Given the preliminary status of this action, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

By order of the court dated January 24, 2012, the above actions and a smaller non-class action commenced in April 2009 involving the same incident will be tried at the same time or consecutively.

2369 Lakeshore Boulevard West

A third party action was commenced against LDC in October 2009 in the Ontario Superior Court of Justice under the Class Proceedings Act, 1992 (Ontario) seeking damages in the amount of $30,000,000 as compensation for damages allegedly suffered as a result of a fire in the electrical room at 2369 Lakeshore Boulevard West on March 19, 2009. Subsequently, in March 2010, the plaintiff in the main action amended its statement of claim to add LDC as a defendant. The plaintiff in the main action seeks damages in the amount of $100,000 from LDC. Both actions are at a preliminary stage and no certification hearing has yet to occur. Statements of defence to the main action and to the third party claim have not been filed. Accordingly, given the preliminary status of these actions, it is not possible at this time to reasonably quantify the effect, if any, of these actions on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with these actions.

Another third party action was commenced against LDC in October 2009 in the Ontario Superior Court of Justice seeking damages in the amount of $30,000,000 as compensation for damages allegedly suffered as a result of the fire at 2369 Lakeshore Boulevard West. Subsequently, in March 2010, the plaintiff in the main action amended its statement of claim to add LDC as a defendant. The plaintiff in the main action sought damages in the amount of $400,000 from LDC. LDC has filed a statement of defence, crossclaim and counterclaim. Examinations for discovery have not taken place, notwithstanding a court ordered timetable to have them completed by February 29, 2012. By order dated December 5, 2012, these actions were dismissed by the court for delay.

On August 29, 2011, LDC was served with a statement of claim by the owner of the building and the property management company for the building seeking damages in the amount of $2,000,000 as a result of the fire at 2369 Lakeshore Boulevard West. LDC has filed a statement of defence and counterclaim. Given the preliminary status of this action, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

b) OEB PILs Proceeding

The OEB conducted a review of the PILs variances accumulated in regulatory variance accounts for the period from October 1, 2001 to April 30, 2006 for certain Municipal Electricity Utilities [“MEUs”]. On June 24, 2011, the OEB issued its decision for these MEUs and provided guidelines for the calculation and further disposition of the balances accumulated in the PILs regulatory variance accounts. Subsequent to this decision, the OEB issued interrogatories and decisions for other MEUs.

LDC has reviewed the balances of its PILs regulatory variance accounts and applied the guidelines provided by the OEB. As at December 31, 2012, LDC estimated its liability at approximately $7,048,000. This balance has been recorded in LDC's financial statements. LDC has applied for disposition of the balance as part of its pending IRM/ICM Application filed on May 10, 2012. The amount to be approved by the OEB will be based on the OEB's interpretation and application of its guidelines and the final balance which is yet to be approved by the OEB could differ materially from LDC's estimation of its liability.

c) Payments in Lieu of Additional Municipal and School Taxes

The Ministry of Finance had issued assessments in respect of payments in lieu of additional municipal and school taxes under section 92 of the Electricity Act that were in excess of the amounts LDC believed were payable. The dispute arose as a result of inaccurate information included in Ontario Regulation 224/00. LDC worked with the Ministry of Finance to resolve this issue, and as a result the Ministry of Finance issued Ontario Regulation 423/11 on August 31, 2011. The new regulation revoked Ontario Regulation 224/00 and corrected inaccurate information retroactively to 1999.

In May 2012, the Ministry of Finance completed its reassessment as a consequence of the change in regulation. The impact of the reassessment issued was favourable to LDC.

22. NON-CASH WORKING CAPITAL BALANCES

Changes in non-cash working capital provided (used) cash as follows:

	2012 $	2011 $
Accounts receivable	5,515	(5,101)
Unbilled revenue	(11,983)	20,852
Income tax receivable	3,974	(6,154)
Inventories	(664)	610
Other current assets	(276)	(599)
Accounts payable and accrued liabilities	(21,487)	37,086
Restructuring accrual	11,954	—
Deferred conservation credit	6,298	13,316
Other current liabilities	(332)	(489)
	(7,001)	59,521

23. US GAAP TRANSITION

Publicly accountable enterprises in Canada were required to adopt IFRS for interim and annual reporting purposes for fiscal years beginning on or after January 1, 2011. On September 10, 2010, the Accounting Standards Board granted an optional one-year deferral for IFRS adoption for entities subject to rate regulation. The Corporation elected to take the optional one-year deferral of its adoption of IFRS. In the absence of a definitive plan to consider the issuance of a rate-regulated accounting standard by the International Accounting Standards Board, the Corporation decided to evaluate the option of adopting US GAAP effective January 1, 2012 as an alternative to IFRS. On July 21, 2011, the Ontario Securities Commission granted the Corporation an exemption to allow the Corporation to file financial statements under US GAAP for the years commencing on or after January 1, 2012 but before January 1, 2015. On August 26, 2011, the Board of Directors of the Corporation approved the adoption of US GAAP for financial reporting purposes for the year beginning on January 1, 2012. As a wholly-owned subsidiary, LDC elected to follow the Corporation and adopted US GAAP for financial reporting purposes for the year beginning on January 1, 2012.

These are LDC's first annual financial statements prepared in accordance with US GAAP. The accounting policies set out in note 4 have been applied consistently in preparing the financial statements for the year ended December 31, 2012 and the comparative periods.

LDC has adjusted amounts reported previously in its financial statements prepared in accordance with Canadian GAAP. For reporting purposes, the transition date to US GAAP is January 1, 2011, which is the commencement of the 2011 comparative period to LDC's 2012 financial statements. An explanation of how the transition from Canadian GAAP to US GAAP has affected LDC's financial statements is set out in the following tables and accompanying notes.

Given the Corporation's exemption to file under US GAAP to December 31, 2014 by the Ontario Securities Commission, the Corporation is actively monitoring developments by the International Accounting Standards Board on rate-regulated accounting should a future IFRS conversion be required. Although the conversion of LDC's general purpose financial statements to IFRS was suspended in 2011, the IFRS conversion work is being managed in such a way that if a future transition to IFRS is required, it can be effectively accomplished.

The reconciliation of the January 1, 2011 balance sheet from Canadian GAAP to US GAAP is as follows:

BALANCE SHEET

[in thousands of Canadian dollars]

As at January 1, 2011	Notes	Canadian GAAP $	Transitional Adjustments $	US GAAP $
ASSETS				
Current				
Regulatory assets	A	—	3,55	3,555
Other	A	657,135	1,71(	658,845

The reconciliation of net income from Canadian GAAP to US GAAP for the year ended December 31, 2011 is as follows:

RECONCILIATION OF NET INCOME FROM CANADIAN GAAP TO US GAAP

[in thousands of Canadian dollars]

	Notes	2011 $
Net income, Canadian GAAP		93,331
Revenues	C	14,212
Operating expenses	C, D	(16,735)
Income tax recovery	D	2,523
Net income, US GAAP		93,331

Notes to the transitional adjustments

A. Post-retirement benefits

Under Canadian GAAP, unamortized actuarial gains and losses and unamortized prior service costs are not recorded on the balance sheets. Under US GAAP, all actuarial gains and losses and prior service costs are fully recognized in OCI in the period in which they arise and are presented within equity as Accumulated Other Comprehensive Income ["AOCI"]. Due to the rate-regulated nature of LDC's business, the impact to AOCI on transition and the impact to OCI on a go-forward basis will be reclassified to a regulatory asset account [note 9[a]]. This reclassification results in the full recognition of the benefit obligation as a liability on LDC's balance sheets and no balance reported in OCI and AOCI. A portion of the benefit obligation will also be presented as a current liability on the balance sheets. The current portion is the amount of the actuarial present value of benefits included in the benefit obligation which is expected to be paid in the next 12 months.

B. Customers' advance deposits

Under US GAAP, deposits that are due on demand or will be due on demand within one year from the end of the reporting period have been reclassified as current liabilities.

C. Demand billable income and expenses

Under US GAAP, associated costs related to demand billable income have been reclassified on the statements of net income and comprehensive income. There is no impact to the overall net income.

D. Income tax recovery

Under Canadian GAAP, all ITCs are recognized as a reduction of the related expenditure. Under US GAAP, the benefits of the refundable apprenticeship and co-operative ITCs are recognized as a reduction of the related expenditure. All other ITCs are recorded as a reduction of income tax expense in the current period to the extent that realization of such benefits is more likely than not.

INDEPENDENT AUDITORS' REPORT

To the Shareholder of Toronto Hydro-Electric System Limited

We have audited the accompanying financial statements of Toronto Hydro-Electric System Limited, which comprise the balance sheets as at December 31, 2013 and December 31, 2012, the statements of net income and comprehensive income, shareholder's equity and cash flows for the years ended December 31, 2013 and December 31, 2012, and notes, comprising a summary of significant accounting policies and other explanatory information.

Management's Responsibility for the Financial Statements

Management is responsible for the preparation and fair presentation of these financial statements in accordance with United States Generally Accepted Accounting Principles, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditors' Responsibility

Our responsibility is to express an opinion on these financial statements based on our audits. We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained in our audits is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements present fairly, in all material respects, the financial position of Toronto Hydro-Electric System Limited as at December 31, 2013 and December 31, 2012 and its statements of net income and comprehensive income, shareholder's equity and cash flows for the years ended December 31, 2013 and December 31, 2012 in accordance with United States Generally Accepted Accounting Principles

The accompanying notes are an integral part of the financial statements.

1. INCORPORATION

On June 23, 1999, LDC was incorporated under the Business Corporations Act (Ontario), and is wholly-owned by the Corporation. The incorporation was required in accordance with the provincial government's Electricity Act.

LDC distributes electricity to customers located in the City and is subject to rate regulation. LDC is also engaged in the delivery of CDM activities.

2. BASIS OF PRESENTATION

These audited financial statements of LDC have been prepared in accordance with US GAAP with respect to the preparation of annual financial information, and are presented in Canadian dollars.

LDC has evaluated the events and transactions occurring after the balance sheet date through March 19, 2014 when LDC's financial statements were available to be issued after the approval by LDC's Board of Directors, and identified the events and transactions which required recognition in the financial statements and/or disclosure in the notes to the financial statements [notes 3, 4, 9, 13, 20 and 21]

3. REGULATION

In April 1999, the Government of Ontario began restructuring Ontario's electricity industry. Under regulations passed pursuant to the restructuring, LDC and other electricity distributors purchase electricity from the wholesale market administered by the IESO and recover the costs of electricity and certain other costs at a later date in accordance with procedures mandated by the OEB.

The OEB has regulatory oversight of electricity matters in Ontario. The OEB Act sets out the OEB's authority to issue a distribution licence that must be obtained by owners or operators of an electricity distribution system in Ontario. The OEB prescribes licence requirements and conditions including, among other things, specified accounting records, regulatory accounting principles, separation of accounts for distribution and other activities, and requirements for rate-setting and other legal filings.

The OEB's authority and responsibilities include the power to approve and fix rates for the transmission and distribution of electricity, the responsibility to provide rate protection for rural or remote electricity customers, and the responsibility for ensuring that electricity distribution companies fulfill their obligations to connect and service customers.

LDC is required to charge its customers for the following amounts (all of which, other than distribution rates, represent a pass-through of amounts payable to third parties):

- Commodity Charge – The commodity charge represents the market price of electricity consumed by customers and is passed through the IESO to operators of generating stations. It includes the global adjustment, which represents the difference between the market price of electricity and the rates paid to regulated and contracted generators.

- Retail Transmission Rate – The retail transmission rate represents the costs incurred in respect of the transmission of electricity from generating stations to local distribution networks. Retail transmission rates are passed through to operators of transmission facilities.

- WMS Charge – The WMS charge represents various wholesale market support costs, such as the cost of the IESO to administer the wholesale electricity system, operate the electricity market, and maintain reliable operation of the provincial grid. Wholesale charges are passed through to the IESO.

- Distribution Rate – The distribution rate is designed to recover the costs incurred by LDC in delivering electricity to customers, including the OEB-allowed cost of capital. Distribution rates are regulated by the OEB and are comprised of fixed and variable (usage-based) components, based on a forecast of LDC's customers and load.

LDC is required to satisfy and maintain prudential requirements with the IESO, which include credit support with respect to outstanding market obligations in the form of letters of credit, cash deposits or guarantees from third parties with prescribed credit ratings.

a) Electricity Distribution Rates

Regulatory developments in Ontario's electricity industry, including current and possible future consultations between the OEB and interested stakeholders, may affect LDC's electricity distribution rates and other permitted recoveries in the future.

On May 10, 2012, LDC filed an application for electricity distribution rates for 2012, 2013, and 2014 using the IRM framework, including the filing of an ICM application [the "IRM/ICM Application"].

On October 31, 2012, LDC submitted an update to its IRM/ICM Application modifying the requested capital expenditures for 2012 and 2013 to $283,000,000 and $579,100,000, respectively, and requesting that consideration for 2014 be deferred to a second phase of the proceeding, once LDC had received a decision from the OEB in respect of phase one. On November 8, 2012, the OEB accepted LDC's request for a two-phase proceeding: phase one comprising LDC's 2012 and 2013 work program proposals and phase two comprising LDC's 2014 work program proposal.

On April 2, 2013, the OEB issued a partial decision and order for phase one of the proceeding comprising LDC's 2012 and 2013 work program proposals. The OEB's decision determined that eligible capital funding under the ICM framework was to be calculated on an in-service basis. This correlates to the approval of capital expenditures amounting to $203,330,000 for 2012 and $484,220,000 for 2013. New rates became effective June 1, 2013. In 2015, LDC will be allowed to seek recovery for capital spent in 2012 and 2013 that has not yet been approved by the OEB in the current ICM decision due to the standard operation of the regulatory model.

On August 1, 2013, LDC filed an application with the OEB requesting approval for the disposition of balances in its smart meter deferral account related to smart meter costs incurred in 2008, 2009 and 2010. In the application, LDC requested two new rate riders effective May 1, 2014. The first rate rider relates to the recovery of $23,927,000, which represents the cumulative revenue requirement net of recoveries from an existing smart meter rate rider. This existing smart meter rate rider would be discontinued when the new rate riders become effective. The second rate rider relates to the recovery of $9,631,000, which represents the forecasted 2014 incremental revenue requirement until LDC may be permitted to transfer the smart meter assets into rate base.

On August 19, 2013, LDC submitted an update to its IRM/ICM Application regarding its 2014 work program proposal. The filed update incorporates the OEB's guidance on the ICM methodology provided in the April 2, 2013 partial decision and order with respect to phase one of this proceeding. In phase two, LDC sought approval for total capital expenditures amounting to $398,780,000 for 2014.

On December 18, 2013, LDC filed a settlement agreement with the OEB, which allowed for the entirety of LDC's requested 2014 capital program. On December 19, 2013, the OEB approved this settlement agreement. Consistent with the April 2, 2013 partial decision and order with respect to phase one, eligible capital funding under the ICM framework is to be calculated on an in-service basis. This correlates to the approval of capital expenditures amounting to $398,780,000 for 2014.

On January 16, 2014, the OEB approved LDC's requested disposition of the smart meter deferral account balances, permitting the recovery of $23,927,000 and $9,631,000 through two separate rate riders effective May 1, 2014[note 9[c]].

b) CDM Activities

On March 31, 2010, the Minister of Energy and Infrastructure of Ontario, under the guidance of sections 27.1 and 27.2 of the OEB Act, directed the OEB to establish CDM targets to be met by electricity distributors. Accordingly, on November 12, 2010, the OEB amended LDC's distribution licence to require LDC, as a condition of its licence, to achieve 1,304 GWh of energy savings and 286 MW of summer peak demand savings, over the period beginning January 1, 2011 through December 31, 2014.

Effective January 1, 2011, LDC entered into an agreement with the OPA in the amount of approximately $50,000,000 to deliver CDM programs extending from January 1, 2011 to December 31, 2014. As at December 31, 2013, LDC received approximately $45,919,000 [December 31, 2012 - $35,366,000] from the OPA for the delivery of CDM programs. All programs to be delivered are fully funded and paid in advance by the OPA. Amounts received but not yet spent are presented under current liabilities as deferred conservation credit. Upon the expiration of the agreement, LDC is required to repay to the OPA any excess funding received for program administration less any cost efficiency incentives. These programs are expected to support the achievement of the mandatory CDM targets described above.

On December 21, 2012, the Minister of Energy of Ontario issued a direction to the OPA under subsection 25.32(4.1) of the Electricity Act to extend the funding time period for OPA-contracted province-wide CDM initiatives under the Green Energy Act framework to December 31, 2015.

4. SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

a) Regulation

The following regulatory treatments have resulted in accounting treatments which differ from US GAAP for enterprises operating in an unregulated environment:

Regulatory Assets and Liabilities

LDC has determined that its assets and liabilities arising from rate-regulated activities qualify for the application of regulatory accounting treatment in accordance with FASB ASC 980 – "Regulated Operations", which includes accounting principles prescribed by the OEB in the "Accounting Procedures Handbook for Electricity Distributors". Under RRA, the timing and recognition of certain expenses and revenues may differ from those otherwise expected under US GAAP in order to appropriately reflect the economic impact of regulatory decisions regarding LDC's regulated revenues and expenditures. These timing differences are recorded as regulatory assets and regulatory liabilities on LDC's balance sheets and represent existing rights and obligations regarding cash flows expected to be recovered from or refunded to customers, based on decisions and approvals by the OEB. Regulatory assets and liabilities can be recognized for rate-setting and financial reporting purposes only if the OEB directs the relevant regulatory treatment or if future OEB direction is judged to be probable. In the event that the disposition of these balances was assessed to no longer be probable, the balances would be recorded in LDC's statements of net income and comprehensive income in the period that the assessment is made. The measurement of regulatory assets and liabilities is subject to certain estimates and assumptions, including assumptions made in the interpretation of the OEB's regulations and decisions.

Regulatory assets and liabilities are classified as current if they are expected to be recovered from, or refunded to, customers within 12 months after each reporting period. All other regulatory asset and liability balances are classified as long-term on the balance sheets.

Allowance for funds used during construction

The OEB provides for the inclusion of an AFUDC when capitalizing construction-in-progress assets, until such time as the asset is substantially complete. A concurrent credit of the same amount is made to net financing charges when the allowance is capitalized. The interest rate for capitalization is prescribed by the OEB and modified on a

periodic basis, and is applied to the balance of the construction-in-progress assets on a simple interest basis. The interest rate for capitalization for the period from January 1, 2013 to September 30, 2013 was 3.23%, and from October 1, 2013 to December 31, 2013 was 3.70% [January 1, 2012 to March 31, 2012 - 3.92%; April 1, 2012 to September 30, 2012 - 3.51%; October 1, 2012 to December 31, 2012 - 3.23%]. AFUDC is included in PP&E and intangible assets for financial reporting purposes, and is recovered through depreciation and amortization expense over the useful lives of the related assets and recovered through future revenue.

b) Cash and cash equivalents

Cash and cash equivalents include cash in bank accounts and short-term investments with terms to maturity of 90 days or less from their date of acquisition.

c) Accounts receivable

Accounts receivable are recorded at the invoiced amount and overdue amounts bear interest at OEB-approved rates. The carrying amount of accounts receivable is reduced through an allowance for doubtful accounts and the amount of the related impairment loss is recognized in the statements of net income and comprehensive income. Subsequent recoveries of receivables previously provisioned and written off are credited to the statements of net income and comprehensive income. Management estimates uncollectible accounts receivable after considering historical loss experience and the characteristics of existing accounts.

d) Inventories

Inventories consist primarily of small consumable materials mainly related to the maintenance of the electricity distribution infrastructure. LDC classifies all major construction related components of its electricity distribution system infrastructure to PP&E. As prescribed by the OEB, these items are depreciated when they are acquired. Inventories are carried at the lower of cost and market, with cost determined on an average cost basis net of a provision for obsolescence.

e) Property, plant and equipment

PP&E are stated at cost. In accordance with group depreciation practices, assets in a group are not removed from the accounts on disposition and instead depreciation continues to be recorded until the asset group is fully depreciated. Readily identifiable assets are removed from the accounts at retirement or disposition. The cost of PP&E represents the original cost, consisting of direct materials and labour, contracted services, AFUDC, and overhead directly attributable to the capital project.

PP&E relating to eligible capital expenditures approved under the ICM framework for the 2012 and 2013 work program proposals are reclassified from construction in progress to regulatory assets once an asset is determined to be in-service, as directed by the OEB. The assets are then depreciated in the regulatory asset account over the estimated useful lives previously specified for PP&E. Upon final approval by the OEB and inclusion in LDC's rate base, the assets will be transferred back to PP&E.

Capital contributions received are used to finance additions to PP&E. According to the accounting principles prescribed by the OEB, capital contributions received are recorded as a credit to PP&E. The amount is subsequently depreciated by a charge to accumulated depreciation and a credit to depreciation expense at an equivalent rate to that used for the depreciation of the related PP&E.

Depreciation is provided on a straight-line basis over the estimated useful lives at the following annual rates:

Distribution lines	2.0% to 5.0%
Transformers	3.3% to 5.0%
Meters	2.5% to 6.7%

Stations	2.5% to 10.0%
Buildings	1.3% to 5.0%
Rolling stock	12.5% to 25.0%
Other capital assets	4.0% to 20.0%
Equipment and tools	10.0% to 16.7%
Computer hardware	16.7% to 25.0%
Assets under capital lease	14.3% to 25.0%
Communications	10.0% to 20.0%

Construction in progress relates to assets not currently in use and therefore is not depreciated.

In the event that facts and circumstances indicate that PP&E may be impaired, an evaluation of recoverability is performed. For purposes of such an evaluation, the estimated future undiscounted cash flows associated with the asset are compared to the carrying amount of the asset to determine if a write-down is required. The impairment loss is measured as the amount by which the carrying amount of the asset exceeds its fair value, which is determined by the estimated future discounted cash flows.

f) Intangible assets

Effective January 1, 2012, LDC revised its estimate of useful life of its Customer Care and Billing Customer Information System from five years to ten years as a result of an analysis completed related to the useful life assessment. This change has been accounted for on a prospective basis in the financial statements effective January 1, 2012. The change in estimate reduced amortization expense by approximately $4,000,000 for the year ended December 31, 2012 with an offsetting increase in the carrying value of intangible assets. The change in estimate will decrease future amortization expense by $4,000,000 per year over the term of the original useful life with no impact to the final year of the original useful life, and thereafter increase future amortization expense by $4,000,000 per year.

Intangible assets are stated at cost. Amortization is provided on a straight-line basis over the estimated useful lives at the following annual rates:

Computer software	10.0% to 25.0%
Contributions	4.0%

Software in development and contributions for work in progress relate to assets not currently available for use and therefore are not amortized. Contributions represent payments made to Hydro One Networks Inc. for dedicated infrastructure in order to receive connections to transmission facilities.

In the event that facts and circumstances indicate that intangible assets may be impaired, an evaluation of recoverability is performed. For purposes of such an evaluation, the estimated future undiscounted cash flows associated with the asset are compared to the carrying amount of the asset to determine if a write-down is required. The impairment loss is measured as the amount by which the carrying amount of the asset exceeds its fair value, which is determined by the estimated future discounted cash flows.

g) Restructuring

Restructuring charges are recorded based upon planned employee termination dates, site closure and consolidation plans, and contract terminations. Restructuring charges can include severance costs to eliminate a specified number of employee positions, infrastructure charges to vacate facilities and consolidate operations, and contract cancellation costs. The timing of associated cash payments is dependent upon the type of restructuring charge and can extend over a multi-year period.

h) Revenue recognition

Revenue from the sale of electricity is recorded on the basis of cyclical billings and includes an estimated amount for electricity delivered and not yet billed, the amount of which is impacted by energy demand, customer class usage patterns and composition, and weather conditions. Revenue related to eligible capital expenditures under the ICM framework is recognized on the basis of in-service assets.

Other income, which includes revenues from electricity distribution related services and revenues from demand billable activities, is recognized as the services are rendered.

In the course of its operations, LDC collects HST from customers. When customers are billed, a current liability for HST is recognized which corresponds to the revenue derived from the services provided by LDC. When expenses are incurred by LDC, a current asset for HST is recorded which corresponds to the expenditures derived from the goods or services received by LDC. LDC's revenue and expenses exclude HST. This net asset or liability is settled with the appropriate government authority.

i) Financial instruments

At inception, all financial instruments which meet the definition of a financial asset or financial liability are recorded at fair value, unless fair value cannot be reliably determined. Gains and losses related to the measurement of financial instruments are reported in the statements of net income and comprehensive income. Subsequent measurement of each financial instrument will depend on the balance sheet classification elected by LDC. The fair value of a financial instrument is the amount of consideration that would be agreed upon in an arm's length transaction between willing parties.

The following summarizes the accounting classification LDC has elected to apply to each of its significant categories of financial instruments:

Cash equivalents and short-term investments	Held for Trading
Accounts receivable and unbilled revenue	Loans and Receivables
Advance from related party	Other Financial Liabilities
Accounts payable and accrued liabilities	Other Financial Liabilities
Obligations under capital lease	Other Financial Liabilities
Customers' advance deposits	Other Financial Liabilities
Notes payable to related parties	Other Financial Liabilities

LDC uses the following methods and assumptions to estimate the fair value of each class of financial instruments for which carrying amounts are included in the balance sheets:

- Cash equivalents, comprising short-term investments, are classified as "Held for Trading" and are measured at fair value. The carrying amounts approximate fair value because of the short maturity of these instruments.

- Accounts receivable and unbilled revenue are classified as "Loans and Receivables" and are measured at amortized cost, which, upon initial recognition, is considered equivalent to fair value. Subsequent measurements are recorded at amortized cost using the effective interest rate method. The carrying amounts approximate fair value because of the short maturity of these instruments.

- Advance from related party is classified as "Other Financial Liabilities" and is initially measured at fair value. Subsequent measurements are recorded at amortized cost using the effective interest rate method. The carrying amount approximates fair value because of the short maturity of this instrument.

- Accounts payable and accrued liabilities are classified as "Other Financial Liabilities" and are initially measured at fair value. Subsequent measurements are carried at amortized cost using the effective interest rate method. The carrying amounts approximate fair value because of the short maturity of these instruments.

- Obligations under capital lease are classified as "Other Financial Liabilities" and are initially measured at fair value. Subsequent measurements are based on a discounted cash flow analysis and approximate the carrying value as management believes that the fixed interest rates are representative of current market rates.

- Customers' advance deposits are classified as "Other Financial Liabilities" and are initially measured at fair value. Subsequent measurements are recorded at cost plus accrued interest. The carrying amounts approximate fair value because of the short maturity of the current portion, and the long-term portion approximates the carrying value, taking into account interest accrued on the outstanding balance.

- Notes payable to related parties are classified as "Other Financial Liabilities" and are initially measured at fair value. The carrying amounts are carried at amortized cost, based on an initial fair value as determined at the time using quoted market price for similar debt instruments. The fair value of the notes payable is calculated by discounting the related cash flows at the estimated yield to maturity of similar instruments [note 15[a]].

j) Fair value measurements

LDC utilizes valuation techniques that maximize the use of observable inputs and minimize the use of unobservable inputs when measuring fair value. A fair value hierarchy exists that prioritizes observable and unobservable inputs used to measure fair value. Observable inputs reflect market data obtained from independent sources, while unobservable inputs reflect LDC's assumptions with respect to how market participants would price an asset or liability. The fair value hierarchy includes three levels of inputs that may be used to measure fair value:

- Level 1: Unadjusted quoted prices in active markets for identical assets or liabilities. An active market for the asset or liability is a market in which transactions for the asset or liability occur with sufficient frequency and volume to provide pricing information on an ongoing basis;

- Level 2: Other than quoted prices included within level 1 that are observable for the assets or liabilities, either directly or indirectly; and

- Level 3: Unobservable inputs, supported by little or no market activity, used to measure the fair value of the assets or liabilities to the extent that observable inputs are not available.

k) Employee future benefits

Multi-employer pension plan

LDC's full-time employees participate in a pension plan through OMERS. OMERS is a multi-employer, contributory, defined benefit pension plan established in 1962 by Ontario for employees of municipalities, local boards and school boards. Both participating employers and employees are required to make plan contributions based on participating employees' contributory earnings. The OMERS plan is accounted for as a defined contribution plan where LDC recognizes the expense related to this plan as contributions are made, since it is not practicable to determine LDC's portion of pension obligations or the fair value of plan assets. LDC is not responsible for any other contractual obligations other than the contributions.

Post-retirement benefits other than pension

LDC has a number of unfunded benefit plans providing post-retirement benefits (other than pension) to its employees. LDC pays certain medical, dental and life insurance benefits under unfunded defined benefit plans on

behalf of its retired employees. LDC pays accumulated sick leave credits, up to certain established limits based on service, in the event of retirement, termination or death of certain employees.

LDC periodically measures its accumulated benefit obligation for accounting purposes as at December 31 of the applicable year. The latest actuarial valuation was performed as at January 1, 2012.

The cost of providing benefits under the defined benefit plan is determined using the projected unit credit method and based on assumptions that reflect management's best estimates. All actuarial gains and losses and prior service costs are recognized in OCI as they arise and subsequently reclassified to a regulatory asset on the balance sheets. This results in the full recognition of the benefit obligation as a liability on the balance sheets.

Actuarial gains and losses are amortized into net periodic benefit cost for the current period when the net cumulative unrecognized actuarial gains or losses in the regulatory asset at the end of the previous reporting period exceed 10% of the accumulated benefit obligation at that date. These gains or losses are recognized over the expected average remaining service period of active employees participating in the plans.

The prior service costs in the regulatory asset are recognized as an expense on a straight-line basis over the average remaining service period of employees active at the date of amendment.

The effects of a curtailment loss are recognized in the statements of net income and comprehensive income when its occurrence is probable and reasonably estimable. The effects of a curtailment gain are recognized in the statements of net income and comprehensive income when the related employees terminate or the plan suspension or amendment is adopted. The effects of a settlement gain or loss are recognized in the statements of net income and comprehensive income in the period in which a settlement occurs.

l) Asset retirement obligations

LDC recognizes a liability for the future removal and handling costs for contamination in distribution equipment and for the future environmental remediation of certain properties. Initially, the liability is measured at present value and the amount of the liability is added to the carrying amount of the related asset. In subsequent periods, the capitalized amount is depreciated over the useful life of the related asset and the liability is adjusted quarterly for the discount applied upon initial recognition of the liability ["accretion expense"] and for changes in the underlying assumptions. The liability is recognized when the ARO is incurred and when the fair value can be reasonably estimated.

LDC has not recorded a liability related to certain AROs as a reasonable estimate of fair value could not be made. LDC does not recognize an ARO for active properties that support LDC's distribution operations since it cannot reasonably determine the amount of any remediation costs due to possible contamination, and a reliable estimate cannot be made until environmental site assessments have been completed. LDC expects to use the majority of its installed assets in perpetuity. If, at some future date, a particular asset is shown not to meet the perpetuity assumption, it will be reviewed to determine if an ARO exists.

m) Customers' advance deposits

Security deposits from electricity customers are cash collections to guarantee the payment of electricity bills. The electricity customer security deposits liability includes related interest amounts owed to the customers with the debit charged to net financing charges. Deposits that are refundable upon demand are classified as a current liability.

Security deposits on Offers to Connect are cash collected from specific customers to guarantee the payment of additional costs relating to expansion projects. This liability includes related interest amounts owed to the customers with the debit charged to net financing charges. Deposits are classified as a current liability when LDC no longer has an unconditional right to defer payment of the liability for at least 12 months after the reporting period.

n) Income taxes

Under the Electricity Act, LDC is required to make PILs to the Ontario Electricity Financial Corporation. These payments are calculated in accordance with the ITA and the TA as modified by regulations made under the Electricity Act and related regulations. This effectively results in LDC paying taxes similar to what would be imposed under the Federal and Ontario Tax Acts.

LDC uses the liability method of accounting for income taxes. Under the liability method, current income taxes payable are recorded based on taxable income. LDC recognizes deferred income tax assets and liabilities for the future tax consequences of events that have been included in the financial statements or income tax returns. Deferred income tax assets and liabilities are determined based on the difference between the carrying value of assets and liabilities on the balance sheets and their respective tax basis, using the tax rates enacted by the balance sheet date that are in effect for the year in which the differences are expected to reverse. Tax benefits associated with income tax positions taken, or expected to be taken, in an income tax return are recorded only when it is more likely than not that they will be realized, and are measured at the largest amount of the benefit that has a likelihood greater than 50 percent of being realized upon settlement. Deferred income tax assets are evaluated and unless realization is considered more likely than not, a valuation allowance is established.

ASC 980 requires the recognition of deferred income tax assets and liabilities and related regulatory liabilities and assets for the amount of deferred income taxes expected to be refunded to, or recovered from, customers in future electricity distribution rates. These amounts include a gross up to reflect the income tax benefits associated with reduced revenues resulting from the realization of deferred income tax assets. Deferred income taxes that are not included in the rate-setting process are charged or credited to the statements of net income and comprehensive income.

The benefits of the refundable apprenticeship and co-op ITCs are credited against the related expense in the statements of net income and comprehensive income. All other types of ITCs are recorded as a reduction to income tax expense in the current period to the extent that realization of such benefit is more likely than not.

o) Use of estimates

The preparation of LDC's financial statements in accordance with US GAAP requires management to make estimates and assumptions which affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses for the year. The estimates are based on historical experience, current conditions and various other assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgments about the carrying values of assets and liabilities as well as identifying and assessing the accounting treatment with respect to commitments and contingencies. Significant areas requiring the use of management estimates relate to unbilled revenue, regulatory assets and liabilities, ARO, post-retirement benefits, income taxes (including deferred income taxes), and revenue recognition. Actual results could differ from those estimates, including changes as a result of future decisions made by the OEB, the Ministry of Energy of Ontario, or the Ministry of Finance of Ontario.

p) Adoption of New Accounting Pronouncements

In December 2011, the FASB issued ASU No. 2011-11, "Balance Sheet (Topic 210): Disclosures about Offsetting Assets and Liabilities". The amendments require an entity to disclose both gross and net information about financial instruments and transactions eligible for offset in the balance sheets. ASU No. 2011-11 is effective for fiscal years, and interim periods within those years, beginning on or after January 1, 2013. Retrospective application is required. The ASU No. 2013-01, "Balance Sheet (Topic 210): Clarifying the Scope of Disclosures about Offsetting Assets and Liabilities", was issued in January 2013 to amend the scope of ASU No. 2011-11 to clarify that the disclosure requirements are limited to derivatives, repurchase and reverse repurchase agreements, and securities borrowing and lending transactions that are either offset in the balance sheets or subject to enforceable master netting arrangements

or similar agreements. The adoption of these amendments did not have an impact on LDC's balance sheets and related disclosures.

q) Future Accounting Pronouncements

On July 21, 2011, the OSC granted an exemption to allow the Corporation to prepare its financial statements in accordance with US GAAP for its fiscal years beginning on or after January 1, 2012 but before January 1, 2015. In the absence of the exemption, the Corporation would have previously been required to adopt IFRS on January 1, 2012. Accordingly, LDC decided to adopt US GAAP at the time to mirror the decision of the Corporation. On March 19, 2014, the Board of Directors of the Corporation approved the adoption of IFRS for the year beginning on January 1, 2015 due to the pending expiration of the exemption. Since the Corporation is converting to IFRS, on March 19, 2014 the Board of Directors of LDC also approved the adoption of IFRS for the year beginning on January 1, 2015. Accordingly, LDC's financial statements for 2015 are expected to be prepared in accordance with IFRS and applied retrospectively to LDC's opening IFRS statement of financial position as at January 1, 2014.

LDC has an internal initiative to govern the conversion process and is currently in the process of evaluating the potential impact of the conversion to IFRS on its financial statements. LDC believes that the impact on its financial statements could be material.

5. INVENTORIES

Inventories consist of the following:

	2013 $	2012 $
Fuses	2,498	2,137
Consumables, tools and other maintenance items	2,024	1,968
Drums and reels	1,473	1,115
Other	2,571	2,335
	8,566	7,555

For the year ended December 31, 2013, LDC recognized operating expenses of $6,936,000 related to inventory used to service electrical distribution assets [2012 - $6,934,000].

6. CURRENT PORTION OF OTHER ASSETS

Current portion of other assets consists of the following:

	2013 $	2012 $
Prepaid expenses	8,546	4,369
Deferred financing costs	308	311
	8,854	4,680

7. PROPERTY, PLANT AND EQUIPMENT

PP&E consist of the following:

	2013			2012		
	Cost $	Accumulated depreciation $	Net book value $	Cost $	Accumulated depreciation $	Net book value $
Land	16,740	—	16,740	16,747	—	16,747
Distribution lines	3,064,167	1,519,944	1,544,223	2,930,296	1,460,979	1,469,317
Transformers	702,027	396,012	306,015	672,981	377,900	295,081
Meters	199,634	60,506	139,128	243,152	133,789	109,363
Stations	291,699	154,017	137,682	286,229	145,601	140,628
Buildings	172,306	76,793	95,513	160,368	69,248	91,120
Rolling stock	72,865	50,282	22,583	73,239	43,834	29,405
Other capital assets	73,420	51,728	21,692	70,291	47,561	22,730
Equipment and tools	47,711	36,191	11,520	45,611	33,936	11,675
Computer hardware	56,337	45,138	11,199	50,511	40,003	10,508
Assets under capital lease	13,723	4,836	8,887	13,538	2,948	10,590
Communications	33,092	28,498	4,594	32,082	26,597	5,485
Construction in progress	320,252	—	320,252	291,779	—	291,779
	5,063,973	2,423,945	2,640,028	4,886,824	2,382,396	2,504,428

For the year ended December 31, 2013, AFUDC in the amount of $1,306,000 [2012 - $94,000] was capitalized to PP&E and credited to net financing charges.

For the year ended December 31, 2013, capital contributions in the amount of $27,701,000 [2012 - $21,309,000] were credited to PP&E.

For the year ended December 31, 2013, LDC recorded depreciation expense of $144,375,000 [2012 - $119,393,000], of which $1,977,000 [2012 - $1,985,000] related to assets under capital lease and $21,537,000 [2012 - $nil] related to smart meter depreciation that had been deferred [note 9[c]].

