RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1A-STAFF-1

Reference: N/A

Preamble:

Updated Revenue Requirement Work Form (RRWF) and Models

QUESTION (A):

a) Upon completing all interrogatories from Ontario Energy Board (OEB) staff and intervenors, please provide an updated RRWF in working Microsoft Excel format with any corrections or adjustments that the Applicant wishes to make to the amounts in the populated version of the RRWF filed in the initial applications. Entries for changes and adjustments should be included in the middle column on sheet 3 Data_Input_Sheet. Sheets 10 (Load Forecast), 11 (Cost Allocation), and 13 (Rate Design) should be updated, as necessary. Please include documentation of the corrections and adjustments, such as a reference to an interrogatory response or an explanatory note. Such notes should be documented on Sheet 14 Tracking Sheet and may also be included on other sheets in the RRWF to assist understanding of changes.

RESPONSE (A):

Toronto Hydro notes that it is not possible to complete this work within the timelines for responding to interrogatories. This information will be provided in advance of the Technical Conference,[1] along with the updated 2025-2029 revenue requirement and rates, as well as DVA balances and rate riders, related to the following:

(i) the 2023 financial actuals and updated 2024 forecast along with any material downstream impacts to 2025-2029 forecasts;[2]

[1] EB-2023-0195, Evidence Update Cover Letter (January 29,2024)
[2] Pleas see 2A-Staff-104 and 1B-SEC-01

(ii) the 2023 load and customer actuals and updated 2024-2029 forecast;

(iii) the January 29, 2024 evidence update as noted in the accompanying cover letter;

(iv) any other material updates or corrections identified in interrogatory responses;

As noted in the January 29, 2024 cover letter, in advance of the Technical Conference, the utility also intends to update the value of the Performance Incentive Mechanism (PIM) in Exhibit 1B, as the PIM is a function of the utility's 2025-2029 total revenue requirement. In addition, Toronto Hydro will file the 2023 actual results related to performance measures identified in Exhibit 1B, Tab 3, Schedule 1 (Performance Outcomes Framework) and Schedule 3 (Historical Performance Results).

QUESTION (B):

b) In addition, please file an updated set of models that reflects the interrogatory responses. Please ensure the models used are the latest available models on the OEB's 2024 Electricity Distributor Rate Applications webpage.

RESPONSE (B):

The OEB models filed as part of this rate application and subsequent updates include a number of modifications made to reflect the utility's specific considerations. Updating these models to the latest version would require a significant effort, which would not provide commensurate value at this stage of the proceeding based on Toronto Hydro's understanding that there are have only been minor changes from the previous version that the utility used when the application was filed. Where applicable, Toronto Hydro proposes to update the models at the time of the Draft Rate Order.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1A-STAFF-2

Reference: Chapter 2 Filing Requirements, Page 3 (update for 2024 FRs)

QUESTION:

As required in the Chapter 2 Filing Requirements, please provide a summary of any updates or amendments to an OEB model to accommodate Toronto Hydro's circumstance, if applicable.

RESPONSE:

Please see Toronto Hydro's response to interrogatory 1A-Staff-1.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1A-CCC-1

Reference: Exhibit 1A

Please file all materials provided to Toronto Hydro's Board of Directors with respect to this Application, the underlying budgets and THESL's most recent Business Plan.

RESPONSE:

Please refer to the appendices to this response for the following materials:

- Appendix A – Toronto Hydro's 2023-2025 Business Plan
- Appendix B – Toronto Hydro's 2024-2026 Business Plan
- Appendix C – 2025 Rate Application Strategy & Update
- Appendix D – Customer Engagement & Rate Application Update

Please note that some parts of these documents have been redacted for confidentiality purposes. Also, certain information in these documents is subject to solicitor-client privilege, or is not relevant to answering the question above, and has been permanently redacted in both the public and confidential versions of these documents.

SUSTAINMENT

• OBJECTIVES

PLAN OBJECTIVES & HIGHLIGHTS

- Maintain **overall health demographics** of the asset population in 2025-2029
- Ensure investment pacing contributes to **stable long-term investment profiles** (2030+) for all assets
- Adhere to previous commitments for **safety and environmental compliance activities** (e.g. PCBs by 2025; Box Conversion by 2026)
- Maintain recent historical **system reliability.**
- **Optimize the pace of renewal investment** from year-to-year (cost control) using improved **risk-based** decision-making tools.

Outcome.	Goal	2025-2029 Status Quo Option	2025-2029 Business Plan	2025-2029 Enhanced Option

GROWTH

• OBJECTIVES

PLAN OBJECTIVES & HIGHLIGHTS

- **Connect customers** efficiently and with consideration for a likely increase in connections volumes due to electrification
- **Expand stations capacity** to alleviate future load constraints, with consideration for increased EV uptake, decarbonization drivers, and other growth factors (digitization and redevelopment).
- **Optimize near-term system capacity** through load transfers, bus balancing, cable upgrades and the targeted use of non-wires alternatives such as demand response and energy efficiency.
- Alleviate constraints on restricted feeders to accommodate **increasing DER connections.**
- Install **control and monitoring capabilities** for all generators > 50kW
- Accommodate relocations for committed **third-party developments**, including priority transit projects

Outcome	Goal	2025-2029 Status Quo Option	2025-2029 Business Plan	2025-2029 Enhanced Option

MODERNIZATION

• OBJECTIVES

PLAN OBJECTIVES & HIGHLIGHTS

- Prioritize investments that will deliver demonstrable benefits to customers, especially enhancements that will **enhance value-for-money** in the long-term (i.e. efficiency)
- **Improve system reliability** through enhanced fault management, leveraging automation and advanced metering (AMI2.0)
- Enhance **system observability** across the system, enabling better asset management and operational decision making
- Leverage technology to **improve customer experience** (e.q. reliability, power quality, customer tools, DER integration)
- Enhance **resiliency** and **security** of the system through advanced grids, targeted undergrounding of critical overhead assets, and enhancements to distribution schemes for critical loads downtown.

Outcome	Goal	2025-2029 Status Quo Option	2025-2029 Business Plan	2025-2029 Enhanced Option

GENERAL PLANT

• OBJECTIVES

PLAN OBJECTIVES & HIGHLIGHTS

Fleet & Facilities:

- Implement **Toronto Hydro's NZ40** strategy:
  - Achieve 80% buildings emissions reductions by 2040
  - Expand fleet electric vehicle charging infrastructure and electrify 40% of fleet by 2029
- Improve **stations site conditions and physical security** to meet legislative requirements (OBC, OHSA, CSF, etc.)
- Replace **critical** facilities assets in **poor** condition

IT/OT:

- Support Utility of the Future objectives re Grid Modernization, Process Automation & Customer Experience objectives
- **Minimize reliability and cybersecurity risks**
- Ensure IT **infrastructure is available and reliable** with minimal service disruption

Outcome	Goal	2025-2029 Status Quo Option	2025-2029 Business Plan	2025-2029 Enhanced Option

BUSINESS PLAN
ASSUMPTIONS

The 2023-2025 Business Plan incorporates the following:

- Alignment to the 10-year Utility of the Future strategy and strategic priorities including Climate Action;
- 2020-2024 CIR decision and inclusion of new emerging issues (e.g.: increase in customer connections and incremental inflationary costs);
- 2025 aligned to 2025-2029 rate application strategy;
- Long-term economic impact resulting from COVID-19;

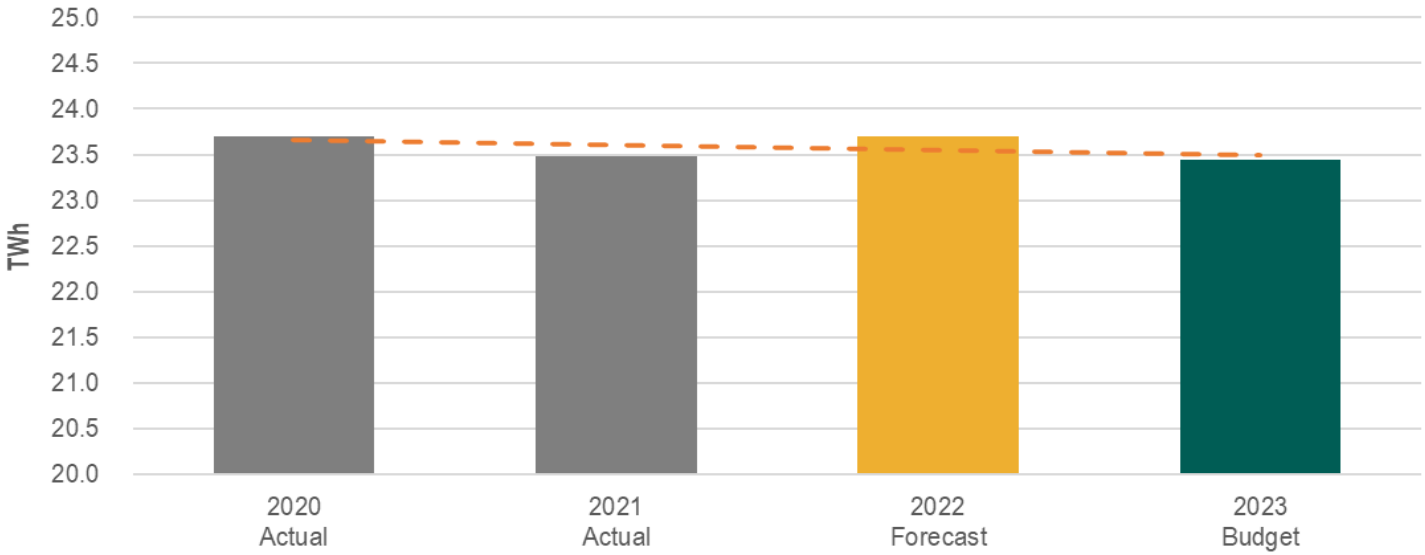
REVENUES



In millions of Canadian dollars	2021 Actual	2022 Budget	2022 Forecast	2023 Budget	Variance
Distribution Revenue	759	750	750	827	77
Other Revenues	86	84	85	87	2
Total Revenues	**845**	**834**	**835**	**914**	**79**

- Higher Distribution Revenue due to the recovery of regulatory settlement variances, which are offset in net movement line, and increase in distribution rates in 2023 resulting from the 2020-2024 regulatory decision
- Increase in Other Revenues primarily due to higher late payment fees and customer demand work

PLANNING TIMELINE

Privileged & Confidential

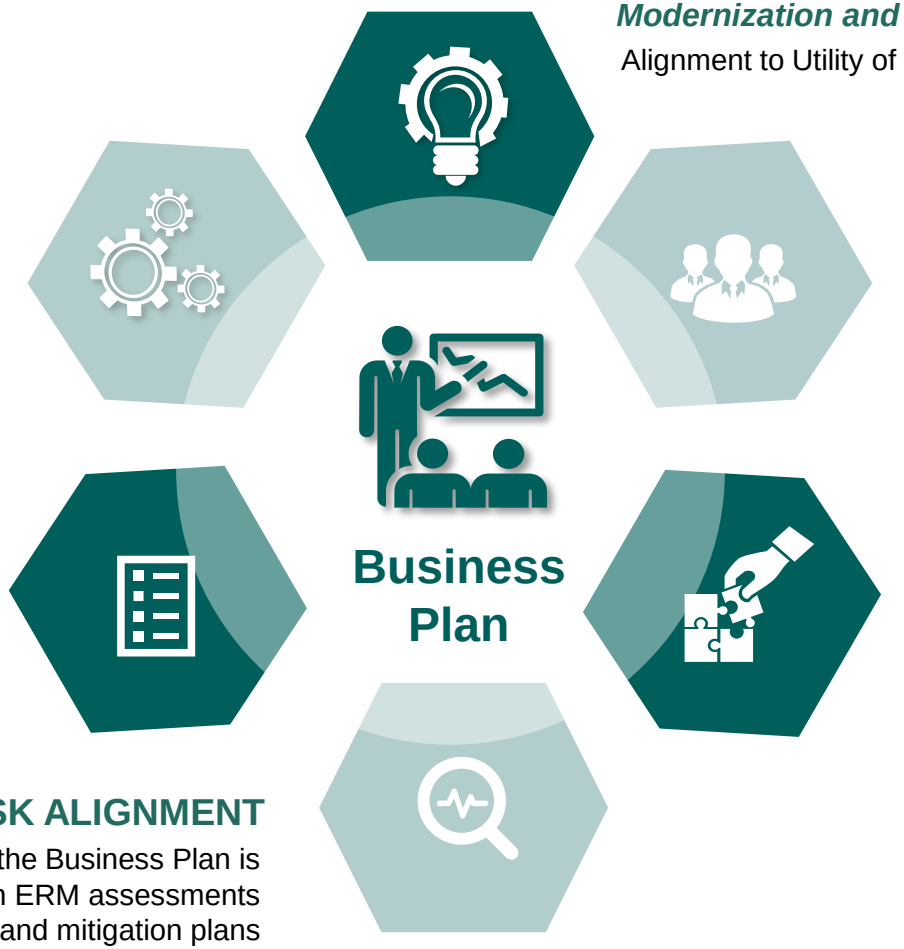
INTEGRATED BUSINESS PLAN



CORPORATE STRATEGY
Modernization and Electrification

Alignment to Utility of the Future and Climate Action

BUSINESS NEEDS
Identification of Capital Investment and Operational needs that underpin the Corporate Pillars

PEOPLE STRATEGY
Workforce of Tomorrow

Build a culture of safety, sustainment and innovation that propels TH into the future

COMPLIANCE REVIEW
Consideration of compliance requirements and related mitigating actions

REGULATORY ALIGNMENT
- 2024: Alignment to 2020-2024 OEB decision and inclusion of new emerging issues (e.g.: customer connections, inflation)
- 2025-2026: Alignment to 2025-2029 rate application strategy

RISK ALIGNMENT
Ensure the Business Plan is grounded in ERM assessments and mitigation plans

Privileged & Confidential

BUSINESS PLAN
ASSUMPTIONS

The 2024-2026 Business Plan incorporates the following:

- Alignment to the 10-year Utility of the Future strategy and strategic priorities including Climate Action;
- 2020-2024 CIR decision and inclusion of new emerging issues (e.g. increase in customer connections, inflationary costs, ramp-up to support electrification);
- Regulated Operations Plan aligned to 2025-2029 rate application strategy and strategic parameters approved by the Board;

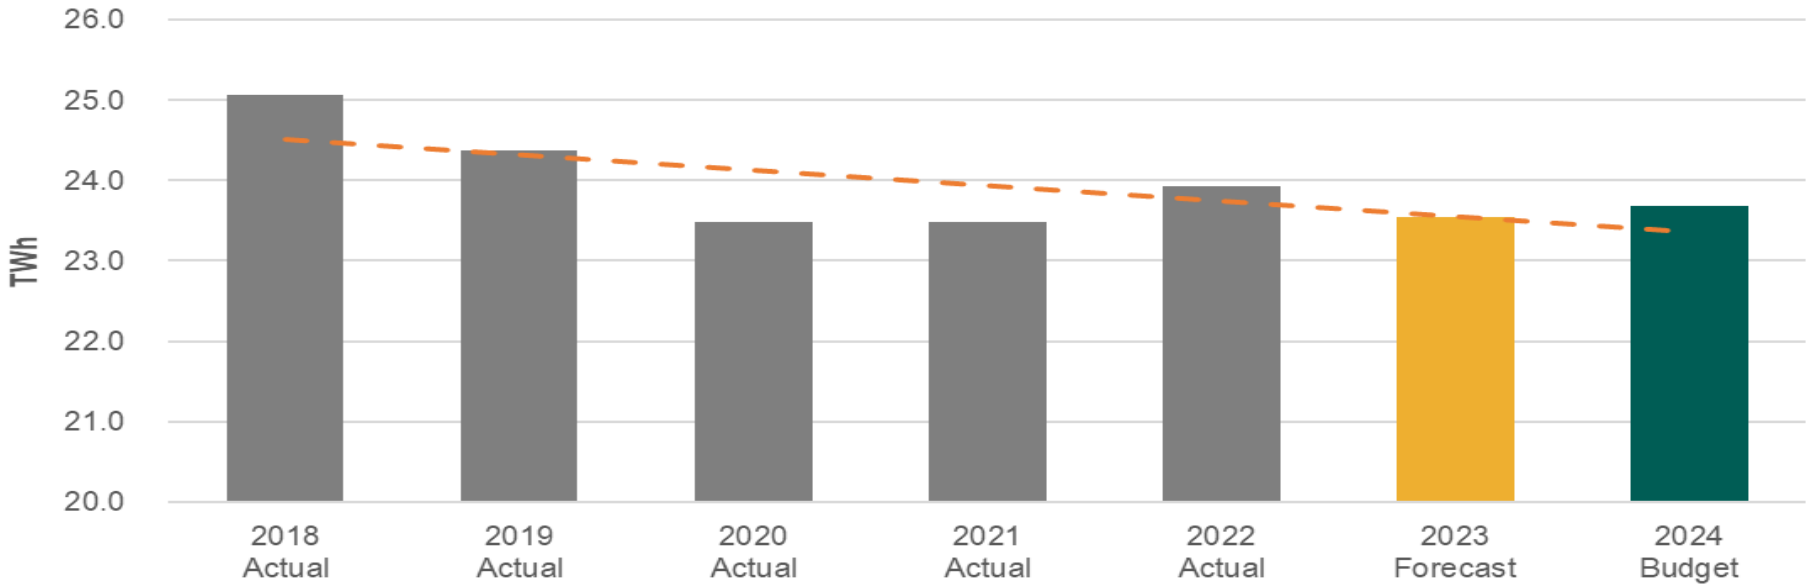
REVENUES



In millions of Canadian dollars	2022 Actual	2023 Budget	2023 Forecast	2024 Budget	Variance
Distribution Revenue	754	827	833	931	98
Other Revenues	93	87	86	87	1
Total Revenues	**847**	**914**	**919**	**1,018**	**99**

- Higher Distribution Revenue due to the recovery of regulatory settlement variances, which are offset in net movement line, and increase in distribution rates in 2024 resulting from the 2020-2024 regulatory decision
- Increase in Other Revenues primarily due to higher capital contributions

Privileged & Confidential

LOAD FORECAST

	2022 Actual	2023 Budget	2023 Forecast	2024 Budget
Load (TWh)[1]	23.9	23.4	23.5	23.7
Year over Year % Change	1.9%	(0.2%)	(1.6%)	0.6%

- Loads over the 2018-2022 period exhibit an overall declining trend as customer growth is offset by declining average use per customer primarily driven by conservation activities

[1] Wholesale Purchase Load

GRID & OPERATIONS PLANS

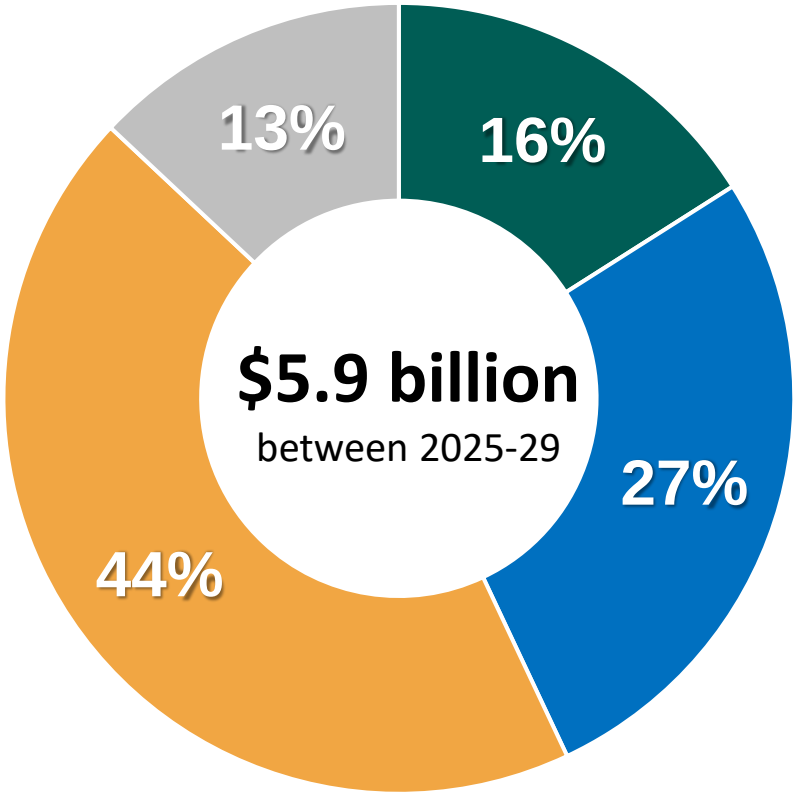
KEY INVESTMENT CATEGORIES



General Plant

Investments in vehicles, work centers and IT to keep the business running and reduce Toronto Hydro's emissions.

Modernization

Investments in technology to get more use out of existing equipment, and build a smarter, more efficient and reliable grid.

Sustainment & System Stewardship

Investments to upkeep old equipment that is in poor condition and replace outdated equipment.

City Growth & Electrification

Investments in capacity to power the growing city and serve customers' growing and changing needs for electricity.