8. INTANGIBLE ASSETS

Intangible assets consist of the following:

	2013			2012		
	Cost $	Accumulated amortization $	Net book value $	Cost $	Accumulated amortization $	Net book value $
Computer software	268,389	198,816	69,573	242,254	174,410	67,844
Contributions	22,181	3,077	19,104	19,649	2,175	17,474
Software in development	11,700	—	11,700	14,210	—	14,210
Contributions for work in progress	71,112	—	71,112	34,552	—	34,552
	373,382	201,893	171,489	310,665	176,585	134,080

Contributions for work in progress relate to payments made by LDC for connection projects to increase electricity distribution system capacity.

For the year ended December 31, 2013, AFUDC in the amount of $2,016,000 [2012 - $1,331,000] was capitalized to intangible assets and credited to net financing charges.

For the year ended December 31, 2013, LDC recorded amortization expense on intangible assets of $25,308,000 [2012 - $20,959,000], of which $7,196,000 [2012 - $nil] related to smart meter software amortization that had been deferred [note 9[c]].

Estimated future amortization expense related to intangible assets recorded as at December 31, 2013 is as follows:

	$
2014	19,306
2015	18,524
2016	17,029
2017	14,698
2018	10,748

9. REGULATORY ASSETS AND LIABILITIES

Regulatory assets consist of the following:

	2013 $	2012 $
ICM	151,930	—
Post-retirement benefits	38,781	61,499
Smart meters	25,230	55,599
Stranded meters	16,877	—
Settlement variances	8,227	1,071
RARA	—	2,466
Other	439	579
Total regulatory assets	241,484	121,214
Less: Current portion of regulatory assets	7,060	1,658
Long-term portion of regulatory assets	234,424	119,556

Regulatory liabilities consist of the following:

	2013 $	2012 $
Deferred income taxes	155,853	193,276
Revision of prior year tax position	19,421	—
RARA	4,277	—
Income and other taxes variance account	2,432	2,398
Other	1,150	1,135
Total regulatory liabilities	183,133	196,809
Less: Current portion of regulatory liabilities	2,516	—
Long-term portion of regulatory liabilities	180,617	196,809

For the year ended December 31, 2013, LDC disposed of approved net regulatory assets amounting to $153,000 through permitted distribution rate adjustments [2012 – approved net regulatory liabilities of $8,838,000].

The regulatory assets and liabilities of LDC consist of the following:

a) Incremental Capital Module

The ICM regulatory asset account relates to the partial decision and order from the OEB for LDC's 2012 and 2013 work program proposals and the associated rate rider, which became effective June 1, 2013 [note 3[a]]. As directed by the OEB, this account is comprised of the cost of the eligible in-service capital expenditures under ICM, offset by the amount collected through the rate rider. This account is also adjusted by the amount recognized into revenues related to the eligible in-service capital expenditures and their associated depreciation.

For the year ended December 31, 2013, eligible in-service capital expenditures of $159,672,000 [2012 - $nil] were reclassified from PP&E to regulatory assets. As a non-cash transaction, this has been excluded from the statements of cash flows. As at December 31, 2013, eligible in-service capital expenditures, net of accumulated depreciation, totalling $157,880,000, were recorded in regulatory assets [December 31, 2012 - $nil]. In the absence of rate regulation, PP&E would have been $157,880,000 higher at December 31, 2013 [December 31, 2012 - $nil impact].

For the year ended December 31, 2013, LDC recorded depreciation expenses of $1,792,000 [2012 - $nil] related to the eligible in-service capital expenditures.

For the year ended December 31, 2013, revenues related to the eligible in-service capital expenditures were $6,707,000 [2012 - $nil]. In the absence of rate regulation, for the year ended December 31, 2013, revenues would have been $5,925,000 higher [2012 - $nil impact].

b) Post-Retirement Benefits

This regulatory asset account relates to the expected future electricity distribution charges to customers arising from timing differences in the recognition of actuarial losses and prior service costs of other post-retirement benefits. In the absence of rate regulation, these amounts would be recorded in OCI and accumulated other comprehensive income. The amount is amortized over the same period as the corresponding actuarial losses and prior service costs. The period in which recovery is expected cannot be determined at this time.

c) Smart Meters and Stranded Meters

The smart meters and stranded meters regulatory assets relate to Ontario's decision to install smart meters throughout Ontario. LDC substantially completed its smart meter project as at December 31, 2010. In connection with this initiative, the OEB ordered LDC to record expenditures and related revenues from 2008 to 2010 to a regulatory asset account and allowed LDC to keep the net book value of the stranded meters in PP&E. Effective January 1, 2011, LDC has recorded post-2010 smart meter costs in PP&E and intangible assets as a regular distribution activity as directed by the OEB. On August 1, 2013, LDC filed an application with the OEB requesting approval for the disposition of balances in its smart meter deferral account related to smart meter installations in 2008, 2009 and 2010, and incremental revenue related to these assets. On January 16, 2014, the OEB approved LDC's request for incremental revenue and disposition of the smart meter deferral account balances [note 3[a]].

The OEB ruling on smart meters also permitted the recovery in principle of LDC's allowed cost of capital on smart meters since 2008, with a rate order issued to this effect. Accordingly, a new regulatory asset of $25,230,000 has been created to reflect the future amount to be recovered through rates, with a related amount recorded in revenue. For the year ended December 31, 2013, LDC ceased to defer operating and depreciation expenses related to the deployment of the 2008 to 2010 smart meters and recognized revenues as approved by the OEB, resulting in a decrease in the smart meters regulatory asset of $25,025,000, an increase in PP&E of $45,720,000, an increase in intangible assets of $1,066,000, an increase in revenues of $57,482,000, an increase in operating expenses of

$7,105,000, an increase in depreciation and amortization expenses of $28,733,000 and a decrease in net financing charges of $117,000.

The net book value of stranded meters related to the deployment of smart meters has been reclassified from PP&E to regulatory assets, resulting in an increase in regulatory assets of $17,362,000 and a decrease in PP&E of $17,362,000 as at December 31, 2013. Salvage proceeds of $485,000 have been applied to reduce the stranded meters regulatory asset account. LDC expects to apply to the OEB for recovery of the remaining stranded meters costs as part of its 2015 electricity distribution rates application.

In the absence of rate regulation, for the year ended December 31, 2013, revenues relating to smart meters and stranded meters would be $51,474,000 lower [2012 - $5,889,000 higher], operating expenses would be $7,105,000 lower [2012 - $nil impact] and depreciation and amortization expenses would be $25,461,000 lower [2012 - $3,518,000 higher].

d) Settlement Variances

This account is comprised of the variances between amounts charged by LDC to customers, based on regulated rates, and the corresponding cost of non-competitive electricity service incurred by LDC. The settlement variances relate primarily to service charges, non-competitive electricity charges and the global adjustment. Accordingly, LDC has deferred the variances between the costs incurred and the related recoveries in accordance with the criteria set out in the accounting principles prescribed by the OEB. The balance for settlement variances continues to be calculated and attracts carrying charges in accordance with the OEB's direction.

For the year ended December 31, 2013, settlement variances included in the RARA of $nil were disposed through rate adjustments [2012 - $12,249,000].

e) Regulatory Assets Recovery Account

The RARA consists of balances of regulatory assets or regulatory liabilities approved for disposition by the OEB through rate riders. The RARA is subject to carrying charges following the OEB-prescribed methodology and related rates.

On February 22, 2011, the OEB approved the disposition of the Late Payment Penalties Settlement regulatory asset of $7,526,000, over a 21-month period commencing on August 1, 2011 and ending on April 30, 2013.

On April 2, 2013, the OEB approved the disposition of regulatory liabilities of $6,509,000, primarily consisting of PILs regulatory variance accounts, over an 11-month period commencing on June 1, 2013 and ending on April 30, 2014.

f) Deferred Income Taxes

This regulatory liability account relates to the expected future electricity distribution rate reduction for customers arising from timing differences in the recognition of deferred income tax assets [note 4[n]].

As at December 31, 2013, LDC recorded a deferred income tax asset and a corresponding regulatory liability of $155,853,000 [December 31, 2012 - $193,276,000] in respect to its rate-regulated activities that will be included in the rate-setting process.

g) Revision of Prior Year Tax Position

The revision of prior year tax position regulatory liability account relates to a favourable change to certain prior year tax positions based on reassessments received and in process, not reflected in electricity distribution rates charged to customers. As at December 31, 2013, the balance in this account consisted of an over-recovery of PILs from customers of $19,421,000 [December 31, 2012 - $nil].

h) Income and Other Taxes Variance Account

The income and other taxes variance regulatory liability account relates to the differences that have resulted from a legislative or regulatory change to the tax rates or rules assumed in applications for electricity distribution rates. As at December 31, 2013, the balance in this account consisted of an over-recovery of PILs from customers of $2,432,000 [December 31, 2012 - $2,398,000].

10. OTHER ASSETS

Other long-term assets consist of the following:

	2013 $	2012 $
Prepaid expenses	7,103	7,191
Deferred financing costs	905	907
	8,008	8,098

11. RESTRUCTURING

In the first quarter of 2012, the Corporation's Board of Directors approved a workforce restructuring program aimed at reducing operating expenditures for LDC. The program was approved following the decision by the OEB to deny the request of LDC to set its electricity distribution rates for 2012, 2013 and 2014 under the cost of service framework. In preparing its revised application using the IRM framework, LDC concluded that significant cost reductions were necessary to manage its business within the guidelines of the expected allowed electricity distribution rates provided by the IRM framework [note 3[a]]. The main component of these operating cost reduction initiatives was a workforce restructuring program, which included the severance of management employees and a voluntary exit incentive program for targeted unionized positions.

For the year ended December 31, 2013, costs incurred as a result of these operating cost reduction initiatives amounted to $nil [2012 - $27,796,000] and were comprised of ongoing termination charges of $nil and one-time termination incentive charges of $nil [2012 - $23,668,000 and $4,128,000, respectively], of which $nil remains unpaid as at December 31, 2013 [December 31, 2012 - $11,954,000].

12. NOTES PAYABLE TO RELATED PARTIES

Notes payable to related parties consist of the following:

	2013 $	2012 $
Notes payable to related parties:		
6.16% Long-term note payable to the Corporation due May 6, 2013	—	180,000
5.20% Long-term note payable to the Corporation due November 14,	245,058	245,058
4.54% Long-term note payable to the Corporation due November 12,	245,058	245,058
5.59% Long-term note payable to the Corporation due May 21, 2040	200,000	200,000
3.59% Long-term note payable to the Corporation due November 18,	300,000	300,000
2.96% Long-term note payable to the Corporation due April 10, 2023	250,000	—
4.01% Long-term note payable to the Corporation due April 9, 2063	200,000	—
6.16% Long-term note payable to the Corporation due May 6, 2013	—	245,058
6.16% Demand note payable to the Corporation due on demand	45,000	45,000
3.32% Demand note payable to the Corporation due on the earlier of demand and January 1, 2022	15,000	15,000
3.09% Demand note payable to TH Energy due on the earlier of dem and July 1, 2022	—	14,013
Total notes payable to related parties	1,500,116	1,489,187
Less: Unamortized discount/premium	6,917	4,938
Less: Current portion of notes payable to related parties	60,000	498,906
Long-term portion of notes payable to related parties	1,433,199	985,343

All notes payable to related parties of LDC rank equally.

On April 9, 2013, LDC issued a promissory note to the Corporation. The principal amount of the promissory note is $250,000,000, which bears interest at a rate of 2.96% per annum payable on April 10, 2023. Interest is calculated and payable semi-annually in arrears on October 10 and April 10 of each year.

On April 9, 2013, LDC issued a promissory note to the Corporation. The principal amount of the promissory note is $200,000,000, which bears interest at a rate of 4.01% per annum payable on April 9, 2063. Interest is calculated and payable semi-annually in arrears on October 9 and April 9 of each year.

The net proceeds of the promissory notes were mainly used to repay LDC's notes payable to the Corporation which matured on May 6, 2013.

13. EMPLOYEE FUTURE BENEFITS

Pension

LDC's full-time employees participate in a pension plan through OMERS. The plan assets are pooled together to provide benefits to plan participants and are not segregated in separate accounts for each member entity. As at December 31, 2013, the OMERS plan was 88% funded, with a funding deficit of approximately $3,600,000,000. For the year ended December 31, 2013, the total contributions of all participating employers and employees were approximately $3,500,000,000. For the year ended December 31, 2013, LDC's contributions were $18,102,000 [2012 - $16,374,000], representing less than one percent of total contributions to the plan.

For 2013, OMERS contribution rates were 9.0% up to the year's maximum pensionable earnings ["YMPE"] and 14.6% over YMPE for normal retirement age of 65 [2012 – 8.3% up to YMPE and 12.8% over YMPE for normal retirement age of 65].

As at December 31, 2012, OMERS had approximately 266,000 active members. As at December 31, 2013, approximately 1,500 members [December 31, 2012: 2,700] had a current relationship with LDC.

Post-retirement benefits other than pension

a) Benefit Obligations

	2013 $	2012 $
Balance, beginning of year	253,890	244,326
Service cost	4,816	5,035
Interest cost	10,570	11,454
Benefits paid	(10,432)	(8,069)
Actuarial (gain) loss	(20,230)	254
Transfer from related parties	178	890
Balance, end of year	238,792	253,890

On February 13, 2014, LDC's unionized workforce ratified a collective agreement to expire at the end of January 2018. The agreement does not contain terms that create a retirement benefits liability in respect of past service.

b) Amounts recognized in regulatory assets

	2013 $	2012 $
Actuarial loss	38,767	61,477
Prior service cost	14	22
Total recognized in regulatory assets [note 9]	38,781	61,499

As at December 31, 2013, the estimated actuarial loss and prior service cost that are expected to be amortized from regulatory asset to net periodic benefit cost in 2014 are $909,000 and $nil, respectively.

c) Components of net periodic benefit costs

	2013 $	2012 $
Service cost	4,816	5,035
Interest cost	10,570	11,454
Amortization of actuarial loss	2,064	3,146
Amortization of prior service cost	2	840
Net periodic benefit cost	17,452	20,475
Capitalized as part of PP&E	6,623	7,305
Charged to operations	10,829	13,170

d) Expected benefit payments

The following benefit payments, which reflect expected future service, as appropriate, are expected to be paid over the next five years, and in the aggregate for the five fiscal years thereafter:

	Post-retirement Benefits $
2014	8,191
2015	8,403
2016	9,090
2017	9,541
2018	10,112
2019-2023	59,394

e) Significant assumptions

	2013 %	2012 %
Accrued benefit obligation as at December 31:		
Discount rate	4.75	4.25
Benefit costs for years ended December 31:		
Discount rate	4.25	4.75
Assumed health care cost trend rates as at December 31:		
Rate of increase in dental costs assumed for next year	4.00	4.00
Rate of increase in medical costs assumed for next year		
For pre July 2000 retirements	6.00	6.50
For other retirements	7.50	8.00
Rate that medical cost trend rate gradually declines to		
For pre July 2000 retirements	5.00	5.00
For other retirements	5.00	5.00
Year that the medical cost trend rate reaches the ultimate trend rate		
For pre July 2000 retirements	2016	2016
For other retirements	2019	2019

f) Sensitivity analysis

Assumed medical and dental care cost trend rates have a significant effect on the amounts reported for medical and dental care plans. A one-percentage-point change in assumed medical and dental care cost trend rates would have the following effects for 2013:

	Increase $	Decrease $
Total of current service and interest cost (at 4.25%)	2,327	(2,046)
Accrued benefit obligation as at December 31, 2013 (at 4.75%)	30,388	(26,664)

Assumed interest rates have a significant effect on the amounts reported for the total accrued benefit obligation and expense. A one-percentage-point change in assumed interest rates would have the following effects:

	Increase $	Decrease $
Accrued benefit obligation as at December 31, 2013	(37,041)	45,469
Estimated net periodic benefit cost for 2014	(1,713)	2,937

14. ASSET RETIREMENT OBLIGATIONS

The reconciliation between the opening and closing ARO liability balances is as follows:

	2013 $	2012 $
Balance, beginning of year	5,004	4,831
ARO liabilities settled in the year	(573)	(313)
Accretion expense	177	170
Revision in estimated cash flows	1,639	316
Balance, end of year	6,247	5,004

15. FINANCIAL INSTRUMENTS

a) Recognition and measurement

As at December 31, 2013 and December 31, 2012, the fair values of cash and cash equivalents, net accounts receivable, unbilled revenue, advance from related party, and accounts payable and accrued liabilities approximate their carrying values due to the short maturity of these instruments [note 4[i]]. The fair values of customers' advance deposits approximate their carrying values taking into account interest accrued on the outstanding balance. Obligations under capital lease are measured based on a discounted cash flow analysis and approximate the carrying value as management believes that the fixed interest rates are representative of current market rates.

The carrying value and fair value of LDC's notes payable consist of the following:

	2013 $		2012 $	
	Carrying value	Fair value [1]	Carrying value	Fair value [1]
Long-term notes payable to the Corporation				
6.16% due May 6, 2013	—	—	179,835	182,999
5.20% due November 14, 2017	244,453	269,601	244,316	278,314
4.54% due November 12, 2019	244,089	265,186	243,948	274,786
5.59% due May 21, 2040	198,747	226,700	198,727	256,357
3.59% due November 18, 2021	298,511	302,837	298,352	316,935
2.96% due April 10, 2023	248,701	232,888	—	—
4.01% due April 9, 2063	198,698	172,863	—	—
6.16% due May 6, 2013	—	—	245,058	249,174
Demand note payable to the Corporation due on demand	45,000	45,000	45,000	45,754
Demand note payable to the Corporation due on the earlier of demand and January 1, 2022	15,000	15,000	15,000	15,489
Demand note payable to TH Energy due on the earlier of demand and July 1, 2022	—	—	14,013	14,043

[1] The fair value measurement of financial instruments for which the fair value has been disclosed is included in Level 2 of the fair value hierarchy.

b) Financial Risks

The following is a discussion of financial risks and related mitigation strategies that have been identified by LDC for financial instruments. This is not an exhaustive list of all risks, nor will the mitigation strategies eliminate all risks listed.

LDC is exposed to a variety of financial risks, particularly credit risk, interest rate risk and liquidity risk.

Credit risk

LDC is exposed to credit risk as a result of the risk of counterparties defaulting on their obligations. LDC's exposure to credit risk primarily relates to accounts receivable and unbilled revenue. LDC monitors and limits its exposure to credit risk on a continuous basis.

LDC's credit risk associated with accounts receivable is primarily related to electricity bill payments from customers. LDC has approximately 730,000 customers. LDC obtains security instruments from certain customers in accordance with direction provided by the OEB. As at December 31, 2013, LDC held security deposits in the amount of $44,649,000 [December 31, 2012 - $46,088,000], of which $22,211,000 [December 31, 2012 - $25,666,000] were related to security deposits on Offers to Connect to guarantee the payment of additional costs relating to expansion projects. As at December 31, 2013, there were no significant concentrations of credit risk with respect to any customer.

LDC did not have any single customer that generated more than 10% of total revenues for the years ended December 31, 2013 and December 31, 2012.

Credit risk associated with accounts receivable and unbilled revenue is as follows:

	2013 $	2012 $
Unbilled revenue	326,111	274,272
Accounts receivable		
Outstanding for not more than 30 days	175,124	164,523
Outstanding for more than 30 days and not more than 120 days	22,791	18,214
Outstanding for more than 120 days	11,874	13,772
Less: Allowance for doubtful accounts	(10,766)	(10,568)
Total accounts receivable, net	199,023	185,941
Total accounts receivable and unbilled revenue	525,134	460,213

Reconciliation between the opening and closing allowance for doubtful accounts balances is as follows:

	2013 $	2012 $
Balance, beginning of year	(10,568)	(12,810)
Provision for doubtful accounts	(7,805)	(6,590)
Write-offs	8,130	9,242
Recoveries	(523)	(410)
Balance, end of year	(10,766)	(10,568)

Unbilled revenue represents amounts for which LDC has a contractual right to receive cash through future billings and are unbilled at period-end. Unbilled revenue is considered current and no allowance for doubtful accounts had been provided as at December 31, 2013 and December 31, 2012.

The credit risk related to cash, cash equivalents and investments is mitigated by LDC's treasury policies on assessing and monitoring the credit exposures of counterparties. LDC's maximum exposure to credit risk is approximately equal to the carrying value of its financial assets.

Interest rate risk

LDC is exposed to fluctuations in interest rates for the valuation of its post-retirement benefit obligations [Note 13[f]]. LDC is also exposed to short-term interest rate risk on the net of cash and cash equivalents, advances from related party, and customers' advance deposits. LDC manages interest rate risk by monitoring the mix of fixed and floating rate instruments, and taking action as necessary to maintain an appropriate balance. Advances from related party bear interest based on the prevailing market conditions at the time of issuance.

As at December 31, 2013, aside from the valuation of its post-retirement benefit obligations, LDC was exposed to interest rate risk predominately from advances from the Corporation, while most of its remaining obligations were either non-interest bearing or bear fixed interest rates, and its financial assets were predominately short-term in nature and mostly non-interest bearing. LDC estimates that a 100 basis point increase (decrease) in short-term interest rates, with all other variables held constant, would result in an increase (decrease) of approximately $1,800,000 to annual net financing charges.

Liquidity risk

LDC is exposed to liquidity risk related to its ability to fund its obligations as they become due. LDC monitors and manages its liquidity risk to ensure access to sufficient funds to meet operational and investing requirements. LDC has access to credit facilities and borrowings through the Corporation and monitors cash balances daily. LDC's

objective is to ensure that sufficient liquidity is on hand to meet obligations as they fall due while minimizing net financing charges.

Liquidity risks associated with financial commitments are as follows:

December 31, 2013						
	Due within 1 year $	Due within 2 years $	Due within 3 years $	Due within 4 years $	Due within 5 years $	Due after 5 years $
Financial liabilities						
Advance from related party	150,000	—	—	—	—	—
Accounts payable and accrued liabilities	455,752	—	—	—	—	—
Obligations under capital lease	2,537	2,537	2,537	2,537	1,270	—
Long-term notes payable to the Corporatio						
5.20% due November 14, 2017	—	—	—	245,058	—	—
4.54% due November 12, 2019	—	—	—	—	—	245,058
5.59% due May 21, 2040	—	—	—	—	—	200,000
3.59% due November 18, 2021	—	—	—	—	—	300,000
2.96% due April 10, 2023	—	—	—	—	—	250,000
4.01% due April 9, 2063	—	—	—	—	—	200,000
Demand note payable to the Corporation o on demand	45,000	—	—	—	—	—
Demand note payable to the Corporation o on the earlier of demand and January 2022	15,000	—	—	—	—	—
Interest payments on long-term not payable and demand notes payable[(1)]	50,466	61,239	61,239	61,239	48,496	673,996
	718,755	63,776	63,776	308,834	49,766	1,869,054

(1) The "Due within 1 year" column excludes $10,773,000 of interest on long-term notes payable and demand notes payable that was accrued as at December 31, 2013.

Foreign exchange risk

As at December 31, 2013, LDC had limited exposure to changing values of foreign currencies. While LDC purchases goods and services which are payable in US dollars, and purchases US currency to meet the related commitments when required, the impact of these transactions is not material to the financial statements.

16. FINANCIAL ASSISTANCE

As at December 31, 2013, $48,388,000 [December 31, 2012 - $48,388,000] was utilized under the Corporation's demand credit facility in the form of letters of credit to satisfy the prescribed prudential requirements of LDC with the IESO for the purchase of electricity. As at December 31, 2013, an additional amount of $761,000 [December 31, 2012 - $761,000] was utilized for the Ministry of Finance of Ontario, and $905,000 [December 31, 2012 - $nil] was utilized to satisfy requirements of the City in relation to Copeland Station.

17. INCOME TAXES

LDC's effective tax rate for the year ended December 31, 2013 was 2.63% [2012 – 3.62%]. Income tax expense for the year ended December 31, 2013 was $3,123,000 [2012 - $3,125,000]. The effective tax rate and income tax

expense for the year ended December 31, 2013 were lower than those for the year ended December 31, 2012 due to changes in permanent and temporary differences between accounting and tax treatments.

Income tax expense differs from the amount that would have been recorded using the combined statutory Canadian federal and Ontario income tax rate. Reconciliation of income tax expense computed at the statutory income tax rate to the income tax provision is set out below:

Statements of Net Income and Comprehensive Income

	2013 $	2012 $
Rate reconciliation		
Income before income taxes	118,862	86,314
Statutory Canadian federal and provincial income tax rate	26.50%	26.50%
Expected income tax expense	31,498	22,873
Temporary differences not benefited	(20,186)	(16,133)
Change in unrecognized tax benefits	(5,051)	(1,771)
Impact of change in expected future tax rate on existing deferred incon balances	—	(923)
Other	(3,138)	(921)
Income tax expense	3,123	3,125
Effective tax rate	2.63%	3.62%
Components of income tax expense		
Current tax	5,265	6,011
Deferred income tax related to the origination and reversal of temporary differences	(48)	(245)
Non-refundable ITCs	(2,094)	(2,641)
Income tax expense	3,123	3,125

Balance Sheets

Significant components of LDC's deferred income tax assets are as follows:

	2013 $	2012 $
PP&E and intangible assets	64,518	82,604
Post-retirement benefits liability	53,003	50,667
Regulatory adjustments	41,301	51,218
Other taxable temporary differences	(2,955)	8,753
Deferred income tax assets	155,867	193,242

A reconciliation of the beginning and ending amount of unrecognized tax benefits is as follows:

	2013 $	2012 $
Balance, beginning of year	5,274	7,045
Increases for tax positions taken in the current year	18	248
Decreases for tax positions taken in prior years	(1,603)	(38)
Settlements with tax authorities	(3,466)	(1,981)
Balance, end of year	223	5,274

As at December 31, 2013, $223,000 of unrecognized tax benefits [December 31, 2012 - $274,000] would have a favourable effect on the effective tax rate, if recognized. No interest and penalties have been accrued, since LDC is of the view that none are expected to be payable. During the next 12 months, unrecognized tax benefits are not expected to significantly change.

As at December 31, 2013, LDC's tax years currently open to examination by tax authorities include 2007 and subsequent years. Other than in respect of the fair market revaluation of LDC's assets on October 1, 2001 pursuant to Section 7 of Ontario Regulation 162/01 of the Electricity Act, tax years prior to 2007 are closed to further examination.

18. SHARE CAPITAL

Share capital consists of the following:

	2013 $	2012 $
Authorized		
The authorized share capital of LDC consists of an unlimited number of common shares without par value		
Issued and outstanding		
1,000 common shares	556,278	556,278

Dividends

For the year ended December 31, 2013, the Board of Directors of LDC declared and paid dividends totalling $40,000,000 [2012 - $nil] to the Corporation.

19. RELATED PARTY TRANSACTIONS

For LDC, transactions with related parties include transactions with the City, which wholly owns the Corporation, the Corporation and TH Energy, a wholly-owned subsidiary of the Corporation. All transactions with related parties are conducted on terms similar to those offered to unrelated parties.

2013	City $	Corporation $	TH Energy $
Revenues	235,846	—	340
Operating expenses (recoveries) and capital expenditures	31,859	3,137	(863)
Net financing charges	—	69,136	270
Dividends	—	40,000	—
Accounts receivable	2,131	—	—
Unbilled revenue	19,425	—	—
Advance from related party	—	150,000	—
Accounts payable and accrued liabilities	45,152	11,565	—
Current portion of notes payable to related parties	—	60,000	—
Long-term portion of notes payable to related parties	—	1,433,199	—
Advance deposits	8,816	—	—

2012	City $	Corporation $	TH Energy $
Revenues	210,835	—	324
Operating expenses (recoveries) and capital expenditures	26,232	3,035	(1,029)
Net financing charges	—	75,303	433
Accounts receivable	5,603	—	14,271
Unbilled revenue	4,350	—	9,268
Accounts payable and accrued liabilities	38,013	11,426	433
Current portion of notes payable to related parties	—	484,893	14,013
Long-term portion of notes payable to related parties	—	985,343	—
Advance deposits	8,926	—	—

Revenues represent amounts charged to the City primarily for electricity, street lighting and ancillary services, and TH Energy for demand billable services. Operating expenses and capital expenditures represent amounts charged by the City for purchased road cut repairs, property taxes and other services, and the Corporation for purchased corporate and management services. Operating expense recoveries represent amounts charged to TH Energy for the provision of goods and services. Net financing charges represent interest charged by the Corporation and TH Energy on the advances and notes payable [note 12]. Dividends are paid to the Corporation [note 18].

Accounts receivable represent receivables from the City primarily for electricity and ancillary services, and TH Energy for the provision of goods and services, including electricity billing activities. Unbilled revenue represents receivables from the City and TH Energy related to electricity provided and not yet billed. Advance from related party represents amounts payable to the Corporation for short-term borrowings obtained under the Corporation's revolving credit facility and commercial paper program. Accounts payable and accrued liabilities represent amounts payable to the City related to road cut repairs and other services, as well as amounts received from the City for the construction of electricity distribution assets. Included in the accounts payable and accrued liabilities are amounts payable to the Corporation for purchased corporate and management services and interest accruing on the notes payable to the Corporation and TH Energy. Notes payable to related parties represent amounts borrowed from the Corporation and TH Energy [note 12]. Advance deposits represent amounts received from the City for future expansion projects.

On January 1, 2012, certain electricity distribution assets of TH Energy were transferred to LDC through a newly created wholly-owned legal entity (1798594 Ontario Inc.) of the Corporation. Immediately thereafter, the new legal entity was amalgamated with LDC. The transfer was completed for a purchase price of $28,460,000, with a post closing adjustment of $14,013,000. The transfer was initially financed with share capital issued by the new wholly-owned legal entity to the Corporation. Subsequently, LDC issued an intercompany note payable to TH Energy for the increase in the purchase price. On August 16, 2013, the principal amount of the note was repaid to TH Energy.

20. COMMITMENTS

Operating leases and capital projects

As at December 31, 2013, the future minimum annual payments under property operating leases, capital projects and other commitments with remaining terms from one to five years and thereafter were as follows:

	Operating leases $	Capital projects [2] and other $
2014	6,175	79,797
2015	6,186	2,772
2016	5,784	—
2017	2,123	—
2018	—	—
Thereafter	—	—
Total amount of future minimum payments [1]	20,268	82,569

[1] Refer to note 15 for repayments of notes payable and advance from related party excluded from the table above.
[2] Reflects capital project commitments for construction services and estimated capital contributions, with the majority related to Copeland Station.

LDC has the option to renew its two major property operating leases at the end of the current lease term for an additional five years at the then fair rental value.

Operating lease expense for the year ended December 31, 2013 was $6,132,000 [2012 - $6,547,000].

Subsequent to December 31, 2013, LDC entered into capital commitments of approximately $21,000,000 for capital contributions payable to Hydro One Networks Inc. over the next year in respect of Copeland Station.

Capital leases

As at December 31, 2013, the future minimum annual lease payments under capital leases with remaining lease terms from one to five years and thereafter were as follows:

	$
2014	2,537
2015	2,537
2016	2,537
2017	2,537
2018	1,270
Thereafter	—
Total amount of future minimum lease payments	11,418
Less: interest and executory costs	1,143
	10,275
Current portion included in Other liabilities	2,100
Long-term portion included in Other liabilities	8,175

21. CONTINGENCIES

a) Legal Proceedings

In the ordinary course of business, LDC is subject to various legal actions and claims with customers, suppliers, former employees and other parties. On an ongoing basis, LDC assesses the likelihood of any adverse judgments or outcomes as well as potential ranges of probable costs and loss. A determination of the provision required, if any, for these contingencies is made after an analysis of each individual issue. The provision may change in the future due to new developments in each matter or changes in approach, such as a change in settlement strategy. If damages were awarded under these actions, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with these actions.

2 Secord Avenue

An action was commenced against LDC in September 2008 in the Ontario Superior Court of Justice under the Class Proceedings Act, 1992 (Ontario) seeking damages in the amount of $30,000,000 as compensation for damages allegedly suffered as a result of a fire and explosion in an underground vault at 2 Secord Avenue on July 20, 2008. This action is at a preliminary stage. The statement of claim has been served on LDC, a statement of defence and third party claim have been served by LDC and a third party defence and counterclaim against LDC seeking damages in the amount of $51,000,000 have been filed. A certification order has been issued. Affidavits of documents have been produced by LDC to the other parties and examinations for discovery have commenced and are continuing. A mediation took place on January 15, 2014 and the parties have agreed to settle the action of the class plaintiffs by the payment by LDC of the total amount of $6,527,000, including all taxes and legal fees, subject to approval by the Ontario Superior Court of Justice. LDC will make a claim under its liability insurance which LDC believes will cover the settlement payment. A settlement approval hearing will be scheduled. If the settlement is approved by the court, the main action commenced by the class plaintiffs will be dismissed without costs, however the claims, counterclaims and third party claims amongst the various defendants to the class action will continue. Given the preliminary status of the remaining unsettled actions, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

On December 20, 2010, LDC was served with a statement of claim by the City seeking damages in the amount of $2,000,000 as a result of the fire at 2 Secord Avenue. A statement of defence and a third party claim have been served. Given the preliminary status of this action, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

By order of the court dated January 24, 2012, the above actions and a smaller non-class action commenced in April 2009 involving the same incident will be tried at the same time or consecutively.

2369 Lakeshore Boulevard West

A third party action was commenced against LDC in October 2009 in the Ontario Superior Court of Justice under the Class Proceedings Act, 1992 (Ontario) seeking damages in the amount of $30,000,000 as compensation for damages allegedly suffered as a result of a fire in the electrical room at 2369 Lakeshore Boulevard West on March 19, 2009. Subsequently, in March 2010, the plaintiff in the main action amended its statement of claim to add LDC as a defendant. The plaintiff in the main action seeks general damages in the amount of $10,000,000 and special damages in the amount of $20,000,000 from LDC. The proposed class action is at a preliminary stage. The plaintiff cancelled its certification motion set for November 2013 and advised it intends to reschedule. Cross-examinations for a certification motion have commenced, but have not been completed. Statements of defence to the main action and to the third party claim have not been filed. Given the preliminary status of these actions, it is not possible at this time to reasonably quantify the effect, if any, of these actions on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with these actions.

On August 29, 2011, LDC was served with a statement of claim by the owner of the building and the property management company for the building seeking damages in the amount of $2,000,000 as a result of the fire at 2369 Lakeshore Boulevard West. LDC has filed a statement of defence and counterclaim. Given the preliminary status of this action, it is not possible to reasonably quantify the effect, if any, of this action on the financial performance of LDC. If damages were awarded, LDC would make a claim under its liability insurance which LDC believes would cover any damages which may become payable by LDC in connection with the action.

b) OEB PILs Proceeding

The OEB conducted a review of the PILs variances accumulated in regulatory variance accounts for the period from October 1, 2001 to April 30, 2006 for certain MEUs. On June 24, 2011, the OEB issued its decision for these MEUs and provided guidelines for the calculation and further disposition of the balances accumulated in the PILs regulatory variance accounts.

LDC reviewed the balance of its PILs regulatory variance accounts and applied the guidelines provided by the OEB. LDC applied for disposition of the balance as part of its IRM/ICM Application filed on May 10, 2012. The OEB issued its decision and order on April 2, 2013 approving the disposition of the balance. The impact was recorded previously in LDC's financial statements.

22. NET FINANCING CHARGES

Net financing charges consist of the following:

	2013 $	2012 $
Interest income	2,196	895
Interest expense		
Long-term debt[1]	(70,359)	(76,596)
Other interest	(4,029)	(2,833)
AFUDC	3,322	2,325
	(68,870)	(76,209)

(1) Includes amortization of debt issuance costs, premiums and discounts.

23. STATEMENTS OF CASH FLOWS

Changes in non-cash working capital provided/(used) cash as follows:

	2013 $	2012 $
Accounts receivable	(13,082)	5,515
Unbilled revenue	(51,839)	(11,983)
Income tax receivable	4,368	3,974
Inventories	(1,011)	(664)
Other current assets	(4,174)	(276)
Accounts payable and accrued liabilities	44,845	(9,356)
Restructuring accrual	(11,954)	11,954
Deferred conservation credit	112	6,298
Other current liabilities	195	(332)
	(32,540)	5,130

The reconciliation between total additions to PP&E and the amount presented on the statements of cash flows after factoring in the non-cash additions is as follows:

	2013 $	2012 $
Purchase of PP&E, cash basis	355,232	302,198
Net change in accruals related to PP&E	32,959	(12,131)
Capital lease additions	305	—
ARO additions	1,669	377
Capitalized overhead costs	2,315	1,620
Total additions to PP&E	392,480	292,064

24. Comparative Figures

Certain comparative figures have been reclassified from financial statements previously presented to conform to the presentation of the 2013 financial statements. During the fourth quarter of 2013, LDC changed its presentation of the statements of cash flows for the net change in regulatory assets and liabilities from investing activities to operating activities. Prior year comparatives have been retrospectively reclassified with $14,581,000 previously presented as investing activities for the year ended December 31, 2012 reclassified to operating activities.

RECONCILIATIONS

In accordance with section 2.4.3 of the OEB's Filing Requirements (July 17, 2013), this schedule provides reconciliations of the financial results shown in the Audited Financial Statements with the regulatory financial results filed under Section 2.1.13 of the OEB's Reporting and Record Keeping Requirements for years 2011 through 2013:

- Appendix A: 2011 Reconciliation;
- Appendix B: 2012 Reconciliation; and
- Appendix C: 2013 Reconciliation.

Notes:

Note 1: HST Adjustment: In the Financial statement, THESI has booked the HST to the HST / OVAT Input Tax Credits (ITCs) variance account with offset entry to distribution revenue. For RRR Reporting, THESI has booked HST to the HST / OVAT Input Tax Credits (ITCs) variance account with offset entry to HST/OVAT Contra Account accounts as per the OEB guidelines. The adjustment entry is, HST/OVAT Contra Account (Dr.) $1,118k, Distribution Revenue (Cr.) $367k, Misc. Interest (Cr.) $15k and Retained Earning (Cr.) 736k.

Note 2: Global Adjustment (GA): Per Corporate Accounting Policy "GA Charge for Regulated Price Plan (RPP) Customers" for regulatory reporting COP expense and COP revenues shall exclude the GA COP charge for RPP customers. The adjustment is a decrease to COP expense and a decrease to COP revenue in the amount of $402,049k.