CUSTOM RATE FRAMEWORK

Element	2025-2029 Custom IR Application
Custom Revenue Cap Index (CRCI)	Prior Year Revenue escalated by *Inflation (I-factor) - Incentive (X-factor) + Revenue Growth Factor*
Revenue Growth Factor	Escalates revenue annually to increase Toronto Hydro's financial capacity to invest in capital and operations programs over the outer years of the rate period (i.e. 2026-29)
Inflation (I-Factor)	OEB methodology with a custom index for labour (*Conference Board of Canada Toronto Salary and Wages Index*)
Incentive (X-Factor)	Provides upfront benefits to customers (rate reduction) and the utility an opportunity to earn an incentive by achieving outcomes tied to metrics and targets on the 2025-2029 custom scorecard.
New Deferral and Variance Accounts	Growth Variance Account (*reconciles cost and revenue variances related to changes in demand*); Locates Variance Account (*reconciles cost variances related to Bill 93*)

APPENDIX

STRATEGIC PARAMETER: CAPITAL PROGRAM (CAPEX)

Note: the slides that follow are taken from the draft plan that underpinned the Customer Engagement survey.

SUSTAINMENT OBJECTIVES

PLAN OBJECTIVES & HIGHLIGHTS

- Maintain **overall health demographics** of the asset population in 2025-2029
- Ensure investment pacing contributes to **stable long-term investment profiles** (2030+) for all assets
- Adhere to previous commitments for **safety and environmental compliance activities** (e.g. PCBs by 2025; Box Conversion by 2026)
- Maintain recent historical **system reliability.**
- **Optimize the pace of renewal investment** from year-to-year (cost control) using improved **risk-based** decision-making tools.

Outcome.	Goal	2025-2029 Status Quo Option	2025-2029 Draft Plan	2025-2029 Enhanced Option

GROWTH OBJECTIVES

PLAN OBJECTIVES & HIGHLIGHTS

- **Connect customers** efficiently and with consideration for a likely increase in connections volumes due to electrification
- **Expand stations capacity** to alleviate future load constraints, with consideration for increased EV uptake, decarbonization drivers, and other growth factors (digitization and redevelopment).
- **Optimize near-term system capacity** through load transfers, bus balancing, cable upgrades and the targeted use of non-wires alternatives such as demand response and energy efficiency.
- Alleviate constraints on restricted feeders to accommodate **increasing DER connections.**
- Install **control and monitoring capabilities** for all generators > 50kW
- Accommodate relocations for committed **third-party developments**, including priority transit projects

Outcome	Goal	2025-2029 Status Quo Option	2025-2029 Draft Plan	2025-2029 Enhanced Option

MODERNIZATION
OBJECTIVES

PLAN OBJECTIVES & HIGHLIGHTS

- Prioritize investments that will deliver demonstrable benefits to customers, especially enhancements that will **enhance value-for-money** in the long-term (i.e. efficiency)
- **Improve system reliability** through enhanced fault management, leveraging automation and advanced metering (AMI2.0)
- Enhance **system observability** across the system, enabling better asset management and operational decision making
- Leverage technology to **improve customer experience** (e.q. reliability, power quality, customer tools, DER integration)
- Enhance **resiliency** and **security** of the system through advanced grids, targeted undergrounding of critical overhead assets, and enhancements to distribution schemes for critical loads downtown.

Outcome	Goal	2025-2029 Status Quo Option	2025-2029 Draft Plan	2025-2029 Enhanced Option

GENERAL PLANT OBJECTIVES

PLAN OBJECTIVES & HIGHLIGHTS

Fleet & Facilities:

- Implement **Toronto Hydro's NZ40** strategy:
  - Achieve 80% buildings emissions reductions by 2040
  - Expand fleet electric vehicle charging infrastructure and electrify 40% of fleet by 2029
- Improve **stations site conditions and physical security** to meet legislative requirements (OBC, OHSA, CSF, etc.)
- Replace **critical** facilities assets in **poor** condition

IT/OT:

- Support Utility of the Future objectives re Grid Modernization, Process Automation & Customer Experience objectives
- **Minimize reliability and cybersecurity risks**
- Ensure IT **infrastructure is available and reliable** with minimal service disruption

Outcome	Goal	2025-2029 Status Quo Option	2025-2029 Draft Plan	2025-2029 Enhanced Option

2025-2029 INVESTMENT PLAN

ENGAGEMENT PROCESS

1. Identify Customer Needs and Priorities

In 2021 and 2022, Toronto Hydro asked many types of customers from across the city about their priorities for electricity distribution service.

2. Use Customer Feedback to Guide Development of Plan

Toronto Hydro planners were given summaries of key findings from the initial customer engagement to consider as they began building their plans.

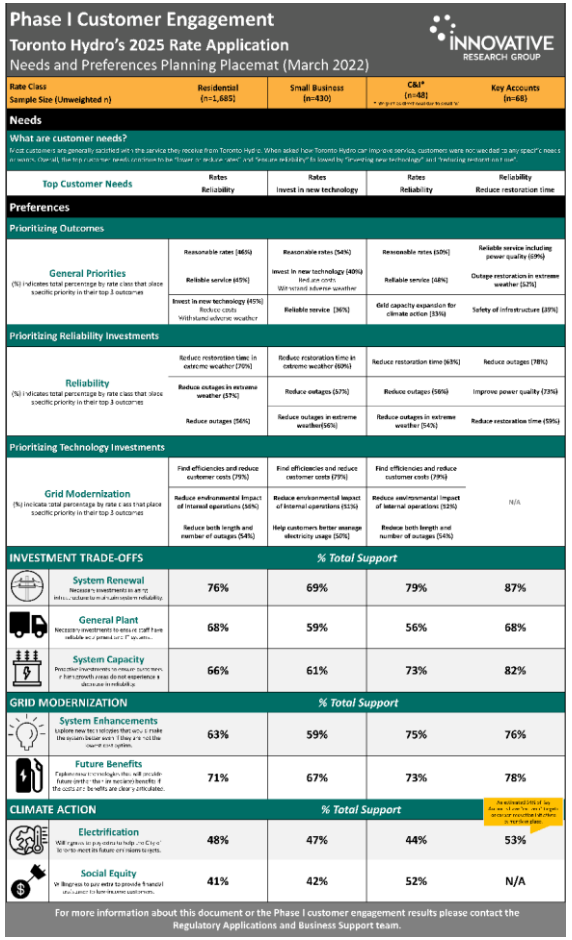
3. Collect Customer Feedback on the Draft Plan

Toronto Hydro is returning to customers to get feedback on aspects of their preliminary forecasted plan and ask customers how it's plan could better meet their needs and preferences.

4. Re-Examine Plan

Make appropriate changes to the Plan based on customer feedback.

5. Submit the Plan to the Ontario Energy Board



File the Plan, this workbook, and a summary report with the OEB where it will be examined by the OEB, consumer advocates, and other independent parties in a public hearing.

2025-2029 INVESTMENT PLAN

PHASE 1 ENGAGEMENT: NEEDS & PRIORITIES

Outcome	Customer Feedback
Price & Reliability	Price and reliability are top priorities. Despite a continued emphasis on price, reliability is becoming more important to low-volume customers.
Modernization & Automation	Support for investments in new technology even if the benefits aren't immediate, as long as the benefits and costs are clear.

GRID & OPERATIONS PLANS

2025-2029 INVESTMENT DRIVERS

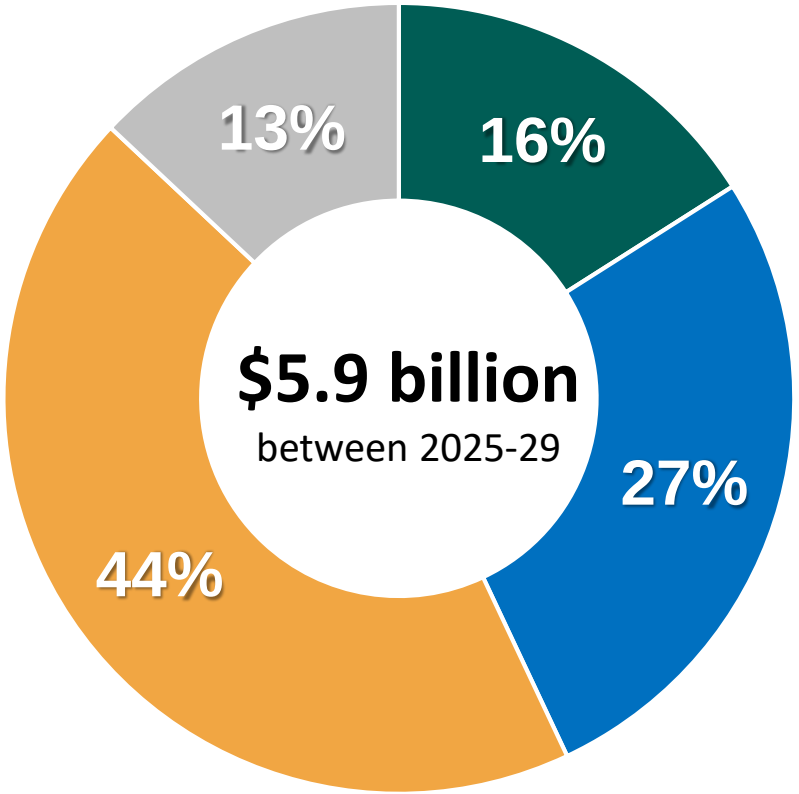
Customer Engagement – Phase 1 Needs and Priorities

Price & Reliability	New Technology	System Capacity
Top priorities. Despite a continued emphasis on price, reliability is becoming more important to low-volume customers.	*Support for investments in new technology that will make the system better and reduce costs even if the benefits aren't immediate*	*Support for investments in system capacity infrastructure to ensure customers in high growth areas do not experience a decrease in reliability.*

System Stewardship: Grid & Operational Performance	Modernization	City Growth & Electrification
Continue to deliver safe and reliable/resilient service	Adopt technology to modernize our grid and operations	Connect and serve growing demand

Privileged & Confidential

GRID & OPERATIONS PLANS
KEY INVESTMENT CATEGORIES



General Plant

Investments in vehicles, work centers and IT to keep the business running and reduce Toronto Hydro's emissions.

Modernization

Investments in technology to get more use out of existing equipment, and build a smarter, more efficient and reliable grid.

Sustainment & System Stewardship

Investments to upkeep old equipment that is in poor condition and replace outdated equipment.

City Growth & Electrification

Investments in capacity to power the growing city and serve customers' growing and changing needs for electricity.