Note 3: $2,388k towards Financing Cost ($1,967k) and interest on customer advance deposits ($421k) are reclass to OM&A for the RRR.

Note 4: Special Purpose Charge (SPC) In the Audited Financial Statements (AFS) THESI had ($3,050k) as SPC recovered balances For the purpose of OEB RRR filing, the SPC recovery is booked in OEB account 4324 " Special Purpose Charge Recovery" and the SPC expense is booked in OEB account 5681 "Special purpose charge expense".

Notes:

Note 1: HST Adjustment: In the Financial statement, THESL has booked the HST to the HST / OVAT Input Tax Credits (ITCs) variance account with offset entry to interest expenses. For RRR Reporting, THESL has booked HST to the HST / OVAT Input Tax Credits (ITCs) variance account with offset entry to HST/OVAT Contra Account account as per the OEB guidelines. The amount for 2011 is $1,118k and 2012 is $16k. The adjustment entry is, HST/OVAT Contra Account (Dr.) $1,134k, Misc. Interest (Cr.) $16k and Retained Earning (Cr.) 1,118k.

Note 2: Global Adjustment (GA): Per Corporate Accounting Policy "GA Charge for Regulated Price Plan (RPP) Customers" for regulatory reporting COP expense and COP revenue shall exclude the GA COP charge for RPP customers. The "adjustment" is a decrease to COP expense and a decrease to COP revenue in the amount of $486,009k.

Note 3: Demand Billable Charges: As per USGAAP, THESL book demand billable charges on gross based while for RRR it is shown on net bases.

Toronto Hydro-Electric System Limited
Balance Sheet
As at December 31, 2013

Notes:

Note 1: Difference in "Regulatory assets" of $30,144: Calculated Audited Financial Statement (AFS) Regulated balance of $234,424 & RRR balance of $204,280, a difference of ($30,144), as follows:	
a. A "Smart meter recovery" regulatory asset (RA) was booked for AFS, and is not considered a regulatory asset for purposes of RRR reporting:	$25,230
b. Incremental Capital Model (ICM) revenue and depreciation expense contra account RA were booked for the AFS, and this not considered a regulatory asset for purposes of RRR reporting:	$4,914
Total difference:	$30,144
Note 2: Difference in "Accounts payable and accrued liabilities" of $19,421: Calculated AFS Regulated balance of ($451,802) & RRR balance of ($471,223), a difference of $19,421, as follows:	
a. A "Revision of prior year tax position" regulatory liability (RL) was booked for AFS, and is not considered a regulatory liability for purposes of RRR reporting: For RRR Reporting, the amount was transferred to OEB account 2220 "Miscellaneous Current and Accrued Liabilities" from Regulatory Liabilities.	19,421
Note 3: Difference in "Regulatory liabilities" of ($20,616): Calculated AFS Regulated balance of ($180,617) & RRR balance of ($160,001) a difference of ($20,616), as follows:	
a. A Revision of prior year tax position" regulatory liability (RL) was booked for AFS, and is not considered a regulatory liability for purposes of RRR reporting: For RRR Reporting, the amount was transferred to OEB account 2220 "Miscellaneous Current and Accrued Liabilities" from Regulatory Liabilities.	$19,421
b. HST Contra account adjustment: In prior years' AFS, THESI has booked to the OEB account 1592, "PILs and Tax Variances for 2006 and Subsequent Years, Sub-account HST / OVAT Input Tax credits (ITCs)' the ITCs savings arising from the elimination of Provincial Sales Tax and implementation of the HST on July 1, 2010. For AFS purposes, the offsetting entry was booked to the income statement rather the regulatory sub-account established a contra account within Account 1592, "PILs and Tax Variances for 2006 and subsequent years - HST/OVAT Contra Account" of Account 1592. The following adjustment has been made to the AFS to reflect for RRR Reporting the amount in the above mentioned contra account: The adjustment entry is, HST/OVAT Contra Account (Dr.) $1,150k, Misc. Interest (Cr.) $16k and Retained Earnings (Cr.) 1,134k.	$1,150
c. For RRR reporting, THESI has written off to Distribution revenue a credit amount of $44, which was included in regulatory liabilities in the AFS. The amount does not represent a regulatory liability for RRR reporting:	$44
Total difference:	$20,616
Note 4: Difference in "Retained Earnings' of ($28,950): Calculated AFS Regulated balance of ($606,111) & RRR balance of ($577,161) a difference of ($28,950). Adjustments have been made to certain AFS income statement items to arrive at the RRR reporting as follows:	
a. Reduction to AFS Distribution revenue booked for SmartMeter "net revenue requirement" on the disposition of Account 1555 "SmartMeter Capital & Recovery' and 1556 "SmartMeter OM&A Variance account" balances. The amount shall be booked to Distribution revenue for RRR reporting, to OEB account 4080 as the amount is billed to THESI customers in the future:	$25,230
b. Reverse the ICM revenue and related depreciation expense booked in 2013 in the AFS. This ICM revenue and depreciation expense shall be booked for RRR reporting in the future under regulatory prescribed ICM accounting treatment:	$4,914
c. HST Contra account adjustment: In prior years' AFS, THESI has booked to the OEB account 1592, "PILs and Tax Variances for 2006 and Subsequent Years, Sub-account HST / OVAT Input Tax credits (ITCs)' the ITCs savings arising from the elimination of Provincial Sales Tax and implementation of the HST on July 1, 2010. For AFS purposes, the offsetting entry was booked to the income statement rather the regulatory sub-account established a contra account within Account 1592, "PILs and Tax Variances for 2006 and subsequent years - HST/OVAT Contra Account" of Account 1592. The following adjustment has been made to the AFS to reflect for RRR Reporting the amount in the above mentioned contra account: The adjustment entry is, HST/OVAT Contra Account (Dr.) $1,150k, Misc. Interest (Cr.) $16k and Retained Earnings (Cr.) 1,134k.	1,150
d. For RRR reporting, THESI has written off to Distribution revenue a credit amount of $44, which was included in regulatory liabilities in the AFS. The amount does not represent a regulatory liability for RRR reporting:	44
Total difference:	$28,950

Notes:

Note 1: Difference in "Sale of electricity" of ($65,238): Calculated Audited Financial Statement (AFS) Regulated balance of ($3,145,455) & RRR balance of ($3,080,217), a difference of ($65,238), as follows:	
a. A "Smart meter recovery" regulatory asset (RA) was booked for AFS, with the offsetting entry to Distribution revenue. This is not considered a regulatory asset for purposes of RRR reporting, and the RA and related distribution revenue have been reversed for RRR reporting:	$25,230
b. For RRR Reporting, THESI booked to "Cost of Power revenue" and "COP expense" the amount of the IESO settlement invoices charge type 142, in the amounts of $33,346 and ($33,346), respectively.	$33,346
For the AFS, THESI does not book IESO settlement invoices charge type 142 to either COP revenue or COP expense.	
c. An Incremental Capital Model (ICM) revenue contra account Regulatory Asset (RA) was booked for the AFS, with an offsetting entry to Distribution revenue. This is not considered a regulatory asset for purposes of RRR reporting. The RA and related Distribution revenue have been reversed for RRR reporting:	$6,706
d. For RRR reporting, THESI has written off to Distribution revenue a credit amount of $44, which was included in regulatory liabilities in the AFS. The amount does not represent a regulatory liability for RRR reporting:	$44
Total difference:	$65,238

Note 2: Difference in "Other income" of ($8,240): Calculated AFS Regulated balance of ($36,042) & RRR balance of ($27,802), a difference of ($8,240), as follows:	
a. Demand Billable Charges. As per USGAAP, THESI booked demand billable charges on a gross basis while for RRR it is reported on a net basis:	$12,194
b. Smart Metering Entity charge: As per USGAAP, THESI books the Smart Metering entity revenue and charge on a net basis, while for RRR it is booked on a gross basis, in the prescribed regulatory accounts 4076 "Billed Smart Metering Entity Charge" and 4751 "Charges Smart Metering Entity Charge":	$3,954
Total difference:	$8,240

Note 3: Difference in "Purchased power" of $33,346: Calculated AFS Regulated balance of $2,567,512 & RRR balance of $2,534,165 a difference of $33,346, as follows:	
a. For RRR Reporting we booked to "Cost of Power revenue" and "COP expense" the amount of the IESO settlement invoices charge type 142, in the amounts of $33,346 and ($33,346), respectively.	
For the AFS, THESI does not book IESO settlement invoices charge type 142 to either COP revenue or COP expense:	$33,346

Note 4: Difference in "Operating expenses" of $8,240: Calculated AFS Regulated balance of $258,416 and RRR balance of $250,176, a difference of $8,240, as follows:	
a. Demand Billable Charges. As per USGAAP, THESI booked demand billable charges on a gross basis while for RRR it is reported on a net basis:	$12,194
b. Smart Metering Entity charge: As per USGAAP, THESI books the Smart Metering entity revenue and charge on a net basis, while for RRR it is booked on a gross basis, in the prescribed regulatory accounts 4076 "Billed Smart Metering Entity Charge" and 4751 "Charges Smart Metering Entity Charge":	$3,954
Total difference:	$8,240

Note 5: Difference in "Depreciation and amortization" of $1,792: Calculated AFS Regulated balance of $169,487 & RRR balance of $167,695, a difference of $1,792, as follows:	
a. An Incremental Capital Model (ICM) depreciation contra account Regulatory Asset (RA) was booked for the AFS, with an offsetting entry to Depreciation expense. This is not considered a regulatory asset for purposes of RRR reporting. The RA and related depreciation expense have been reversed for RRR reporting:	$1,792

Note 6: Difference in "Net Financing Charges" of $16: Calculated AFS Regulated balance of $68,731 & RRR balance of $68,715, a difference of $16, as follows:	$16

a. HST Contra account adjustment: In prior years' AFS, THESI has booked to the OEB account 1592, "PILs and Tax Variances" for 2006 and Subsequent Years, Sub-account HST / OVAT Input Tax credits (ITCs) 'the ITCs savings arising from the elimination of Provincial Sales Tax and implementation of the HST on July 1, 2010.
For AFS purposes, the offsetting entry was booked to the income statement rather the regulatory sub-account established, a contra account within Account 1592, "PILs and Tax Variances for 2006 and subsequent years - HST/OVAT Contra Account" of Account 1592.
The following adjustment has been made to the AFS to reflect for RRR Reporting the amount in the above-mentioned contra account:
The adjustment entry is, HST/OVAT Contra Account (Dr.) $1,150k, Misc. Interest (Cr.) $16k and Retained Earnings (Cr.) 1,134k.

MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS FOR THE THREE MONTHS AND YEARS ENDED DECEMBER 31, 2013 AND 2012

Executive Summary

- Net income for the three months and year ended December 31, 2013 was $29.2 million and $121.2 million, compared to net income of $22.8 million and $86.0 million for the comparable periods in 2012;
- capital expenditures were primarily related to the renewal of the electricity infrastructure of LDC and were $151.6 million and $450.3 million for the three months and year ended December 31, 2013, compared to $108.5 million and $292.4 million for the comparable periods in 2012;
- on December 19, 2013, the OEB approved a settlement agreement filed by LDC to allow for the entirety of LDC's requested 2014 capital program;
- on January 16, 2014, the OEB approved LDC's request for disposition of the smart meter deferral account balances, permitting the recovery of $23.9 million and $6.9 million through two separate rate riders effective May 1, 2014;
- in December 2013, the Ice Storm caused damage to the above-ground infrastructure of the Corporation's electricity distribution system resulting in power outages throughout the City;
- on May 22, 2013, the Corporation celebrated the official groundbreaking at Copeland Station, and construction continued during the year;
- on December 17, 2013, the Corporation launched a commercial paper program allowing up to $400.0 million of unsecured short-term promissory notes to be issued in various maturities of no more than one year; and
- on April 9, 2013, the Corporation issued $250.0 million of 2.91% senior unsecured debentures due April 10, 2023 ("Series 8") and $200.0 million of 3.96% senior unsecured debentures due April 9, 2063 ("Series 9"). The net proceeds of the above debentures, together with borrowings under the Corporation's revolving credit facility, were used to repay the Corporation's $225.0 million of 6.11% senior unsecured debentures ("Series 1") and $245.1 million of 6.11% senior unsecured debentures ("Series 5") which matured on May 7, 2013 and May 6, 2013, respectively.

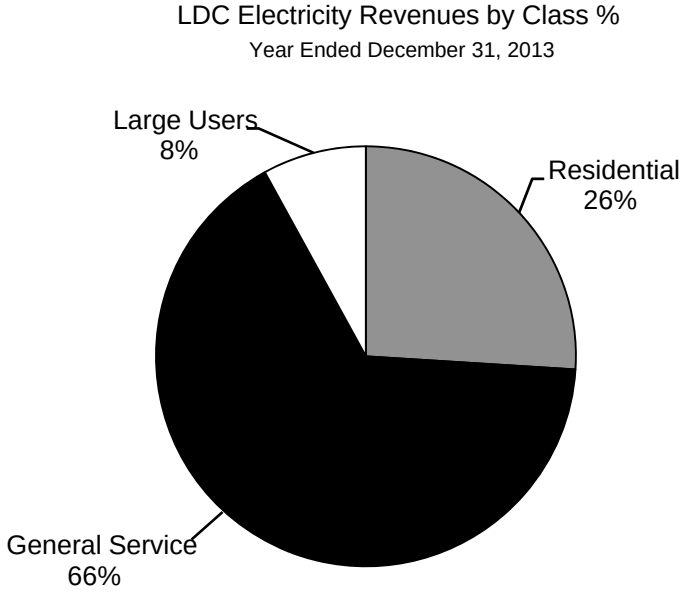
Introduction

The following MD&A should be read in conjunction with:

- the audited consolidated financial statements and accompanying notes of the Corporation as at and for the years ended December 31, 2013 and 2012 ("Consolidated Financial Statements"); and

- the audited consolidated financial statements and accompanying notes of the Corporation as at and for the years ended December 31, 2012 and 2011.

Copies of these documents are available on the System for Electronic Document Analysis and Retrieval website at www.sedar.com.



The Corporation's above noted annual consolidated financial statements have been prepared in accordance with US GAAP and are presented in Canadian dollars (see "Significant Accounting Policies" below). The OSC granted an exemption to allow the Corporation to file financial statements under US GAAP for the years commencing on or after January 1, 2012 but before January 1, 2015.

Business of Toronto Hydro Corporation

The Corporation is a holding company which wholly owns two subsidiaries:

- LDC - which distributes electricity and engages in CDM activities; and
- TH Energy- which provides street lighting services.

The principal business of the Corporation and its subsidiaries is the distribution of electricity by LDC. LDC owns and operates an electricity distribution system, which delivers electricity to approximately 730,000 customers located in the City. The City is the sole shareholder of the Corporation. LDC is the largest municipal electricity distribution company in Canada and distributes approximately 18% of the electricity consumed in Ontario. The business of LDC is regulated by the OEB, which has broad powers relating to licensing, standards of conduct and service, and the regulation of electricity distribution rates charged by LDC and other electricity distributors in Ontario. For the year ended December 31, 2013, LDC earned electricity revenues of $3,145.5 million. As illustrated in the accompanying chart, 66% of the revenues were received from general service users[1], 26% from residential service users[2], and 8% from large users[3].

[1] "General Service" means a service supplied to premises other than those receiving "Residential Service" and "Large Users" and typically includes small businesses and bulk-metered multi-unit residential establishments. This service is provided to customers with a monthly peak demand of 5,000 kW or less averaged over a twelve-month period.

[2] "Residential Service" means a service that is for domestic or household purposes, including single family or individually metered multi-family units and seasonal occupancy.

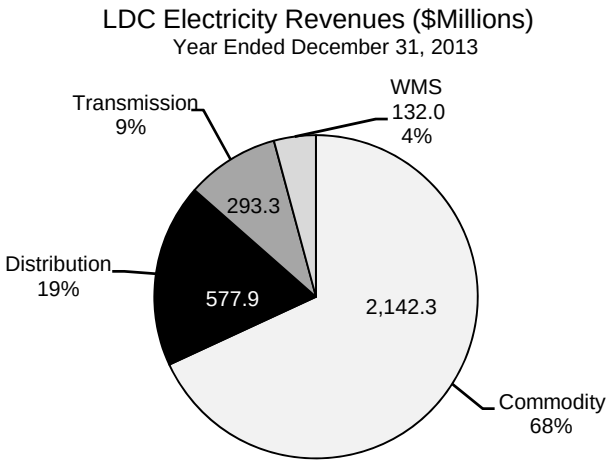
[3] "Large Users" means a service provided to a customer with a monthly peak demand of 5,000 kW or more averaged over a twelve-month period.

Electricity Distribution – Industry Overview

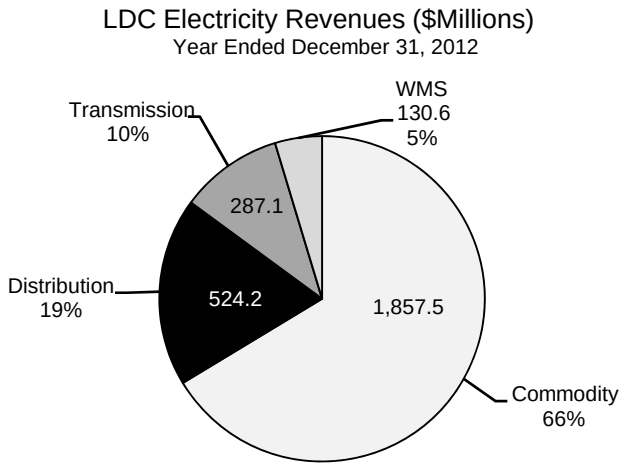
In April 1999, the Government of Ontario began restructuring Ontario's electricity industry. Under regulations passed pursuant to the restructuring, LDC and other electricity distributors purchase electricity from the wholesale market administered by the IESO and recover the costs of electricity and certain other costs at a later date in accordance with procedures mandated by the OEB.

The OEB has regulatory oversight of electricity matters in Ontario. The OEB Act sets out the OEB's authority to issue a distribution licence that must be obtained by owners or operators of an electricity distribution system in Ontario. The OEB prescribes licence requirements and conditions including, among other things, specified accounting records, regulatory accounting principles, separation of accounts for distribution and other activities, and requirements for rate-setting and other legal filings.

The OEB's authority and responsibilities include the power to approve and fix rates for the transmission and distribution of electricity, the responsibility to provide rate protection for rural or remote electricity customers, and the responsibility for ensuring that electricity distribution companies fulfill their obligations to connect and service customers.



LDC is required to charge its customers for the following amounts (all of which, other than distribution rates, represent a pass-through of amounts payable to third parties):



- Commodity Charge – The commodity charge represents the market price of electricity consumed by customers and is passed through the IESO to operators of generating stations. It includes the global adjustment, which represents the difference between the market price of electricity and the rates paid to regulated and contracted generators.

- Retail Transmission Rate – The retail transmission rate represents the costs incurred in respect of the transmission of electricity from generating stations to local distribution networks. Retail transmission rates are passed through to operators of transmission facilities.

- WMS Charge – The WMS charge represents various wholesale market support costs, such as the cost of the IESO to administer the wholesale electricity system, operate the electricity market, and maintain reliable operation of the provincial grid. Wholesale charges are passed through to the IESO.

- Distribution Rate – The distribution rate is designed to recover the costs incurred by LDC in delivering electricity to customers, including the OEB-allowed cost of capital. Distribution rates are regulated by the OEB and are comprised of fixed and variable (usage-based) components, based on a forecast of LDC's customers and load.

The electricity revenues for the year ended December 31, 2013 were $3,145.5 million compared to $2,799.4 million for the comparable period in 2012. The increase in electricity revenues for the year ended December 31, 2013 was primarily due to an increase in the commodity charges by the IESO related to higher global adjustment and average energy prices in 2013 compared to 2012 ($284.8 million) and an increase in LDC's distribution revenue for 2013 ($53.7 million) (see "Net Revenues" below in the section entitled "Results of Operations – 2013 compared to 2012").

LDC is required to satisfy and maintain prudential requirements with the IESO, which include credit support with respect to outstanding market obligations in the form of letters of credit, cash deposits or guarantees from third parties with prescribed credit ratings.

The Corporation is exempt from tax under the ITA if not less than 90% of the capital of the Corporation is owned by the City and not more than 10% of the income of the Corporation is derived from activities carried on outside the municipal geographical boundaries of the City. In addition, the Corporation's subsidiaries are also exempt from tax under the ITA provided that all of their capital is owned by the Corporation and not more than 10% of their respective income is from activities carried on outside the municipal geographical boundaries of the City. A corporation exempt from tax under the ITA is also exempt from tax under the TA.

The Corporation and each of its subsidiaries are MEUs for purposes of the PILs regime contained in the Electricity Act. The Electricity Act provides that a MEU that is exempt from tax under the ITA and the TA is required to make, for each taxation year, a PILs payment to the Ontario Electricity Financial Corporation in an amount equal to the tax that it would be liable to pay under the ITA and the TA if it were not exempt from tax. The PILs regime came into effect on October 1, 2001, at which time the Corporation and each of its subsidiaries were deemed to have commenced a new taxation year for purposes of determining their respective liabilities for PILs payments.

Corporate Strategy

The Corporation's vision is to "continuously maximize customer and stakeholders' satisfaction by being safe, reliable and environmentally responsible at optimal costs". The Corporation has an ERM framework that helps determine whether the Corporation is well positioned to achieve its strategic objectives. The ERM framework provides a consistent, disciplined methodology for controlling risk by identifying, assessing, managing, monitoring and reporting risks for the Corporation.

The Corporation is focused on the following four strategic pillars:

People – the Corporation aims to maintain an engaged, healthy, productive, and safe workforce to meet changing business requirements, as it strives to:

- Provide a healthy and safe workplace
- Develop a skilled and knowledgeable workforce
- Keep its workforce engaged

The Corporation will continue to strengthen its already strong safety culture through various internal initiatives in order to achieve world-class results. The Corporation is committed to employee safety and will remain persistent in its efforts to mitigate the risk of injury to its workforce. This will be accomplished through ongoing safety inspections, audits, annual policy review and the continuation of the safety programs and standards. The Corporation will continue to use the internal responsibility system to reinforce the importance of safety in the workplace.

Financial – the Corporation aims to meet the financial objectives of its shareholder, as it strives to:

- Provide a fair return to the shareholder
- Continue to increase shareholder value

The Corporation has provided its shareholder with an annual increase in economic value over the last decade. To meet financial objectives of the shareholder, the Corporation seeks to increase shareholder value and is committed to provide a fair return to its shareholder in the future. Along with excellence in corporate financing and financial management, the Corporation will strive to maintain an investment grade credit rating.

Operations – the Corporation aims to improve reliability through sustainable system management, as it strives to:

- Keep the lights on
- Keep the system safe
- Build a grid that supports a modern Toronto

The Corporation is engaging in resource and capital-intensive programs to improve capacity, reliability and quality. The capital program will replace aging assets and accommodate next generation technology to suit the regulatory trends that incent the increased use of distributed generation.

Customer – the Corporation aims to provide value to customers, as it strives to:

- Make it easy to work with
- Help conserve energy
- Provide innovative tools and technology

The Corporation is looking at ways to improve the level of satisfaction that customers experience, whether it is through education and awareness programs, interaction with call centre representatives, their account managers or over the internet. The Corporation continues to undertake initiatives and invest in technology and processes to improve the customer experience. In turn, this focus on customer service will provide long-term value for money.

Performance Measurement

The Corporation measures its performance in relation to the achievement of its strategic objectives by using a balanced scorecard approach. KPIs are monitored throughout the year and appropriate actions are taken as required. The definitions of the 2013 KPIs associated with the previously mentioned four strategic pillars are as follows:

Strategic Pillars	Performance Measure	Definition
People	Safety	x Number of recordable injuries x 200,000 / exposure hours.
	Employee Engagement	› Average number of employee engagement sessions per employee per year, including corporate-wide, divisional and departmental.
Financial	Net Income	x Net income per the Corporation's consolidated financial statements.
Operations	System Average Interruption Duration Index	x Measure of the annual system average interruption duration per customers served, not including MED.
	System Average Interruption Frequency Index	› Measure of the frequency of service interruptions per customers served, not including MED.
	Worst Performing Feeders	› Total number of feeders experiencing seven or more sustained outages in a year, with outages defined as interruptions greater than one minute.
	LDC Regulated Capital	› Achievement of LDC capital work program as approved by the Board of Directors.
Customer	Conservation Demand Management	x Annual summer peak demand savings through year over year megawatt reduction.
	Enhanced Customer Engagement	› Increase in customer self-serve transactions / engagements using various self-serve options.
	Call Centre Service Response	› Average of call centre responses within thirty seconds.

Capability to Deliver Results

The Corporation strives to manage its performance and deliver results. In 2013, the Corporation exceeded all of its corporate and divisional objectives represented by its KPIs. The Corporation's ability to deliver results in each of its strategic pillars is limited by risks inherent in its regulatory environment, business, workforce and in the economic environment. These risks are discussed under the section “Risk Management and Risk Factors” in this MD&A.

Results of Operations – 2013 compared to 2012

Net Income

Net income for the three months and year ended December 31, 2013 was $29.2 million and $121.2 million compared to $22.8 million and $86.0 million for the comparable periods in 2012.

The increase in net income for the three months ended December 31, 2013 was primarily due to higher net revenues ($52.1 million) and lower net financing charges ($3.6 million). These favourable variances were partially offset by a higher depreciation expense ($30.7 million), higher operating expenses ($14.2 million), a higher income tax expense ($2.7 million), and lower gains on disposals of surplus properties ($1.6 million).

The increase in net income for the year ended December 31, 2013 was primarily due to higher net revenues ($58.0 million), restructuring costs recognized in the first quarter of 2012 ($27.8 million) related to the cost reduction initiatives at LDC (see "Restructuring Costs" below), lower net financing charges ($7.7 million), and lower income tax expense ($0.2 million). These favourable variances were partially offset by a higher depreciation expense ($31.2 million), higher operating expenses ($26.8 million), and lower gains on disposals of surplus properties ($0.5 million).

Ice Storm

In December 2013, the Ice Storm caused damage to the above-ground infrastructure of the Corporation's electricity distribution system. Approximately 300,000 customers lost power for periods of up to eight days, though strenuous efforts resulted in 75% power restoration within 48 hours. As a result, the Corporation incurred incremental costs consisting of overtime of its own employees, time and equipment costs of other utilities that provided mutual aid, tree clearing services and the replacement of damaged assets. The total costs incurred amounted to $13.8 million, of which $3.6 million were capitalized to PP&E and $10.2 million were charged to operating expenses. In addition, potential distribution revenue of approximately $0.9 million was lost due to the power outage. The Corporation decided not to file a special application with the OEB to seek recovery of incremental operating expenses for the Ice Storm as it was able to absorb the impact from other favourable variances.

Smart Meters

On August 1, 2013, LDC filed an application with the OEB requesting approval for the disposition of balances in its smart meter deferral account related to smart meter installations in 2008, 2009 and 2010, and incremental revenue related to these assets. On January 16, 2014, the OEB approved LDC's request for incremental revenue and disposition of the smart meter deferral account balances.

The OEB ruling on smart meters also permitted the recovery in principle of LDC's allowed cost of capital on smart meters since 2008, with a rate order issued to this effect. Accordingly, a new regulatory asset of $25.2 million has been created to reflect the future amount to be recovered through rates, with a related amount recorded in revenue. For the year ended December 31, 2013, LDC ceased to defer operating and depreciation expenses related to the deployment of the 2008 to 2010 smart meters and recognized revenues as approved by the OEB, resulting in a decrease in the smart meters regulatory asset of $25.0 million, an increase in PP&E of $4.7 million, an increase in intangible assets of $1.1 million, an increase in revenues of $57.5 million, an increase in operating expenses of $7.1 million, and an increase in depreciation and amortization expenses of $28.7 million. See note 9 (c) to the Consolidated Financial Statements for further details.

Net Revenues

Net revenues for the three months and year ended December 31, 2013 were $192.7 million and $635.3 million compared to $140.6 million and $577.3 million for the comparable periods in 2012 (see "Non-GAAP Financial Measures" below).

The increase in net revenues for the three months ended December 31, 2013 was primarily due to higher regulated distribution revenue at LDC ($47.9 million) and higher other income ($4.2 million). The increase in distribution revenue was primarily due to revenue recognition related to the disposition of the 2008-2010 smart meter deferral account balances ($57.5 million) (see "Smart Meters" above), revenue recognition related to the IRM adjustment and the eligible in-service capital expenditures under ICM ($5.1 million), and higher consumption in the fourth quarter of 2013 ($3.7 million). These variances were partially offset by a reduction in distribution revenue related to

the revision of prior year tax positions based on reassessments received and in process, not reflected in applications for electricity distribution rates resulting in an over-recovery of PILs from customers ($19.4 million). The increase in other income for the three months ended December 31, 2013 was primarily due to higher revenue in connection with disposal of scrap material, solar panel installation, and duct rental fees.

The increase in net revenues for the year ended December 31, 2013 was primarily due to higher regulated distribution revenue at LDC ($53.7 million) and higher other income ($4.3 million). The increase in distribution revenue was primarily due to revenue recognition related to the disposition of the 2008-2010 smart meter deferral account balances ($57.5 million) (see “Smart Meters” above), revenue recognition related to the IRM adjustment and the eligible in-service capital expenditures under ICM ($8.2 million), and an unfavourable revenue adjustment recorded in 2012 for PILs variances accumulated in regulatory variance accounts ($4.8 million). These variances were partially offset by a reduction in distribution revenue related to the revision of prior year tax positions based on reassessments received and in process, not reflected in applications for electricity distribution rates resulting in an over-recovery of PILs from customers ($19.4 million). The increase in other income for the year ended December 31, 2013 was primarily due to higher revenue in connection with disposal of scrap material, solar panel installation, and duct rental fees.

Expenses

Operating expenses for the three months and year ended December 31, 2013 were $79.3 million and $272.0 million compared to $65.1 million and $245.2 million for the comparable periods in 2012.

The increase in operating expenses for the three months ended December 31, 2013 was primarily due to the cost of power restoration incurred in 2013 as a result of the Ice Storm that adversely affected the City ($10.2 million) and the recognition of operating expenses related to the disposition of the 2008-2010 smart meter deferral account balances ($7.1 million) (see “Smart Meters” above). These variances were partially offset by lower costs associated with street lighting maintenance and customer demand billable work ($2.7 million).

The increase in operating expenses for the year ended December 31, 2013 was primarily due to the cost of power restoration incurred in 2013 as a result of the Ice Storm that adversely affected the City ($10.2 million), a favourable reassessment for payments in lieu of property taxes to the Ministry of Finance of Ontario recorded in the second quarter of 2012 ($8.7 million), and the recognition of operating expenses related to the disposition of the 2008-2010 smart meter deferral account balances ($7.1 million) (see “Smart Meters” above).

Depreciation and amortization expense for the three months and year ended December 31, 2013 was $66.6 million and $172.8 million compared to $35.9 million and $141.6 million for the comparable periods in 2012.

The increase in depreciation and amortization expense for the three months and year ended December 31, 2013 was primarily due to the recognition of depreciation and amortization expenses related to the disposition of the 2008-2010 smart meter deferral account balances ($28.7 million) (see “Smart Meters” above).

Net Financing Charges

Net financing charges for the three months and year ended December 31, 2013 were $15.1 million and $66.3 million compared to $18.6 million and $74.0 million for the comparable periods in 2012.

The decrease in net financing charges for the three months and year ended December 31, 2013 was primarily due to the refinancing of maturing debentures at a lower interest rate in the second quarter of 2013.

Gain on Disposals of PP&E

Gain on disposals of PP&E for the three months and year ended December 31, 2013 were $0.2 million and $1.3 million compared to $1.8 million and $1.8 million for the comparable periods in 2012.

The decrease in gain on disposals of PP&E for the three months and year ended December 31, 2013 was primarily due to a lower gain realized in connection with the disposals of surplus properties at LDC in 2013.

Restructuring Costs

In the first quarter of 2012, the Corporation’s Board of Directors approved a workforce restructuring program aimed at reducing operating expenditures for LDC. The program was approved following the decision by the OEB to deny

the request of LDC to set its electricity distribution rates for 2012, 2013 and 2014 under the cost of service framework. In preparing its revised application using the IRM framework, LDC concluded that significant cost reductions were necessary to manage its business within the guidelines of the expected allowed electricity distribution rates provided by the IRM framework. The main component of these operating cost reduction initiatives was a workforce restructuring program, which included the severance of management employees and a voluntary exit incentive program for targeted unionized positions.

Restructuring costs for the year ended December 31, 2013 were $nil compared to $27.8 million for the comparable period in 2012.

Income Tax Expense (Recovery)

Income tax expense for the three months and year ended December 31, 2013 was $2.6 million and $4.3 million compared to an income tax recovery of $0.1 million and an income tax expense of $4.6 million for the comparable periods in 2012.

The increase in income tax expense for the three months ended December 31, 2013 was due to higher income before taxes.

The decrease in income tax expense for the year ended December 31, 2013 was due to higher deductions for permanent and temporary differences between accounting and tax treatments ($4.6 million) and favourable resolution of issues identified in prior periods and related assessments by the Ministry of Finance of Ontario ($4.9 million). These variances were partially offset by higher income before taxes ($9.3 million).

Results of Operations – 2012 compared to 2011

Net income was $86.0 million in 2012 compared to $95.9 million in 2011. The decrease in net income was primarily due to restructuring costs recognized in the first quarter of 2012 ($27.8 million) related to the cost reduction initiatives at LDC, lower net revenues ($9.7 million), and lower gains on disposals of surplus properties ($2.1 million). These unfavourable variances were partially offset by lower operating expenses ($17.1 million), lower depreciation expense ($9.5 million), lower income tax expense ($1.7 million), and lower net financing charges ($1.3 million). For further details, see “Selected Consolidated Financial Data” above and the Corporation’s 2012 annual MD&A as filed on the System for Electronic Document Analysis and Retrieval website at www.sedar.com.

Quarterly Results of Operations

The table below presents unaudited quarterly consolidated financial information of the Corporation for 2013 and 2012, which has been prepared in accordance with US GAAP.

Quarterly Results of Operations
(in thousands of Canadian dollars, unaudited)

	December 31 2013 $	September 30 2013 $	June 30 2013 $	March 31 2013 $
Revenues	819,669	833,339	792,905	756,880
Costs	772,965	778,240	743,934	717,087
Net income	29,220	35,885	37,555	18,581

	December 31 2012 $	September 30 2012 $	June 30 2012 $	March 31 2012 $
Revenues	691,847	751,270	709,700	699,660
Costs	652,274	693,809	649,831	666,040
Net income (loss)	22,842	34,436	41,538	(12,826)

The Corporation's quarterly results are impacted by changes in revenues resulting from variations in seasonal weather conditions, the fluctuations in electricity prices, and the timing and recognition of regulatory decisions. Consequently, the Corporation's revenues, all other things being equal, would tend to be higher in the first quarter as a result of higher energy consumption for winter heating, and in the third quarter due to air conditioning/cooling. A variation in the above trend was noted in 2013 and 2012, evidenced by higher revenue and cost of purchased power in the second quarters of both years, compared to the first quarters of both years. This variation was primarily due to an increase in commodity costs (see "Electricity Distribution – Industry Overview" above).

Financial Position

The following table outlines the significant changes in the consolidated balance sheets as at December 31, 2013 as compared to the consolidated balance sheets as at December 31, 2012.

Consolidated Balance Sheet Data
(in thousands of Canadian dollars)

Balance Sheet Account	Increase (Decrease) $	Explanation of Significant Change
Assets		
Cash and cash equivalents	(76,592)	See "Liquidity and Capital Resources" below.
Accounts receivable, net of allowance for doubtful accounts	27,555	The increase was primarily due to the timing of billing and collection activities from electricity customers.
Unbilled revenue	48,786	The increase was primarily due to higher pass-through electricity commodity costs and higher consumption in December 2013 compared to December 2012.
Income tax receivable	(7,315)	The decrease was due to a favourable change in prior year reassessments received and in process.
PP&E and intangible assets, net	175,107	The increase was primarily due to the 2013 capital program expenditures and the disposition of the 2008-2010 smart meter deferral account balances (see "Smart Meters" above in the section entitled "Results of Operations – 2013 compared to 2012"), partially offset by depreciation during the period and net eligible in-service capital expenditures under ICM reclassified to regulatory assets per the direction from the OEB.
Regulatory assets	120,270	The increase was primarily due to the reclassification of ICM-related net eligible in-service capital expenditures, partially offset by the net impact of the disposition of the 2008-2010 smart meter deferral account balances (see "Smart Meters" above in the section entitled "Results of Operations – 2013 compared to 2012").

Consolidated Balance Sheet Data
(in thousands of Canadian dollars)

Balance Sheet Account	Increase (Decrease) $	Explanation of Significant Change
Deferred income tax assets	(36,713)	The decrease was due to lower net deductible temporary differences between tax and accounting values of PP&E.
Liabilities and Shareholder's Equity		
Working capital facility	19,084	The increase was due to funds drawn under the Corporation's working capital facility (see "Liquidity and Capital Resources" below).
Commercial paper	150,000	The increase was due to funds drawn under the Corporation's commercial paper program (see "Liquidity and Capital Resources" below).
Accounts payable and accrued liabilities	73,379	The increase was primarily due to higher electricity commodity cost payable to the IESO, higher capital programs, and the costs related to the Ice Storm (see "Ice Storm" above in the section entitled "Results of Operations – 2013 compared to 2012").
Restructuring accrual	(11,954)	The decrease was due to payments made against the restructuring accrual related to the workforce restructuring program initiated by the Corporation in the first quarter of 2012.
Debentures	(20,258)	The decrease was due to the repayment of $470.1 million senior unsecured debentures, offset by the issuance of $450.0 million senior unsecured debentures during the second quarter of 2013 (see "Liquidity and Capital Resources" below).
Post-retirement benefits	(15,098)	The decrease was primarily due to the actuarial gain recorded in 2013.
Regulatory liabilities	(13,676)	The decrease was primarily due to lower income tax payable to customers in the future.
Retained earnings	78,246	The increase in retained earnings was due to net income for the year ($121.2 million), partially offset by dividends paid ($43.0 million).

Liquidity and Capital Resources

Sources of Liquidity and Capital Resources

The Corporation's current assets and current liabilities amounted to $555.3 million and $696.4 million, respectively, as at December 31, 2013, resulting in a working capital deficit of $141.1 million. The deficit is due to the

Corporation's decision to utilize its commercial paper program and revolving credit facility in lieu of issuing additional debentures to fulfill the Corporation's liquidity requirements, including funding significant capital spending in the current year.

The Corporation's primary sources of liquidity and capital resources are cash provided by operating activities, issuances of commercial paper, amounts available to be drawn against its credit facilities, and borrowings from debt capital markets. The Corporation's liquidity and capital resource requirements are mainly for capital expenditures to maintain and improve the electricity distribution system of LDC, to purchase power, to meet financing obligations and for prudential requirements.

The Corporation does not believe that equity contributions from the City, its sole shareholder, will constitute a source of capital.

The City has authorized the Corporation to provide financial assistance to its subsidiaries, and LDC to provide financial assistance to other subsidiaries of the Corporation, in the form of guarantees, letters of credit, direct loans or otherwise, for the purpose of enabling them to carry on their businesses, with financial assistance provided to subsidiaries other than LDC not to exceed an aggregate amount of $500.0 million.

On December 17, 2013, the Corporation launched a commercial paper program allowing up to $400.0 million of unsecured short-term promissory notes to be issued in varying maturities of no more than one year. The commercial paper program is supported by liquidity facilities available under the Corporation's revolving credit facility; hence, available borrowing under its revolving credit facility is reduced by the amount of commercial paper outstanding at any point in time. Proceeds from the commercial paper program are being used for general corporate purposes. For the three months ended December 31, 2013, the average outstanding borrowing under the commercial paper program was $33.5 million with a weighted average interest rate of 1.21%. Borrowings under the commercial paper program bear interest based on the prevailing market conditions at the time of issuance.

On September 6, 2013, the Corporation extended the maturity date of its $600.0 million revolving credit facility from October 10, 2017 to October 10, 2018. Borrowings under the revolving credit facility bear interest at short-term floating rates with reference to the Corporation's credit rating.

As at December 31, 2013, no amounts had been drawn under the revolving credit facility and $19.1 million had been drawn under the $20.0 million working capital facility. As at December 31, 2013, $50.1 million of letters of credit had been issued against the $75.0 million prudential facility. For the three months and the year ended December 31, 2013, the average outstanding borrowings on the Corporation's credit facilities, excluding the prudential facility and commercial paper, were $69.2 million and $59.2 million with weighted average interest rates of 1.81% and 2.09 %, respectively. The revolving credit facility, the working capital facility, and the prudential credit facility are summarized in note 11 to the Consolidated Financial Statements.

The Corporation filed a base shelf prospectus dated December 10, 2012 with the securities commissions or similar regulatory authorities in each of the provinces of Canada. These filings allow the Corporation to make offerings of unsecured debt securities of up to $1,500.0 million during the 25-month period following the date of the prospectus.

On April 9, 2013, the Corporation issued Series 8 ($250.0 million) and Series 9 ($200.0 million) debentures, which bear interest payable semi-annually in arrears and contain covenants which, subject to certain exceptions, restrict the ability of the Corporation and LDC to create security interests, incur additional indebtedness or dispose of all or substantially all of their assets. The Corporation may redeem all or part of the Series 8 and Series 9 debentures at any time prior to maturity at a price equal to the greater of the Canada Yield Price (determined in accordance with the terms of the debentures) and par, plus accrued and unpaid interest up to and excluding the date fixed for redemption. The net proceeds of the debentures, together with borrowings under the Corporation's revolving credit facility, were used to repay the Corporation's Series 1 and Series 5 debentures which matured on May 7, 2013 and May 6, 2013, respectively. Debt issuance costs of $2.7 million relating to the Series 8 and Series 9 debentures were deferred as other assets in the second quarter of 2013.

As at December 31, 2013, the Corporation had long-term debentures outstanding in the principal amount of $1,450.0 million. These debentures mature between 2017 and 2063. The Corporation may issue up to $1,050.0 million of additional debentures under the existing base shelf prospectus.

Credit Ratings
As at December 31, 2013

	Debentures	Commercial Paper
DBRS	A (high)	R-1 (low)
Standard & Poor's	A	-

The Corporation believes that it has sufficient availableresou of liquidity and capital to satisfy working capital requirements for the next 12 months.

Consolidated Statements of Cash Flows
(in thousands of Canadian dollars)

	Three months Ended December 31		Year Ended December 31	
	2013 $	2012 $	2013 $	2012 $
Cash and cash equivalents, beginning of perio	-	137,323	76,592	154,256
Net cash provided by operating activities	79,602	54,925	236,123	246,729
Net cash used in investing activities	(126,857)	(104,949)	(411,652)	(265,432)
Net cash provided by (used in) financing activities	47,255	(10,707)	98,937	(58,961)
Cash and cash equivalents, end of period	-	76,592	-	76,592

Net Cash Provided by Operating Activities

Net cash provided by operating activities for the three months and year ended December 31, 2013 was $79.6 and $236.1 million compared to $54.9 million and $246.7 million for the comparable periods in 2012.

The increase in net cash provided by operating activities for the three months ended December 31, 2013 was primarily due to lower working capital and an increase in net income.

The decrease in net cash provided by operating activities for the year ended December 31, 2013 was primarily due to higher working capital, partially offset by an increase in net income.

Net Cash Used in Investing Activities

Net cash used in investing activities for the three months and year ended December 31, 2013 was $126.9 million and $411.7 million compared to $104.9 million and $265.4 million for the comparable periods in 2012.

The increase in net cash used in investing activities for the three months ended December 31, 2013 was primarily due to higher capital expenditures in 2013.

The increase in net cash used in investing activities for the year ended December 31, 2013 was primarily due to higher capital expenditures in 2013 and the sale and maturity of investments in 2012.

Electricity distribution is a capital-intensive business. As the largest municipal electricity distribution company in Canada, LDC continues to invest in rebuilding existing aging infrastructure to address safety, reliability and customer service requirements.

LDC estimates that approximately one-third of its electricity distribution assets are past their expected useful lives. As a strategic response to meet the objective of maximizing customer and stakeholder satisfaction through providing safe and reliable service, LDC is committed to maintenance and capital expenditure requirements for distribution plant refurbishment and replacement.

The following table summarizes the Corporation's capital expenditures for the periods indicated.

Capital Expenditures
(in thousands of Canadian dollars)

	Three months Ended December 31		Year Ended December 31	
	2013 $	2012 $	2013 $	2012 $

Total Capital Expenditures	151,633	108,530	450,314	292,375

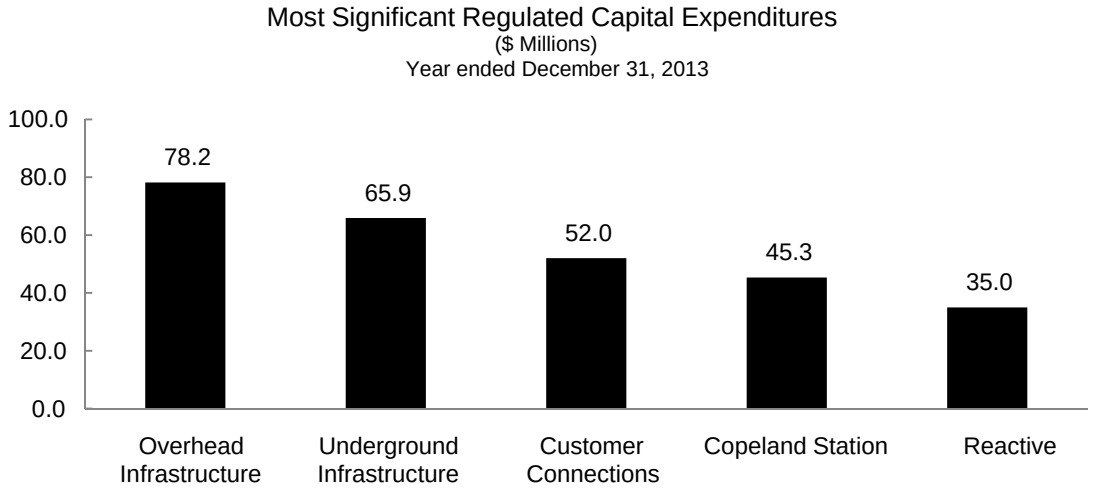
[1] Includes fleet capital and buildings.

[2] Includes unregulated capital expenditures primarily related to TH Energy equipment.

The total regulated capital expenditures were $150.5 million and $445.7 million for the three months and year ended December 31, 2013 compared to $107.2 million and $288.6 million for the comparable periods in 2012. For the year ended December 31, 2013, the increase in regulated capital expenditures was primarily related to planned spending on overhead infrastructure ($52.2 million), Copeland Station ($41.3 million), underground infrastructure ($24.4 million), customer connections ($22.4 million), and network infrastructure and equipment ($13.5 million).

The largest capital initiatives in 2013 include the replacement of overhead infrastructure, the replacement of underground infrastructure, the delivery of customer connections, and the construction of Copeland Station in response to the developing need for distribution solutions in the downtown core of the City.

The replacement of overhead infrastructure includes replacing poles, overhead transformers, overhead switches and other aging overhead infrastructure and equipment. The replacement of underground infrastructure includes replacing direct buried cables, transformers, handwells, and other aging underground infrastructure. Both initiatives will allow LDC to continue to provide ongoing safe and reliable service to its customers. As at December 31, 2013, the year-to-date capital expenditures for the overhead and the underground infrastructure initiatives were $78.2 million and $65.9 million, respectively.



The delivery of customer connections includes spending related to new services and upgrades to existing services for specific commercial customers. For 2013, capital expenditures for the delivery of customer connections were $52.0 million, net of related capital contributions received of $23.6 million.

Copeland Station will be the first transformer station built in downtown Toronto since the 1960's and will be the second underground transformer station in Canada. When in service, the new station will provide electricity to buildings and neighbourhoods in the central-southwest region of Toronto. Between 2006 and 2011, the population in the City's downtown increased by over 50%[4], and Toronto is now the fourth largest metropolitan area, by population, in North America. Copeland Station will provide much needed additional capacity to serve current and future load requirements in this high-density, high-growth area of Toronto.

On May 22, 2013, the Corporation celebrated the official groundbreaking at the station. On February 1, 2014, the tunnel boring machine arrived on-site and was being prepared to begin tunnelling north to connect the new infrastructure to the grid. As at December 31, 2013, capital expenditures on the Copeland Station project

[4] http://www.toronto.ca/legdocs/mmis/2013/bgrd/backgroundfile-56336.pdf

amounted to $60.5 million of which $45.5 million was recorded in 2013. The total capital expenditures required to complete Copeland Station are expected to be approximately $194.9 million. All capital expenditures related to Copeland Station are recorded to PP&E.

Net Cash Provided by (Used in) Financing Activities

Net cash provided by financing activities for the three month and year ended December 31, 2013 was $47.3 million and $98.9 million compared to net cash used in financing activities of $10.7 million and $59.0 million for the comparable periods in 2012.

The increase in net cash provided by financing activities for the three months ended December 31, 2013 was primarily due to an increase in funds drawn under the Corporation's commercial paper program and working capital facility related to higher capital expenditures in 2013, partially offset by a decrease in funds drawn under the Corporation's revolving credit facility.

The increase in net cash provided by financing activities for the year ended December 31, 2013 was primarily due to funds drawn under the Corporation's commercial paper program and working capital facility related to higher capital expenditures, a decrease in customer deposits in 2012 in compliance with OEB rules and regulations, and lower dividends paid in 2013 compared to 2012. These variances were partially offset by the net effect of the payment in connection with the retirement of $470.1 million of senior unsecured debentures and the issuance of $450.0 million of senior unsecured debentures in the second quarter of 2013.

The shareholder direction adopted by the City with respect to the Corporation provides that the Board of Directors of the Corporation will use its best efforts to ensure that the Corporation meets certain financial performance standards, including those relating to the credit rating and dividends. Subject to applicable law, the shareholder direction provides that the Corporation will pay dividends to the City each year amounting to the greater of $25.0 million or 50% of the Corporation's consolidated net income for the prior fiscal year. The dividends are not cumulative and are payable as follows:

- $6.25 million on the last day of each fiscal quarter of the year; and
- the amount, if any, by which 50% of the Corporation's annual consolidated net income for the year exceeds $25.0 million, within ten days after the approval of the Corporation's audited consolidated financial statements for the year by the Board of Directors of the Corporation.

For the year ended December 31, 2013, the Board of Directors of the Corporation declared and paid dividends totalling $43.0 million to the City.

On March 19, 2014, the Board of Directors of the Corporation declared dividends in the amount of $41.87 million. The dividends are comprised of $35.62 million with respect to net income for the year ended December 31, 2013,

payable to the City on March 28, 2014, and $6.25 million with respect to the first quarter of 2014, payable to the City on March 31, 2014.

Summary of Contractual Obligations and Other Commitments

The following table presents a summary of the Corporation's debentures, major contractual obligations and other commitments.

Summary of Contractual Obligations and Other Commitments
As at December 31, 2013
(in thousands of Canadian dollars)

	Total $	2014 $	2015/2016 $	2017/2018 $	After 2018 $
Working capital facility	19,084	19,084	-	-	-
Commercial paper	150,000	150,000	-	-	-
Debentures – principal repayment	1,450,000	-	-	250,000	1,200,000
Debentures – interest payments	958,583	60,995	121,990	109,115	666,483
Operating lease obligations	20,268	6,175	11,970	2,123	-
Capital project and other commitments[1,2]	82,569	79,797	2,772	-	-
Capital lease obligations	11,418	2,537	5,074	3,807	-
AROs	7,147	2,417	377	376	3,977
Total contractual obligations and other commitments	2,699,069	321,005	142,183	365,421	1,870,460

[1] Reflect capital project commitments for construction services and estimated capital contributions, with the majority related to Copeland Station.

[2] Subsequent to December 31, 2013, the Corporation entered into capital commitments of approximately $21.0 million for capital contributions payable to Hydro One Networks Inc. over the next year in respect of Copeland Station.

Corporate Developments

Distribution Rates for LDC

Regulatory developments in Ontario's electricity industry, including current and possible future consultations between the OEB and interested stakeholders, may affect LDC's electricity distribution rates and other permitted recoveries in the future.

On May 10, 2012, LDC filed an application for electricity distribution rates for 2012, 2013, and 2014 using the IRM framework, including the filing of an ICM application (the "IRM/ICM Application").

On October 31, 2012, LDC submitted an update to its IRM/ICM Application modifying the requested capital expenditures for 2012 and 2013 to $283.0 million and $579.1 million, respectively, and requesting that consideration for 2014 be deferred to a second phase of the proceeding, once LDC had received a decision from the OEB in respect of phase one. On November 8, 2012, the OEB accepted LDC's request for a two-phase proceeding: phase one comprising LDC's 2012 and 2013 work program proposals and phase two comprising LDC's 2014 work program proposal.

On April 2, 2013, the OEB issued a partial decision and order for phase one of the proceeding comprising LDC's 2012 and 2013 work program proposals. The OEB's decision determined that eligible capital funding under the ICM framework was to be calculated on an in-service basis. This correlates to the approval of capital expenditures amounting to $203.3 million for 2012 and $484.2 million for 2013. New rates became effective June 1, 2013. In 2015, LDC will be allowed to seek recovery for capital spent in 2012 and 2013 that has not yet been approved by the OEB in the current ICM decision due to the standard operation of the regulatory model.

On August 1, 2013, LDC filed an application with the OEB requesting approval for the disposition of balances in its smart meter deferral account related to smart meter installations in 2008, 2009 and 2010. In the application, LDC requested two new rate riders effective May 1, 2014. The first rate rider relates to the recovery of $23.9 million, which represents the cumulative revenue requirement net of recoveries from an existing smart meter rate rider. This

existing smart meter rate rider would be discontinued when the new rate riders become effective. The second rate rider relates to the recovery of $9.6 million, which represents the forecasted 2014 incremental revenue requirement until LDC may be permitted to transfer the smart meter assets into rate base.

On August 19, 2013, LDC submitted an update to its IRM/ICM Application regarding its 2014 work program proposal. The filed update incorporated the OEB's guidance on the ICM methodology provided in the April 2, 2013 partial decision and order with respect to phase one of this proceeding. In phase two, LDC sought approval for total capital expenditures amounting to $398.8 million for 2014.

On December 18, 2013, LDC filed a settlement agreement with the OEB, which allowed for the entirety of LDC's requested 2014 capital program. On December 19, 2013, the OEB approved the settlement agreement. Consistent with the April 2, 2013 partial decision and order with respect to phase one, eligible capital funding under the ICM framework is to be calculated on an in-service basis. This correlates to the approval of capital expenditures amounting to $398.8 million for 2014.

On January 16, 2014, the OEB approved LDC's requested disposition of the smart meter deferral account balances, permitting the recovery of $23.9 million and $9.6 million through two separate rate riders effective May 1, 2014.

CDM Activities

On March 31, 2010, the Minister of Energy and Infrastructure of Ontario, under the guidance of sections 27.1 and 27.2 of the OEB Act, directed the OEB to establish CDM targets to be met by electricity distributors. Accordingly, on November 12, 2010, the OEB amended LDC's distribution licence to require LDC, as a condition of its licence, to achieve 1,304 GWh of energy savings and 286 MW of summer peak demand savings, over the period beginning January 1, 2011 through December 31, 2014.

Effective January 1, 2011, LDC entered into an agreement with the OPA in the amount of approximately $50.0 million to deliver CDM programs extending from January 1, 2011 to December 31, 2014. As at December 31, 2013, LDC received approximately $45.9 million from the OPA for the delivery of CDM programs. All programs to be delivered are fully funded and paid in advance by the OPA. Amounts received but not yet spent are presented under current liabilities as deferred conservation credits. Upon the expiration of the agreement, LDC is required to repay to the OPA any excess funding received for program administration less any cost efficiency incentives. These programs are expected to support the achievement of the mandatory CDM targets described above.

On December 21, 2012, the Minister of Energy of Ontario issued a direction to the OPA under subsection 25.32(4.1) of the Electricity Act to extend the funding time period for OPA-contracted province-wide CDM initiatives under the Green Energy Act framework to December 31, 2015.

OEB PILs Proceeding

The OEB conducted a review of the PILs variances accumulated in regulatory variance accounts for the period from October 1, 2001 to April 30, 2006 for certain MEUs. On June 24, 2011, the OEB issued its decision for these MEUs and provided guidelines for the calculation and further disposition of the balances accumulated in the PILs regulatory variance accounts.

LDC reviewed the balance of its PILs regulatory variance accounts and applied the guidelines provided by the OEB. LDC applied for disposition of the balance as part of its IRM/ICM Application filed on May 10, 2012. The OEB issued its decision and order on April 2, 2013 approving the disposition of the balance. The impact was recorded previously in the Corporation's consolidated financial statements.

Changes to the Corporation's Board of Directors

On April 3, 2013, the City, as the sole shareholder of the Corporation, appointed David Williams, Colum Bastable, Vincent Brescia, Glenna Carr, Derek Cowbourne, Sarah Gee, Paulette Kennedy and Isabel Meharry to the Board of Directors as independent directors of the Corporation. Their appointments were effective April 15, 2013 for a term ending April 14, 2015 or until their successors are appointed. On April 3, 2013, the City also nominated David Williams as Chairman of the Corporation. Mr. Williams was appointed Chairman by the Corporation's Board of Directors effective April 15, 2013 for a term ending April 14, 2015 or until his successor is appointed.

Effective January 1, 2013, the City, as the sole shareholder of the Corporation, appointed councillor Gloria Lindsay Luby to the Board of Directors of the Corporation to replace councillor Rob Metcheser and also re-appointed each of councillor Josh Colle, as the Mayor's designate, and John Shelley Carroll to the Board of Directors of the Corporation. Their appointments are effective for a term ending November 30, 2014 until their successors are appointed.

Labour Agreement

On February 13, 2014, CUPE One ratified collective agreements governing inside and outside employees for a four-year period expiring January 31, 2018. The collective agreements implemented a wage increase of 1.5% on February 1, 2014 and provide for general wage increases of 1.75% effective February 1, 2015, 1.75% effective February 1 2016, and 2% effective February 1, 2017. The collective agreements also contain cost of living escalator clauses that provide for wage adjustments corresponding to the percentage change in the consumer price index. The escalator clauses only become effective if certain prescribed thresholds are exceeded.

Legal Proceedings

In the ordinary course of business, the Corporation is subject to various legal actions and claims with customers, suppliers, former employees and other parties. On an ongoing basis, the Corporation assesses the likelihood of any adverse judgments or outcomes as well as potential ranges of probable costs and losses. A determination of the provision required, if any, for these contingencies is made after an analysis of each individual issue. The provision may change in the future due to new developments in each matter or changes in approach, such as a change in settlement strategy. If damages were awarded under these claims, the Corporation and its subsidiaries would make a claim under their liability insurance which the Corporation believes would cover any damages which may become payable by the Corporation and its subsidiaries in connection with these actions. See note 22 (a) to the Consolidated Financial Statements for a discussion of material legal proceedings.

Share Capital

The authorized share capital of the Corporation consists of an unlimited number of common shares without par value, of which 1,000 common shares are issued and outstanding as at the date hereof.

Transactions with Related Parties

As a wholly-owned subsidiary of the City, the Corporation and the City are considered related parties. All transactions with the City are conducted on terms similar to those offered to unrelated parties.

Summary of Transactions with Related Parties
(in thousands of Canadian dollars)

	Year Ended December 31	
	2013 $	2012 $
Revenues	246,894	222,032
Operating expenses and capital expenditures	31,861	26,259
Dividends	42,995	47,966

Summary of Amounts Due to/from Related Parties
(in thousands of Canadian dollars)

	As at December 31	
	2013 $	2012 $
Accounts receivable	5,579	7,810
Unbilled revenue	19,425	17,018
Accounts payable and accrued liabilities	45,472	38,020
Advance deposits	8,816	8,926

Revenues represent amounts charged to the City primarily for electricity, street lighting and ancillary services. Operating expenses and capital expenditures represent amounts charged by the City for purchased road cut repairs, property taxes and other services. Dividends are paid to the City.

Accounts receivable represent receivables from the City primarily for electricity, street lighting and ancillary services. Unbilled revenue represents receivables from the City related to electricity and other services provided and not yet billed. Accounts payable and accrued liabilities represent amounts payable to the City related to road cut repairs and other services, as well as amounts received from the City for the construction of electricity distribution assets. Advance deposits represent amounts received from the City for future expansion projects.

Controls and Procedures

For purposes of certain Canadian securities regulations, the Corporation is a "Venture Issuer". As such, it is exempt from certain of the requirements of National Instrument 52-109 Certification of Disclosure in Issuers' Annual and Interim Filings. Accordingly, the Chief Executive Officer and Chief Financial Officer have reviewed the Consolidated Financial Statements and the MD&A for the three months and year ended December 31, 2013. Based on their knowledge and exercise of reasonable diligence, they have concluded that these documents fairly present in all material respects the financial condition, results of operations and cash flows of the Corporation for the periods presented.

Risk Management and Risk Factors

The Corporation faces various risks that could impact the achievement of its strategic objectives. It adopts an enterprise wide approach to risk management, achieved through a process of consolidating and aligning the various views of risk across the enterprise via a risk governance structure. The Corporation executes its ERM activities via an ERM framework that is aligned to industry best practices and international guidelines. The Corporation views ERM as a management activity undertaken to add value and improve overall operations. It helps the Corporation by enabling the attainment of its strategic goals and objectives through a systematic, disciplined approach towards identifying, evaluating, treating, monitoring and reporting risks. Accordingly, ERM is an integral part of the strategic management of the Corporation and is routinely considered in forecasting, planning and executing all aspects of the business.

The ERM framework is operationalized by a consistent, disciplined methodology that clearly defines the risk management process which incorporates subjective elements, risk quantification and risk interdependencies.

While the Corporation's philosophy is that ERM is the responsibility of all business units, at all levels, in matters strategic and operational, the ERM governance structure is comprised of three key levels.

At the top level is the Board of Directors, who works to maintain a general understanding of the risk categories, the types of risks to which the Corporation may be exposed and the practices used to identify, assess, measure and manage those risks. Quarterly, the Board of Directors reviews the Corporation's risk profile, a list of key risks together with treatment activities that represents the greatest threats to meeting the Corporation's strategic objectives.

The second level is the ROC, a lead body to ensure systems are in place to identify, manage, and monitor risks. Through its review of reports from the business and control areas, the ROC assesses the appropriateness and consistent application of systems to manage risks within the Corporation. The ROC also ensures that key risks are brought forward to the attention of the Board and for action by executive management.

Finally, the third level is the Risk Forum. The Risk Forum supports the ROC and is a collection of subject matter experts from across the Corporation who actively engage in the day to day management of risks. Working with the ROC, the Risk Forum oversees the Corporation's risk profile, its performance against the defined risk appetite and determines appropriate risk responses. They also work to ensure effective, efficient, complete and transparent risk reporting to the ROC.

The Corporation is subject to a variety of risks including those described below:

Regulatory Developments

Ontario's electricity industry regulatory developments and policy changes may affect the electricity distribution rates charged by LDC and the costs LDC is permitted to recover. This may in turn have a material adverse effect on the financial performance of the Corporation and/or its ability to provide reliable service to its customers. In particular, there can be no assurance that:

- the OEB will approve LDC's electricity distribution rates under the RRFE, at levels that will permit LDC to carry out its planned capital work programs required to maintain safe and reliable service to its customers and earn the allowed rate of return on the investment in the business;
- the regulatory instruments that arise from the RRFE will be sufficient to address LDC's operations, needs and circumstances in respect of future applications for electricity distribution rates;
- the OEB will not set a lower recovery for LDC's cost of capital;
- the full cost of providing service to distribution customers will be permitted to be recovered through LDC's electricity distribution rates;
- the OEB will not permit competitors to provide distribution services in LDC's licensed area, or permit loads within LDC's service area to become electrically served by means other than through LDC's electricity distribution system;
- the OEB will allow recovery for revenue lost as a consequence of unanticipated effects of CDM;
- parts of LDC's services will not be separated from LDC and opened to competition; or
- regulatory or other changes will not be made to the PILs regime.

Changes to any of the laws, rules, regulations and policies applicable to the businesses carried on by the Corporation could also have a significant impact on the Corporation. There can be no assurance that the Corporation will be able to comply with applicable future laws, rules, regulations and policies. Failure by the Corporation to comply with applicable laws, rules, regulations and policies may subject the Corporation to civil or regulatory proceedings that may have a material adverse effect on the Corporation.

Any future regulatory decision to disallow or limit the recovery of costs could lead to potential asset impairment and charges to results from operations, which could have a material adverse effect.

Condition of Distribution Assets

LDC estimates that approximately one-third of its electricity distribution assets are past their expected useful lives. LDC's ability to continue to provide a safe work environment for its employees and a reliable and safe distribution service to its customers and the general public will depend, among other things, the OEB allowing recovery of costs in respect of LDC's maintenance program and capital expenditure requirements for distribution plant refurbishment and replacement.

LDC is focused on overcoming the above challenges and executing its maintenance program. However, if LDC is unable to carry out these plans in a timely and optimal manner, equipment performance will degrade which may compromise the reliability of distribution assets, the ability to deliver sufficient electricity and/or customer supply security and increase the costs of operating and maintaining these assets.

Information Technology Infrastructure

LDC's ability to operate effectively is in part dependent on the development, maintenance and management of complex information technology systems. Computer systems are employed to operate LDC's electricity distribution system and financial, billing and business systems to capture data and to produce timely and accurate information. Failures of any one of the financial, business and operating systems could have a material adverse effect on the Corporation's business, operating results, financial condition and prospects. The Corporation mitigates this risk through various methods including the use of security event management tools on its distribution and business systems, by separating the electricity distribution system from the business systems and by providing company-wide awareness training to personnel.

LDC's electricity distribution infrastructure and technology systems are also potentially vulnerable to damage or interruption from cyber attacks, which could have an adverse impact on its operations, financial conditions, brand and reputation. While LDC has implemented preventative measures to monitor and protect against cyber attacks and mitigate their effects, there can be no assurance that such measures will be completely effective in protecting LDC's electricity distribution infrastructure or assets from a cyber attack or the effects thereof.

Natural and Other Unexpected Occurrences

LDC's operations are exposed to the effects of natural and other unexpected occurrences, such as severe or unexpected weather conditions, terrorism and pandemics. In the current year, the City experienced two severe weather events, one of which (see "Ice Storm" above in the section entitled "Results of Operations – 2013 compared to 2012") had a significant financial impact. Although LDC's facilities and operations are constructed, operated and maintained to withstand such occurrences, there can be no assurance that they will successfully do so in all circumstances. Any major damage to LDC's facilities or interruption of LDC's operations arising from these occurrences could result in lost revenues and repair costs that can be substantial. Although the Corporation has insurance, if it sustained a large uninsured loss caused by natural or other unexpected occurrences, LDC would apply to the OEB for the recovery of the loss related to the electricity distribution system. There can be no assurance that the OEB would approve, in whole or in part, such an application.

Electricity Consumption

LDC's electricity distribution rates are comprised of a fixed charge and a usage-based (consumption) charge. The volume of electricity consumed by LDC's customers during any period is governed by events largely outside LDC's control (e.g., principally sustained periods of hot or cold weather could increase the consumption of electricity, sustained periods of mild weather could decrease the consumption of electricity and general economic conditions could affect overall electricity consumption). Accordingly, there can be no assurance that LDC will earn the revenue requirement approved by the OEB.

Economic conditions could also lead to lower overall electricity consumption, particularly in the commercial customer segment, which is estimated to be the most sensitive to economic changes. Lower electricity consumption from customers could negatively impact LDC's revenue. On an annual basis, the Corporation estimates that a decrease of 1% in electricity consumption would reduce net revenue by approximately $3.5 million.

Market and Credit Risk

LDC is subject to credit risk with respect to customer non-payment of electricity bills. LDC is permitted to mitigate the risk of customer non-payment using any means permitted by law, including security deposits (including letters of credit, surety bonds, cash deposits or lock-box arrangements, under terms prescribed by the OEB), late payment penalties, pre-payment, pre-authorized payment, load limit and disconnection. In the event of an actual payment default and a corresponding bad debt expense incurred by LDC, approximately 80% of the expense would be related to commodity and transmission costs and the remainder to LDC's distribution revenue. While LDC would be liable for the full amount of the default, there can be no assurance that the OEB would allow recovery of the bad debt expense from remaining customers. Established practice in such cases is that the OEB would examine any electricity distributor's application for recovery of extraordinary bad debt expenses on a case-by-case basis.

The Corporation is exposed to fluctuations in interest rates for the valuation of its post-retirement benefit obligations. The Corporation estimates that a 1% (100 basis point) increase in the discount rate used to value these obligations would decrease the accrued benefit obligation, as at December 31, 2013, by approximately $37.0 million, and a 1% (100 basis point) decrease in the discount rate would increase the accrued benefit obligation, as at December 31, 2013, by approximately $45.5 million.

As at December 31, 2013, aside from the valuation of its post-retirement benefit obligations, the Corporation was exposed to interest rate risk predominately from short-term borrowings under its commercial paper program, while most of its remaining obligations were either non-interest bearing or bear fixed interest rates, and its financial assets were predominately short-term in nature and mostly non-interest bearing. The Corporation estimates that a 100 basis point increase (decrease) in short-term interest rates, with all other variables held constant, would result in an increase (decrease) of approximately $2.1 million to annual net financing charges.

Additional Debt Financing and Credit Rating

Cash generated from operations, after the payment of expected dividends, is not expected to be sufficient to repay existing indebtedness, fund capital expenditures and meet other obligations. The Corporation relies on debt financing through its medium-term note program, commercial paper program or existing credit facilities to repay existing indebtedness, finance the Corporation's daily operations, and fund capital expenditures. The Corporation's ability to arrange sufficient and cost-effective debt financing could be adversely affected by a number of factors, including financial market conditions, the regulatory environment in Ontario, the Corporation's results of operations and financial condition, the ratings assigned to the debentures issued under the Corporation's medium-term note program by credit rating agencies, the current timing to maturity of the Corporation's debentures, the availability of the commercial paper market, and general economic conditions. See notes 11 and 13 to the Consolidated Financial Statements.

Should the Corporation's credit rating from both credit rating agencies fall below "A (minus)" with stable outlook (S&P) and "A (low)" with stable trend (DBRS), the Corporation and its subsidiaries may be required to post additional collateral with the IESO.

Work Force Renewal

Over the next decade, a significant portion of LDC's employees will become eligible for retirement, including potential retirements occurring in supervisory, trades and technical positions. Accordingly, LDC will be required to attract, train and retain skilled employees. There can be no assurance that LDC will be able to attract and retain the required workforce.

Labour Relations

The Corporation's ability to operate successfully in the electricity industry in Ontario will continue to depend in part on its ability to make changes to existing work processes and conditions to adapt to changing circumstances. The Corporation's ability to make such changes, in turn, will continue to depend in part on its relationship with its labour unions and its ability to develop plans and approaches that are acceptable to its labour unions. There can be no assurance that the Corporation will be able to secure the support of its labour unions.

Insurance

Although the Corporation maintains insurance, there can be no assurance that the Corporation will be able to obtain or maintain adequate insurance in the future at rates it considers reasonable or that insurance will continue to be available. In addition, there can be no assurance that liability insurance will cover all losses or liabilities that might arise in the conduct of the Corporation's business. The Corporation self-insures against risks (e.g., business interruption and physical damage to certain automobiles). The occurrence of a significant uninsured claim or a claim in excess of the insurance coverage limits maintained by the Corporation could have a material adverse effect on the Corporation's results of operations and financial position.

Conflicts of Interest

The City owns all of the outstanding shares of the Corporation and has the power to determine the composition of the Board of Directors of the Corporation and influence the Corporation's major business and corporate decisions, including its financing programs and dividend payments. A conflict may arise between the City's role as the sole

shareholder of the Corporation and its role as the administrator of the City's budget and other matters for the residents of the City.

Change of Ownership

The City may decide to sell all or part of the Corporation. In the case of such event, depending on the nature of the transaction, the Corporation's credit ratings could be negatively affected.

Real Property Rights

Certain terminal stations and municipal sub-stations of LDC are located on lands owned by the Province, the City and others. In some cases, LDC does not have and may not be able to obtain formal access agreements with respect to such facilities. Failure to obtain or maintain access agreements could adversely affect LDC's operations.

LDC Competition

In the past, there had been one electricity distributor in each region of Ontario. Under the current regulatory regime, a person must obtain a licence from the OEB in order to own and operate an electricity distribution system. LDC has the right to distribute electricity in the City. Although the distribution licence specifies the area in which the distributor is authorized to distribute electricity, unless otherwise provided, the licence does not provide exclusive distribution rights for such area.

The Corporation believes that the complexities and potential inefficiencies that would be created by having multiple electricity distributors authorized to serve a single area are likely to result in the continuation of the practice of having a single electricity distributor authorized to serve a single area. In addition, the Corporation believes that there are significant barriers to entry with respect to the business of electricity distribution in Ontario, including the cost of maintaining an electricity distribution system, OEB regulation of electricity distribution rates and the level of regulatory compliance required to operate an electricity distribution system. However, the Corporation recognizes that more than one distribution licence could be issued for the same area and there is a possibility that in the future some business functions or activities could be separated from LDC and made open to competition from non-regulated business entities, or that defined geographical areas within LDC's service area may be electrically supplied by a means other than through LDC's electricity distribution system.

Non-GAAP Financial Measures

The Corporation's MD&A includes references to "net revenues", which is a non-GAAP financial measure. The definition of net revenues is revenue minus the cost of purchased power. This measure does not have any standard meaning prescribed by US GAAP and is not necessarily comparable to similarly titled measures of other companies. The Corporation uses this measure to assess its performance and to further make operating decisions. Users of the MD&A utilize this measure to assess the Corporation's financial performance from ongoing operations.

Critical Accounting Estimates

The preparation of the Corporation's Consolidated Financial Statements in accordance with US GAAP requires management to make estimates and assumptions which affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the consolidated financial statements, and the reported amounts of revenues and expenses for the year. The estimates are based on historical experience, current conditions and various other assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgments about the carrying values of assets and liabilities as well as identifying and assessing the accounting treatment with respect to commitments and contingencies. Actual results may differ from these estimates and judgments under different assumptions or conditions.

The following critical accounting estimates involve significant estimates and judgments used in the preparation of the Consolidated Financial Statements:

Revenue Recognition

Revenue from the sale of electricity is recorded on the basis of cyclical billings and includes an estimated amount for electricity delivered and not yet billed, the amount of which is impacted by energy demand, customer class usage patterns and composition, and weather conditions. Revenue related to eligible capital expenditures under the ICM

framework is recognized on the basis of in-service assets. Other revenues, which include revenues from electricity distribution related services, revenues from the delivery of street lighting services and revenues from demand billable activities, are recognized as the services are rendered.

Regulatory Assets and Liabilities

As at December 31, 2013, regulatory assets amounted to $241.5 million and were primarily related to the reclassification of ICM-related net eligible in-service capital expenditures and timing differences in the recognition of actuarial losses and prior service costs of post-retirement benefits. As at December 31, 2013, regulatory liabilities amounted to $183.1 million and were primarily related to deferred income tax assets payable to customers. These assets and liabilities can be recognized for rate-setting and financial reporting purposes only if the OEB directs the relevant regulatory treatment or if future OEB direction is judged to be probable. In the event that the disposition of these balances was assessed to no longer be probable, the balances would be recorded in the Corporation's consolidated statements of net income and comprehensive income in the period that the assessment is made. The measurement of regulatory assets and liabilities is subject to certain estimates and assumptions, including assumptions made in the interpretation of the OEB's regulations and decisions.

Employee Future Benefits

Employee future benefits other than pension provided by the Corporation include medical, dental and life insurance benefits, and accumulated sick leave credits. These plans provide benefits to employees when they are no longer providing active service. The accrued benefit obligation and net periodic benefit cost are calculated by independent actuaries using the projected unit credit method and based on assumptions that reflect management's best estimate. The assumptions were determined by management recognizing the recommendations of the Corporation's actuaries. There could be no assurance that actual employee future benefit cost will not differ significantly from the estimates calculated using management's assumptions.