CUSTOM RATE FRAMEWORK

Element	2025-2029 Custom IR Application
Custom Revenue Cap Index (CRCI)	Prior Year Revenue escalated by *Inflation (I-factor) - Incentive (X-factor) + Revenue Growth Factor (RGF)*
Revenue Growth Factor (RGF)	Escalates revenue annually to enable Toronto Hydro to deliver its capital and operations programs over the outer years of the rate period (i.e. 2026-29)
Inflation (I-Factor)	Based on standard OEB methodology with a custom Toronto-specific index for labour to reflect the cost pressures of attracting and retaining talent in a competitive urban environment.
Incentive (X-Factor)	Provides upfront benefits to customers (rate reduction) and the utility an opportunity to earn an incentive by achieving outcomes tied to metrics and targets on the 2025-2029 custom scorecard.
New Deferral and Variance Accounts	Demand Related Variance Account (*reconciles cost and revenue variances related to changes in customer demand*); Locates Variance Account (*reconciles cost variances related to Bill 93*)

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1A-CCC-2

Reference: Exhibit 1A

QUESTION (A) - (C) :

a) Please provide a complete list of all external consultants/lawyers Toronto engaged to assist it in the development of the Application and pre-filed evidence;

b) For each engagement please provide the nature of the work and the retainer and terms of reference;

c) Please provide the budgeted cost for the work for each engagement and the costs incurred to date. Please indicate how the costs are to be recovered;

RESPONSE (A) - (C):

The table below includes a list of all the consultants Toronto Hydro engaged to prepare expert evidence for this rate application, the costs incurred to date (as of year-end 2023), and notes whether the expert was engaged pursuant to an RFP. The total expected costs of the consultants depends on the work required by these third parties to answer interrogatories, and the extent to which the OEB and intervenors seek to have these third parties attend the hearing and be involved with other procedural steps in this application. With the exception of certain studies undertaken in the normal course of business, the cost of this work is managed through the consulting budget in Appendix 2-M and is to be recovered through the Regulatory Affairs segment of the Public, Legal and Regulatory Affairs program at Exhibit 4, Tab 1, Schedule 18. The budgeted costs for legal expenses are also set out in Appendix 2-M. Please refer to 1B-SEC-11 for retainers for external service providers engaged to prepare expert evidence.

Expert	Nature of Work /Evidence Reference	Evidence Reference	RFP	Actual Costs Incurred to Date (2023)
Innovative Research Group	Customer Engagement Study	Exhibit 1B, Tab 5, Schedule 1, App A	Yes	$760,661
Clearspring Energy Advisors	Total Cost and Reliability Benchmarking	Exhibit 1B, Tab 3, Schedule 3, App A	Yes	$588,536
	Load Forecast EV & DER Integration	Exhibit 3, Tab 1, Schedule 1, Appendix J	Yes	
UMS Group Inc.	Unit Cost Benchmarking	Exhibit 1B, Tab 3, Schedule 3, App C	No	$276,300
Scott Madden Associates	Rate Framework Review	Exhibit 1B, Tab 2, Schedule 1, Appendix A	Yes	$97,780 (USD)
Guidehouse	Lead/Lag Study	Exhibit 2A, Tab 3, Schedule 2	No	$92,000
Concentric Advisors	Financial Useful Lives	Exhibit 2A, Tab 2, Schedule 1, Appendix D	Yes	$225,857
EA Technology	Asset Condition Assessment (ACA) Review	Exhibit 2B, Section D4, Appendix C	No	$53,500 (USD)
Element Energy	Future Energy Scenarios	Exhibit 2B, Section D4, App B	Yes	$125,000[1]
Gartner Consulting	IT Cost & Maturity Benchmarking	Exhibit 2B, Section D8, App A	No	$137,500
Stantec	Climate Change Vulnerability	Exhibit 2B, Section D2, App A	Yes	$29,374
Mercer Canada	Compensation Benchmarking	Exhibit 4, Tab 4, Schedule 5	Yes	$79,999.75

QUESTION (D) :

Please explain, in detail, how Toronto Hydro determined which areas of the Application should be reviewed and validated by external experts;

[1] Toronto Hydro notes that the cost noted here is only for the preparation of the report. For details on the model development and implementation costs, please see Exhibit 2B-Staff-156.

RESPONSE (D):

Toronto Hydro used experience and professional judgment to determine which areas of the application would benefit from review and/or validation from external consultants. Factors included: guidance provided by the OEB in the RRF, the Handbook for Utility Rate Applications and the Filing Requirements; what may be helpful to the OEB in understanding and assessing Toronto Hydro's application; and precedent from prior proceedings. In addition, some studies were undertaken in the normal course of business and not for rate application business such as the Climate Change Vulnerability Assessment.

QUESTION (E) :

Did Toronto Hydro develop an overall budget for this external work. If so, please indicate what that budget was and how it was developed. If not, why not?

RESPONSE (E):

The current budget for this work is included in the updated Appendix 2-M (found at Appendix A to the response to Interrogatory 4-SEC-110). Please note that not all of the third-party studies and reports noted above formed part of this budget; some studies (e.g. Mercer Non-Executive Compensation and Benefits Review and Stantec Climate Change Vulnerability) were done within the normal course of business and are not reflected in the budget.

QUESTION (F) :

Please indicate whether each piece of work was subject to an RFP process. In those cases where there was no RFP please explain why.

RESPONSE (F):

Please refer to the table in the response to Part (a) – (c) above for a summary of which consultants were retained through an RFP Process. In respect of the consultants that were not:

- UMS Group Inc. was engaged due to its depth of experience and understanding of Ontario's regulated electricity sector, and its previous experience working with Toronto Hydro and other large Ontario distributors on unit cost benchmarking.
- Gartner Canada Inc. was engaged due to its previous experience working with Toronto Hydro on IT benchmarking and because the firm offers access to the world's largest data set for organizational IT spending and staffing.
- Guidehouse was engaged due to its depth of experience and understanding of Ontario's regulated electricity sector, and its previous experience performing lead-lag studies for Toronto Hydro in the 2015 and 2020 custom rate applications.
- EA Tech is the industry leader in Asset Condition Assessment (ACA) and has been supporting Distribution Network Operators in UK develop and implement a Common Network Asset Indices Methodology (CNAIM), which Toronto Hydro adopted and continues to implement. EA Tech was engaged due to its previous experience with Toronto Hydro's adoption of CNAIM, and due to their knowledge and expertise in this field.

QUESTION (G):

Did Toronto Hydro retain any external consultants and lawyers to undertake work related to the Application that has not been included with the Application and pre-filed evidence?

RESPONSE (G):

Anything not included in the Application and pre-filed evidence before the OEB does not form the basis of Toronto Hydro's proposal, is irrelevant and provides no probative value.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1A-CCC-3

Reference: Exhibit 1A

QUESTION:

Please provide all documents provided to employees related to the development of the Business Plan and budgets that form part of this Application.

RESPONSE:

Toronto Hydro respectfully declines to provide disclosure of the requested information on the basis that this information is irrelevant and provides no probative value to the OEB in deciding the issues in this proceeding. The information sought is contained throughout the evidence. The strategic direction adopted and provided in preparing the 2025-2029 capital and operational investment plans presented in this application is contained within the integrated business planning sections of Exhibit 2B, Section E2 at page 5 and Exhibit 4, Tab 1, Schedule 1 at page 24. Please also see Toronto Hydro's responses to: (i) 2B-SEC-32 for a chronology of the integrated planning process, (ii) 2B-SEC-33 for a description of the budget and price limits that the utility adopted to guide the planning process; and (iii) 4-CCC-58 for a description of the workforce planning aspects of the process.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1A-CCC-4

Reference: Exhibit 1A

QUESTION:

Please provide Toronto Hydro's most recent Business Plan. Please provide all Business Plans produced during the period 2020-2023.

RESPONSE:

The business plan that underpins this application is filed in the response to 1A-CCC-1. Toronto Hydro declines to provide the historical business plans (i.e. 2020-2022) as they are irrelevant and provide limited to no probative value in deciding the issues in this proceeding.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1A-CCC-5

References: Exhibit 1A, Tab 3, Schedule 1, Pages 4-7

Preamble:

"Toronto Hydro indicated that intervenors are asking the OEB panel to either make changes to generic policy through a particular utility's rate application or to fetter the discretion of a future panel. Toronto Hydro also submitted that its proposed ratemaking formula is structurally the same as the one approved in its 2015-2019 Custom IR proceeding. The OEB notes that the Custom IR approach taken has required extensive evidence and time to consider the details provided. Toronto Hydro is encouraged to consider an alternative approach in the future that might be more efficient in establishing the revenue requirement for the base year and following years as well as meeting OEB RRF objectives, and improving the balance of risk between customers and the utility. Toronto Hydro should not assume that future panels will continue to accept Toronto Hydro's current proposed Custom IR Framework."

QUESTION (A) AND (B):

a) Toronto Hydro sets out OEB directions specified in the 2020-2024 Decision. Does Toronto Hydro not consider the above a Direction from the OEB in the 20202-2024 Decision? If not, why not?

b) Please explain how its proposed plan is more efficient in establishing the revenue requirement for the base year and following years as well as meeting OEB RRF objectives and improving the balance of risk between customers and the utility.

RESPONSE (A) AND (B):

Please see Toronto Hydro's response to interrogatory 1B-SEC-10.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1A-CCC-6

References: Exhibit 1A, Tab 3, Schedule 1, Page 8

Exhibit 2B, Section E5.1

QUESTION:

Toronto Hydro proposes to increase its basic connection allowance for certain customer classes from $1396 to $3059. Please explain to what extent Toronto Hydro undertook customer engagement with respect to this change.

RESPONSE:

The basic connection allowance was not specifically identified in the customer engagement process. The proposal to increase the basic allowance, however, is consistent with customer priorities described in the Customer Engagement Report (Exhibit 1B, Tab 5, Schedule 1, Appendix A), including: ensuring reliable electrical service (e.g. updating the basic connection to current standards), and enabling customers to access electricity services (e.g. making new service connection more affordable). lease see Exhibit 2B, Section E5.1, page 20 for further details.

As per OEB's Distribution System Code ("DSC"), Section 2.4.8, Toronto Hydro will provide public notice of any approved change to the basic connection allowance as part of the implementation of the revision to Toronto Hydro's Conditions of Service.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1A-CCC-7

References: Exhibit 1A, Tab 3, Schedule 1, Appendix A

Toronto Hydro has set out in Appendix A summaries of the revisions to its Conditions of Service since its last rebasing.

QUESTION (A):

a) Please identify which of those changes apply to residential customers;

RESPONSE (A):

Table 1 below highlights changes that apply to residential customers:

Table 1 – Summary of Changes to Conditions of Service Applicable to Residential Customers

Rev.#	Effective Date	Section #	Section Title	Summary of Change/Rationale
Rev. 19	Jan 1, 2020	1.8	Disputes	Revised the website address that refers to the Dispute Resolution process, which is on Toronto Hydro's website.
		2.2	Disconnection	Added a statement that a customer must pay any outstanding arrears prior to the removal of Toronto Hydro equipment.