Asset Retirement Obligations

The Corporation recognizes a liability for the future removal and handling costs for contamination in distribution equipment and for the future environmental remediation of certain properties. The liability is recognized when an ARO is incurred and when the fair value can be reasonably estimated. AROs amounted to $6.3 million as at December 31, 2013 compared to $5.1 million as at December 31, 2012. See note 4 (n) and 15 to the Consolidated Financial Statements.

Significant Accounting Policies

The Consolidated Financial Statements of the Corporation have been prepared in accordance with US GAAP and are presented in Canadian dollars. In preparing the Consolidated Financial Statements, management makes estimates and assumptions which affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the Consolidated Financial Statements, and the reported amounts of revenues and expenses for the year. Actual results could differ from those estimates, including changes as a result of future decisions made by the OEB, the Ministry of Energy of Ontario, or the Ministry of Finance of Ontario. The significant accounting policies of the Corporation are summarized in notes 2 and 4 to the Consolidated Financial Statements.

Adoption of New Accounting Pronouncements

In December 2011, the FASB issued ASU No. 2011-11, "Balance Sheet (Topic 210): Disclosures about Offsetting Assets and Liabilities". The amendments require an entity to disclose both gross and net information about financial instruments and transactions eligible for offset in the consolidated balance sheets. ASU No. 2011-11 is effective for fiscal years, and interim periods within those years, beginning on or after January 1, 2013. Retrospective application is required. The ASU No. 2013-01, "Balance Sheet (Topic 210): Clarifying the Scope of Disclosures about Offsetting Assets and Liabilities", was issued in January 2013 to amend the scope of ASU No. 2011-11 to clarify that the disclosure requirements are limited to derivatives, repurchase and reverse repurchase agreements, and securities borrowing and lending transactions that are either offset in the consolidated balance sheets or subject to enforceable master netting arrangements or similar agreements. The adoption of these amendments did not have an impact on the Corporation's consolidated balance sheets and related disclosures.

Future Accounting Pronouncements

On July 21, 2011, the OSC granted an exemption to allow the Corporation to prepare its consolidated financial statements in accordance with US GAAP for its fiscal years beginning on or after January 1, 2012 but before January 1, 2015. In the absence of the exemption, the Corporation would have previously been required to adopt IFRS on January 1, 2012. On March 19, 2014, the Board of Directors of the Corporation approved the adoption of IFRS for the year beginning on January 1, 2015 due to the pending expiration of the exemption. Accordingly, the Corporation's consolidated financial statements for 2015 are expected to be prepared in accordance with IFRS and applied retrospectively to the Corporation's opening IFRS consolidated statement of financial position as at January 1, 2014.

The Corporation has an internal initiative to govern the conversion process and is currently in the process of evaluating the potential impact of the conversion to IFRS on its consolidated financial statements. The Corporation believes that the impact on its financial statements could be material.

IFRS Conversion Project

As a result of above decision, the Corporation has initiated its IFRS conversion project, which was previously suspended as a result of the Corporation's decision to adopt US GAAP. The Corporation established a formal project governance structure. This structure includes a steering committee consisting of senior levels of management from finance, information technology and operations, among others. Regular progress reports are provided to senior executive management.

The Corporation's project consists of two phases:

1) the awareness and assessment phase; and
2) the design and implementation phase.

The Corporation updated its awareness and initial assessment during the fourth quarter of 2013. During the initial assessment it was determined that the areas of accounting differences with the highest potential impact to the Corporation are accounting for PP&E, PILs, employee future benefits, rate regulatory deferral accounts, as well as initial adoption of IFRS under the provisions of IFRS 1, First-time Adoption of IFRS ("IFRS 1"). The Corporation next updated the detailed assessment of accounting and disclosure differences which is expected to be completed in the first quarter of 2014. In parallel, a detailed assessment of the impact of the IFRS conversion on the Corporation's systems, processes and controls as well as other business, regulatory and tax impacts is also in process. During the awareness and assessment phase, the Corporation established a communication plan and a staff-training plan.

The Corporation has not yet started the design and implementation phase of the project. The design phase will involve establishing issue-specific working groups in each of the identified risk areas. The working groups will establish key milestones which include developing recommendations, analyzing financial system and internal control impacts, developing significant accounting policies, and carrying out ongoing discussions with external auditors, in each area. Based on the outcomes of each working group, the Corporation is currently determining the projected impacts of adopting IFRS on its financial statements after considering the options available under IFRS 1.

The roll-out of the changes developed in the design phase will take place during the implementation phase and involve the development of new accounting policies and accounting manuals and the associated training for the finance and operational teams, testing the effectiveness of the changes made to systems, a simulation of the financial reporting process, preparation of opening balance sheet at transition date and related reconciliations, assessing the ongoing impacts on the IFRS financial statements and related disclosures.

The Corporation has revised its project plan to reflect the necessary work involved in determining the impacts of adopting IFRS at the new adoption date of January 1, 2015. The following table provides certain key activities of the changeover plan and an assessment of the Corporation's progress at this time. This information reflects the Corporation's most recent assumptions and expectations. Circumstances may arise such as changes in IFRS, regulations, or economic conditions, which would affect these assumptions or expectations.

Key Activities	Status
Accounting policies & procedures:	
x High level review of major differences between US GAAP and IFRS x Establish issue-specific working groups in the identified risk areas x Detailed assessment of accounting and disclosure differences, accounting policy choices and IFRS 1 elections available x Develop recommendations and accounting policies through ongoing discussions with external auditors x Finalize new accounting policies and accounting manuals	x All accounting policy positions are in process x Final approval of the policies will be finalized in 2014 x Continue to monitor ongoing IASB projects and assess potential impacts x Accounting policies and procedure manuals continue to be updated based on the IASB project developments
Financial statements preparation:	
x Identify US GAAP to IFRS financial statements presentation differences and design interim and annual financial statements formats and related notes disclosures x Simulate the financial reporting process under IFRS x Prepare the opening balance sheet at the date of transition and IFRS 1 related reconciliations and disclosures x Assess ongoing impacts on the IFRS financial statements and related disclosures	x Developed drafted financial statements formats x Started testing of system related modifications to IFRS generated financial statements x Preparation of the opening balance sheet on transition date is in progress
Training & communication:	
x Provide training to affected finance and operational teams, management and the Board of Directors, and relevant committees thereof, including the audit committee x Develop and execute staff training plan, and roll out communication initiatives x Continue to update audit committee and senior management on a quarterly basis for key developments in IFRS and the potential impacts to the Corporation's financial statements	x Completed detailed training for resources directly engaged in the changeover and general awareness training to broader group of finance employees x Started topic-specific and relevant training to finance and operational teams on all finalized positions. Key areas include PP&E, PILs, employee benefits, provisions, capital contributions, borrowing cost and financial statement presentation x Continue ongoing, periodic internal and external communications on the Corporation's progress on the IFRS project and direction x Develop staff training plans with respect to regulatory deferral accounts

Key Activities	Status
Business impacts:	
x Evaluate impacts and implement necessary changes to debt covenants, internal performance measures, contracts and processes	x Impacts to debt covenants, regulatory and other business processes are being assessed
Information technology systems:	
x Analysis of financial system to identify required modifications x Test the effectiveness of the changes made to systems x Ensure solution captures financial information under US GAAP and IFRS during the year of transition for comparative reporting purposes	x Completed system changes for reporting purposes including subledger configurations for derecognition and depreciation on a component level. Further changes to information systems are to be made based upon the changes required to meet the regulatory deferral account standard x Complete the modifications to the system to accommodate the new transition date of January 1, 2014 and begin to accumulate IFRS data for reporting comparative information x Continue to implement remaining required modifications to financial systems
Control environment:	
x Detailed assessment of the impact of IFRS conversion on people, systems, processes and internal controls x Analyze and update internal control processes and documentation x Implement related controls and procedures to ensure the integrity and effectiveness of internal controls over financial reporting ("ICFR") and disclosure controls and procedures ("DC&P")	x Based on the accounting policies and procedures developed, the Corporation continues to evaluate and document the impacts on new and existing controls to ensure the integrity and effectiveness of ICFR and DC&P x Additional controls may be required to address first-time IFRS adoption and new processes implemented to support ongoing IFRS reporting requirements. These controls will be implemented and tested on a timely basis for reporting under IFRS in 2015.

In general, a first-time adopter is required to apply the IFRS standards retrospectively and recognize any consequential adjustments in retained earnings. IFRS 1 sets out all of the transitional requirements applicable for the first-time adoption of IFRS. Several mandatory and optional exemptions to the retrospective application are available. The Corporation has considered the impacts of IFRS 1 and an initial assessment has been made as to which exemptions would be elected upon transition. At this time, the impact on the Corporation's future financial position and results of operations is not reasonably determinable. In addition, during the year of 2014 until the transition, changes to IFRS may impact exemptions available for first-time adopters, and in turn, may change the Corporation's original assessments and policy selections.

The Corporation has completed a detailed assessment of the accounting and disclosure differences between US GAAP and IFRS and identified the following areas as having the potential to materially impact the consolidated financial statements on the date of transition to IFRS and post-IFRS implementation.

Risk Areas	Key Differences IFRS vs. US GAAP	Potential Key Impacts
IAS 12 - Income Taxes	IAS 12 requires that a deferred tax asset is recognized to the extent it is probable that it will be realized - i.e. a net approach, whereas US GAAP allows all deferred tax assets being recognized and a valuation allowance being recognized to the extent that it is more likely than not that the deferred tax assets will not be realized - i.e. a gross approach.	Currently a valuation allowance has been established for certain capital loss carryforwards and allowed tax depreciation under US GAAP. All other deferred tax assets are considered more likely than not to be realized. The impact of adopting IAS 12 is one of disclosure only as the net deferred tax assets recorded would be similar under both standards.
IAS 16 - PP&E	IAS 16 requires that the estimates of useful life and residual value, and the method of depreciation, are reviewed at a minimum at each annual reporting period. Any changes are accounted for prospectively as a change in estimate. The carrying amount of an item of PP&E shall be derecognized upon disposal or when no future economic benefits are expected. The gain or loss arising from the derecognition of an item of PP&E shall be included in profit or loss (unless IAS 17 requires otherwise on a sale and leaseback). Gains shall not be classified as revenue.	As a result of adoption of IAS 16, useful lives and residual value will need to be reviewed annually. The Corporation will be derecognizing all items of PP&E as soon as they are taken out of service. PP&E will decrease with a corresponding increase to depreciation expense.

Risk Areas	Key Differences IFRS vs. US GAAP	Potential Key Impacts
IAS 19 - Employee Benefits	IAS 19 does not specify whether an entity should distinguish current and non-current portions related to post-employment benefits. Under US GAAP, the amount of the actuarial present value of benefits included in the benefit obligation which is expected to be paid in the next 12 months is classified as current. Actuarial gains or losses of defined benefit plans are recognized immediately in OCI and cannot be recycled into profit or loss. The corridor method, which is permitted under US GAAP has been eliminated under IFRS. For other long-term benefits other than post-employment benefits, IAS 19 requires benefits that are expected to be settled wholly before twelve months after the end of the annual reporting period in which the employees render the related service to be classified as current. Under IFRS, short-term benefits that accumulate are recognized even when the benefit is non-vested, as opposed to US GAAP, in which recognition of such benefits is permitted but not mandatory.	Based on preliminary assessments, the Corporation will elect to account for all post-employment benefits as non-current under IFRS. All actuarial gains and losses related to post-employment benefits will be recognized immediately into OCI under IFRS and will not be allowed to be recycled to profit or loss. The Corporation's long-term benefits are not expected to be wholly settled within 12 months and therefore will remain as non-current under IFRS. As a result of adoption of IAS 19, the Corporation will need to accrue for the required employee benefits liability.
IAS 23- Borrowing Costs	The core principle of IAS 23 is that borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset form part of the cost of that asset. Other borrowing costs are recognized as an expense in the period in which they are incurred. Borrowing costs under IFRS are calculated using the weighted average interest rate of the Corporation's general borrowings, including borrowing costs previously capitalized, as opposed to the OEB prescribed rate on a simple interest basis permitted under US GAAP. Borrowing costs should also be capitalized as soon as the asset meets the conditions of commencement date as opposed to the current practice, in which costs can be capitalized after the 6 month mark.	Based on preliminary assessments, it is expected that additional borrowing costs would be capitalized as a result of the adoption of IAS 23.
IAS 37 - Provisions, Contingent Assets and Liabilities	IAS 37 requires a discount rate that reflects current market assessments of the time value of money and risks specific to the liability, whereas US GAAP requires the use of a credit-adjusted risk-free rate.	Based on preliminary assessments, the impact on the date of transition when using the IFRS 1 optional exemption is an increase to decommissioning provisions, a decrease to PP&E, and a decrease to opening retained earnings.
IFRIC 18 - Transfer Assets from Customers (Capital Contributions)	IFRIC 18 does not allow for the netting of capital contributions received against items of PP&E.	Based on preliminary assessments, there will be a reclassification between PP&E, and unearned revenue liability. The capital contribution will be amortized, and recognized into revenue opposed to against depreciation under US GAAP. Presentation differences will have no impact on the net income reported.
IFRS 14 – Regulatory Deferral Accounts	The Corporation is in the process of determining key differences.	The Corporation is in the process of determining key differences.

Forward-Looking Information

The Corporation includes forward-looking information in its MD&A within the meaning of applicable securities laws in Canada. The purpose of the forward-looking information is to provide management's expectations regarding the Corporation's future results of operations, performance, business prospects and opportunities and may not be appropriate for other purposes. All forward-looking information is given pursuant to the "safe harbour" provisions of applicable Canadian securities legislation. The words "aims", "anticipates", "believes", "budgets", "committed", "could", "estimates", "expects", "focus", "forecasts", "intends", "may", "might", "plans", "projects", "schedule", "should", "strives", "will", "would" and similar expressions are often intended to identify forward-looking information, although not all forward-looking information contains these identifying words. The forward-looking information reflects management's current beliefs and is based on information currently available to the Corporation's management.

The forward-looking information in the MD&A includes, but is not limited to, statements regarding the Corporation's achievement of its strategic pillars as described in the section entitled "Corporate Strategy", the Corporation's plans to borrow funds to repay maturing debentures and to finance the investment in LDC's infrastructure and the Corporation's available sources of liquidity and capital resources and the sufficiency thereof to satisfy working capital requirements for the next 12 months as described in the sections entitled "Liquidity and Capital Resources" and "Additional Debt Financing and Credit Rating", the anticipated capacity to be provided by Copeland Station and the expected capital expenditures required to complete Copeland Station as described in the section entitled "Liquidity and Capital Resources", the ability to pay any damages in connection with legal actions and claims as described in the section entitled "Legal Proceedings", the impact of market volatility on the Corporation's consolidated results of operations, performance, business prospects and opportunities as described in the section entitled "Quarterly Results of Operations", the effect of changes in energy consumption on future revenue as described in the section entitled "Electricity Consumption", the effect of changes in interest rates and discount rates on future revenue requirements and future post-retirement benefit obligations, respectively, as described in the section entitled "Market and Credit Risk", changes in accounting estimates as described in the section entitled "Significant Accounting Policies", and the plan in connection with the IFRS conversion project and progress of the regulatory deferral account project as described in the section entitled "Future Accounting Pronouncements". The statements that make up the forward-looking information are based on assumptions that include, but are not limited to, the future course of the economy and financial markets, the receipt of applicable regulatory approvals and requested rate orders, the receipt of favourable judgments, the level of interest rates and the Corporation's ability to borrow, and the effectiveness of the potential future transition to IFRS by the Corporation.

The forward-looking information is subject to risks, uncertainties and other factors that could cause actual results to differ materially from historical results or results anticipated by the forward-looking information. The factors which could cause results or events to differ from current expectations include, but are not limited to, market liquidity and the quality of the underlying assets and financial instruments, the timing and extent of changes in prevailing interest rates, inflation levels, legislative, judicial and regulatory developments that could affect revenues and the results of borrowing efforts.

All forward-looking information in the MD&A is qualified in its entirety by the above cautionary statements and, except as required by law, the Corporation undertakes no obligation to revise or update any forward-looking information as a result of new information, future events or otherwise after the date hereof.

Selected Annual Information

The following table sets forth selected annual financial information of the Corporation for the three years ended December 31, 2013, 2012 and 2011. This information has been derived from the Consolidated Financial Statements.

Selected Annual Consolidated Financial Information
(in thousands of Canadian dollars)

	2013 $	2012 $	2011[1] $
Year Ended December 31,			
Net revenues[2]	635,281	577,268	586,929
Operating expenses[2]	271,958	245,173	262,241
Net income[2]	121,241	85,990	95,932
Capital expenditures[3]	450,314	292,375	437,067
As at December 31,			
Total assets[4]	3,797,531	3,539,354	3,527,507
Total debentures[4,5]	1,449,332	1,469,590	1,469,527
Other non-current financial liabilities[6]	15,531	16,175	27,101
Shareholder's equity[4]	1,218,518	1,140,272	1,102,248
Dividends[3]	42,995	47,966	33,063
Total debt to capitalization ratio[7]	57.0%	56.3%	57.1%
Return on equity[8]	10.3%	7.7%	9.0%

[1] The Corporation's consolidated financial statements were prepared in accordance with Part V of Canadian GAAP until December 31, 2011. Selected financial information from comparative consolidated financial statements for 2011 have been adjusted retroactively from the consolidated financial statements previously filed to conform to the presentation of the Corporation's 2012 and 2013 consolidated financial statements prepared in accordance with US GAAP.

[2] See "Results of Operations" for further details on net revenues, operating expenses and net income.

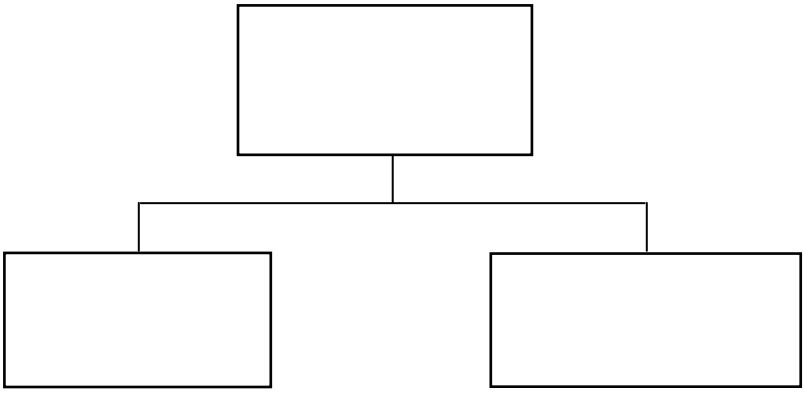
[3] See "Liquidity and Capital Resources" for further details on capital expenditures and dividends.

[4] See "Financial Position" for further details of significant changes in assets, debentures and shareholder's equity.

[5] Total debentures include current and long-term debentures.

[6] Other non-current financial liabilities include non-current obligations under capital lease and non-current customers' deposits. Under US GAAP, deposits that are due or will become due on demand within one year from the end of the reporting period have been reclassified to other current financial liabilities.

[7] Total debt to capitalization ratio = (total debt) / (total debt + total shareholder's equity), where total debt = (working capital facility + commercial paper + revolving credit facility + current portion of debentures + long-term portion of debentures).



[8] Return on equity = net income / average total shareholder's equity. Return on equity is measured over a 12-month period.

Additional Information

Additional information with respect to the Corporation, including its annual information form) is available on the System for Electronic Document Analysis and Retrieval website at www.sedar.com

Toronto, Canada

March 19, 2014

Toronto Hydro is subject to extensive federal, provincial and local regulation relating to the protection of the environment. The principal federal legislation is the Canadian Environmental Protection Act which regulates the use, import, export and storage of toxic substances, including PCBs and ozone-depleting substances. Toronto Hydro is also subject to the federal Transportation of Dangerous Goods Act which prescribes safety standards and requirements for the handling and transportation of hazardous goods including PCBs and sets out reporting, training and inspection requirements relating thereto.

The principal provincial legislation is the Environmental Protection Act which regulates releases and spills of contaminants, including PCBs, ozone-depleting substances and other halocarbons, contaminated soil management, and the monitoring and reporting of and liability for contaminant discharge. The provincial Technical Standards and Safety Act also applies to Toronto Hydro's operations with respect to the handling of and training related to compressed gas, propane and liquid fuels. The provincial Fire Protection and Prevention Act requires Toronto Hydro to incorporate procedures and training for dealing with any spills of flammable or combustible liquids. The provincial Dangerous Goods Transportation Act prescribes safety standards and requirements for transportation of dangerous goods on provincial highways and sets out inspection requirements related thereto.

Municipal by-laws regulate discharges of industrial sewage and storm water run-off to the municipal sewer system and the reporting of the release of certain toxic substances into the atmosphere.

In 2013, LDC spent approximately $4.4 million to meet environmental protection requirements. These costs are not anticipated to significantly increase for future years, and do not currently have a material impact on the Corporation's financial and operational results.

The Corporation recognizes a liability for the future environmental remediation of certain properties and for future removal and handling costs for contamination in electricity distribution equipment in service and in storage. The liability is recognized when the asset retirement obligation is incurred and when the fair value is determined. As at December 31, 2013, the Corporation's asset retirement obligations amounted to $6.3 million. See notes 4 and 15 to the Consolidated Financial Statements.

PUBLIC OFFERING INFORMATION

In accordance with section 2.4.3 of the OEB Filing Requirements (July 17, 2013), this schedule includes the following information about Toronto Hydro's recent public offerings:

- Appendix A: Prospectus, issued 10 December 2012;
- Appendix B: 8th Supplemental Trust Indenture, issued November 2011;
- Appendix C: 9th Supplemental Trust Indenture, issued April 2013; and
- Appendix D: 10th Supplemental Trust Indenture, issued April 2013.

No securities regulatory authority has expressed an opinion about these securities and it is an offence to claim otherwise.

This short form prospectus constitutes a public offering of these securities only in those jurisdictions where they may be lawfully offered for sale and therein only by persons permitted to sell such securities. The securities to be issued hereunder have not been and will not be registered under the United States Securities Act of 1933, as amended, and, subject to certain exceptions, may not be offered or sold within the United States or to United States persons. See "Plan of Distribution".

Information has been incorporated by reference in this short form prospectus from documents filed with securities commissions or similar authorities in Canada. Copies of the documents incorporated herein by reference may be obtained on request without charge from the Chief Financial Officer, Toronto Hydro Corporation, 14 Carlton Street, Toronto, Ontario, M5B 1K5, (416) 542-3100 and are also available electronically at www.sedar.com.

SHORT FORM BASE SHELF PROSPECTUS

New Issue December 10, 2012

TORONTO HYDRO CORPORATION

$1,500,000,000 DEBENTURES
(unsecured)

Toronto Hydro Corporation (the "Corporation") may offer and issue from time to time unsecured debentures (the "Debentures") in one or more series in an aggregate principal amount of up to $1,500,000,000 (or the equivalent thereof in foreign currencies or currency units if any of the Debentures are denominated in foreign currencies or currency units) during the twenty-five months from the date of this prospectus. The Debentures will be offered pursuant to an MTN program established by the Corporation.

The Debentures will be issued under a trust indenture dated May 7, 2003 (as supplemented from time to time by supplemental indentures), will be direct unsecured obligations of the Corporation and will rank equally (except as to sinking funds and to the extent prescribed by law) with all other unsecured and unsubordinated indebtedness of the Corporation. The Debentures will have a term to maturity of not less than one year and will be issuable in denominations of $1,000 or more. The Debentures may be issued in Canadian dollars or any foreign currency or currency unit determined at the time of issue.

The specific terms of an offering of Debentures (including the aggregate principal amount of the Debentures being offered, the currency or currencies, the issue and delivery date, the form, the maturity date, the interest rate, the issue price, the interest payment date(s), any redemption or repayment provisions, any provisions entitling the Corporation to extend the maturity date of the Debentures, the name(s) of the dealer(s) offering the Debentures, the commission payable to such dealer(s), the method of distribution and the net proceeds to the Corporation) will be set forth in a pricing supplement which will be delivered to purchasers together with this prospectus. The Corporation reserves the right to set forth in a pricing supplement specific terms of Debentures which are not within the parameters set forth in this prospectus.

The sole shareholder of the Corporation is the City of Toronto. The Debentures will not be obligations of, and will not be guaranteed in any manner by, the City of Toronto.

There is no market through which the Debentures may be sold and purchasers may not be able to resell Debentures purchased under this prospectus. This may affect the pricing of the Debentures in the secondary market, the transparency and availability of trading prices, the liquidity of the Debentures and the extent of issuer regulation. See "Risk Factors". Unless otherwise indicated in a pricing supplement, the Debentures will not be listed on any securities exchange.

RATES ON APPLICATION

(continued on next page)

(continued from cover)

The Debentures may be offered by one or more dealers as selected from time to time by the Corporation (collectively, the "Dealers"), in each case, acting as agent of the Corporation or as principal. Where the Debentures are offered by the Dealer(s) as agent(s), the commissions payable by the Corporation in connection with sales of such Debentures shall be agreed from time to time between the Corporation and any such Dealer(s). Where the Debentures are purchased by the Dealer(s) as principal, the Debentures shall be purchased at such prices and with such commissions as may be agreed from time to time between the Corporation and any such Dealer(s) for resale to the public at prices to be negotiated with each purchaser. Such resale prices may vary during the distribution period and as between purchasers. Each Dealer's compensation will increase or decrease by the amount by which the aggregate price paid for Debentures by purchasers exceeds or is less than the price paid by the Dealer, acting as principal, to the Corporation. The commissions payable in connection with sales of Debentures will be set forth in a pricing supplement which will be delivered to purchasers together with this prospectus. The Corporation may also offer the Debentures directly to potential purchasers pursuant to applicable statutory exemptions at prices and upon terms negotiated between the purchaser and the Corporation. The Corporation and, if applicable, the Dealers, may reject any offer to purchase the Debentures in whole or in part. The Corporation also reserves the right to withdraw, cancel or modify the offering of the Debentures under this prospectus without notice. The Dealers may over-allot or effect transactions which stabilize or maintain the market price of the Debentures offered at a level above that which might otherwise prevail in the open market. See "Plan of Distribution".

The offering of the Debentures is subject to the approval of certain legal matters on behalf of the Corporation by McMillan LLP.

The registered and head office of the Corporation is located at 14 Carlton Street, Toronto, Ontario, M5B 1K5.

DOCUMENTS INCORPORATED BY REFERENCE

The following documents of the Corporation filed with the provincial securities regulatory authorities in Canada are incorporated by reference in this prospectus for the purposes of the offering of Debentures hereunder:

(a) the annual information form (the "AIF") of the Corporation dated March 29, 2012;

(b) the comparative audited consolidated financial statements of the Corporation together with the auditors' report thereon and the notes thereto as at and for the years ended December 31, 2011 and December 31, 2010;

(c) management's discussion and analysis of financial condition and results of operations for the year ended December 31, 2011;

(d) the comparative unaudited interim consolidated financial statements of the Corporation together with the notes thereto as at and for the three-month and nine-month periods ended September 30, 2012 and September 30, 2011 and management's discussion and analysis relating thereto;

(e) earnings coverage ratios for the twelve-month periods ended December 31, 2011 and September 30, 2012; and

(f) the Ernst & Young LLP auditors' report on the financial statements as at and for the year ended December 31, 2010 referred to in item (b).

All material change reports, business acquisition reports and unaudited interim consolidated financial statements of the Corporation (and management's discussion and analysis relating thereto) filed by the Corporation after the date of this prospectus with the securities regulatory authorities in Canada will be deemed to be incorporated by reference in this prospectus for the purposes of the offering of Debentures hereunder.

Updated earnings coverage ratios will be filed quarterly with the provincial securities regulatory authorities in Canada and will be deemed to be incorporated by reference in this prospectus for the purposes of the offering of Debentures hereunder.

When new documents of the type referred to in paragraphs (a), (b) and (c) above are filed by the Corporation with and, where required, accepted by the provincial securities regulatory authorities in Canada during the currency of this prospectus, such documents will be deemed to be incorporated by reference in this prospectus and the previous documents of the type referred to in paragraphs (a), (b) and (c) above and all material change reports, business acquisition reports, unaudited interim consolidated financial statements (and management's discussion and analysis relating thereto) and prospectus supplements filed by the Corporation with the provincial securities regulatory authorities in Canada before the commencement of the Corporation's financial year in which the new documents are

filed will no longer be deemed to be incorporated by reference in this prospectus for the purposes of the future offering of Debentures hereunder.

A pricing supplement containing the specific variable terms for an issue of Debentures will be delivered to purchasers of such Debentures together with this prospectus and will be deemed to be incorporated by reference in this prospectus as of the date of the pricing supplement, solely for the purposes of the Debentures issued under that pricing supplement.

Any statement contained in this prospectus or in a document incorporated or deemed to be incorporated by reference herein will be deemed to be modified or superseded, for purposes of this prospectus, to the extent that a statement contained herein or in a document incorporated or deemed to be incorporated by reference herein modifies or supersedes such prior statement. The modifying or superseding statement need not state that it has modified or superseded a prior statement or include any other information set forth in the document that it modifies or supersedes. The making of a modifying or superseding statement will not be deemed an admission for any purposes that the modified or superseded statement, when made, constituted a misrepresentation, an untrue statement of a material fact or an omission to state a material fact that is required to be stated or that is necessary to make a statement not misleading in light of the circumstances in which it was made. Any statement so modified or superseded will not constitute a part of this prospectus, except as so modified or superseded.

FORWARD-LOOKING INFORMATION

Certain information included or incorporated by reference in this prospectus constitutes "forward-looking information". The purpose of the forward-looking information is to provide management's expectations regarding the Corporation's future results of operations, performance, business prospects and opportunities and may not be appropriate for other purposes. The words "anticipates", "believes", "budgets", "could", "estimates", "expects", "forecasts", "intends", "may", "might", "plans", "projects", "schedule", "should", "will", "would" or the negative or other variations of these words or other comparable words or phrases, are intended to identify forward-looking information. The forward-looking information is based on estimates and assumptions made by the Corporation's management in light of past experience and perception of historical trends, current conditions and expected future developments, as well as other factors that management considers to be reasonable in the circumstances. The forward-looking information is subject to risks, uncertainties and other factors that could cause actual results to differ materially from historical results or results anticipated by the forward-looking information, including, without limitation, the following factors: the outcome of outstanding rate applications and other proceedings before the OEB, the timing and amount of future cash flows generated by the Corporation's investments, market liquidity and the quality of the underlying assets and financial instruments; the timing and extent of changes in prevailing interest rates; inflation levels; legislative, judicial and regulatory developments that could affect revenues, accounting policies or the business carried on by Toronto Hydro; LDC's ability to continue to maintain and operate the distribution system reliably and safely in the future; LDC's ability to develop, maintain and manage a complex information technology systems infrastructure; the volume of electricity consumed by LDC's customers; credit risk with respect to customer non-payment; the Corporation's ability to arrange sufficient and cost-effective debt financing; Toronto Hydro's ability to attract and retain the required workforce; the effects of natural and other unexpected occurrences; Toronto Hydro's ability to obtain or maintain adequate insurance to cover losses or liabilities that might arise at rates it considers reasonable; Toronto Hydro's compliance with Canadian, federal, provincial and municipal environmental regulation (changes in environmental regulation or enforcement may impose material additional costs on Toronto Hydro); material changes in Toronto Hydro's assessment of the estimated fair value of its investments; a credit rating change; Toronto Hydro's ability to develop plans and approaches that are acceptable to its labour unions; the risks associated with being controlled by the City of Toronto as well as potential conflicts of interest that may arise between Toronto Hydro, the City of Toronto and related parties; Toronto Hydro's ability to obtain formal access agreements with respect to certain terminal stations and municipal substations located on lands owned by the Province of Ontario, the City of Toronto and others; and more than one distribution licence could be issued for the same area and there is a possibility that in the future some business functions or activities could be separated from LDC and made open to more competition from non-regulated business entities, or that defined geographical areas within LDC's service area may be electrically supplied by a means other than through LDC's system. All of the forward-looking information included or incorporated by reference in this prospectus is qualified by these cautionary statements and those made in the "Risk Factors" section of this prospectus and the comparable sections of the documents incorporated or deemed to be incorporated by reference in this prospectus (including the Corporation's annual information form and the management's discussion and analysis of financial condition and results of operations accompanying the financial statements of the Corporation). These factors are not intended to represent a complete list of the factors that could affect the Corporation; however, these factors should be considered carefully and readers should not place undue reliance on forward-looking information

made herein or in the documents incorporated by reference. The Corporation has no intention and undertakes no obligation to update or revise any forward-looking information, whether as a result of new information, future events or otherwise, except as required by law.

Capitalized terms used in this section without definition, have the meanings given to them elsewhere in this prospectus.

CURRENCY

Unless otherwise specified, all references to dollars contained in this prospectus are to Canadian dollars.

TORONTO HYDRO

Toronto Hydro Corporation (the "Corporation" and, together with its subsidiaries, "Toronto Hydro") is a holding company which, through its wholly-owned subsidiaries:

- Toronto Hydro-Electric System Limited ("LDC") – distributes electricity and engages in conservation and demand management activities; and
- Toronto Hydro Energy Services Inc. – provides street lighting services.

The principal business of Toronto Hydro is the distribution of electricity by LDC. LDC owns and operates an electricity distribution system located in the City of Toronto. LDC is the largest municipal electricity distribution company in Canada. The business of LDC is regulated by the Ontario Energy Board ("OEB") which has broad powers relating to licensing and standards of conduct and service and the regulation of rates charged by LDC and other electricity distributors.

The sole shareholder of the Corporation is the City of Toronto.

USE OF PROCEEDS

The net proceeds from the sale of Debentures will be used by the Corporation for general corporate purposes. Proceeds from the sale of the Debentures may also be used to reduce indebtedness that the Corporation may have with the bank affiliates of one or more of the Dealers (as defined below).

PLAN OF DISTRIBUTION

The Debentures may be offered by one or more dealers as selected from time to time by the Corporation (collectively, the "Dealers"), in each case, acting as agent of the Corporation or as principal. Where the Debentures are offered by the Dealer(s) as agent(s), the commissions payable by the Corporation in connection with sales of such Debentures shall be agreed from time to time between the Corporation and any such Dealer(s). Where the Debentures are purchased by the Dealer(s) as principal, the Debentures shall be purchased at such prices and with such commissions as may be agreed from time to time between the Corporation and any such Dealer(s). Resale to the public at prices to be negotiated with each purchaser. Such resale prices may vary during the distribution period and as between purchasers. Each Dealer's compensation will increase or decrease by the amount by which the aggregate price paid for Debentures by purchasers exceeds or is less than the price paid by such Dealer, acting as principal, to the Corporation. The commissions payable in connection with sales of Debentures will be set forth in a pricing supplement which will be delivered to purchasers together with this prospectus. The Corporation may also offer the Debentures directly to potential purchasers pursuant to applicable statutory exemptions at prices and upon terms negotiated between the purchaser and the Corporation.

The Corporation may enter into one or more dealer agreements with the Dealers relating to the sale of Debentures under this prospectus. A copy of the dealer agreement(s) will be filed with the securities regulatory authorities in each of the provinces of Canada following its execution.

The Corporation and, if applicable, the Dealers, may reject any offer to purchase the Debentures in whole or in part. The Corporation also reserves the right to withdraw, cancel or modify the offering of the Debentures under this prospectus without notice.

In connection with any offering of Debentures, the Dealers may over-allot or effect transactions which stabilize or maintain the market price of the Debentures offered at a level above that which might otherwise prevail in the open market. Such transactions, if commenced, may be discontinued at any time. In addition, the Dealers may, from time to time purchase and sell the Debentures in the secondary market but are not obliged to do so. There can be no assurance that there will be a secondary market for the Debentures. The offering price and other terms for such sales in the secondary market may, from time to time, be varied by the Dealers.

The Debentures have not and will not be registered under the United States Securities Act of 1933, as amended (the "U.S. Securities Act"), or any state securities laws, and may not be offered or sold within the United States or to United States persons unless registered under the U.S. Securities Act and applicable state securities laws or an exemption therefrom is available. Each of the Dealers will agree not to buy or offer to buy, to sell or offer to sell, or

solicit any offer to buy any Debentures in the United States of America, its territories or possessions, or to or for the account or benefit of United States persons, except to "qualified institutional buyers" in accordance with Rule 144A under the U.S. Securities Act. Debentures issued to qualified institutional buyers pursuant to Rule 144A under the U.S. Securities Act will be represented by definitive certificates and will be subject to certain restrictions on transfer set forth therein and in the supplemental indenture and will bear a legend regarding such restrictions as set forth in the supplemental indenture. This prospectus does not constitute an offer to sell or a solicitation of an offer to buy any of the Debentures in the United States. In addition, until 40 days after the commencement of the offering of an issue of Debentures, an offer or sale of that issue within the United States by any Dealer (whether or not participating in the offering) may violate the registration requirements of the U.S. Securities Act if such offer or sale is made otherwise than in accordance with Rule 144A under the U.S. Securities Act.

RATINGS

The Debentures have been assigned a rating of "A (high)" with a stable trend by DBRS Limited ("DBRS") and "A" by Standard &Poor's ("S&P").

DBRS rates long-term debt instruments by rating categories ranging from a high of "AAA" to a low of "D". A DBRS rating may be modified by the addition of "high" or "low" to indicate relative standing within the major rating categories. Long-term debt instruments which are rated in the "A" category by DBRS are considered to be of "good credit quality", with substantial capacity for the payment of financial obligations. Entities in the "A" category, however, are considered to be more vulnerable to future events, but qualifying negative factors are considered manageable. An A rating is the second of the three sub-categories within the third of the ten rating categories. S&P rates long-term debt instruments by rating categories ranging from a high of "AAA" to a low of "D". An S&P rating may be modified by the addition of a plus or minus sign to indicate relative standing within the major rating categories. Long-term debt instruments which are rated in the "A" category by S&P are considered somewhat more susceptible to the adverse effects of changes in circumstances and economic conditions than obligations in higher-rated categories; however, the obligor's capacity to meet its financial commitment on the obligation is still strong. An A rating is the second of the three sub-categories within the third of the ten rating categories.

Credit ratings are intended to provide investors with an independent measure of the credit quality of an issue of securities. A rating is not a recommendation to buy, sell or hold securities and may be subject to revision or withdrawal at any time by the rating agency.

DESCRIPTION OF THE DEBENTURES

The Debentures will be issued in one or more series under a trust indenture dated May 7, 2003 between the Corporation and BNY Trust Company of Canada (the "Trustee", which term shall include, unless the context requires otherwise, its successors), as supplemented from time to time by supplemental indentures (together, the "Indenture"). The Indenture permits the issuance of an unlimited principal amount of debentures of the Corporation in one or more series. The terms of each series of debentures issued pursuant to the Indenture will be specified in a supplemental indenture to the Indenture. A copy of the Indenture is available electronically at www.sedar.com.

The specific terms of an offering of Debentures (including the aggregate principal amount of the Debentures being offered, the currency or currencies, the issue and delivery date, the form, the maturity date, the interest rate, the issue price, the interest payment date(s), any redemption or repayment provisions, any provisions entitling the Corporation to extend the maturity date of the Debentures, the name(s) of the Dealer(s) offering the Debentures, the commission payable to such Dealer(s), the method of distribution and the net proceeds to the Corporation) will be set forth in a pricing supplement which will be delivered to purchasers together with this prospectus. Unless otherwise indicated in a pricing supplement, the Debentures will not be listed on any securities exchange. The Corporation reserves the right to set forth in a pricing supplement specific terms of Debentures which are not within the parameters set forth in this prospectus.

The following is a summary of the material attributes of the Debentures. This summary does not purport to be complete. For a complete description of the Debentures, reference should be made to the Indenture. Certain capitalized terms used in this summary are defined below under "Definitions".

Term, Denomination and Currency

The Debentures will have a term to maturity of not less than one year and will be issuable in denominations of $1,000 or more. The Debentures may be issued in Canadian dollars or any foreign currency or currency unit determined at the time of issue.

Interest

The Debentures will bear interest at fixed or floating rates as set out in the applicable pricing supplement to this prospectus.

Rank

The Debentures will be direct unsecured obligations of the Corporation and will rank equally (except as to sinking funds and to the extent prescribed by law) with all other unsecured and unsubordinated indebtedness of the Corporation, including indebtedness of the Corporation under a $600 million revolving credit facility with a syndicate of Canadian banks (the "THC Revolving Credit Facility"), two bilateral credit facilities under which up to $95 million is available from two Canadian banks (the "Bilateral Credit Facilities") and debentures of every other series issued pursuant to the Indenture.

The Debentures will not be obligations of, and will not be guaranteed in any manner by, the City of Toronto.

Redemption

If so specified in the applicable pricing supplement, a series of Debentures may be redeemed, at the Corporation's option, in whole at any time or in part from time to time, prior to maturity, on not more than 60 and not less than 15 business days prior notice, at the redemption price, together in each case with accrued and unpaid interest to, but not including, the date fixed for redemption. The applicable pricing supplement will specify the redemption price (or the manner of calculating the redemption price), if any, for the series of Debentures.

If less than all Debentures of any series of Debentures are to be redeemed, the Debentures to be redeemed will be selected by the Trustee on a pro rata basis or by lot or such other means as the Trustee may deem equitable and expedient.

Purchase for Cancellation

The Corporation may, at any time, purchase Debentures for cancellation, in the open market, by tender or by private contract, at any price.

Covenants

Negative Pledge

The Corporation will not, and will not permit any Designated Subsidiary to, create, assume or suffer to exist any Security Interest, other than Permitted Encumbrances, over any of its assets (present or future) to secure any Obligation, unless at the same time it shall secure equally and rateably therewith all the Debentures issued pursuant to the Indenture then outstanding.

Limitation on Funded Indebtedness

The Corporation will not, and will not permit any Designated Subsidiary to, directly or indirectly, issue, incur, assume or otherwise become liable for or in respect of any Funded Indebtedness unless, after giving effect thereto, Consolidated Funded Indebtedness would not exceed 75% of Total Consolidated Capitalization. This covenant will not operate to prevent the Corporation or a Designated Subsidiary from issuing, incurring, assuming or otherwise becoming liable for or in respect of any Inter-Company Indebtedness and Non-Speculative Financial Instrument Obligations. This covenant will operate to prevent the Corporation or a Designated Subsidiary from assigning any Inter-Company Indebtedness to a person other than the Corporation or a Designated Subsidiary.

Limitation on Designated Subsidiary Indebtedness

The Corporation will not permit a Designated Subsidiary to, directly or indirectly, issue, incur, assume or otherwise become liable for or in respect of any Indebtedness except:

(a) Inter-Company Indebtedness of the Designated Subsidiary;

(b) Non-Recourse Debt of the Designated Subsidiary;

(c) Non-Speculative Financial Instrument Obligations of the Designated Subsidiary;

(d) Permitted Capital Lease Obligations of the Designated Subsidiary;

(e) Prudential and Bilateral Credit Support Obligations of the Designated Subsidiary;

(f) Purchase Money Obligations of the Designated Subsidiary; and

(g) any other Indebtedness of the Designated Subsidiary (in addition to the Indebtedness referred to in paragraphs (a) to (f)) if, after giving effect to the Indebtedness, the aggregate amount of all Indebtedness of all Designated Subsidiaries incurred by this paragraph (g) only would not exceed 5% of Consolidated Net Worth.

For the purposes of this covenant, the assignment by the Corporation to a third party of Inter-Company Indebtedness owing by a Designated Subsidiary will be considered to be an incurrence of Indebtedness by such Designated Subsidiary.

Designation of Subsidiaries as Designated Subsidiaries

LDC is a Designated Subsidiary. The board of directors of the Corporation may designate a subsidiary of the Corporation in addition to LDC as a Designated Subsidiary if:

(a) at the time of and after giving effect to the designation, no Event of Default or event that, with the passing of time or the giving of notice or both, would constitute an Event of Default has occurred and is continuing;

(b) after giving effect to the designation, the Corporation would be entitled under the Indenture to issue Funded Indebtedness in the amount of at least $1.00; and

(c) none of the shares of the subsidiary is owned by another subsidiary of the Corporation that is not a Designated Subsidiary.

The board of directors of the Corporation may terminate the designation of a subsidiary of the Corporation other than LDC as a Designated Subsidiary if:

(a) at the time of and after giving effect to the termination, no Event of Default or event that, with the passing of time or the giving of notice or both, would constitute an Event of Default has occurred and is continuing;

(b) after giving effect to the termination, the Corporation would be entitled under the Indenture to issue Funded Indebtedness in the amount of at least $1.00; and

(c) the subsidiary does not own any Funded Indebtedness of the Corporation or any shares or Funded Indebtedness of any other Designated Subsidiary.

Restriction on Mergers and Dispositions

The Corporation will not, directly or indirectly through a Designated Subsidiary, enter into a transaction or series of transactions in which all or substantially all of the undertaking, property and assets of the Corporation and its Designated Subsidiaries determined on a consolidated basis would become the property of any other person, whether by way of reorganization, consolidation, amalgamation, arrangement, merger, transfer, sale, lease or otherwise, unless:

(a) the person is a corporation organized and existing under the laws of Canada or a province or territory thereof and expressly assumes, by a supplemental indenture satisfactory in form to the Trustee and its counsel and executed and delivered to the Trustee, all of the covenants and obligations of the Corporation under the Indenture and all debentures issued pursuant to the Indenture; and

(b) at the time of and after giving effect to the reorganization, consolidation, amalgamation, arrangement, merger, transfer, sale, lease or other transaction, no Event of Default or event that, with the passing of time or the giving of notice or both, would constitute an Event of Default has occurred and is continuing.

Events of Default

The following are Events of Default applicable to a series of debentures, including each series of Debentures, issued pursuant to the Indenture:

(a) failure to pay principal or premium (if any) on the debentures when due;

(b) failure to pay interest on the debentures when due if such failure continues for a period of 30 days;

(c) the sale, transfer, lease or other disposition of all or substantially all of the property and assets of the Corporation and its Designated Subsidiaries determined on a consolidated basis other than in accordance with the covenants described above under "– Covenants – Restriction on Mergers and Dispositions";

(d) failure to observe or perform any other covenant or condition contained in the Indenture if such failure continues for a period of 60 days after written notice thereof has been given to the Corporation by the Trustee or the holders of at least 25% in principal amount of the debentures of any affected series then outstanding;

(e) failure by the Corporation or any Material Subsidiary to pay principal, premium (if any) or interest due on any Indebtedness, the principal amount of which is more than $50 million in the aggregate, beyond the applicable grace period;

(f) failure by the Corporation or any Material Subsidiary to observe or perform any provision of any agreement under which Indebtedness is created if such failure has the effect of causing more than $50 million of such Indebtedness in the aggregate to become due and payable or to be required to be redeemed or repurchased before its stated maturity;

(g) the rendering by a court of competent jurisdiction of one or more judgments against the Corporation or any Material Subsidiary in an aggregate amount of more than $50 million if the judgments remain undischarged or unstayed for more than 30 days; and

(h) specified events of bankruptcy, insolvency or reorganization affecting the Corporation or any Material Subsidiary.

Default

If an Event of Default described in paragraphs (a) to (g) above occurs and is continuing, the Trustee or the holders of not less than 25% of the principal amount of debentures of a series of debentures issued pursuant to the Indenture then outstanding may declare the principal amount of, and the premium (if any) and accrued and unpaid interest on all debentures of that series then outstanding to be due and payable immediately.

If an Event of Default described in paragraph (h) above occurs and is continuing, the principal amount of and the premium (if any) and accrued and unpaid interest on all debentures issued pursuant to the Indenture then outstanding shall be due and payable immediately without any declaration or other action by the Trustee or the holders of the debentures.

Protection of Trustee

Subject to the provisions of the Indenture relating to the duties of the Trustee, if an event of default applicable to a series of debentures issued pursuant to the Indenture occurs and is continuing, the Trustee will be under no

obligation to exercise any of its rights or powers under the Indenture at the request or direction of any holders of such debentures unless the Trustee is sufficiently indemnified in accordance with the provisions of the Indenture. Subject to the provisions of the Indenture providing for the indemnification of the Trustee, the holders of the requisite principal amount of such debentures will have the right to direct the time, method and place of conducting any proceedings for any remedy available to the Trustee or exercising any rights or powers of the Trustee in respect of such debentures.

Modification

The Indenture provides that certain rights, privileges, restrictions and conditions of debentures issued and outstanding under the Indenture may be modified if such modifications are authorized by extraordinary resolution.

The term "extraordinary resolution" is defined in the Indenture to mean:

(a) in the case of modifications which affect a particular series of debentures issued pursuant to the Indenture, a resolution passed by the affirmative votes of the holders of not less than 66⅔% of the principal amount of debentures of that series then outstanding represented and voting at a meeting or an instrument in writing signed by the holders of not less than 66⅔% of the principal amount of debentures of that series then outstanding; and

(b) in the case of modifications which affect all debentures issued pursuant to the Indenture, a resolution passed by the affirmative votes of the holders of not less than 66⅔% of the principal amount of all debentures then outstanding represented and voting at a meeting or an instrument in writing signed by the holders of not less than 66⅔% in principal amount of all debentures then outstanding, treated in each case as a single class.

Defeasance

The Indenture requires the Trustee to release the Corporation from its obligations in respect of a series of debentures issued pursuant to the Indenture if specified conditions are met, including the deposit by the Corporation of cash or certain cash-equivalent securities for the payment of all principal and interest and any other amounts on the debentures of such series and the payment of the expenses of the Trustee.

Form, Transfer and Payment Mechanics

Except as described under "Plan of Distribution" or as set out in a pricing supplement, the Debentures will be represented by one or more global Debentures (collectively, the "Global Debenture") registered in the name of CDS Clearing and Depository Services Inc. or a successor thereof (the "Depository") or its nominee and held by or on behalf of the Depository as custodian for institutions (including Dealers) which participate directly or indirectly in the Depository's book-entry only registration system ("BEO Participants"). Interests in the Debentures represented by the Global Debenture will be evidenced by credits to book-entry accounts of BEO Participants maintained with the Depository. Interests of the owners of Debentures represented by the Global Debenture will be evidenced by credits to accounts maintained with such BEO Participants on behalf of such owners.

Except as described under "Plan of Distribution" and as described below or as set out in a pricing supplement, purchasers of Debentures represented by the Global Debenture will not be entitled to certificates or other instruments from the Corporation or the Depository evidencing their ownership of Debentures. Beneficial owners of Debentures represented by the Global Debenture will not be shown on the registers maintained by the Trustee or the records maintained by the Depository but will be shown through the book-entry accounts of BEO Participants. The rights of beneficial owners of Debentures represented by the Global Debenture may be exercised only through the BEO Participants with which such book-entry accounts are maintained. Purchasers of Debentures represented by the Global Debenture will receive a customer confirmation of purchase from the selling Dealer.

Purchasers of Debentures represented by the Global Debenture will receive definitive Debentures registered in their name only:

(a) if the Corporation determines that the Depository is no longer willing, able or qualified to discharge properly its responsibilities as holder of the Global Debenture in connection with the Debentures and the Corporation is unable to locate a qualified successor;

(b) if the Corporation elects to terminate the book-only registration of Debentures through the Depository; or

(c) in certain other specified circumstances.

Transfers of interests in Debentures represented by the Global Debenture will be effected through records maintained by the Depository or its nominee (with respect to interests of BEO Participants) and on the records of BEO Participants (with respect to interests of persons other than BEO Participants). Beneficial owners of Debentures represented by the Global Debenture who are not BEO Participants but who desire to transfer any interest in Debentures may do so only through BEO Participants.

Payments of interest and principal on the Global Debenture will be made to the Depository or its nominee as registered holder of the Global Debenture. As long as the Depository or its nominee is the registered owner of the Global Debenture, the Depository or its nominee will be considered the sole owner of the Global Debenture for the purposes of receiving payment on the Global Debenture and for all other purposes under the Indenture and the Global Debenture.

The Corporation expects that the Depository or its nominee, upon receipt of any payment of principal or interest in respect of the Global Debenture, will credit the accounts of BEO Participants, on the date principal or interest is payable, with payments in amounts proportionate to their respective interests in the principal amount of the Global Debenture as shown on the records of the Depository or its nominee. The Corporation also expects that payments of principal and interest by BEO Participants to the owners of interests in the Debentures represented by the Global Debenture held through accounts maintained with BEO Participants will be governed by standing instructions and customary practices, as is the case with securities held for the accounts of customers in bearer form or registered in "street name", and will be the responsibility of BEO Participants. The responsibility and liability of the Corporation and the Trustee in respect of Debentures represented by the Global Debenture is limited to making payment of any principal and interest due on the Global Debenture to the Depository or its nominee.

Governing Law

The Indenture is and the Debentures will be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein.

Definitions

The following defined terms used in this section of the prospectus are defined in the Indenture substantially as set out below.

"Capital Lease" means, with respect to a person, a lease or other arrangement in respect of real or personal property that is required to be classified and accounted for as a capital lease on a balance sheet of the person in accordance with GAAP.

"Capital Lease Obligation" means, with respect to a person, the obligation of the person to pay rent or other amounts under a Capital Lease.

"Consolidated Funded Indebtedness" means the aggregate amount of all Funded Indebtedness of the Corporation and its Designated Subsidiaries determined on a consolidated basis in accordance with GAAP.

"Consolidated Net Worth" means the shareholder's equity of the Corporation and its Designated Subsidiaries determined on a consolidated basis in accordance with GAAP. For greater certainty, the shareholder's equity of a subsidiary of the Corporation that is not a Designated Subsidiary will not be included in making such determination.

"Contingent Liability" means, with respect to a person, any agreement, undertaking or arrangement by which the person guarantees, endorses or otherwise becomes or is contingently liable upon (by direct or indirect agreement, contingent or otherwise, to provide funds for payment, to supply funds to, or otherwise to invest in, a debtor, or otherwise to assure a creditor against loss) the obligation, debt, or other liability of any other person (other than by endorsements of instruments in the course of collection), or guarantees the payment of dividends or other distributions upon the shares of any other person. The amount of any Contingent Liability will, subject to any limitation contained therein, be deemed to be the outstanding principal amount (or maximum principal amount, if larger) of the obligation, debt or other liability to which the Contingent Liability relates.

"Deferred Purchase Price Obligation" means, with respect to a person, any obligation issued, incurred or assumed by the person in connection with the acquisition by the person of an asset in respect of the deferred purchase price of the asset.

"Designated Subsidiary" means Toronto Hydro-Electric System Limited and, until such designation is terminated in accordance with the covenants described above under "Covenants – Designation of Subsidiaries as Designated Subsidiaries", any other subsidiary of the Corporation designated as a Designated Subsidiary by the board of directors of the Corporation in accordance with the covenants described above under "Covenants – Designation of Subsidiaries as Designated Subsidiaries".

"Event of Default" means an event of default under the Indenture.

"Financial Instrument Obligations" means, with respect to any person, obligations arising under:

(a) interest rate swap agreements, forward rate agreements, floor, cap or collar agreements, futures or options, insurance or other similar agreements or arrangements, or any combination thereof, entered into or guaranteed by the person where the subject matter thereof is interest rates or the price, value or amount payable thereunder is dependent or based upon interest rates or fluctuations in interest rates in effect from time to time (but excluding conventional floating rate indebtedness);

(b) currency swap agreements, cross-currency agreements, forward agreements, floor, cap or collar agreements, futures or options, insurance or other similar agreements or arrangements, or any combination thereof, entered into or guaranteed by the person where the subject matter thereof is currency exchange rates or the price, value or amount payable thereunder is dependent or based upon currency exchange rates or fluctuations in currency exchange rates in effect from time to time; and

(c) any agreement for the making or taking of any commodity (including coal, natural gas, oil and electricity), swap agreement, floor, cap or collar agreement or commodity future or option or other similar agreement or arrangement, or any combination thereof, entered into or guaranteed by the person where the subject matter thereof is any commodity or the price, value or amount payable thereunder is dependent or based upon the price or fluctuations in the price of any commodity;

or any other similar transaction, including any option to enter into any of the foregoing, or any combination of the foregoing, in each case to the extent that the net amount due or accruing due by the person under the obligations determined by marking the obligations to market in accordance with their terms.

"Funded Indebtedness" means Indebtedness (other than Subordinated Indebtedness) that, on the date of issue or assumption of liability, has a term to maturity (including any right of extension or renewal) of greater than 18 months.

"GAAP" means at any date of determination:

(a) accounting principles which are generally recognized as being generally accepted in Canada, if the Corporation is then preparing its financial statements in accordance with such principles; or

(b) accounting principles which are generally recognized as being generally accepted in the United States, if the Corporation is then preparing its financial statements in accordance with such principles.

"Indebtedness" means, with respect to a person, without duplication:

(a) all obligations of the person for borrowed money, including obligations with respect to bankers' acceptances and contingent reimbursement obligations relating to letters of credit and other financial instruments;

(b) all Financial Instrument Obligations of the person;

(c) all Deferred Purchase Price Obligations of the person;

(d) all Capital Lease Obligations and Purchase Money Obligations of the person;

(e) all Prudential and Bilateral Credit Support Obligations of the person; and

(f) all Contingent Liabilities of the person with respect to obligations of another person if such obligations are of the type referred to in paragraphs (a) to (e).

"Inter-Company Indebtedness" means, with respect to the Corporation, Indebtedness of the Corporation to a Designated Subsidiary and, with respect to a Designated Subsidiary, Indebtedness of the Designated Subsidiary to the Corporation or to another Designated Subsidiary.

"Material Subsidiary" means a Designated Subsidiary and any other subsidiary of the Corporation:

(a) the total assets of which represent more than 10% of the total assets of the Corporation and its Designated Subsidiaries determined on a consolidated basis in accordance with GAAP; or

(b) the total revenues of which represent more than 10% of the total revenues of the Corporation and its Designated Subsidiaries determined on a consolidated basis in accordance with GAAP.

For greater certainty, the assets and revenues of a subsidiary of the Corporation that is not a Designated Subsidiary will not be included in making such determinations.

"Non-Recourse Debt" means, with respect to a person, any indebtedness incurred to finance the creation, development, construction or acquisition of an asset of the person (and any extensions, renewals or refunding of any such indebtedness) provided that the recourse of the obligee thereof against the person is limited in all circumstances (other than in respect of false or misleading representations or warranties) to the asset (including all rights and benefits related to or arising out of the asset).

"Non-Speculative Financial Instrument Obligations" means, with respect to a person, Financial Instrument Obligations of the person entered into by the person in the ordinary course of business for risk management purposes and not for speculative or capital raising purposes.

"Obligations" means, with respect to a person, without duplication, all items which, in accordance with GAAP, would be included as liabilities on the liability side of the balance sheet of the person and all Contingent Liabilities of the person.

"Permitted Capital Lease Obligations" means, with respect to a Designated Subsidiary, the obligation of the Designated Subsidiary to pay rent or other amounts under a Capital Lease, other than a Capital Lease entered into as part of a Sale and Leaseback Transaction unless:

(a) the property which is the subject matter of the Sale and Leaseback Transaction is owned by the Designated Subsidiary;

(b) the proceeds of sale of such property have been determined by the board of directors of the Designated Subsidiary to be at least equal to its fair value; and

(c) either of the following is applicable:

(1) at the time of the Sale and Leaseback Transaction, the cost of acquiring such property could have been financed pursuant to a Purchase Money Obligation; or

(2) within 120 days after completion of the Sale and Leaseback Transaction, the Designated Subsidiary reduces its Indebtedness, other than Indebtedness permitted pursuant to paragraphs (a) to (e) above under "– Covenants – Limitation on Designated Subsidiary Indebtedness", by an amount at least equal to the net proceeds from the Sale and Leaseback Transaction.

"Permitted Encumbrances" means:

(a) any Security Interest securing Obligations of a Designated Subsidiary that:

(1) exists before and at the time that the Designated Subsidiary becomes a Designated Subsidiary;

(2) was not created or assumed in contemplation or as a result of the Designated Subsidiary becoming a Designated Subsidiary; and

(3) immediately before and after the Designated Subsidiary becomes a Designated Subsidiary, does not attach to the assets or secure Obligations of the Corporation or any other Designated Subsidiary;

(b) any Purchase Money Mortgage or Capital Lease of the Corporation or a Designated Subsidiary;

(c) any Security Interest in an asset created or assumed by the Corporation or a Designated Subsidiary to secure Non-Recourse Debt of the Corporation or the Designated Subsidiary in respect of such asset;

(d) any Security Interest in cash, marketable debt securities or accounts receivable created or assumed by the Corporation or a Designated Subsidiary to or in favour of a bank or other lending institution to secure indebtedness of the Corporation or the Designated Subsidiary that is payable on demand or that, on the date of issue or assumption of liability, has a term to maturity (including any right of extension or renewal) of 18 months or less and that is incurred by the Corporation or the Designated Subsidiary in the ordinary course of business and for the purpose of carrying on the same;

(e) any Security Interest in cash or marketable debt securities created or assumed by the Corporation to secure Non-Speculative Financial Instrument Obligations of the Corporation if the aggregate value of such cash and marketable debt securities is not more than 105% of the aggregate amount of the Non-Speculative Financial Instrument Obligations;

(f) any Security Interest created or assumed by a Designated Subsidiary in favour of the Corporation or any Wholly-Owned Designated Subsidiary;

(g) any Security Interest in an asset acquired by the Corporation or a Designated Subsidiary that secures Obligations of any other person, whether or not such Obligations are assumed by the Corporation or the Designated Subsidiary provided that the Security Interest:

(1) exists before and at the time that the asset is acquired by the Corporation or the Designated Subsidiary;

(2) was not created or assumed in contemplation of or as a result of the asset being acquired by the Corporation or the Designated Subsidiary; and

(3) immediately before and after the asset is acquired by the Corporation or the Designated Subsidiary, does not attach to the assets or secure Obligations of the Corporation or any other Designated Subsidiary;

(h) any Security Interest in cash or marketable debt securities in a sinking fund account established by the Corporation in support of a series of debentures issued pursuant to the Indenture;

(i) any Security Interest or deposit under workers' compensation, social security or similar legislation or in connection with bids, tenders, leases, contracts or expropriation proceedings or to secure public or statutory obligations, surety and appeal bonds or costs of litigation where required by law;

(j) any Security Interest or privilege imposed by law, such as builders', mechanics, material men's, carriers', warehousemen's and landlords' liens and privileges; or any Security Interest or privilege arising out of judgments or awards with respect to which the Corporation or a Designated Subsidiary at the time is prosecuting an appeal or proceedings for review and with respect to which it has secured a stay of execution pending such appeal or proceedings for review; or any Security Interest for taxes, assessments or governmental charges or levies not at the time due and delinquent or the validity of which is being contested at the time by the Corporation or a Designated Subsidiary in good faith; or any undetermined or inchoate Security Interest or privilege incidental to current operations that has not been filed pursuant to law against the Corporation or a Designated Subsidiary or that relates to obligations not due or delinquent; or the deposit of cash or securities in connection with any Security Interest or privilege referred to in this paragraph (j);

(k) any right reserved to or vested in any municipality or governmental or other public authority by the terms of any lease, licence, franchise, grant or permit held or acquired by the Corporation or a Designated Subsidiary, or by any statutory provision, to terminate the lease, licence, franchise, grant or permit or to purchase assets used in connection therewith or to require annual or other periodic payments as a condition of the continuance thereof;

(l) any Security Interest or right of distress reserved in or exercisable under any lease for rent to which the Corporation or a Designated Subsidiary is a party and for compliance with the terms of the lease;

(m) any Security Interest created or assumed by the Corporation or a Designated Subsidiary in favour of a public utility or any municipality or governmental or other public authority when required by the utility, municipality or other authority in connection with the operations of the Corporation or a Designated Subsidiary;

(n) any reservations, limitations, provisos and conditions expressed in original grants from the Crown;

(o) any minor encumbrances, such as easements, rights-of-way, servitudes or other similar rights in land granted to or reserved by other persons, rights-of-way for sewers, electric lines, telegraph and telephone lines, oil and natural gas pipelines and other similar purposes, or zoning or other restrictions applicable to the Corporation's or a Designated Subsidiary's use of real property, that do not in the aggregate materially detract from the value of the property or materially impair its use in the operation of the business of the Corporation or the Designated Subsidiary;

(p) any extension, renewal, alteration, substitution or replacement, in whole or in part, of a Security Interest referred to in paragraphs (a) to (o) provided that the Security Interest is limited to all or part of the same assets, the principal amount of the secured Obligations is not increased by that action, the term of the secured Obligations is not shortened and the terms and conditions of the Security Interest are no more restrictive in any material respect than the Security Interest so extended; and

(q) any other Security Interest created or assumed by the Corporation or a Designated Subsidiary (in addition to the Security Interests referred to in paragraphs (a) to (p)) if, after giving effect to the Security Interest, the aggregate amount of all Indebtedness secured by Security Interests permitted by this paragraph only does not at that time exceed 5% of Consolidated Net Worth.

"Prudential and Bilateral Credit Support Obligations" means, without duplication, the following obligations:

(a) all contingent reimbursement obligations of the Corporation relating to letters of credit and other financial instruments and all Contingent Liabilities of the Corporation in respect of Obligations of a subsidiary of the Corporation for the purchase or sale of electricity or natural gas; and

(b) all obligations of a Designated Subsidiary for borrowed money, including contingent reimbursement obligations relating to letters of credit and other financial instruments under credit facilities established for participants in the wholesale market for electricity administered by the Independent Electricity System Operator ("IESO"), in respect of the Obligations of the Designated Subsidiary for the purchase or sale of electricity or natural gas;

if such obligations were incurred or assumed to satisfy:

(x) prescribed prudential requirements in the wholesale market for electricity administered by the IESO;

(y) credit support arrangements required by electricity distribution companies under the terms of the Retail Settlement Code established by the OEB; or

(z) credit support requirements of counterparties under bilateral contracts or customers under purchase contracts.

"Purchase Money Mortgage" means, with respect to a person, any Security Interest created or assumed by the person to secure a Purchase Money Obligation provided that such Security Interest is limited to the asset financed by such Purchase Money Obligation and is created or assumed not later than three months after such Purchase Money Obligation is issued, incurred or assumed.

"Purchase Money Obligation" means, with respect to a person, indebtedness of the person issued, incurred or assumed to finance all or part of the cost of acquiring any asset for the person, other than shares, bonds and other securities, or constructing, installing or improving any real property or fixtures of the person, provided that the indebtedness is issued, incurred or assumed within twelve months after such acquisition, construction, installation or improvement, and includes any extension, renewal or refunding of such indebtedness so long as the principal amount thereof outstanding on the date of such extension, renewal or refunding is not increased.

"Sale and Leaseback Transaction" means, with respect to a person, a transaction or series of transactions pursuant to which the person sells or transfers real or personal property owned by the person to a third party and subsequently leases such real or personal property.

"Security Interest" means any security interest, assignment by way of security, mortgage, charge (whether fixed or floating), hypothec, pledge, lien or other encumbrance on or in respect of property or assets that secures the payment of Obligations.

"Subordinated Indebtedness" means all indebtedness of the Corporation in respect of which, upon any distribution of assets of the Corporation upon any dissolution, winding-up, liquidation or reorganization of the Corporation (whether in bankruptcy, insolvency or receivership proceedings or upon an assignment for the benefit of creditors, or any other marshalling of the assets and liabilities of the Corporation or otherwise), the payment of all indebtedness and liabilities of the Corporation in connection with all debentures issued pursuant to the Indenture including principal, interest, fees and expenses, must be satisfied in full prior to any amount being applied to such indebtedness.

"Total Consolidated Capitalization" means, without duplication, the sum of:

(a) the principal amount of all Consolidated Funded Indebtedness;

(b) the principal amount of all Subordinated Indebtedness; and

(c) the Consolidated Net Worth;

in each case, as determined by the Corporation and its Designated Subsidiaries.

"Wholly-Owned Designated Subsidiary" means a Designated Subsidiary all of the outstanding shares in the capital of which are owned by the Corporation or one or more Wholly-Owned Designated Subsidiaries.

RISK FACTORS

In addition to the risks described in the documents incorporated or deemed to be incorporated by reference in this prospectus (including the Corporation's annual information form and the management's discussion and analysis of financial condition and results of operations accompanying the financial statements of the Corporation) and the section entitled "Forward-Looking Information" in each such document and this prospectus, prospective purchasers should consider the risks described below before purchasing Debentures.

Rank of Debentures and Holding Company Structure

The Debentures will be direct unsecured obligations of the Corporation and will rank equally with all other unsecured and unsubordinated indebtedness of the Corporation, including indebtedness of the Corporation under the THC Revolving Credit Facility and the Bilateral Credit Facilities. A default by the Corporation under the Indenture will constitute an event of default under the THC Revolving Credit Facility and an event of default or repayment event under the Bilateral Credit Facilities. There can be no assurance that sufficient funds would be available at the time of any such default to make any required payment under the Debentures.

The Corporation is a holding company and substantially all of its business activities are carried on by its subsidiaries. Because the Corporation is a holding company, the Debentures will be effectively subordinated to all existing and future liabilities, including trade payables and other indebtedness, of the Corporation's subsidiaries. In addition, as a holding company, the Corporation's ability to meet its financial obligations is dependent primarily upon the receipt of interest and principal, management fees, cash dividends and other payments from its subsidiaries, together with proceeds raised by the Corporation through the issuance of debt. The Corporation is wholly-owned by the City of Toronto and does not currently raise funds through the issuance of share capital. The Corporation's subsidiaries are distinct legal entities and have no legal obligation, contingent or otherwise, to pay any amount due under the Debentures

or to make any amounts available therefor. In addition, the payment of dividends and the making of loans, advances and other payments to the Corporation by its subsidiaries may be subject to statutory or contractual restrictions, will depend on the earnings of the subsidiaries and will be subject to various business and other considerations.

Absence of Public Market for the Debentures

The Debentures will be newly issued securities for which there is no existing trading market. The Corporation does not intend to list the Debentures on any Canadian, U.S. or other securities exchange. This may affect the pricing of the Debentures in the secondary market, the transparency and availability of trading prices, the liquidity of the Debentures and the extent of issuer regulation. There can be no assurance that a secondary market will develop for the Debentures or that any secondary market that does develop will continue. Accordingly, purchasers may not be able to sell the Debentures. In addition, if a trading market does develop for the Debentures, the Debentures could trade at prices that may be higher or lower than their initial offering price, depending on many factors, including prevailing interest rates, the Corporation's results of operations and financial position, the ratings assigned to the Debentures and the Corporation's other debt securities and the markets for similar debt securities.

Ratings

There is no assurance that any rating assigned to the Debentures issued hereunder will remain in effect for any given period of time or that any rating will not be lowered or withdrawn entirely by the relevant rating agency. A lowering or withdrawal of such rating may have an adverse effect on the market value of the Debentures.

Interest Rate Risks

Prevailing interest rates will affect the market price or value of the Debentures. Generally, the market price or value of the Debentures will decline as prevailing interest rates for comparable debt instruments rise and increase as prevailing interest rates for comparable debt instruments decline. Fluctuations in interest rates may also impact borrowing costs of the Corporation which may adversely affect its creditworthiness.

Risks Associated with Floating Rate Notes

The Debentures will bear interest at fixed or floating rates as set out in the applicable pricing supplement to this prospectus. Investments in floating rate Debentures entail risks not associated with investments in fixed rate Debentures. The resetting of the applicable rate on a floating rate Debenture may result in a lower interest rate as compared to a fixed rate Debenture issued at the same time. The applicable rate on a floating rate Debenture will fluctuate in accordance with fluctuations in the instrument or obligation or other measure on which the applicable rate is based, which in turn may fluctuate and be affected by a number of interrelated factors, including economic, financial and political events over which the Corporation has no control.

Foreign Currency Risks

An investment in Debentures that are denominated or payable in other than Canadian dollars entails significant risks that are not associated with a similar investment in a security denominated in Canadian dollars. Such risks include, without limitation, the possibility of significant changes in rates of exchange between the Canadian dollar and the applicable foreign currency unit, the possibility of the imposition or modification of foreign exchange controls by either the Canadian or foreign governments and potential illiquidity in the secondary market. These risks will vary depending upon the currency or currencies involved and, where appropriate, will be more fully described in a pricing supplement.

This prospectus does not describe all the risks of an investment in the Debentures denominated or payable other than in Canadian dollars and prospective investors should consult their own financial and legal advisor as to the risk entailed with respect thereto. Debentures denominated in other than Canadian dollars are not appropriate investments for investors who are unfamiliar with foreign currency transactions.

The Debentures will be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein. A judgment by a Canadian court relating to any Debenture may be awarded only in Canadian currency and such judgment may be based on a rate of exchange in existence on a day other than the day of payment.

Additional Debt Financing

The Corporation expects to borrow to repay the Debentures when required to do so under the terms of the Debentures and to finance the renewal of LDC's electricity infrastructure. The Corporation's ability to arrange sufficient and cost-effective debt financing could be adversely affected by a number of factors, including financial market conditions, the regulatory environment in Ontario, the Corporation's results of operations and financial condition, the ratings assigned to the Corporation and its securities by credit rating agencies, the current timing of debt maturities and general economic conditions.

Shareholder Direction

Council of the City of Toronto has adopted a shareholder direction (the "Shareholder Direction") which sets out certain corporate governance principles with respect to Toronto Hydro. The Shareholder Direction is summarized in the AIF under "Relationship with the City". The Shareholder Direction is not for the benefit of, or enforceable by, the holders of the Debentures.

LEGAL MATTERS

Certain legal matters relating to the offering will be passed on for the Corporation by McMillan LLP. The partners and associates of McMillan LLP beneficially own, directly or indirectly, less than one per cent of the securities of the Corporation or any associate or affiliate of the Corporation.

AUDITORS

The auditors of the Corporation are KPMG LLP, Chartered Accountants ("KPMG LLP"), at their office at Bay Adelaide Centre, 333 Bay Street, Suite 4600, Toronto, Ontario, M5H 2S5. KPMG LLP have been the auditors of the Corporation since April 12, 2011. KPMG LLP is independent in Ontario in accordance with its rules of professional conduct.

PURCHASERS' STATUTORY RIGHTS

Securities legislation in certain of the provinces of Canada provides purchasers with the right to withdraw from an agreement to purchase securities. This right may be exercised within two business days after receipt or deemed receipt of a prospectus, the accompanying prospectus supplement and any amendment. In several of the provinces, the securities legislation further provides a purchaser with remedies for rescission or, in some provinces, revision of the price or damages if the prospectus, the accompanying prospectus supplement and any amendment contain a misrepresentation or are not delivered to the purchaser, provided that the remedies for rescission, revision of the price or damages are exercised by the purchaser within the time limit prescribed by the securities legislation of the purchaser's province. The purchaser should refer to any applicable provisions of the securities legislation of the purchaser's province for the particulars of these rights or consult with a legal advisor.

AUDITORS' CONSENT

We have read the short form base shelf prospectus (the "Prospectus") of Toronto Hydro Corporation (the "Corporation") dated December 10, 2012 relating to the issuance in an aggregate principal amount of up to $1,500,000,000 of Debentures of the Corporation. We have complied with Canadian generally accepted standards for an auditor's involvement with offering documents.

We consent to the incorporation by reference in the Prospectus of our report to the shareholder of the Corporation on the consolidated balance sheet of the Corporation as at December 31, 2011, and the consolidated statements of income, retained earnings and cash flows for the year ended December 31, 2011. Our report is dated March 2, 2012.