Rev.#	Effective Date	Section #	Section Title	Summary of Change/Rationale
		2.2.1	Disconnection and Reconnection – Process and Charges	Revised statements: - from "… a disconnect notice has been delivered to the Customer" to "… a disconnect notice has been received by the Customer", - from "… on the third business day after mailing." to "… on the third business day after the date on which the notice was printed.", and - customer must remedy the condition within "seven calendar days" to "a reasonable period". Added a statement not to disconnect an occupied residential property for non-payment during a Disconnection Ban Period.
		2.4.3	Deposits	Added a statement that a security deposit for a residential account may be waived where the customer enrolls in an equal monthly payment, provided that a deposit may otherwise be required as per the Distribution System Code.
		2.4.5	Payments and Overdue Account Interest Charges	Revised statements: - the interest rate used to determine any late payment charges, and - from "Pre-Authorized Payments" to "Pre-Authorized Debits". Added a statement that bills are to be paid in full within 20 days of the statement date.

Rev.#	Effective Date	Section #	Section Title	Summary of Change/Rationale
Rev. 19.1	Mar 1, 2020	2.2.1	Disconnection and Reconnection – Process and Charges	Revised statements: - the minimum payment period was amended as 14 calendar days from the date on which the disconnection notice is received before a customer can be disconnected for non-payment, and - where a disconnection notice was sent by mail, the period is to be revised to the fifth calendar day after the date on which the notice was printed. Added statements: - before issuing a disconnection notice for non-payment, an account overdue notice shall be delivered to the customer, and - the customer responsible for a disconnection may be charged for reconnection costs and reasonable costs for repairs of the distributor's physical assets attached to the property in reconnecting the property.
		2.4.3	Deposits	Revised statements: - the calculation method in determining the amount of an account security deposit, and - the minimum time period from "5 years" to "3 years" for good payment history for non-residential customers that have a demand less than 50 kW.

Rev.#	Effective Date	Section #	Section Title	Summary of Change/Rationale
		2.4.5	Payments and Overdue Account Interest Charges	Revised statements: - payment plans are available to customers, such that equal monthly payment plans are to be offered to residential customers and to general service less than 50 kW customers, and the equal monthly payment plans may not be offered under specified conditions, and - bills are to be paid in full within 24 days of the statement date.
Rev. 20	Jan 1, 2021	2.1.5	Relocation of Plant	Revised to reflect the OEB's new relocation cost recovery standard.
		2.2.1	Disconnection & reconnection	Revised to better align with the new Distribution System Code (DSC) disconnection and reconnection amendment.
		2.3.4.2	Supply Voltage	Revised to reflect the equivalent service sizes of the demand loads offered to Customers when supplied from secondary street circuits on road allowance.
		2.3.7.1	Metering - General	Added conditions in the section to give Toronto Hydro the right to operate on Customer-Owned switches when conducting meter work, and Toronto Hydro is not be liable for any damages or losses sustained resulting from inadequate maintenance of Customer-Owned equipment and infrastructure.
		2.4.3	Deposits	Revised the wording in the Conditions of Service to better align with the Distribution System Code (DSC) and clarify the time period over which a good payment history must be on file for waiving of new or increased deposit amounts.

Rev.#	Effective Date	Section #	Section Title	Summary of Change/Rationale
Rev. 21	Jan 1, 2022	2.2.1	Disconnection & Reconnection	Expanded the wording in the Disconnection & Reconnection – Process and Charges section to describe in greater detail the disconnection process that Toronto Hydro follows in accordance with the applicable regulatory requirements.
		2.3.4.2	Supply Voltage	Modified section 2.3.4.2 Supply Voltage to provide more detail with respect to available supply voltages.
		2.3.4.3	Supply Offerings	Introduced a new section entitled “Supply Offerings” to provide more detail regarding Toronto Hydro’s supply offering in the public road allowance and transformer offerings on private property.
		2.3.4.4	Number of Connections to Toronto Hydro Distribution System	Renumbered and renamed former section 2.3.4.3 to 2.3.4.4 “Number of Connections to Toronto Hydro’s Distribution System” and modified the revision to clarify Toronto Hydro’s policy with customer requests for diversity of supply.
		2.4.3	Deposits	For the purpose of satisfactory credit checks, revised the acceptable Equifax Credit commercial scores for Business customers to align with Equifax scoring for commercial customers. • Revised the wording to further clarify the requirements for a security deposit to be returned to the Customer or Consumer within six weeks of closure of Customer or Consumer’s account and when a Consumer or Customer moves from Standard Supply Service (“SSS”) to a competitive retailer where the retailer is performing the billing function (retailer consolidated billing), for all account types.

Rev.#	Effective Date	Section #	Section Title	Summary of Change/Rationale
		Tables 1 &2	Civil Ownership Demarcation Point	Merged Tables 1.1, 1.2, 1.3, 1.4 and 1.5 as Table 1 for ease of reference. • Specified the ownership demarcation point for civil infrastructure between the Customer and Toronto Hydro based on the customer class and supply method.
Rev. 22	Jan 1, 2023	1.7.3	Tree and Vegetation Management	Clarified Toronto Hydro and Customer's responsibilities with respect to tree trimming and vegetation management on both public road allowance and private property.
		2.2.1	Disconnection and Reconnection	Expanded the wording in the Disconnection & Reconnection – Process and Charges section to reflect Toronto Hydro's new policy of providing eligible low-income customers (ELIC) one free disconnection and reconnection in a rolling 12-month period.
		2.4.4.1	Rate Reclassification	Added a new section outlining Toronto Hydro's rate reclassification policy
		2.4.5	Payments and Overdue Account Interest Changes	Revised the provision to clarify the application of non-sufficient fund fees.
		Ref 6	Metering Requirements 750 Volts of Less – Toronto Hydro meter locations	Clarified Toronto Hydro's meter locations requirements.
Rev.23	Jan 1, 2024	1.4	Amendments and Changes	Updated the method of notifying Customers about Conditions of Service and Rates changes from notice by newspaper to notice by Toronto Hydro's website and social media platforms, as needed.

Rev.#	Effective Date	Section #	Section Title	Summary of Change/Rationale
		1.6	Customer Rights	Expanded wording to clarify Customer's rights when making use of Green Button's "Connect My Data" and "Download My Data" to access and download their usage data.
		1.7.3	Tree and Vegetation Management	Expanded wording to clarify the need for Customers to hire authorized persons, such as utility arborists, to perform the tree trimming on private property for their own safety, the safety of the public, and the safety of the distribution system.
		2.1.5	Relocation of Toronto Hydro-Owned Assets	Expanded wording to clarify the requirements for Toronto Hydro's relocation of Toronto Hydro-owned assets.
		2.3.6	Emergency Backup Generation Facilities	Clarified Toronto Hydro's emergency backup generation facilities requirements.

QUESTION (B):

b) For those that have changed please explain the rationale for the changes;

RESPONSE (B):

Please see response to part (a) of this interrogatory.

QUESTION (C):

c) Please explain the extent to which Toronto Hydro engaged its customers regarding those changes;

RESPONSE (C):

Per Distribution System Code 2.4.8, Toronto Hydro provided advanced public notice for a minimum period of 30 calendar days (typically from the end of October to mid-December, dependent on

customer billing dates) for any changes to its Conditions of Service. Public notice was communicated through bill inserts, the Toronto Hydro website, and social media. During this period, customers are provided the opportunity to ask questions and provide feedback, which is addressed prior to the Conditions of Service being published.

QUESTION (D):

d) Please explain the extent to which Toronto Hydro has communicated those changes to its customers.

RESPONSE (D):

Please see response to part (c) of this interrogatory.

QUESTION (E):

e) What relief in Toronto Hydro seeking with respect to its Conditions of Service through this Application?

RESPONSE (E):

Toronto Hydro does not seek relief with updates to the Conditions of Service. The Conditions of Service are updated to improve accuracy, clarity and to ensure alignment with applicable laws, codes, and regulations.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1A-PP-1

References: Exhibit 1A, Tab 3, Schedule 1, Page 3

Preamble: THESL indicates that relative to the previous plan, this rate plan "Enhanced the capacity planning process consider electrification drivers and municipal energy plans in producing the system peak load forecast that underpins the 2025-2029 Investment Plan."

QUESTION (A):

a) Please describe what THESL has already completed (if anything) to enhance the capacity planning process to consider electrification drivers and municipal energy plans in producing the system peak load forecast that underpins the 2025-2029 Investment Plan.

RESPONSE (A):

Please refer to Exhibit 2B, Section D4 for a detailed description of the enhancements made to Toronto Hydro's capacity planning process to consider electrification drivers and the Municipal Energy Plans.

QUESTION (B):

b) Please explain why efforts over the current (2020-2024) rate term (and in preparation for this application) were not a sufficient foundation to prepare the Investment Plan, requiring incremental focus in the new rate period (2025-2029).

RESPONSE (B):

The statement that Toronto Hydro has not laid a sufficient foundation to prepare for the investment plan is incorrect. In preparation for the 2025-2029 rate application, it became necessary to focus on specific aspects of electrification. For additional details on electrification drivers, please see Exhibit 2B Section D4 "Capacity Planning, Growth & Electrification" pp. 1-2, and

Section D4.1.1 "System Peak Demand Forecast" pp.2-6. For additional details on system needs, please see Exhibit 2B, Section E7.4, Stations Expansion, which discusses needs beyond the 2025-2029 period requiring early action, consideration of short circuit capacity constraints, and alignment with recommendations from Regional Planning.

QUESTION (C):

c) The Investment Plan (and Distribution System Plan) underpin the THESL application for the 2025-2029 term. Please explain how the OEB can approve the application and related budgets at this time if there is incremental information that is not available at this point supporting investments that will be made over the 2025-2029 period?

RESPONSE (C):

Please refer to the evidence in Exhibit 1B, Tab 2, Schedule 1 starting on page 36 for an explanation of (i) the uncertainty factors that Toronto Hydro faces with respect to demand-related expenditures and revenues and (ii) the regulatory mechanism – known as the Demand Relative Variance Account, that Toronto Hydro proposes to manage these uncertainties in the next rate period and protect customers and the utility's ability to deliver the 2025-2029 Investment Plan objectives.

QUESTION (D):

d) Has THESL included opportunities to share (or leverage) investments from other stakeholders (including building owners, City of Toronto, industrial sites, etc.) on Distributed Energy Resources over the 2025-2029 Rate term. If no, please explain why not. If yes, please provide a summary, the process used and what results (cost avoidance and kW/kWh) are forecasted to be achieved.

RESPONSE (D):

Toronto Hydro has not entered into new DER ownership arrangements with third-parties in this rate-period and has not proposed such arrangements for 2025-2029. Toronto Hydro is focused on procuring DER services if and when such services can provide system benefit that is quantifiable

and credible as part of its Local Demand Response investments (Exhibit 2B, Section E7.2). Should an opportunity be identified in the future where such an arrangement would be cost-effective as compared to a conventional distribution system solution, Toronto Hydro will investigate the opportunity.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1A-PP-2

Reference: Exhibit 1A, Tab 3, Schedule 1, Page 4

Preamble:

THESL indicates that it has "Enhanced the load forecast to consider electrification drivers and changes to the availability of conservation and demand management ("CDM") savings in producing the revenue forecast that underpins to 2025-2029 rates"

QUESTION (A):

a) Please provide what CDM results THESL will have achieved by end of the 2024 rate term against the total achievable CDM results and what potential remains, by sector if possible

RESPONSE (A):

Please refer to Exhibit 9, Tab 2, Schedule 3 and 9-Staff-354 which indicates CDM results THESL has achieved as part of LRAMVA by 2024.

QUESTION (B):

b) Please indicate what CDM results (total and incremental to those forecasted to the end of the current rate plan) are forecasted to be achieved by year of the 2025-2029 rate plan. Please indicate what portion of the total potential achievable CDM results that will represent.

RESPONSE (B):

The Province's CDM Framework for 2025-2029 is not yet finalized. Since 2019, the role for LDCs in CDM has reduced significantly relative to prior periods. Accordingly, in this Application, Toronto Hydro is not forecasting LDC-led savings as part of CDM Framework during the 2025-2029 period.

QUESTION (C):

c) Please explain why only CDM is included in the above noted item and not the broader scope of DER.

RESPONSE (C):

The reference to "electrification drivers" includes DERs. Toronto Hydro includes DER impacts in its load forecast. Please refer to Exhibit 3, Tab 1, Schedule 1, Appendix J for a description of the integration of DER impacts into the load forecast.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1A-PP-3

Reference: DER definition from National Standard Practice Manual – NESP (nationalenergyscreeningproject.org)

Distributed Energy Resources (DERs) are resources located on the distribution system that are generally sited close to or at customers' facilities. DERs include EE, DR, DG, DS, EVs, and increased electrification of buildings. DERs can either be on the host customer side of the utility interconnection point (i.e., behind the meter) or on the utility side (i.e., in front of the meter). DERs are mostly associated with the electricity system and can provide all or some of host and/or support the utility system by reducing demand and/or providing supply to meet energy, capacity, or ancillary services (time and locational) needs of the electric grid.

QUESTION (A) :

Please provide the definition of DER that THESL is using.

RESPONSE (A):

Toronto Hydro defines Distributed Energy Resource Requirements under Section 1.1 of the Toronto Hydro Conditions of Service Reference 3, revision #7 January 1, 2024. A distributed energy resource (DER) "is any source of electric power that is connected to the distribution grid of a Local Distribution Company (LDC) that distributes electrical power to Customers and Consumers. A DER operator shall be a Customer, Consumer or Supplier within the Toronto Hydro service area which is generating electricity for exporting power to the Toronto Hydro distribution grid or to displace their own load"[1].

[1] https://www.torontohydro.com/documents/d/guest/reference-3-distributed-energy-resource-requirements

QUESTION (B) :

Regulatory initiatives including the Future for Energy Innovation have leveraged the NSPM for DER best practice information and approach. Please indicate what variance (if any) there is between the NSPM definition for DERs, what THESL is using and the potential impact (e.g. are some categories of DER excluded).

RESPONSE (B):

Toronto Hydro's definition of DERs defined in a) above is consistent with the concept of distributed generation by NESP. Concepts like EV's are currently considered as a load and are excluded from the DER definition (although this can change as applications like vehicle-to-grid mature).

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1A-PP-4

Reference: Exhibit 1A, Tab 3, Schedule 1, Appendix A

"Customers having a non-coincident peak demand equal to or greater than 5 MW shall be charged their share of the capital contribution for a new or modified transmitter-owned connection facility."

QUESTION (A):

a) Please explain how the Capital Contribution Policy change would impacts customers (in whole or part) planning to install DERs that could benefit the system.

RESPONSE (A):

The changes to section 2.1.2.2 of Toronto Hydro's Conditions of Service identified in Revision #19 effective January 1, 2020 reflected the enactment of Distribution System Code ("DSC") sections 3.2.4A and 3.6.1 as the result of the EB-2016-0003 consultation. In Toronto Hydro's assessment, the relevant changes do not have any specific impact upon customers planning to install distributed energy resources ("DERs").

QUESTION (B):

b) Please explain if this Capital Contribution Policy change is applied broadly regardless of the whether a customer (in whole or part) is planning to include or add a DER that could benefit the system.

RESPONSE (B):

Toronto Hydro applies the DSC requirements which triggered the Revision #19 updates to the utility's Conditions of Service and capital contribution policy in accordance with the scope set out in those requirements. Toronto Hydro also notes that the DSC prescribes the application of Chapter 3

cost responsibility requirements to all generation facilities, including storage facilities, connecting to a distributor's distribution system.[1]

QUESTION (C):

c) Please explain how this Capital Contribution Policy change aligns with the approach being developed for the OEB BCA Framework.

RESPONSE (C):

As noted in subpart (a), the historical changes to Toronto Hydro's capital contribution policy and associated Conditions of Service provisions in Revision #19 shown in Exhibit 1A, Tab 3, Schedule 1, Appendix A were triggered by DSC amendments resulting from EB-2016-0003 in 2018 and 2019, which precede the OEB's Benefit-Cost Analysis ("BCA") Framework consultation launched on September 20, 2023 by several years. Toronto Hydro is monitoring the BCA Framework consultation for any outcome that may require the utility to make future changes to its policies.

QUESTION (D):

d) Please explain how (if at all) THESL policies and charges encourage customers to include DERs that could provide benefits to the system and how those will be managed during the 20205-2029 rate term to unlock those system benefits.

RESPONSE (D):

Please see the Exhibit 2B, Section E7.2.1 for a description of Toronto Hydro's Flexibility Services segment, including a proposal to procure up to 30 MW of demand response capacity and Toronto Hydro's Benefit Stacking Transmission and Distribution Pilot ("Benefit Stacking Pilot") at pages 12-13. The Benefit Stacking Pilot project explores how customer-owned DERs can provide services to

[1] Distribution System Code (August 2, 2023), s. 6.2.31.

both the distribution grid and transmission/bulk system using an efficient single pathway that works with existing market mechanisms.[2]

[2] The Benefit Stacking Pilot is supported by the IESO's Grid Innovation Fund and the OEB's Innovation Sandbox. Toronto Hydro has partnered with Power Advisory LLC and Toronto Metropolitan University's CUE for the project.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-03

References: Report of the Board, Renewed Regulatory Framework for Electricity, p. 11
Report of the Board, Handbook for Utility Rate Applications, p. 26

Preamble**:**

Reference 1 states the following:

"[Performance-based rate-setting] decouples the price (the distribution rate) that a distributor charges for its service from its cost. This is deliberate and is designed to incent the behaviours described by the Board in 2000. This approach provides the opportunity for distributors to earn, and potentially exceed, the allowed rate of return on equity. It is not necessary, nor would it be appropriate, for rate base to be re-calibrated annually."

Reference 2 states the following:

"If a five-year forecast is provided, it is to be used to inform the derivation of the custom index, not solely to set rates on the basis of multi-year cost of service."

QUESTION (A):

a) Please provide a table showing each element of THESL's revenue requirement resulting from its 2025-2029 investment and spending plans if its rates were established on a cost of service basis, as well as the total for each year.

RESPONSE (A):

Please see Exhibit 6, Tab 1, Schedules 2 – 7 at Tab 9 of the Revenue Requirement Work Form for the full details of the 2025-2029 Revenue Requirement. For ease of reference, a summary table is provided below in Table 1.

Table 1: 2025-2029 Revenue Requirement Related to the Proposed Investment Plan1

	2025	2026	2027	2028	2029
OM&A Expenses (A)	343.0	358.0	370.1	385.5	399.6
Amortization/Depreciation (B)	285.3	299.6	319.9	342.1	354.5
Deemed Interest Expense (C)	143.1	152.4	162.8	174.0	184.5
Return on Equity (D)	220.9	235.3	251.4	268.7	284.8
Payments in Lieu of Taxes (PILs) (E)	27.9	30.5	20.0	56.2	47.7
Service Revenue Requirement [F=SUM(A:E)]	1,020.3	1,075.8	1,124.2	1,226.5	1,271.1
Revenue Offsets (G)	- 47.9	- 48.9	- 49.8	- 50.8	- 51.8
Base Revenue Requirement (H=F-G)	972.4	1,027.0	1,074.4	1,175.7	1,219.2

QUESTION (B):

b) Please provide a table showing each element of THESL's revenue requirement from 2025-2029 as proposed in this application, prior to the application of a Performance Incentive Mechanism (PIM), stretch or productivity factor, as well as the total for each year.

RESPONSE (B):

Toronto Hydro notes that this question seeks the same information requested in question (a) above. As such, Toronto Hydro assumes that the question is asking for the Revenue Requirement after the application of the X-Factor composed of the PIM, the efficiency factor and productivity factor. To that end, Table 2 below show the revenue impact of the Custom Revenue Cap Index (CRCI) when it is applied to the base revenue requirement identified in the table above in part (a).

[1] Based on the pre-filed evidence as of November 17, 2023.

Table 2: 2025-2029 Revenue under the Custom Revenue Cap Index (CRCI)2

	2025	2026	2027	2028	2029	Total
Base Revenue Requirement (A)	**972.4**	**1,027.0**	**1,074.4**	**1,175.7**	**1,219.2**	**5,468.6**
Revenue collected in previous year (B)	n/a	972.4	1,019.6	1,059.1	1,151.0	n/a
X-Factor (PIM): 0.6% (C=B*0.6%)	n/a	- 5.8	- 6.1	- 6.4	- 6.9	n/a
X-Factor (Efficiency): 0.15% (D=B*0.15%)	n/a	- 1.5	- 1.5	- 1.6	- 1.7	n/a
Inflation (E=B*2.0%)	n/a	19.4	20.4	21.2	23.0	n/a
Incremental Revenue via the Revenue Growth Factor (F=B*RGF)	n/a	35.1	26.7	78.7	19.7	n/a
Funded Revenue in current year (G=Sum(B:F))	**972.4**	**1,019.6**	**1,059.1**	**1,151.0**	**1,185.1**	**5,387.1**
Revenue Deficiency (H=A-G)	n/a	7.3	15.3	24.7	34.2	81.5

QUESTION (C):

c) Please explain similarities and differences between the tables in a) and b) and THESL's proposed revenue requirements, by element, while demonstrating how the resulting revenue changes throughout the term accord with the OEB's policy expectations expressed at the references above.

RESPONSE (C):

Table 1 sets out the revenue that Toronto Hydro requires to fund the proposed 2025-2029 Investment Plan based on a cost-of-service review (i.e. the base revenue requirement in row H). This is the starting point for a PBR rate-setting mechanism as outlined on page 11 of the RRF: "*Going into PBR, distribution rates are set based on a cost-of-service review*."

In contrast, Table 2 shows the application of a custom index, which applies a performance and productivity based X-Factor to determine the utility's actual revenue to be collected through rates

[2] Based on the pre-filed evidence as of November 17, 2023.

over the rate term. The difference between the Base Revenue Requirement in Table 1, Row H and the Funded Revenue in Table 2, Row G is the utility's revenue deficiency (column H in Table 2) as a result of the application of the custom index. The total revenue deficiency over the rate period is approximately $81.5 million. This deficiency is further explained in Table 3 below.