EIGHTH SUPPLEMENTAL TRUST INDENTURE

THIS EIGHTH SUPPLEMENTAL TRUST INDENTURE made as of November 18, 2011,

B E T W E E N:

TORONTO HYDRO CORPORATION
a corporation incorporated under the laws of Ontario (the "Corporation")

and

BNY TRUST COMPANY OF CANADA
a trust company existing under the laws of Canada (the "Trustee")

RECITALS

A. BNY Trust Company of Canada is the successor trustee of CIBC Mellon Trust Company;

B. The Corporation has entered into a trust indenture with the Trustee made as of May 7, 2003, as amended, supplemented or restated from time to time (the "Trust Indenture") which provides for the issuance of one or more series of unsecured Debentures of the Corporation by way of Supplemental Indentures;

C. The Corporation entered into a first supplemental trust indenture made as of May 7, 2003 for the purpose of providing for the issue of $225,000,000 aggregate principal amount of Series 1 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 1 Debentures;

D. The Corporation entered into a second supplemental trust indenture made as of November 14, 2007 for the purpose of providing for the issue of $250,000,000 aggregate principal amount of Series 2 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 2 Debentures;

E. The Corporation entered into a third supplemental trust indenture made as of November 12, 2009 for the purpose of providing for the issue of $250,000,000 aggregate principal amount of Series 3 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 3 Debentures;

F. The City Note has been converted, in accordance with its terms, into the Series 4 Debentures and the Series 5 Debentures;

G. The Corporation entered into a fourth supplemental trust indenture made as of April 1, 2010 for the purpose of providing for the issue of $245,057,000 aggregate principal amount of Series 4 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 4 Debentures;

H. The Corporation entered into a fifth supplemental trust indenture made as of April 1, 2010 for the purpose of providing for the issue of $245,057,000 aggregate principal amount of Series 5 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 5 Debentures;

I. The Corporation entered into a sixth supplemental trust indenture made as of May 20, 2010 for the purpose of providing for the issue of $200,000,000 aggregate principal amount of Series 6 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 6 Debentures;

J. The Corporation entered into a seventh supplemental trust indenture made as of September 20, 2011 for the purpose of amending the definition of "GAAP" under the Trust Indenture; and

K. This Eighth Supplemental Trust Indenture is entered into for the purpose of providing for the issue of Series 7 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 7 Debentures.

NOW THEREFORE THIS EIGHTH SUPPLEMENTAL TRUST INDENTURE WITNESSES and it is hereby covenanted, agreed and declared as follows:

SECTION 1 INTERPRETATION

1.1 To Be Read With Trust Indenture

This Eighth Supplemental Trust Indenture is a Supplemental Indenture as that term is used in the Trust Indenture. The Trust Indenture and this Eighth Supplemental Trust Indenture shall be read together and shall have effect as though all the provisions of both indentures were contained in one instrument.

1.2 Headings etc.

The division of this Eighth Supplemental Trust Indenture into Sections and clauses, the provision of a table of contents and the insertion of headings are for convenience of reference only and shall not affect the interpretation hereof. Unless the context otherwise requires, the expression "Section" and "Schedule" followed by a number, letter or combination of numbers and letters refer to the specified Section of or Schedule to this Eighth Supplemental Trust Indenture.

1.3 Definitions

All terms which are defined in the Trust Indenture and used but not defined in this Eighth Supplemental Trust Indenture shall have the meanings ascribed to them in the Trust Indenture, as such meanings may be amended or supplemented with respect to Series 7 Debentures by this Eighth Supplemental Trust Indenture. In the event of any inconsistency between the meaning given to a term in the Trust Indenture and the meaning given to the same term in this Eighth Supplemental Trust Indenture, the meaning given to the term in this Eighth Supplemental Trust Indenture shall prevail to the extent of the inconsistency. Subject to the foregoing, in this Eighth Supplemental Trust Indenture and in the Series 7 Debentures, the following terms have the following meanings:

(1) Canada Yield on any date means the yield to maturity on that date, compounded semi-annually, that a non-callable Government of Canada bond would carry if issued, in Canadian dollars in Canada, at 100% of its principal amount on that date with a term to maturity approximately equal to the remaining term to maturity of the Series 7 Debentures, such yield to maturity being the average of the yields provided by two major Canadian investment dealers specified by the Corporation.

(2) Canada Yield Price means the price equal to the present value of all scheduled payments of interest (other than accrued and unpaid interest) and principal on the Series 7 Debentures, using a discount rate equal to the sum of the Canada Yield and 34 basis points, calculated at 10:00 a.m. (Toronto, Ontario time) on the Business Days prior to the Redemption Date of the Series 7 Debentures.

(3) Series 7 Debentures means the 3.54% Senior Unsecured Debentures due 2021 (Series 7) referred to in Section 2.1.

(4) Series 7 Debentures Debt Account means the deposit account established in respect of the Series 7 Debentures pursuant to Section 8.2 of the Trust Indenture that is designated in writing by the Corporation to the Trustee as the "Series 7 Debentures Debt Account".

(5) Series 7 Debentures Interest Payment Date means May 18 and November 18 in each year that the Series 7 Debentures are outstanding.

(6) Series 7 Debentures Interest Period means the period commencing on and including the later of the date of issue of the Series 7 Debentures and the immediately preceding Series 7 Debentures Interest Payment Date and ending on and including the day immediately preceding the next Series 7 Debentures Interest Payment Date to occur in respect of which interest is payable.

(7) Trust Indenture means the trust indenture made as of May 7, 2003 between the Corporation and the Trustee, as amended, supplemented or restated from time to time.

SECTION 2 SERIES 7 DEBENTURES

2.1 Creation and Designation

The Corporation is authorized in accordance with the Trust Indenture to issue under this Eighth Supplemental Trust Indenture, and hereby creates and issues, a series of debentures designated "3.54% Senior Unsecured Debentures due 2021 (Series 7)", having the terms set out in this Eighth Supplemental Trust Indenture.

2.2 Limitation on Issue

The aggregate principal amount of Series 7 Debentures which may be issued under this Eighth Supplemental Trust Indenture including any supplement hereto will be limited to $1,000,000,000.

2.3 Date of Issue and Maturity

The Series 7 Debentures shall be dated November 18, 2011 (being the applicable date of issue) and will become due and payable, together with all accrued interest and unpaid interest thereon, on November 18, 2021 (being the applicable Stated Maturity).

2.4 Concerning Interest

(a) The Series 7 Debentures shall be issued in $1,000 principal amount denominations or integral multiples thereof and shall bear interest on the unpaid principal amount thereof at a rate of 3.54% per annum from and including their date of issue, payable semi-annually in arrears, in equal instalments on each Series 7 Debentures Interest Payment Date.

(b) Interest shall be payable in respect of each Series 7 Debentures Interest Period (after as well as before maturity, default and judgment, with interest on overdue interest at the same rate) on each Series 7 Debentures Interest Payment Date in accordance with Section 2.8 of the Trust Indenture.

2.5 Interest Payments

The Corporation shall make payments of interest on the Series 7 Debentures in accordance with the provisions of Section 2.8 of the Trust Indenture.

2.6 Payment of Amounts Due on Maturity

In accordance with Section 8.2 of the Trust Indenture, the Corporation will deposit to the Series 7 Debentures Debt Account all amounts required to be paid to the order of Holders of Series 7 Debentures on maturity, by or prior to 9:00 a.m. (Toronto, Ontario time), on the Stated Maturity of the Series 7 Debentures. The deposit of such funds will satisfy and discharge the liability of the Corporation for principal of, and any accrued and unpaid interest on, the Series 7 Debentures to the extent of the sum represented thereby (plus the amount of any taxes deducted or withheld).

2.7 Redemption and Purchase of Series 7 Debentures

(a) The Series 7 Debentures may be redeemed at the Corporation's option when not in default under the Trust Indenture, in whole at any time prior to Stated Maturity, or in part at any time and from time to time prior to Stated Maturity, on not more than 60 Business Days and not less than 15 Business Days prior notice, at a price equal to the greater of the Canada Yield Price and par, together in each case with accrued and unpaid interest to (but excluding) the Redemption Date and in each case otherwise in accordance with Sections 5.1, 5.2, 5.3 and 5.4 of the Trust Indenture.

(b) The Corporation will be entitled at any time when not in default under the Trust Indenture to purchase for cancellation all or any of the Series 7 Debentures in accordance with Section 5.5 of the Trust Indenture.

(c) The Series 7 Debentures will not be subject to purchase pursuant to any sinking fund provisions.

2.8 Form of Series 7 Debentures

(a) Except as set out in 2.8(b) below, the Series 7 Debentures and the registration panel and the certificate of the Trustee to be endorsed thereon shall be issuable initially as one Global Debenture to be held by, or on behalf of, CDS as depository for its participants and registered in the name of CDS or its nominee. The Global Debenture shall be substantially in the form set out in Schedule 1 hereto with such appropriate additions, deletions, substitutions and variations as the Directors shall by resolution determine prior to the time of issue thereof and as the Trustee may approve and with such distinguishing letters and numbers as the Trustee may approve, with such approval in each case to be conclusively evidenced by the Trustee's certification of such Global Debenture.

(b) The Trustee understands and acknowledges that the Series 7 Debentures have not been and will not be registered under the United States Securities Act of 1933, as amended (the "U.S. Securities Act"). Each Series 7 Debenture originally issued in the United States or to a U.S. Person will be represented by a definitive certificate in the form set out in Schedule 2 hereto which definitive certificate, and each Series 7 Debenture certificate issued in exchange therefor or in substitution thereof, shall bear the following legend:

"THE SECURITIES REPRESENTED HEREBY HAVE NOT BEEN REGISTERED UNDER THE UNITED STATES SECURITIES ACT OF 1933, AS AMENDED (THE "U.S. SECURITIES ACT") OR UNDER ANY STATE SECURITIES LAWS. THE HOLDER HEREOF, BY PURCHASING SUCH SECURITIES, AGREES FOR THE BENEFIT OF THE CORPORATION THAT SUCH SECURITIES MAY BE OFFERED, SOLD OR OTHERWISE TRANSFERRED ONLY (A) TO THE CORPORATION, (B) OUTSIDE THE UNITED STATES IN ACCORDANCE WITH RULE 904 OF REGULATION S UNDER THE U.S. SECURITIES ACT, OR (C) INSIDE THE UNITED STATES IN ACCORDANCE WITH (1) RULE 144A UNDER THE U.S. SECURITIES ACT OR (2) RULE 144 UNDER THE U.S. SECURITIES ACT, IF AVAILABLE, OR (3) IN COMPLIANCE WITH CERTAIN OTHER PROCEDURES SATISFACTORY TO THE CORPORATION. A NEW CERTIFICATE BEARING NO LEGEND, DELIVERY OF WHICH WILL CONSTITUTE "GOOD DELIVERY", MAY BE OBTAINED FROM BNY TRUST COMPANY OF CANADA UPON DELIVERY OF THIS CERTIFICATE AND A DULY EXECUTED DECLARATION, IN A FORM SATISFACTORY TO BNY TRUST COMPANY OF CANADA AND THE CORPORATION, TO THE EFFECT THAT THE SALE OF THE SECURITIES REPRESENTED HEREBY IS BEING MADE IN COMPLIANCE WITH RULE 904 OF REGULATION S UNDER THE U.S. SECURITIES ACT."

If any Series 7 Debentures are to be sold or transferred outside the United States in compliance with the requirements of Rule 904 of Regulation S under the U.S Securities Act, the legend may

be removed by providing a declaration to the Trustee to the following effect (or as the Corporation may prescribe from time to time),

> "The undersigned (A) acknowledges that the sale of the securities to which this declaration relates is being made in reliance upon Rule 904 of Regulation S under the United States Securities Act of 1933, as amended (the "U.S. Securities Act"), and (B) certifies that (1) it is not an "affiliate" (as defined in Rule 405 under the U.S. Securities Act) of Toronto Hydro Corporation, (2) the offer of such securities was not made to a person in the United States and at the time the buy order was originated, the buyer was outside the United States, or the seller and any person acting on its behalf reasonably believe that the buyer was outside the United States and (3) neither the seller, nor any affiliate of the seller, nor any person acting on its or their behalf engaged in any directed selling efforts in connection with the offer and sale of such securities. Terms used herein have the meaning given to them by Regulation S under the U.S. Securities Act."

If any Series 7 Debentures are being sold or transferred pursuant to Rule 144 of the U.S. Securities Act, the legend may be removed by delivery to the Trustee of a written opinion of Trustee Counsel to the effect that such legend is no longer required under applicable requirements of the U.S. Securities Act or state securities laws.

Prior to the issuance of Series 7 Debentures, the Corporation shall notify the Trustee, in writing, concerning which Series 7 Debentures are to be certified and are to bear the legend described above. The Trustee will thereafter maintain a list of all registered holders from time to time of legended Series 7 Debentures.

2.9 Signatures on Series 7 Debentures

The Series 7 Debentures shall be signed in accordance with the provisions of Section 2.6 of the Trust Indenture.

2.10 Certification

(a) No Series 7 Debenture issued shall be obligatory or shall entitle the Holder of such Series 7 Debenture to the benefits of this Eighth Supplemental Trust Indenture until it has been certified by manual signature by or on behalf of the Trustee by execution of the certificate of the Trustee endorsed thereto substantially in the form set out in Schedule 1 hereto, or in some other form approved by the Trustee, whose approval shall be conclusively evidenced by the Trustee's execution of the certificate. Such certificate on any Series 7 Debenture shall be conclusive evidence that such Series 7 Debenture is duly issued and is a valid and binding obligation of the Corporation and that the Holder of such Series 7 Debenture is entitled to the benefits of the Trust Indenture, as supplemented by this Eighth Supplemental Trust Indenture, and such Series 7 Debenture.

(b) The certificate of the Trustee on any Series 7 Debenture shall not be construed as a representation or warranty by the Trustee as to the validity of this Eighth

Supplemental Trust Indenture or of the Series 7 Debentures (except the due certification thereof and any other warranties implied by law) and the Trustee shall in no respect be liable or answerable for the use made of the Series 7 Debentures or any of them or the proceeds thereof.

2.11 Location of Register

With respect to the Series 7 Debentures, the Register referred to in Section 3.1 of the Trust Indenture shall be kept by the Trustee at the Corporate Trust Office and may thereafter be kept by the Trustee in such other place as the Corporation, with the approval of the Trustee, may designate.

2.12 Additional Amounts

The Corporation will not be required to pay an additional amount on the Series 7 Debentures in respect of any tax, assessment or government charge that is required by law to be withheld or deducted by it.

2.13 Trustees, etc.

The Trustee will be the Paying Agent and the Registrar for the Series 7 Debentures.

SECTION 3 MISCELLANEOUS

3.1 Acceptance of Trust

The Trustee accepts the trusts in this Eighth Supplemental Trust Indenture and agrees to carry out and discharge the same upon the terms and conditions set out in this Eighth Supplemental Trust Indenture and in accordance with the Trust Indenture.

3.2 Confirmation of Trust Indenture

The Trust Indenture as amended and supplemented by this Eighth Supplemental Trust Indenture is in all respects confirmed.

3.3 Counterparts

This Eighth Supplemental Trust Indenture may be executed in counterparts, each of which so executed shall be deemed to be original and such counterparts together shall constitute one and the same instrument.

[SIGNATURE PAGE FOLLOWS]

IN WITNESS WHEREOF the parties hereto have executed this Eighth Supplemental Trust Indenture under the hands of their proper signatories in that behalf:

Schedule 1 – FORM OF GLOBAL DEBENTURE-SERIES 7

This Debenture is a Global Debenture within the meaning of the Trust Indenture hereinafter referred to and is registered in the name of a Depository or a nominee thereof. Unless this Debenture is presented by an authorized representative of CDS Clearing and Depository Services Inc. ("CDS") to Toronto Hydro Corporation or its agent for registration of transfer, exchange or payment, and any debentures issued in respect thereof is registered in the name of CDS & CO., or in such other name as is requested by an authorized representative of CDS (and any payment is made to CDS & CO. or to such other entity as is requested by an authorized representative of CDS), ANY TRANSFER, PLEDGE OR OTHER USE HEREOF FOR VALUE OR OTHERWISE BY OR TO ANY PERSON IS WRONGFUL since the registered holder hereof, CDS & CO., has a property interest in the securities represented by this debenture herein and it is a violation of its rights for another person to hold, transfer or deal with this debenture.

Stated Maturity	z, 2021
Interest Rate Per Annum	z%
Interest Payment Dates	z and z in each year
Initial Interest Payment Date	z, 2012
Principal Amount	$z

TORONTO HYDRO CORPORATION (the "Corporation") for value received hereby promises to pay to the registered holder hereof on the Stated Maturity, or on such earlier date as the Principal Amount (or a portion thereof) may become due in accordance with the provisions of the Trust Indenture (as defined below), on presentation and surrender of this z% Senior Unsecured Debenture due z, 2021 (Series 7) (the "Series 7 Debenture"), the Principal Amount in lawful money of Canada at the office of the Trustee (as defined below) at 11th Floor, 320 Bay Street, Toronto, Ontario M5H 4A6, and to pay interest on the Principal Amount at the Interest Rate Per Annum from and including the later of the Issue Date and the last Interest Payment Date on which interest has at that time most recently been paid on this Series 7 Debenture, at the

address of the registered holder hereof appearing on the register of Series 7 Debentures maintained by or at the direction of the Trustee (the "Register"), in like money semi-annually in arrears, in equal instalments on the Interest Payment Date in each year, and if the Corporation at any time defaults in the payment of any principal or interest, it will pay interest on the amount in default at the same rate, in like money, on demand, at the address of the registered holder hereof appearing on the Register. The Corporation will (i) on the day that is each Interest Payment Date, make payment by a wire transfer, or (ii) on the day that is two Business Days before each Interest Payment Date, forward or cause to be forwarded a cheque, by same day delivery, to the address of the registered holder hereof appearing on the Register of interest due and payable to such holder on such Interest Payment Date, less any taxes required by law to be deducted or withheld, made payable to the order of such holder; provided, however that in case of payment of interest at maturity or redemption or as otherwise provided in the Trust Indenture, the time for payment of interest, less any such taxes, may at the option of the Corporation be determined based on the time that the certificate representing this Series 7 Debenture is presented to and surrendered to the Trustee. The payment by such wire transfer or forwarding of such cheque (provided such cheque is paid on presentation) will satisfy and discharge the liability for interest upon such Series 7 Debenture to the extent of the sum represented thereby (plus the amount of any taxes deducted or withheld as aforesaid).

This Series 7 Debenture is one of an authorized issue of debentures designated as 2.% Senior Unsecured Debentures due, 2021 (Series 7) and forming the series of debentures created and issued under an eighth supplemental trust indenture made as of 2011 (the "Eighth Supplemental Trust Indenture") to a trust indenture (the "Indenture") made as of May 7, 2003, between the Corporation and BNY Trust Company of Canada (successor trustee of CIBC Mellon Trust Company) (the "Trustee"), as Trustee (the first supplemental trust indenture to the Indenture made as of May 7, 2003 between the Corporation and the Trustee, the second supplemental trust indenture to the Indenture made as of November 14, 2007 between the Corporation and the Trustee, the third supplemental trust indenture to the Indenture made as of November 12, 2009 between the Corporation and the Trustee, the fourth supplemental trust indenture to the Indenture made as of April 1, 2010 between the Corporation and the Trustee, the fifth supplemental trust indenture to the Indenture made as of April 2010 between the Corporation and the Trustee, the sixth supplemental trust indenture to the Indenture made as of May 20, 2010 between the Corporation and the Trustee, the seventh supplemental trust indenture to the Indenture made as of September 20, 2011 between the Corporation and the Trustee, the Eighth Supplemental Trust Indenture and the Indenture (as amended, supplemented or restated from time to time) are collectively referred to herein as the "Trust Indenture"). The Trust Indenture specifies the terms and conditions upon which the Series 7 Debentures are created and issued and may be created, issued and held and the rights of the registered holders of the Series 7 Debentures, the Corporation and the Trustee, all of which terms and conditions are incorporated by reference in this Series 7 Debenture and to each of which the registered holder of this Series 7 Debenture, by acceptance hereof, agrees.

The aggregate principal amount of Series 7 Debentures that may be created and issued under the Trust Indenture is limited to $1,000,000,000 in lawful money of Canada. Series 7 Debentures are issuable as fully registered debentures in denominations of $1,000 and integral multiples thereof and, subject to the terms and conditions set forth in the Trust Indenture, are issued as book entry only debentures.

The Series 7 Debentures are direct unsecured obligations of the Corporation and will rank equally with each other and with all other debentures of every other series from time to time issued and outstanding pursuant to the Trust Indenture and, except to the extent prescribed by law, with all other unsecured and unsubordinated indebtedness of the Corporation.

This Series 7 Debenture is redeemable, at the option of the Corporation when not in default under the Trust Indenture, in whole at any time or in part from time to time, subject to the terms and conditions set forth in the Trust Indenture, at a price equal to the greater of the Canada Yield Price (as defined in the Trust Indenture) and par, together with accrued and unpaid interest to (but excluding) the date fixed for redemption.

At any time when the Corporation is not in default under the Trust Indenture, the Corporation may, subject to the terms and conditions set forth in the Trust Indenture, purchase Series 7 Debentures in the open market, by tender or by private contract, at any price. Series 7 Debentures purchased by the Corporation shall be cancelled and not reissued.

The Principal Amount may become or be declared due before the Stated Maturity on the conditions, in the manner, with the effect and at the times set forth in the Trust Indenture.

The Trust Indenture contains provisions for the holding of meetings of registered holders of debentures issued by the Corporation pursuant to the Trust Indenture and the making of resolutions at such meetings and the creation of instruments in writing signed by the registered holders of a specified majority of debentures issued and outstanding pursuant to the Trust Indenture. Such resolutions and instruments will be binding on and may affect the rights and entitlements of all holders of debentures issued by the Corporation pursuant to the Trust Indenture, subject to the provisions of the Trust Indenture.

This Series 7 Debenture may be transferred only upon compliance with the conditions prescribed in the Trust Indenture relating to the transfer of a Global Debenture (as defined in the Trust Indenture), and upon compliance with such reasonable requirements as the Trustee or other registrar may prescribe, and such transfer shall be duly noted hereon by the Trustee or other registrar.

This Series 7 Debenture shall not become obligatory for any purpose until it shall have been certified by the manual signature of the Trustee in accordance with the Trust Indenture.

IN WITNESS WHEREOF TORONTO HYDRO CORPORATION has caused this Series 7 Debenture to be signed by its z and its z.

TORONTO HYDRO CORPORATION (the "Corporation") for value received hereby promises to pay to the registered holder hereof on the Stated Maturity, or on such earlier date as the Principal Amount (or a portion thereof) may become due in accordance with the provisions of the Trust Indenture (as defined below), on presentation and surrender of this z% Senior Unsecured Debenture due z, 2021 (Series 7) (the "Series 7 Debenture"), the Principal Amount in lawful money of Canada at the office of the Trustee (as defined below) at 11th Floor, 320 Bay

Street, Toronto, Ontario M5H 4A6, and to pay interest on the Principal Amount at the Interest Rate Per Annum from and including the later of the Issue Date and the last Interest Payment Date on which interest has at that time most recently been paid on this Series 7 Debenture, at the address of the registered holder hereof appearing on the register of Series 7 Debentures maintained by or at the direction of the Trustee (the "Register"), in like money semi-annually in arrears, in equal instalments on the Interest Payment Dates in each year, and if the Corporation at any time defaults in the payment of any principal or interest, to pay interest on the amount in default at the same rate, in like money, on demand, at the address of the registered holder hereof appearing on the Register. The Corporation, on the day that is two Business Days before each Interest Payment Date, will forward or cause to be forwarded by same day delivery to the address of the registered holder hereof appearing on the Register a cheque for interest due and payable to such holder on such Interest Payment Date, less any taxes required by law to be deducted or withheld, made payable to the order of such holder; provided, however that in case of payment of interest at maturity or redemption or as otherwise provided in the Trust Indenture, the time for payment of interest, less any such taxes, may at the option of the Corporation be determined based on the time that the certificate representing this Series 7 Debenture is presented and surrendered to the Trustee. The forwarding of such cheque will satisfy and discharge the liability for interest upon such Series 7 Debenture to the extent of the sum represented thereby (plus the amount of any taxes deducted or withheld as aforesaid) unless such cheque is not paid on presentation.

This Series 7 Debenture is one of an authorized issue of debentures designated as 2.0% Senior Unsecured Debentures due December 2, 2021 (Series 7) and forming the series of debentures created and issued under a eighth supplemental trust indenture made as of December 2, 2011 (the "Eighth Supplemental Trust Indenture") to a trust indenture (the "Indenture") made as of May 7, 2003, between the Corporation and BNY Trust Company of Canada (successor trustee of CIBC Mellon Trust Company) (the "Trustee"), as Trustee (the first supplemental trust indenture to the Indenture made as of May 7, 2003 between the Corporation and the Trustee, the second supplemental trust indenture to the Indenture made as of November 14, 2007 between the Corporation and the Trustee, the third supplemental trust indenture to the Indenture made as of November 12, 2009 between the Corporation and the Trustee, the fourth supplemental trust indenture to the Indenture made as of April 1, 2010 between the Corporation and the Trustee, the fifth supplemental trust indenture to the Indenture made as of April 1, 2010 between the Corporation and the Trustee, the sixth supplemental trust indenture to the Indenture made as of May 20, 2010 between the Corporation and the Trustee, the seventh supplemental trust indenture to the Indenture made as of September 20, 2011 between the Corporation and the Trustee, the Eighth Supplemental Trust Indenture and the Indenture (as amended, supplemented or restated from time to time) are collectively referred to herein as the "Trust Indenture"). The Trust Indenture specifies the terms and conditions upon which the Series 7 Debentures are created and issued or may be created, issued and held and the rights of the registered holders of the Series 7 Debentures, the Corporation and the Trustee, all of which rights and conditions are incorporated by reference in this Series 7 Debenture and to each of which the registered holder of this Series 7 Debenture, by acceptance hereof, agrees.

The aggregate principal amount of Series 7 Debentures that may be created and issued under the Trust Indenture is limited to $1,000,000,000 lawful money of Canada. Series 7 Debentures are issuable as fully registered debentures in denominations of $1,000 and integral multiples thereof.

The Series 7 Debentures are direct unsecured obligations of the Corporation and will rank equally with each other and with all other debentures of every other series from time to time issued and outstanding pursuant to the Trust Indenture and, except to the extent prescribed by law, with all other unsecured and unsubordinated indebtedness of the Corporation.

This Series 7 Debenture is redeemable, at the option of the Corporation when not in default under the Trust Indenture, in whole at any time or in part from time to time, subject to the terms and conditions set forth in the Trust Indenture, at a price equal to the greater of the Canada Yield Price (as defined in the Trust Indenture) and par, together with accrued and unpaid interest to (but excluding) the date fixed for redemption.

At any time when the Corporation is not in default under the Trust Indenture, the Corporation may, subject to the terms and conditions set forth in the Trust Indenture, purchase Series 7 Debentures in the open market, by tender or by private contract, at any price. Series 7 Debentures purchased by the Corporation shall be cancelled and not reissued.

The Principal Amount may become or be declared due before the Stated Maturity on the conditions, in the manner, with the effect and at the times set forth in the Trust Indenture.

The Trust Indenture contains provisions for the holding of meetings of registered holders of debentures issued by the Corporation pursuant to the Trust Indenture and the making of resolutions at such meetings and the creation of instruments in writing signed by the registered holders of a specified majority of debentures issued and outstanding pursuant to the Trust Indenture. Such resolutions and instruments will be binding on and may affect the rights and entitlements of all holders of debentures issued by the Corporation pursuant to the Trust Indenture, subject to the provisions of the Trust Indenture.

This Series 7 Debenture may be transferred only upon compliance with the conditions prescribed in the Trust Indenture by the registered holder hereof or the holder's legal representative or attorney duly appointed by an instrument in form and execution satisfactory to the Trustee, and upon compliance with such reasonable requirements as the Trustee or other registrar may prescribe, and such transfer shall be duly noted hereon by the Trustee or other registrar.

This Series 7 Debenture shall not become obligatory for any purpose until it shall have been certified by the manual signature of the Trustee in accordance with the Trust Indenture.

IN WITNESS WHEREOF TORONTO HYDRO CORPORATION has caused this Series 7 Debenture to be signed by its z and its z.

NINTH SUPPLEMENTAL TRUST INDENTURE

THIS NINTH SUPPLEMENTAL TRUST INDENTURE made as of April 9, 2013,

B E T W E E N:

TORONTO HYDRO CORPORATION
a corporation incorporated under the laws of Ontario (the "Corporation")

and

BNY TRUST COMPANY OF CANADA
a trust company existing under the laws of Canada (the "Trustee")

RECITALS

A. BNY Trust Company of Canada is the successor trustee of CIBC Mellon Trust Company;

B. The Corporation has entered into a trust indenture with the Trustee made as of May 7, 2003, as amended, supplemented or restated from time to time (the "Trust Indenture") which provides for the issuance of one or more series of unsecured Debentures of the Corporation by way of Supplemental Indentures;

C. The Corporation entered into a first supplemental trust indenture made as of May 7, 2003 for the purpose of providing for the issue of $225,000,000 aggregate principal amount of Series 1 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 1 Debentures;

D. The Corporation entered into a second supplemental trust indenture made as of November 14, 2007 for the purpose of providing for the issue of $250,000,000 aggregate principal amount of Series 2 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 2 Debentures;

E. The Corporation entered into a third supplemental trust indenture made as of November 12, 2009 for the purpose of providing for the issue of $250,000,000 aggregate principal amount of Series 3 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 3 Debentures;

F. The City Note has been converted, in accordance with its terms, into the Series 4 Debentures and the Series 5 Debentures;

G. The Corporation entered into a fourth supplemental trust indenture made as of April 1, 2010 for the purpose of providing for the issue of $245,057,000 aggregate principal amount of Series 4 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 4 Debentures;

H. The Corporation entered into a fifth supplemental trust indenture made as of April 1, 2010 for the purpose of providing for the issue of $245,057,000 aggregate principal amount of Series 5 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 5 Debentures;

I. The Corporation entered into a sixth supplemental trust indenture made as of May 20, 2010 for the purpose of providing for the issue of $200,000,000 aggregate principal amount of Series 6 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 6 Debentures;

J. The Corporation entered into a seventh supplemental trust indenture made as of September 20, 2011 for the purpose of amending the definition of "GAAP" under the Trust Indenture;

K. The Corporation entered into an eighth supplemental trust indenture made as of November 18, 2011 for the purpose of providing for the issue of $300,000,000 aggregate principal amount of Series 7 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 7 Debentures; and

L. This Ninth Supplemental Trust Indenture is entered into for the purpose of providing for the issue of Series 8 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 8 Debentures.

NOW THEREFORE THIS NINTH SUPPLEMENTAL TRUST INDENTURE WITNESSES and it is hereby covenanted, agreed and declared as follows:

SECTION 1 INTERPRETATION

1.1 To Be Read With Trust Indenture

This Ninth Supplemental Trust Indenture is a Supplemental Indenture as that term is used in the Trust Indenture. The Trust Indenture and this Ninth Supplemental Trust Indenture shall be read together and shall have effect as though all the provisions of both indentures were contained in one instrument.

1.2 Headings etc.

The division of this Ninth Supplemental Trust Indenture into Sections and clauses, the provision of a table of contents and the insertion of headings are for convenience of reference only and shall not affect the interpretation hereof. Unless the context otherwise requires, the expression "Section" and "Schedule" followed by a number, letter or combination of numbers and letters refer to the specified Section of or Schedule to this Ninth Supplemental Trust Indenture.

1.3 Definitions

All terms which are defined in the Trust Indenture and used but not defined in this Ninth Supplemental Trust Indenture shall have the meanings ascribed to them in the Trust Indenture, as such meanings may be amended or supplemented with respect to Series 8 Debentures by this Ninth Supplemental Trust Indenture. In the event of any inconsistency between the meaning

given to a term in the Trust Indenture and the meaning given to the same term in this Ninth Supplemental Trust Indenture, the meaning given to the term in this Ninth Supplemental Trust Indenture shall prevail to the extent of the inconsistency. Subject to the foregoing, in this Ninth Supplemental Trust Indenture and in the Series 8 Debentures, the following terms have the following meanings:

(1) Canada Yield on any date means the yield to maturity on that date, compounded semi-annually, that a non-callable Government of Canada bond would carry if issued, in Canadian dollars in Canada, at 100% of its principal amount on that date with a term to maturity approximately equal to the remaining term to maturity of the Series 8 Debentures, such yield to maturity being the average of the yields provided by two major Canadian investment dealers specified by the Corporation.

(2) Canada Yield Price means the price equal to the present value of all scheduled payments of interest (other than accrued and unpaid interest) and principal on the Series 8 Debentures, using a discount rate equal to the sum of the Canada Yield and 28 basis points, calculated at 10:00 a.m. (Toronto, Ontario time) on the Business Days prior to the Redemption Date of the Series 8 Debentures.

(3) Series 8 Debentures means the 2.91% Senior Unsecured Debentures due 2023 (Series 8) referred to in Section 2.1 below.

(4) Series 8 Debentures Debt Account means the deposit account established in respect of the Series 8 Debentures pursuant to Section 8.2 of the Trust Indenture that is designated in writing by the Corporation to the Trustee as the "Series 8 Debentures Debt Account".

(5) Series 8 Debentures Interest Payment Date means October 10 and April 10 in each year that the Series 8 Debentures are outstanding with the exception of the first payment of interest which will be due on October 10, 2013 as provided in Section 2.4(a) below.

(6) Series 8 Debentures Interest Period means the period commencing on and including the later of the date of issue of the Series 8 Debentures and the immediately preceding Series 8 Debentures Interest Payment Date and ending on and including the day immediately preceding the next Series 8 Debentures Interest Payment Date to occur in respect of which interest is payable.

(7) Trust Indenture means the trust indenture made as of May 7, 2003 between the Corporation and the Trustee, as amended, supplemented or restated from time to time.

SECTION 2 SERIES 8 DEBENTURES

2.1 Creation and Designation

The Corporation is authorized in accordance with the Trust Indenture to issue under this Ninth Supplemental Trust Indenture, and hereby creates and issues, a series of debentures designated "2.91% Senior Unsecured Debentures due 2023 (Series 8)", having the terms set out in this Ninth Supplemental Trust Indenture.

2.2 Limitation on Issue

The aggregate principal amount of Series 8 Debentures which may be issued under this Ninth Supplemental Trust Indenture including any supplement hereto will be limited to $500,000,000.

2.3 Date of Issue and Maturity

The Series 8 Debentures shall be dated April 9, 2013 (being the applicable date of issue) and will become due and payable, together with accrued interest and unpaid interest thereon, on April 10, 2023 (being the applicable Stated Maturity).

2.4 Concerning Interest

(a) The Series 8 Debentures shall be issued in $1,000 principal amount denominations or integral multiples thereof and shall bear interest on the unpaid principal amount thereof at a rate of 2.91% per annum from and including their date of issue, payable semi-annually in arrears, in equal instalments on each Series 8 Debentures Interest Payment Date, with the exception of the first payment of interest which will be due on October 10, 2013 and which will be $14.62972604 per $1,000 principal amount of Series 8 Debentures.

(b) Interest shall be payable in respect of each Series 8 Debentures Interest Period (after as well as before maturity, default and judgment, with interest on overdue interest at the same rate) on each Series 8 Debentures Interest Payment Date in accordance with Section 2.8 of the Trust Indenture.

2.5 Interest Payments

The Corporation shall make payments of interest on the Series 8 Debentures in accordance with the provisions of Section 2.8 of the Trust Indenture.

2.6 Payment of Amounts Due on Maturity

In accordance with Section 8.2 of the Trust Indenture, the Corporation will deposit to the Series 8 Debentures Debt Account all amounts required to be paid to the order of Holders of Series 8 Debentures on maturity, by, or prior to 9:00 a.m. (Toronto, Ontario time), on the Stated Maturity of the Series 8 Debentures. The deposit of such funds will satisfy and discharge the liability of the Corporation for principal of, and any accrued and unpaid interest on, the Series 8 Debentures to the extent of the sum represented thereby (plus the amount of any taxes deducted or withheld).

2.7 Redemption and Purchase of Series 8 Debentures

(a) The Series 8 Debentures may be redeemed at the Corporation's option when not in default under the Trust Indenture, in whole at any time, or in part at any time and from time to time, prior to January 10, 2023, on not more than 60 Business Days and not less than 15 Business Days prior notice, at a price equal to the greater of the Canada Yield Price and par, together in each case with accrued and unpaid

interest to (but excluding) the Redemption Date and in each case otherwise in accordance with Sections 5.1, 5.2, 5.3 and 5.4 of the Trust Indenture.

(b) The Series 8 Debentures may be redeemed at the Corporation's option when not in default under the Trust Indenture, in whole, but not in part, at any time on or after January 10, 2023, on not more than 60 Business Days and not less than 15 Business Days prior notice, at a price equal to 100% of the principal amount of the Series 8 Debentures outstanding, together with accrued and unpaid interest to (but excluding) the Redemption Date and otherwise in accordance with Sections 5.1, 5.3 and 5.4 of the Trust Indenture.

(c) The Corporation will be entitled at any time when not in default under the Trust Indenture to purchase for cancellation all or any of the Series 8 Debentures in accordance with Section 5.5 of the Trust Indenture.

(d) The Series 8 Debentures will not be subject to purchase pursuant to any sinking fund provisions.

2.8 Form of Series 8 Debentures

(a) Except as set out in Section 2.8(b) below, the Series 8 Debentures and the registration panel and the certificate of the Trustee endorsed thereon shall be issuable initially as one Global Debenture to be held by, or on behalf of, CDS as depository for its participants and registered in the name of CDS or its nominee. The Global Debenture shall be substantially in the form set out in Schedule 1 hereto with such appropriate additions, deletions, substitutions and variations as the Directors shall by resolution determine prior to the time of issue thereof and as the Trustee may approve and with such distinguishing letters and numbers as the Trustee may approve, with such approval in each case to be conclusively evidenced by the Trustee's certification of such Global Debenture.

(b) The Trustee understands and acknowledges that the Series 8 Debentures have not been and will not be registered under the United States Securities Act of 1933, as amended (the "U.S. Securities Act"). Each Series 8 Debenture originally issued in the United States or to a U.S. Person will be represented by a definitive certificate in the form set out in Schedule 2 hereto which definitive certificate, and each Series 8 Debenture certificate issued in exchange therefor or in substitution thereof, shall bear the following legend:

"THE SECURITIES REPRESENTED HEREBY HAVE NOT BEEN REGISTERED UNDER THE UNITED STATES SECURITIES ACT OF 1933, AS AMENDED (THE "U.S. SECURITIES ACT") OR UNDER ANY STATE SECURITIES LAWS. THE HOLDER HEREOF, BY PURCHASING SUCH SECURITIES, AGREES FOR THE BENEFIT OF THE CORPORATION THAT SUCH SECURITIES MAY BE OFFERED, SOLD OR OTHERWISE TRANSFERRED ONLY (A) TO THE CORPORATION, (B) OUTSIDE THE UNITED STATES IN ACCORDANCE WITH RULE 904 OF REGULATION S UNDER THE

U.S. SECURITIES ACT, OR (2) OUTSIDE THE UNITED STATES IN ACCORDANCE WITH (1) RULE 144A UNDER THE U.S. SECURITIES ACT OR (2) RULE 144 UNDER THE U.S. SECURITIES ACT, IF AVAILABLE OR (3) IN COMPLIANCE WITH CERTAIN OTHER PROCEDURES SATISFACTORY TO THE CORPORATION. A NEW CERTIFICATE, BEARING NO LEGEND, DELIVERY OF WHICH WILL CONSTITUTE "GOOD DELIVERY" MAY BE OBTAINED FROM BNY TRUST COMPANY OF CANADA UPON DELIVERY OF THIS CERTIFICATE AND A DULY EXECUTED DECLARATION, IN A FORM SATISFACTORY TO BNY TRUST COMPANY OF CANADA AND THE CORPORATION, TO THE EFFECT THAT THE SALE OF THE SECURITIES REPRESENTED HEREBY IS BEING MADE IN COMPLIANCE WITH RULE 904 OF REGULATION S UNDER THE U.S. SECURITIES ACT."