Table 3 shows that the $81.5 million revenue deficiency resulting from Toronto Hydro's proposed custom index is made up of two components: (1) efficiency gains that the utility is expected to make consistent with the results of the Total Cost Benchmarking study filed in Exhibit 1B, Tab 3, Schedule 3, Appendix A (row D), and (2) a pro-active performance incentive factor that Toronto Hydro has proposed to balance risk between ratepayers and the utility (row E).

Table 3: 2025-2029 Revenue Deficiency under the Custom Revenue Cap Index (CRCI)

	$ Million	**2025**	**2026**	**2027**	**2028**	**2029**	**Total**
A	Revenue Requirement (Investment Plan)	972.4	1,027.0	1,074.4	1,175.7	1,219.2	5,468.6
B	Funded Revenue (CRCI)	972.4	1,019.6	1,059.1	1,151.0	1,185.1	5,387.1
C = B – A or D + E	Revenue Deficiency	n/a	- 7.3	- 15.3	- 24.7	- 34.2	- 81.5
D[3]	**X-Factor** : 0.15% Efficiency Component of Deficiency	n/a	- 1.5	- 3.1	- 5.0	- 6.9	- 16.4
E[1]	**X-Factor**: 0.6% Performance Component of Deficiency	n/a	- 5.8	- 12.2	- 19.7	- 27.3	- 65.1

[3] Note the annual adjustment yielded by the Efficiency and Performance components of the X-Factor shown in Table 2 at rows C and D, is a different figure than the revenue deficiency shown above in Table 3 at rows D and E. This is because Table 3 shows the *cumulative annual impact* of the Efficiency and Performance components of the X-Factor when comparing funded revenue under the custom index (CRCI) against Toronto Hydro's revenue requirement to fund the 2025-2029 Investment Plan proposed in this application.

QUESTION (D) :

d) Please discuss the extent to which Toronto Hydro's custom index is the result of anything other than a forecast of its annual costs supplemented by a PIM, stretch and productivity factor.

RESPONSE (D):

In accordance with the OEB's requirements and expectations set out in the RRF and the Rate Handbook, the custom index proposed by Toronto Hydro is informed by:[4] (1) the distributor's five-year cost and revenue forecasts which are supported by detailed historical and forecast evidence; (2) the OEB's inflation[5] and productivity analyses with proposed customization to reflect business challenges and conditions that the utility faces; and (3) extensive benchmarking evidence to assess the reasonableness of the distributor's forecasts.[6] This approach to developing a custom index has been relied on by the OEB in numerous Custom IR applications.[7]

The analysis above in part (c) demonstrates that the 2025-2029 custom index does not fund the entirety of the revenue requirement (i.e. costs) that the utility forecasts to deliver its 2025-2029 Investment Plan. As noted in response to 1B-Staff-12(a), there is a $469 million difference between Toronto Hydro's 2025-2029 revenue requirement and the revenue that the utility could collect under a standard Price Cap IR rate-setting approach – this is the difference that gives rise to the need for a multi-year custom rate-setting approach. The $81.5 million revenue deficiency imposed by the custom index (as described above) represents approximately 17.4% of this funding difference. In other words, under the custom index proposed by Toronto Hydro 17.4% of the incremental revenue required remains unfunded in rates, and is placed at risk subject to the achievement of efficiency and performance expectations associated with the proposed X-factor.

---

[4] Report of the Board, *Renewed Regulatory Framework for Electricity* (October 18, 2012) at page 17; *Handbook for Utility Rate Applications* (October 13, 2016), at page 28.
[5] Please see response to 1B-Staff-93
[6] Exhibit 1B, Tab 3, Schedule 3, at Section 4 (page 27).
[7] E.g. EB-2014-0116, EB-2017-0049, EB-2018-0165, and EB-2019-0261.

The X-Factor thus effectively decouples the price (the distribution rate) that a distributor charges for its services from the utility's actual costs (i.e. the revenue requirement), specifically to incent the behaviours that underpin the RRF: continuous improvement in efficiency and productivity (through the efficiency factor) and performance outcomes (through the incentive factor and PIM). The PIM earn-back proposal provides the utility the opportunity (*not guarantee*) to earn its OEB-approved rate of return on equity in accordance with the quoted statement in the RRF.[8]

Unlike a cost-of-service rate-setting approach where the utility comes in annually or every two years to recalibrate its rate base and establish rates which reflect actual costs, under the proposed custom rate framework Toronto Hydro forecasts its rate base, costs (and revenues) prospectively for five years, and subject to specific adjustments as proposed, the utility must manage within the funding envelope provided even though actual costs may vary from the forecast. Managing actual costs over the five-year period while continuing to achieve performance outcomes and provide high-quality services to customers is another important way in which the proposed rate framework decouples the rates (price) that customers pay over the rate term from costs the utility incurs over the forecast period to serve customers.

[8] Exhibit 1B, Tab 2, Schedule 1 at s. 3.3.1 starting on page 47.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-4

Reference: Exhibit 1B, Tab 1, Schedule 1

Preamble:

Of the four strategic priorities for Toronto Hydro's integrated planning, sustainment and stewardship, modernization, growth and electrification and general plant, Toronto Hydro aligns performance objectives with customer feedback. Such feedback is to "prioritize investments in technology…", and to "invest proactively in system capacity…".

QUESTION (A):

a) Please confirm that this objective applies exclusively to new technology investments that will reduce Toronto Hydro's costs (i.e., revenue requirement), as noted in section 3.1. If not confirmed please explain why not.

RESPONSE (A):

Through Phase 1 of its Customer Engagement study, Toronto Hydro learned that customers support investments in new technologies that would make the system better (even if it could increase customer rates, and even if the benefits are not immediate) as long as the Toronto Hydro is clear about the cost to customers and the potential benefit. Please see Exhibit 1B, Tab 5, Schedule 1, Appendix A – Executive Summary at page 10.

QUESTION (B):

b) Confirm that all new technology investments planned for the test period have been evaluated to reduce Toronto Hydro's costs. If not confirmed, please list all such investments that will not reduce Toronto Hydro's costs in the planning period and explain why they are being proposed.

RESPONSE (B):

Toronto Hydro confirms that new technology investments are aligned with the objective to reduce costs (i.e., cost reductions or avoidance) and/or make the system better with respect to outcomes such as safety, reliability, customer service, security. For more information about how Toronto Hydro intends to leverage new technology to reduce cost and make the system better over time, please refer to (i) the Grid Modernization Strategy at Exhibit 2B, Section D5, (ii) the IT Investment Planning process in Exhibit 2B, Section D8.5, (ii) the Facilitating Innovation evidence in Exhibit 1B, Tab 4, Schedule 1, and the (iii) the Innovation Fund proposal in Exhibit 1B, Tab 4, Schedule 2. For more information on how Toronto Hydro considers value for modernization investments in planning, please refer to the response in interrogatory 2B-Staff-170.

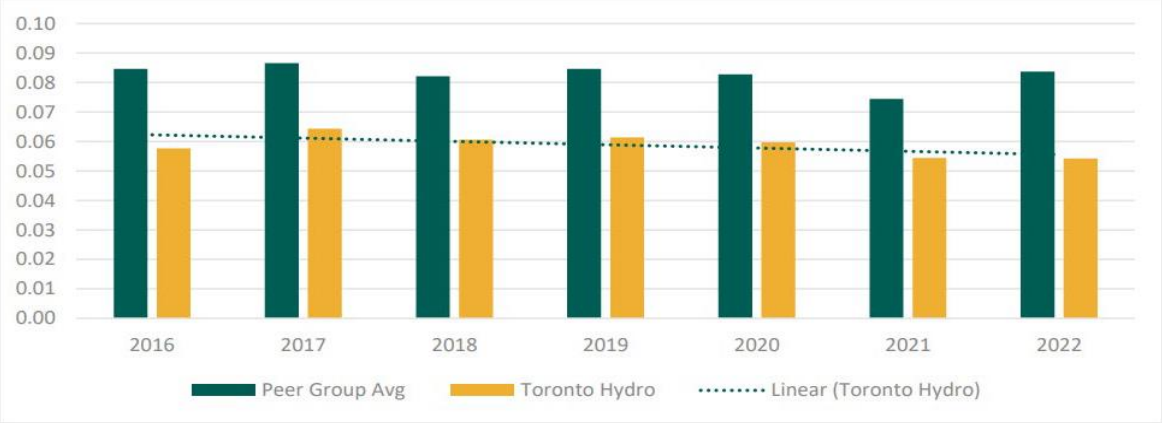
QUESTION (C):

c) Confirm that all proactive system capacity investments have been evaluated using the "least regrets" principle described in section 2.2. d) Please identify Toronto Hydro's marginal system capacity investment, i.e., the project demonstrated to have just made the threshold of an acceptable probability of creating unacceptable regrets by applying Toronto Hydro's "least regrets" investment principle.

RESPONSE (C):

Confirmed as outlined in the evidence in Exhibit 2B, Section D4. One example of a least regrets project that can be found within the plan is the Downsview TS. While it is theoretically possible to defer this expansion investment into the next rate period, this project is being advanced as a least regrets investment because the capacity outlook for this area in the next decade shows an expected increase in peak demand due to the Municipal Energy Plan for Downsview TS along with other drivers of growth. In these circumstances, Toronto Hydro believes that the risk of not having sufficient lead-time to build a new station that is required to connect and serve customers in this area should the pace of growth accelerate over the rate period, is a far more regrettable choice than pulling forward this investment by a few years.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES



INTERROGATORY 1B-STAFF-5

Reference: Exhibit 1B, Tab 1, Schedule 1

Preamble:

Figure 6 is reproduced below.

Figure 6: FTE per GWh of Load Served

QUESTION (A) - (B):

a) Why was GWh of load chosen as the normalization parameter to compare against other utilities?

b) Why does Toronto Hydro believe GWh of load is a more appropriate parameter to utilize versus one of the following:

   i. Service area

   ii. Customer count

RESPONSE (A) - (B):

Toronto Hydro applied various normalization parameters to compare FTE and OM&A trends to other utilities (i.e. GWh, customer count, circuit-km and net fixed assets). Please refer to the OM&A Overview evidence in Exhibit 4, Tab 1, Schedule 1 at pages 14 to 19 for the full analysis.

Gigawatt-hour ("GWh") per load was chosen to normalize FTEs based on electricity consumption by customers served. As indicated in the text right above the graph, this measure was chosen to show "*the utility's past efforts to increase resource throughput and utilization.*"

QUESTION (C):

c) Provide FTE per each of the following parameters for each year inclusive of 2016-2022 for Toronto Hydro and the peer group:

   i. Service area
   ii. Customer count
   iii. Km of line

RESPONSE (C):

Please see Exhibit 4, Tab 1, Schedule 1 at Figures 7 and 8, pages 17 and 18, respectively for FTE per Circuit-km and FTE per customer count. Please see Figure 1 below for an analysis of FTE per service area. The comparative results observed below are logically consistent with the Ontario Cities Population Density analysis presented in Table 1 of Exhibit 1B, Tab 3, Schedule 3 at page 3, which is reproduced in Figure 2 below in a bar graph format for ease of reference.