If any Series 8 Debentures are to be sold or transferred outside the United States in compliance with the requirements of Rule 904 of Regulation S under the U.S Securities Act, the legend may be removed by providing a declaration to the Trustee to the following effect (or as the Corporation may prescribe from time to time),

"The undersigned (A) acknowledges that the sale of the _____ Debentures, represented by certificate numbers _____ to which this declaration relates is being made in reliance on Rule 904 of Regulation S under the United States Securities Act of 1933, as amended (the "U.S. Securities Act") and (B) certifies that (1) it is not an "affiliate" (as defined in Rule 405 under the U.S. Securities Act) of Toronto Hydro Corporation, (2) the offer of such Debentures was not made to a person in the United States and at the time the buy order was originated, the buyer was outside the United States, or the seller and any person acting on its behalf reasonably believe that the buyer was outside the United States and (3) neither the seller, nor any affiliate of the seller, nor any person acting on its or their behalf engaged in any directed selling efforts in connection with the offer and sale of such Debentures. Terms used herein have the meanings given to them by Regulation S under the U.S. Securities Act."

If any Series 8 Debentures are being sold or transferred pursuant to Rule 144 of the U.S. Securities Act, the legend may be removed by delivery to the Trustee of a written opinion of Trustee Counsel to the effect that such legend is no longer required under applicable requirements of the U.S. Securities Act or state securities laws.

Prior to the issuance of Series 8 Debentures, the Corporation shall notify the Trustee, in writing, concerning which Series 8 Debentures are to be certificated and are to bear the legend described above. The Trustee will thereafter maintain a list of all registered holders from time to time of legended Series 8 Debentures.

2.9 Signatures on Series 8 Debentures

The Series 8 Debentures shall be signed in accordance with the provisions of Section 2.6 of the Trust Indenture.

2.10 Certification

(a) No Series 8 Debenture issued shall be obligatory or shall entitle the Holder of such Series 8 Debenture to the benefits of this Ninth Supplemental Trust Indenture until it has been certified by manual signature by or on behalf of the Trustee by execution of the certificate of the Trustee appended thereto substantially in the form set out in Schedule 1 hereto, or in some other form approved by the Trustee, whose approval shall be conclusively evidenced by the Trustee's execution of the certificate. Such certificate on any Series 8 Debenture shall be conclusive evidence that such Series 8 Debenture is duly issued and is a valid and binding obligation of the Corporation and that the Holder of such Series 8 Debenture is entitled to the benefits of the Trust Indenture, as supplemented by this Ninth Supplemental Trust Indenture, and such Series 8 Debenture.

(b) The certificate of the Trustee on any Series 8 Debenture shall not be construed as a representation or warranty by the Trustee as to the validity of this Ninth Supplemental Trust Indenture or of the Series 8 Debentures (except the due certification thereof and any other warranties implied by law) and the Trustee shall in no respect be liable or answerable for the use made of the Series 8 Debentures or any of them or the proceeds thereof.

2.11 Location of Register

With respect to the Series 8 Debentures, the Register referred to in Section 3.1 of the Trust Indenture shall be kept by the Trustee at the Corporate Trust Office and may thereafter be kept by the Trustee in such other place as the Corporation, with the approval of the Trustee, may designate.

2.12 Additional Amounts

The Corporation will not be required to pay an additional amount on the Series 8 Debentures in respect of any tax, assessment or government charge that is required by law to be withheld or deducted by it.

2.13 Trustees, etc.

The Trustee will be the Paying Agent and the Registrar for the Series 8 Debentures.

SECTION 3 MISCELLANEOUS

3.1 Acceptance of Trust

The Trustee accepts the trusts in this Ninth Supplemental Trust Indenture and agrees to carry out and discharge the same upon the terms and conditions set out in this Ninth Supplemental Trust Indenture and in accordance with the Trust Indenture.

3.2 Confirmation of Trust Indenture

The Trust Indenture as amended and supplemented by this Ninth Supplemental Trust Indenture is in all respects confirmed.

3.3 Counterparts

This Ninth Supplemental Trust Indenture may be executed in counterparts, each of which so executed shall be deemed to be original and such counterparts together shall constitute one and the same instrument.

[SIGNATURE PAGE FOLLOWS]

IN WITNESS WHEREOF the parties hereto have executed this Ninth Supplemental Trust Indenture under the hands of their proper signatories in that behalf:

Schedule 1 – FORM OF GLOBAL DEBENTURE-SERIES 8

This Debenture is a Global Debenture within the meaning of the Trust Indenture hereinafter referred to and is registered in the name of a Depository or a nominee thereof. Unless this Debenture is presented by an authorized representative of CDS Clearing and Depository Services Inc. ("CDS") to Toronto Hydro Corporation or its agent for registration of transfer, exchange or payment, and any debentures issued in respect thereof is registered in the name of CDS & CO., or in such other name as is requested by an authorized representative of CDS (and any payment is made to CDS & CO. or to such other entity as is requested by an authorized representative of CDS), ANY TRANSFER, PLEDGE OR OTHER USE HEREOF FOR VALUE OR OTHERWISE BY OR TO ANY PERSON IS WRONGFUL since the registered holder hereof, CDS & CO., has a property interest in the securities represented by this debenture herein and it is a violation of its rights for another person to hold, transfer or deal with this debenture.

TORONTO HYDRO CORPORATION (the "Corporation") for value received hereby promises to pay to the registered holder hereof on the Stated Maturity, or on such earlier date as the Principal Amount (or a portion thereof) may become due in accordance with the provisions of the Trust Indenture (as defined below), on presentation and surrender of this z% Senior Unsecured Debenture due z, 20" (Series 8) (the "Series 8 Debenture"), the Principal Amount in lawful money of Canada at the office of the Trustee (as defined below) at 11th Floor, 320 Bay Street, Toronto, Ontario M5H 4A6, and to pay interest on the Principal Amount at the Interest Rate Per Annum from and including the later of the Issue Date and the last Interest Payment Date on which interest has at that time most recently been paid on this Series 8 Debenture (with the

exception of the first payment of interest which will be due "on 20" and which will be $" per $1,000 principal amount of Series 8 Debentures, to the address of the registered holder hereof appearing on the register of Series 8 Debentures maintained by or at the direction of the Trustee (the "Register"), in like money semi-annually in arrears, in equal instalments on the Interest Payment Dates in each year, and if the Corporation at any time defaults in the payment of any principal or interest, to pay interest on the amount in default at the same rate, in like money, on demand, at the address of the registered holder hereof appearing on the Register. The Corporation will (i) on the day that is each Interest Payment Date, make payment by a wire transfer, or (ii) on the day that is two Business Days before each Interest Payment Date, forward or cause to be forwarded a cheque by same day delivery, to the address of the registered holder hereof appearing on the Register for interest due and payable to such holder on such Interest Payment Date, less any taxes required by law to be deducted or withheld, made payable to the order of such holder; provided, however that in case of payment of interest at maturity or redemption or as otherwise provided in the Trust Indenture, the time for payment of interest, less any such taxes, may at the option of the Corporation be determined based on the time that the certificate representing this Series 8 Debenture is presented and surrendered to the Trustee. The payment by such wire transfer or forwarding of such cheque (provided such cheque is paid on presentation) will satisfy and discharge the liability for interest upon such Series 8 Debenture to the extent of the sum represented thereby (plus the amount of any taxes deducted or withheld as aforesaid).

This Series 8 Debenture is one of an authorized issue of debentures designated as "% Senior Unsecured Debentures due, 20" (Series 8) and forming a series of debentures created and issued under a ninth supplemental trust indenture made as of, 2013 (the "Ninth Supplemental Trust Indenture") to a trust indenture (the "Indenture") made as of May 7, 2003, between the Corporation and BNY Trust Company of Canada (successor trustee of CIBC Mellon Trust Company) (the "Trustee"), as Trustee (the first supplemental trust indenture to the Indenture made as of May 7, 2003 between the Corporation and the Trustee, the second supplemental trust indenture to the Indenture made as of November 14, 2007 between the Corporation and the Trustee, the third supplemental trust indenture to the Indenture made as of November 12, 2009 between the Corporation and the Trustee, the fourth supplemental trust indenture to the Indenture made as of April 1, 2010 between the Corporation and the Trustee, the fifth supplemental trust indenture to the Indenture made as of April 1, 2010 between the Corporation and the Trustee, the sixth supplemental trust indenture to the Indenture made as of May 20, 2010 between the Corporation and the Trustee, the seventh supplemental trust indenture to the Indenture made as of September 20, 2011 between the Corporation and the Trustee, the eighth supplemental trust indenture to the Indenture made as of November 18, 2011 between the Corporation and the Trustee, the Ninth Supplemental Trust Indenture and the Indenture (as amended, supplemented or restated from time to time) are collectively referred to herein as the "Indenture"). The Trust Indenture specifies the terms and conditions upon which the Series 8 Debentures are created and issued or may be created, issued and held, the rights of the registered holders of the Series 8 Debentures, the Corporation and the Trustee, all of which terms and conditions are incorporated by reference in this Series 8 Debenture and to each of which the registered holder of this Series 8 Debenture, by acceptance hereof, agrees.

The aggregate principal amount of Series 8 Debentures that may be created and issued under the Trust Indenture is limited to $ in lawful money of Canada. Series 8 Debentures are issuable as fully registered debentures in denominations of $1,000 and integral multiples thereof

and, subject to the terms and conditions set forth in the Trust Indenture, are issued as book entry only debentures.

The Series 8 Debentures are direct unsecured obligations of the Corporation and will rank equally with each other and with all other debentures of every other series from time to time issued and outstanding pursuant to the Trust Indenture and, except to the extent prescribed by law, with all other unsecured and unsubordinated indebtedness of the Corporation.

This Series 8 Debenture is redeemable, at the option of the Corporation when not in default under the Trust Indenture, in whole at any time, or in part at any time and from time to time, prior to ", 20", subject to the terms and conditions set forth in the Trust Indenture, at a price equal to the greater of the Canada Yield Price (as defined in the Trust Indenture) and par, together with accrued and unpaid interest to (but excluding) the date fixed for redemption.

This Series 8 Debenture is redeemable, at the option of the Corporation when not in default under the Trust Indenture, in whole, but not in part, at any time on or after ", 20", subject to the terms and conditions set forth in the Trust Indenture, at a price equal to 100% of the Principal Amount of the Series 8 Debentures outstanding, together with accrued and unpaid interest to (but excluding) the date fixed for redemption.

At any time when the Corporation is not in default under the Trust Indenture, the Corporation may, subject to the terms and conditions set forth in the Trust Indenture, purchase Series 8 Debentures in the open market, by tender or by private contract, at any price. Series 8 Debentures purchased by the Corporation shall be cancelled and not reissued.

The Principal Amount may become or be declared due before the Stated Maturity on the conditions, in the manner, with the effect and at the times set forth in the Trust Indenture.

The Trust Indenture contains provisions for the holding of meetings of registered holders of debentures issued by the Corporation pursuant to the Trust Indenture and the making of resolutions at such meetings and the creation of instruments in writing signed by the registered holders of a specified majority of debentures issued and outstanding pursuant to the Trust Indenture. Such resolutions and instruments will be binding on and may affect the rights and entitlements of all holders of debentures issued by the Corporation pursuant to the Trust Indenture, subject to the provisions of the Trust Indenture.

This Series 8 Debenture may be transferred only upon compliance with the conditions prescribed in the Trust Indenture relating to the transfer of a Global Debenture (as defined in the Trust Indenture), and upon compliance with such reasonable requirements as the Trustee or other registrar may prescribe, and such transfer shall be duly noted hereon by the Trustee or other registrar.

This Series 8 Debenture shall not become obligatory for any purpose until it shall have been certified by the manual signature of the Trustee in accordance with the Trust Indenture.

IN WITNESS WHEREOF TORONTO HYDRO CORPORATION has caused this Series 8 Debenture to be signed by its z and its z.

TORONTO HYDRO CORPORATION (the "Corporation") for value received hereby promises to pay to the registered holder hereof on the Stated Maturity, or on such earlier date as the Principal Amount (or a portion thereof) may become due in accordance with the provisions of the Trust Indenture (as defined below), on presentation and surrender of this z% Senior Unsecured Debenture due z, 20" (Series 8) (the "Series 8 Debenture"), the Principal Amount in lawful money of Canada at the office of the Trustee (as defined below) at 11th Floor, 320 Bay Street, Toronto, Ontario M5H 4A6, and to pay interest on the Principal Amount at the Interest

Rate Per Annum from and including the later of the Issue Date and the last Interest Payment Date on which interest has at that time most recently been paid on this Series 8 Debenture (with the exception of the first payment of interest which will be due on "[redacted], 20" and which will be $" per $1,000 principal amount of Series 8 Debentures), at the address of the registered holder hereof appearing on the register of Series 8 Debentures maintained by or at the direction of the Trustee (the "Register"), in like money semi-annually in arrears, in equal instalments on the Interest Payment Dates in each year, and if the Corporation at any time defaults in the payment of any principal or interest, to pay interest on the amount in default at the same rate, in like money, on demand, at the address of the registered holder appearing on the Register. The Corporation, on the day that is two Business Days before each Interest Payment Date, will forward or cause to be forwarded by same day delivery to the address of the registered holder hereof appearing on the Register a cheque for interest due and payable to such holder on such Interest Payment Date, less any taxes required by law to be deducted or withheld, made payable to the order of such holder; provided, however that in case of payment of interest at maturity or redemption or as otherwise provided in the Trust Indenture, the time for payment of interest, less any such taxes, may at the option of the Corporation be determined based on the time that the certificate representing this Series 8 Debenture is presented and surrendered to the Trustee. The forwarding of such cheque will satisfy and discharge the liability for interest upon such Series 8 Debenture to the extent of the sum represented thereby (plus the amount of any taxes deducted or withheld as aforesaid) unless such cheque is not paid on presentation.

This Series 8 Debenture is one of an authorized issue of debentures designated as "[redacted]% Senior Unsecured Debentures due [redacted], 20" (Series 8) and forming the series of debentures created and issued under a ninth supplemental trust indenture made as of [redacted], 2013 (the "Ninth Supplemental Trust Indenture") to a trust indenture (the "Indenture") made as of May 7, 2003, between the Corporation and BNY Trust Company of Canada (successor trustee of CIBC Mellon Trust Company) (the "Trustee"), as Trustee (the first supplemental trust indenture to the Indenture made as of May 7, 2003 between the Corporation and the Trustee, the second supplemental trust indenture to the Indenture made as of November 14, 2007 between the Corporation and the Trustee, the third supplemental trust indenture to the Indenture made as of November 12, 2009 between the Corporation and the Trustee, the fourth supplemental trust indenture to the Indenture made as of April 1, 2010 between the Corporation and the Trustee, the fifth supplemental trust indenture to the Indenture made as of April 21, 2010 between the Corporation and the Trustee, the sixth supplemental trust indenture to the Indenture made as of May 20, 2010 between the Corporation and the Trustee, the seventh supplemental trust indenture to the Indenture made as of September 20, 2011 between the Corporation and the Trustee, the eighth supplemental trust indenture to the Indenture made as of November 18, 2011 between the Corporation and the Trustee, the Ninth Supplemental Trust Indenture and the Indenture (as amended, supplemented or restated from time to time) are collectively referred to herein as the "Trust Indenture"). The Trust Indenture specifies the terms and conditions upon which the Series 8 Debentures are created and issued or may be created, issued and held and the rights of the registered holders of the Series 8 Debentures, the Corporation and the Trustee, all of which terms and conditions are incorporated by reference in this Series 8 Debenture and to each of which the registered holder of this Series 8 Debenture, by acceptance hereof, agrees.

The aggregate principal amount of Series 8 Debentures that may be created and issued under the Trust Indenture is limited to $[ ] in lawful money of Canada. Series 8 Debentures are issuable as fully registered debentures in denominations of $1,000 and integral multiples thereof.

The Series 8 Debentures are direct unsecured obligations of the Corporation and will rank equally with each other and with all other debentures of every other series from time to time issued and outstanding pursuant to the Trust Indenture and, except to the extent prescribed by law, with all other unsecured and unsubordinated indebtedness of the Corporation.

This Series 8 Debenture is redeemable, at the option of the Corporation when not in default under the Trust Indenture, in whole at any time or in part at any time and from time to time, prior to [ ], 20[ ], subject to the terms and conditions set forth in the Trust Indenture, at a price equal to the greater of the Canada Yield Price (as defined in the Trust Indenture) and par, together with accrued and unpaid interest to (but excluding) the date fixed for redemption.

This Series 8 Debenture is redeemable, at the option of the Corporation when not in default under the Trust Indenture, in whole, but not in part, at any time on or after [ ], 20[ ], subject to the terms and conditions set forth in the Trust Indenture, at a price equal to 100% of the Principal Amount of the Series 8 Debentures outstanding, together with accrued and unpaid interest to (but excluding) the date fixed for redemption.

At any time when the Corporation is not in default under the Trust Indenture, the Corporation may, subject to the terms and conditions set forth in the Trust Indenture, purchase Series 8 Debentures in the open market, by tender or by private contract, at any price. Series 8 Debentures purchased by the Corporation shall be cancelled and not reissued.

The Principal Amount may become or be declared due before the Stated Maturity on the conditions, in the manner, with the effect and at the times set forth in the Trust Indenture.

The Trust Indenture contains provisions for the holding of meetings of registered holders of debentures issued by the Corporation pursuant to the Trust Indenture and the making of resolutions at such meetings and the creation of instruments in writing signed by the registered holders of a specified majority of debentures issued and outstanding pursuant to the Trust Indenture. Such resolutions and instruments will be binding on and may affect the rights and entitlements of all holders of debentures issued by the Corporation pursuant to the Trust Indenture, subject to the provisions of the Trust Indenture.

This Series 8 Debenture may be transferred only upon compliance with the conditions prescribed in the Trust Indenture by the registered holder hereof or the holder's legal representative or attorney duly appointed by an instrument in form and execution satisfactory to the Trustee, and upon compliance with such reasonable requirements as the Trustee or other registrar may prescribe, and such transfer shall be duly noted hereon by the Trustee or other registrar.

This Series 8 Debenture shall not become obligatory for any purpose until it shall have been certified by the manual signature of the Trustee in accordance with the Trust Indenture.

IN WITNESS WHEREOF TORONTO HYDRO CORPORATION has caused this Series 8 Debenture to be signed by its z and its z.

THIS TENTH SUPPLEMENTAL TRUST INDENTURE made as of April 9, 2013,

B E T W E E N:

TORONTO HYDRO CORPORATION
a corporation incorporated under the laws of Ontario (the "Corporation")

and

BNY TRUST COMPANY OF CANADA
a trust company existing under the laws of Canada (the "Trustee")

RECITALS

A. BNY Trust Company of Canada is the successor trustee of CIBC Mellon Trust Company;

B. The Corporation has entered into a trust indenture with the Trustee made as of May 7, 2003, as amended, supplemented or restated from time to time (the "Trust Indenture") which provides for the issuance of one or more series of unsecured Debentures of the Corporation by way of Supplemental Indentures;

C. The Corporation entered into a first supplemental trust indenture made as of May 7, 2003 for the purpose of providing for the issue of $225,000,000 aggregate principal amount of Series 1 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 1 Debentures;

D. The Corporation entered into a second supplemental trust indenture made as of November 14, 2007 for the purpose of providing for the issue of $250,000,000 aggregate principal amount of Series 2 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 2 Debentures;

E. The Corporation entered into a third supplemental trust indenture made as of November 12, 2009 for the purpose of providing for the issue of $250,000,000 aggregate principal amount of Series 3 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 3 Debentures;

F. The City Note has been converted, in accordance with its terms, into the Series 4 Debentures and the Series 5 Debentures;

G. The Corporation entered into a fourth supplemental trust indenture made as of April 1, 2010 for the purpose of providing for the issue of $245,057,000 aggregate principal amount of Series 4 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 4 Debentures;

H. The Corporation entered into a fifth supplemental trust indenture made as of April 1, 2010 for the purpose of providing for the issue of $245,057,000 aggregate principal amount of Series 5 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 5 Debentures;

I. The Corporation entered into a sixth supplemental trust indenture made as of May 20, 2010 for the purpose of providing for the issue of $200,000,000 aggregate principal amount of Series 6 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 6 Debentures;

J. The Corporation entered into a seventh supplemental trust indenture made as of September 20, 2011 for the purpose of amending the definition of "GAAP" under the Trust Indenture;

K. The Corporation entered into an eighth supplemental trust indenture made as of November 18, 2011 for the purpose of providing for the issue of $300,000,000 aggregate principal amount of Series 7 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 7 Debentures;

L. The Corporation entered into a ninth supplemental trust indenture made as of April 9, 2013 for the purpose of providing for the issue of Series 8 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 8 Debentures; and

M. This Tenth Supplemental Trust Indenture is entered into for the purpose of providing for the issue of Series 9 Debentures pursuant to the Trust Indenture and establishing the terms, provisions and conditions of the Series 9 Debentures.

NOW THEREFORE THIS TENTH SUPPLEMENTAL TRUST INDENTURE WITNESSES and it is hereby covenanted, agreed and declared as follows:

SECTION 1 INTERPRETATION

1.1 To Be Read With Trust Indenture

This Tenth Supplemental Trust Indenture is a Supplemental Indenture as that term is used in the Trust Indenture. The Trust Indenture and this Tenth Supplemental Trust Indenture shall be read together and shall have effect as though all the provisions of both indentures were contained in one instrument.

1.2 Headings etc.

The division of this Tenth Supplemental Trust Indenture into Sections and clauses, the provision of a table of contents and the insertion of headings are for convenience of reference only and shall not affect the interpretation thereof. Unless the context otherwise requires, the expression "Section" and "Schedule" followed by a number, letter or combination of numbers and letters refer to the specified Section of or Schedule to this Tenth Supplemental Trust Indenture.

1.3 Definitions

All terms which are defined in the Trust Indenture and used but not defined in this Tenth Supplemental Trust Indenture shall have the meanings ascribed to them in the Trust Indenture, as such meanings may be amended or supplemented with respect to Series 9 Debentures by this Tenth Supplemental Trust Indenture. In the event of any inconsistency between the meaning given to a term in the Trust Indenture and the meaning given to the same term in this Tenth Supplemental Trust Indenture, the meaning given to the term in this Tenth Supplemental Trust Indenture shall prevail to the extent of the inconsistency. Subject to the foregoing, in this Tenth Supplemental Trust Indenture and in the Series 9 Debentures, the following terms have the following meanings:

(1) Canada Yield on any date means the yield to maturity on that date, compounded semi-annually, that a non-callable Government of Canada bond would carry if issued, in Canadian dollars in Canada, at 100% of its principal amount on that date with a term to maturity approximately equal to the remaining term to maturity of the Series 9 Debentures, such yield to maturity being the average of the yields quoted by two major Canadian investment dealers specified by the Corporation.

(2) Canada Yield Price means the price equal to the present value of all scheduled payments of interest (other than accrued and unpaid interest) and principal on the Series 9 Debentures, using a discount rate equal to the sum of the Canada Yield and 38 basis points, calculated at 10:00 a.m. (Toronto, Ontario time) on the Business Days prior to the Redemption Date of the Series 9 Debentures.

(3) Series 9 Debentures means the 3.96% Senior Unsecured Debentures due 2063 (Series 9) referred to in Section 2.1.

(4) Series 9 Debentures Debt Account means the deposit account established in respect of the Series 9 Debentures pursuant to Section 8.2 of the Trust Indenture that is designated in writing by the Corporation to the Trustee as the "Series 9 Debentures Debt Account".

(5) Series 9 Debentures Interest Payment Date means October 9 and April 9 in each year that the Series 9 Debentures are outstanding.

(6) Series 9 Debentures Interest Period means the period commencing on and including the later of the date of issue of the Series 9 Debentures and the immediately preceding Series 9 Debentures Interest Payment Date and ending on and including the day immediately preceding the next Series 9 Debentures Interest Payment Date to occur in respect of which interest is payable.

(7) Trust Indenture means the trust indenture made as of May 7, 2003 between the Corporation and the Trustee, as amended, supplemented or restated from time to time.

SECTION 2 SERIES 9 DEBENTURES

2.1 Creation and Designation

The Corporation is authorized in accordance with the Trust Indenture to issue under this Tenth Supplemental Trust Indenture, and hereby creates and issues, a series of debentures designated "3.96% Senior Unsecured Debentures due 2063 (Series 9)", having the terms set out in this Tenth Supplemental Trust Indenture.

2.2 Limitation on Issue

The aggregate principal amount of Series 9 Debentures which may be issued under this Tenth Supplemental Trust Indenture including any supplement hereto will be limited to $500,000,000.

2.3 Date of Issue and Maturity

The Series 9 Debentures shall be dated April 9, 2013 (being the applicable date of issue) and will become due and payable, together with accrued interest and unpaid interest thereon, on April 9, 2063 (being the applicable Stated Maturity).

2.4 Concerning Interest

(a) The Series 9 Debentures shall be issued in $1,000 principal amount denominations or integral multiples thereof and shall bear interest on the unpaid principal amount thereof at a rate of 3.96% per annum from and including their date of issue, payable semi-annually in arrears, in equal instalments on each Series 9 Debentures Interest Payment Date.

(b) Interest shall be payable in respect of each Series 9 Debentures Interest Period (after as well as before maturity, default and judgment, with interest on overdue interest at the same rate) on each Series 9 Debentures Interest Payment Date in accordance with Section 2.8 of the Trust Indenture.

2.5 Interest Payments

The Corporation shall make payments of interest on the Series 9 Debentures in accordance with the provisions of Section 2.8 of the Trust Indenture.

2.6 Payment of Amounts Due on Maturity

In accordance with Section 8.2 of the Trust Indenture, the Corporation will deposit to the Series 9 Debentures Debt Account all amounts required to be paid to the order of Holders of Series 9 Debentures on maturity, prior to 9:00 a.m. (Toronto, Ontario time), on the Stated Maturity of the Series 9 Debentures. The deposit of funds will satisfy and discharge the liability of the Corporation for principal of, and any accrued and unpaid interest on, the Series 9 Debentures to the extent of the sum represented thereby (plus the amount of any taxes deducted or withheld).

2.7 Redemption and Purchase of Series 9 Debentures

(a) The Series 9 Debentures may be redeemed at the Corporation's option when not in default under the Trust Indenture, in whole at any time, or in part at any time and from time to time, prior to October 9, 2062, on not more than 60 Business Days and not less than 15 Business Days prior notice, at a price equal to the greater of the Canada Yield Price and par, together in each case with accrued and unpaid interest to (but excluding) the Redemption Date and in each case otherwise in accordance with Sections 5.1, 5.2, 5.3 and 5.4 of the Trust Indenture.

(b) The Series 9 Debentures may be redeemed at the Corporation's option when not in default under the Trust Indenture, in whole, but not in part, at any time on or after October 9, 2062, on not more than 60 Business Days and not less than 15 Business Days prior notice, at a price equal to 100% of the principal amount of the Series 9 Debentures outstanding, together with accrued and unpaid interest to (but excluding) the Redemption Date and otherwise in accordance with Sections 5.1, 5.3 and 5.4 of the Trust Indenture.

(c) The Corporation will be entitled at any time when not in default under the Trust Indenture to purchase for cancellation all or any of the Series 9 Debentures in accordance with Section 5.5 of the Trust Indenture.

(d) The Series 9 Debentures will not be subject to repurchase pursuant to any sinking fund provisions.

2.8 Form of Series 9 Debentures

(a) Except as set out in 2.8(b) below, the Series 9 Debentures and the registration panel and the certificate of the Trustee to be endorsed thereon shall be issuable initially as one Global Debenture to be held by, or on behalf of, CDS as depository for its participants and registered in the name of CDS or its nominee. The Global Debenture shall be substantially in the form set out in Schedule 1 hereto with such appropriate additions, deletions, substitutions and variations as the Directors shall by resolution determine prior to the time of issue thereof and as the Trustee may approve and with such distinguishing letters and numbers as the Trustee may approve, with such approval in each case to be conclusively evidenced by the Trustee's certification of such Global Debenture.

(b) The Trustee understands and acknowledges that the Series 9 Debentures have not been and will not be registered under the United States Securities Act of 1933, as amended (the "U.S. Securities Act"). Each Series 9 Debenture originally issued in the United States or to a U.S. Person will be represented by a definitive certificate in the form set out in Schedule 2 hereto with the definitive certificate, and each Series 9 Debenture certificate issued in exchange therefor or in substitution thereof, shall bear the following legend:

"THE SECURITIES REPRESENTED HEREBY HAVE NOT BEEN REGISTERED UNDER THE UNITED STATES SECURITIES ACT OF

1933, AS AMENDED (THE "U.S. SECURITIES ACT") OR UNDER ANY STATE SECURITIES LAWS. THE HOLDER HEREOF, BY PURCHASING SUCH SECURITIES, AGREES FOR THE BENEFIT OF THE CORPORATION THAT SUCH SECURITIES MAY BE OFFERED, SOLD OR OTHERWISE TRANSFERRED ONLY (A) TO THE CORPORATION, (B) OUTSIDE THE UNITED STATES IN ACCORDANCE WITH RULE 904 OF REGULATION S UNDER THE U.S. SECURITIES ACT, OR (C) INSIDE THE UNITED STATES IN ACCORDANCE WITH (1) RULE 144A UNDER THE U.S. SECURITIES ACT OR (2) RULE 144 UNDER THE U.S. SECURITIES ACT, IF AVAILABLE OR (3) IN COMPLIANCE WITH CERTAIN OTHER PROCEDURES SATISFACTORY TO THE CORPORATION. A NEW CERTIFICATE, BEARING NO LEGEND, DELIVERY OF WHICH WILL CONSTITUTE "GOOD DELIVERY" MAY BE OBTAINED FROM BNY TRUST COMPANY OF CANADA UPON DELIVERY OF THIS CERTIFICATE AND A DULY EXECUTED DECLARATION, IN A FORM SATISFACTORY TO BNY TRUST COMPANY OF CANADA AND THE CORPORATION, TO THE EFFECT THAT THE SALE OF THE SECURITIES REPRESENTED HEREBY IS BEING MADE IN COMPLIANCE WITH RULE 904 OF REGULATION S UNDER THE U.S. SECURITIES ACT."

If any Series 9 Debentures are being sold or transferred outside the United States in compliance with the requirements of Rule 904 of Regulation S under the U.S Securities Act, the legend may be removed by providing a declaration to the Trustee to the following effect (or as the Corporation may prescribe from time to time),

"The undersigned (A) acknowledges that the sale of the _____ Debentures, represented by certificate numbers _____ to which this declaration relates is being made in reliance on Rule 904 of Regulation S under the United States Securities Act of 1933, as amended (the "U.S. Securities Act") and (B) certifies that (1) it is not an "affiliate" (as defined in Rule 405 under the U.S. Securities Act) of Toronto Hydro Corporation, (2) the offer of such Debentures was not made to a person in the United States and at the time the buy order was originated, the buyer was outside the United States, or the seller and any person acting on its behalf reasonably believe that the buyer was outside the United States and (3) neither the seller, nor any affiliate of the seller, nor any person acting on its or their behalf engaged in any directed selling efforts in connection with the offer and sale of such Debentures. Terms used herein have the meanings given to them by Regulation S under the U.S. Securities Act."

If any Series 9 Debentures are being sold or transferred pursuant to Rule 144 of the U.S. Securities Act, the legend may be removed by delivery to the Trustee of a written opinion of Trustee Counsel to the effect that such legend is no longer required under applicable requirements of the U.S. Securities Act or state securities laws.

Prior to the issuance of Series 9 Debentures, the Corporation shall notify the Trustee, in writing, concerning which Series 9 Debentures are to be certificated and are to bear the legend described above. The Trustee will thereafter maintain a list of all registered holders from time to time of legended Series 9 Debentures.

2.9 Signatures on Series 9 Debentures

The Series 9 Debentures shall be signed in accordance with the provisions of Section 2.6 of the Trust Indenture.

2.10 Certification

(a) No Series 9 Debenture issued shall be obligatory or shall entitle the Holder of such Series 9 Debenture to the benefits of this Tenth Supplemental Trust Indenture until it has been certified by manual signature by or on behalf of the Trustee by execution of the certificate of the Trustee endorsed thereto substantially in the form set out in Schedule 1 hereto, or in some other form approved by the Trustee, whose approval shall be conclusively evidenced by the Trustee's execution of the certificate. Such certificate on any Series 9 Debenture shall be conclusive evidence that such Series 9 Debenture is duly issued and is a valid and binding obligation of the Corporation and that the Holder of such Series 9 Debenture is entitled to the benefits of the Trust Indenture, as supplemented by this Tenth Supplemental Trust Indenture, and such Series 9 Debenture.

(b) The certificate of the Trustee on any Series 9 Debenture shall not be construed as a representation or warranty by the Trustee as to the validity of this Tenth Supplemental Trust Indenture or of the Series 9 Debentures (except the due certification thereof and any other warranties implied by law) and the Trustee shall in no respect be liable or answerable for the use made of the Series 9 Debentures or any of them or the proceeds thereof.

2.11 Location of Register

With respect to the Series 9 Debentures, the Register referred to in Section 3.1 of the Trust Indenture shall be kept by the Trustee at the Corporate Trust Office and may thereafter be kept by the Trustee in such other place as the Corporation, with the approval of the Trustee, may designate.

2.12 Additional Amounts

The Corporation will not be required to pay an additional amount on the Series 9 Debentures in respect of any tax, assessment or governmental charge that is required by law to be withheld or deducted by it.

2.13 Trustees, etc.

The Trustee will be the Paying Agent and the Registrar for the Series 9 Debentures.

SECTION 3 MISCELLANEOUS

3.1 Acceptance of Trust

The Trustee accepts the trusts in this Tenth Supplemental Trust Indenture and agrees to carry out and discharge the same upon the terms and conditions set out in this Tenth Supplemental Trust Indenture and in accordance with the Trust Indenture.

3.2 Confirmation of Trust Indenture

The Trust Indenture as amended and supplemented by this Tenth Supplemental Trust Indenture is in all respects confirmed.

3.3 Counterparts

This Tenth Supplemental Trust Indenture may be executed in counterparts, each of which so executed shall be deemed to be original and such counterparts together shall constitute one and the same instrument.

[SIGNATURE PAGE FOLLOWS]

IN WITNESS WHEREOF the parties hereto have executed this Tenth Supplemental Trust Indenture under the hands of their proper signatories in that behalf:

Schedule 1 – FORM OF GLOBAL DEBENTURE-SERIES 9

This Debenture is a Global Debenture within the meaning of the Trust Indenture hereinafter referred to and is registered in the name of a Depository or a nominee thereof. Unless this Debenture is presented by an authorized representative of CDS Clearing and Depository Services Inc. ("CDS") to Toronto Hydro Corporation or its agent for registration of transfer, exchange or payment, and any debentures issued in respect thereof is registered in the name of CDS & CO., or in such other name as is requested by an authorized representative of CDS (and any payment is made to CDS & CO. or to such other entity as is requested by an authorized representative of CDS), ANY TRANSFER, PLEDGE OR OTHER USE HEREOF FOR VALUE OR OTHERWISE BY OR TO ANY PERSON IS WRONGFUL since the registered holder hereof, CDS & CO., has a property interest in the securities represented by this debenture herein and it is a violation of its rights for another person to hold, transfer or deal with this debenture.

TORONTO HYDRO CORPORATION (the "Corporation") for value received hereby promises to pay to the registered holder hereof on the Stated Maturity, or on such earlier date as the Principal Amount (or a portion thereof) may become due in accordance with the provisions of the Trust Indenture (as defined below), on presentation and surrender of this z% Senior Unsecured Debenture due z, 20" (Series 9) (the "Series 9 Debenture"), the Principal Amount in lawful money of Canada at the office of the Trustee (as defined below) at 11th Floor, 320 Bay Street, Toronto, Ontario M5H 4A6, and to pay interest on the Principal Amount at the Interest Rate Per Annum from and including the later of the Issue Date and the last Interest Payment Date on which interest has at that time most recently been paid on this Series 9 Debenture, at the

address of the registered holder hereof appearing on the register of Series 9 Debentures maintained by or at the direction of the Trustee (the "Register"), in like money semi-annually in arrears, in equal instalments on the Interest Payment Date in each year, and if the Corporation at any time defaults in the payment of any principal or interest, it will pay interest on the amount in default at the same rate, in like money, on demand, at the address of the registered holder hereof appearing on the Register. The Corporation will (i) on the day that is each Interest Payment Date, make payment by a wire transfer, or (ii) on the day that is two Business Days before each Interest Payment Date, forward or cause to be forwarded a cheque, by same day delivery, to the address of the registered holder hereof appearing on the Register of interest due and payable to such holder on such Interest Payment Date, less any taxes required by law to be deducted or withheld, made payable to the order of such holder; provided, however that in case of payment of interest at maturity or redemption or as otherwise provided in the Trust Indenture, the time for payment of interest, less any such taxes, may at the option of the Corporation be determined based on the time that the certificate representing this Series 9 Debenture is presented to and surrendered to the Trustee. The payment by such wire transfer or forwarding of such cheque (provided such cheque is paid on presentation) will satisfy and discharge the liability for interest upon such Series 9 Debenture to the extent of the sum represented thereby (plus the amount of any taxes deducted or withheld as aforesaid).