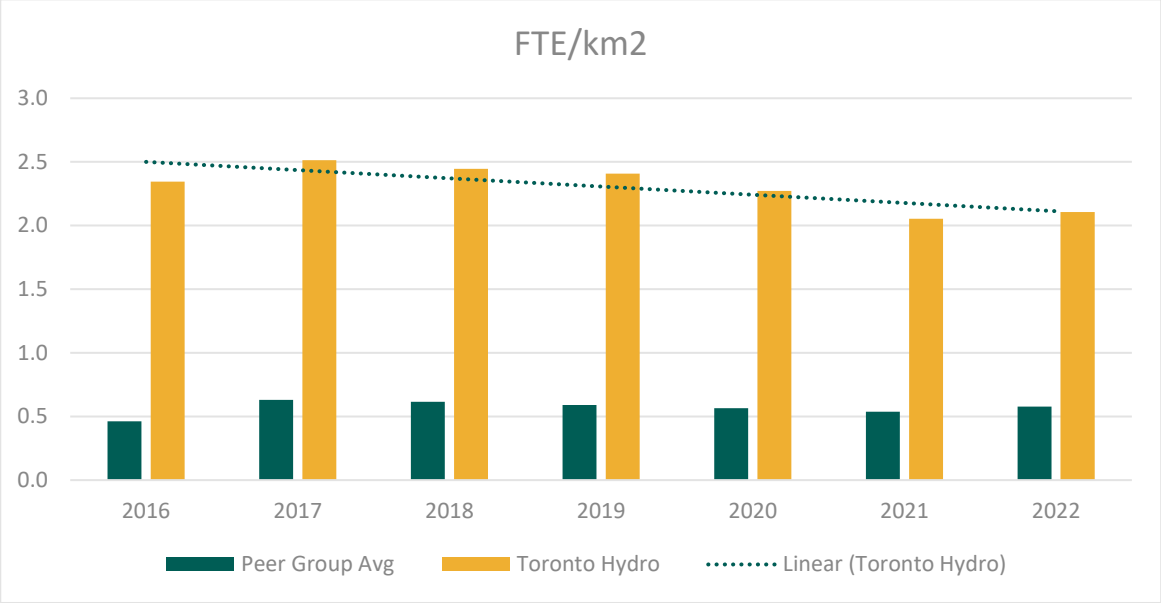


Figure 1 – FTE per Service Area

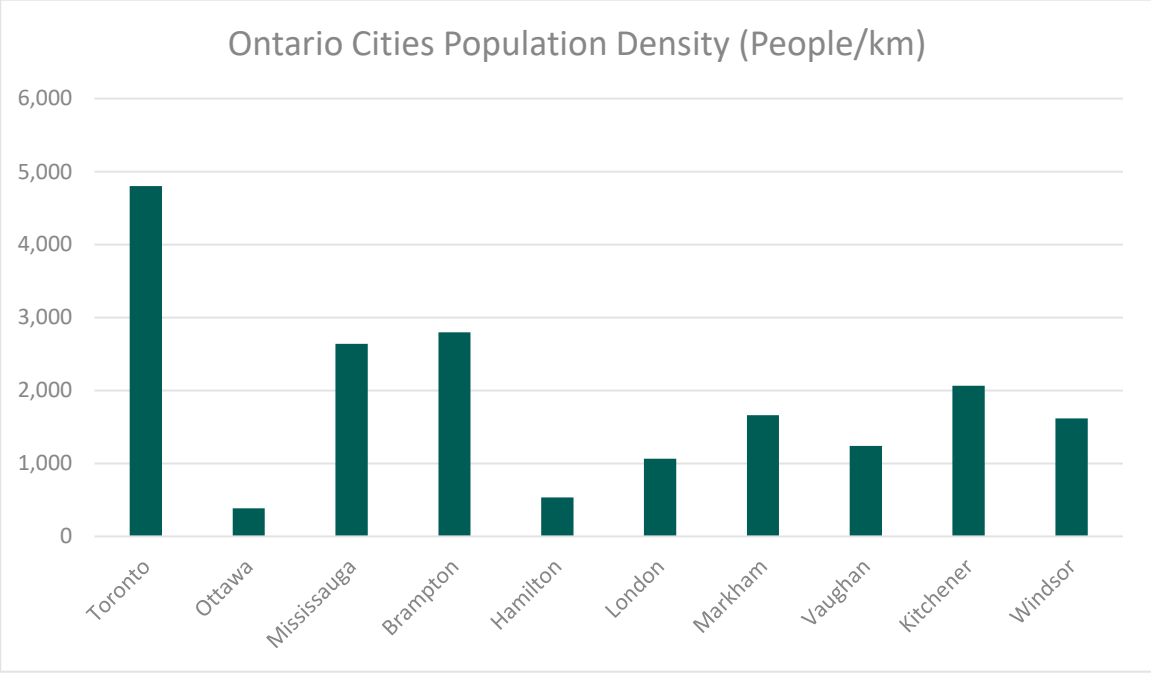

Figure 2 – Ontario Cities Population Density

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-6

Reference: Exhibit 1B, Tab 1, Schedule 1

Preamble:

Toronto Hydro makes multiple references to the "Horseshoe area" within its service area.

QUESTION (A):

a) Of Toronto Hydro's service area, what percentage is made up of the horseshoe?

RESPONSE (A):

Approximately 85 percent of Toronto's service area is made up of the horseshoe region.

QUESTION (B):

b) Of Toronto Hydro's customer count, what percentage are within the horseshoe?

RESPONSE (B):

Please see Toronto Hydro's response to interrogatory 2B-AMPCO-24, part (i).

QUESTION (C):

c) What is Toronto Hydro's calculated building density for:

i. the service area as a whole,

ii. within the horseshoe,

iii. outside the horseshoe?

RESPONSE (C):

Based on the latest City Landbase information acquired from the City of Toronto:

i. The building density for the service area as a whole is approximately 700 per square kilometers.

ii. Within the horseshoe, the calculated building density is 560 per square kilometers.

iii. Within the core, the calculated building density is 1,520 per square kilometer.

Please note that building density does not take into account the large variation of building or customer types within Toronto Hydro's service area. For example, a greater proportion of buildings can be multi-residential high rises and office towers within the downtown core compared to the horseshoe area.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-7

Reference: Exhibit 1B, Tab 1, Schedule 1

Preamble:

The material challenges outlined in section 3, along with customer feedback and the principle of least regrets investments established investment priorities for Toronto Hydro's capital plan. Specifically, Toronto Hydro notes the importance of investments including Distributed Energy Resources to support "Growth & City Electrification".

Question (A):

a) Does Toronto Hydro evaluate proposed DERs to determine if they will increase or decrease system reliability during summer peak demand, winter peak demand, or during peak generation periods of the proposed DER technology?

RESPONSE (A):

Yes. Toronto Hydro performs connection impact assessments (CIA) to assess the impact of connecting DERs on the system and evaluates criteria required to be met to maintain the stability of the grid including during peak demand periods. This assessment takes into consideration the Minimum-Load-to-Generation Ratio, a key determinant of grid stability.

QUESTION (B):

b) How does Toronto Hydro allocate the costs of system investments needed to mitigate any negative reliability impacts that may be associated with implementation of specific DER technologies in specific parts of its system?

RESPONSE (B):

Please see Toronto Hydro's response to 2B-Staff-160 part (c).

QUESTION (C):

c) Please identify the incremental investments in this application that are required to enable Toronto Hydro to integrate new energy storage batteries into its system.

   i. Please explain why such investments would be needed in the planning period.

RESPONSE (C):

Please see 2B-Staff-250 for a response to Toronto Hydro's ESS investments in 2025-2029 and an explanation for why such investments are needed.

QUESTION (D):

Considering that energy storage batteries have been utilized by other utilities as a non-wires alternative technology to help defer or eliminate the need for wires investments, please explain why this would not also apply to Toronto Hydro.

RESPONSE (D):

Please refer to Toronto Hydro's responses to 1B-Staff-88 and 1B-Staff-89 for information about the utility's non-wires strategy, investments and proposed incentives. Toronto Hydro is agnostic to the technology (type of DER) or approach (load curtailment) utilized by aggregators or customers to deliver dispatchable demand response capacity. As such, participants relying on energy storage batteries are welcome to offer capacity into Toronto Hydro's Local Demand Response market, if they are able to provide the required service. Please see the evidence in Exhibit 2B Section E7.2 for more information about the Non-Wires Solutions program.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-8

References: **Exhibit 1B, Tab 1, Schedule 3, Page 5, Table 5**
Exhibit 1B, Tab 1, Schedule 1, Page 2
"Toronto Metropolitan University, Toronto Second Fastest Growing Metropolitan Area, City of Toronto the Fastest Growing Central City, in the United States/Canada in 2022" (May 23, 2023) <https://www.torontomu.ca/centre-urban-research-land-development/blog/blogentry7311/>
Ontario Ministry of Finance "Ontario Population Projections Update, 2022-2046" (July 19, 2023) https://www.ontario.ca/page/ontario-population-projections

Preamble:

In Reference 1, Toronto Hydro shows that Toronto Hydro's customer count has been slowing and is projected to average 0.3% annually in the last three years of the rate period. The same reference shows a downward trend in normalized MVA that is forecast to continue.

In Reference 2, Toronto Hydro states that "Toronto Hydro distributes electricity to Canada's largest - and North America's second fastest growing city."

Reference 4 indicates the City of Toronto's population growth rate will slow.

QUESTION (A):

a) Please explain Toronto Hydro's view of the importance of absolute increase in population as compared to the growth rate of a population in the context of planning a distribution system. Please confirm that in the context of Toronto Hydro's distribution system planning, absolute growth is a more important consideration than the rate of growth. If not, please explain.

RESPONSE (A):

Reference 1 above relates to customer and load growth changes from 2018 to 2029 for the purpose of establishing a customer and load growth forecast to determine revenue to be collected through rates, as fully described in Exhibit 3.

Reference 2 above contextualizes the size and characteristics of Toronto Hydro's system and customer base. Similar information is relied upon in the productivity evidence at Exhibit 1B, Tab 3, Schedule 3 at pages 2 to 4, wherein Toronto Hydro describes its unique characteristics as a dense urban distributor and the resulting operational challenges that it must manage in connecting and serving its customers and carrying out prudent and necessary work to keep the system safe and reliable in accordance with good utility practice.

Neither of the above references relate to growth for the purposes of distribution system planning, which is articulated in full in Exhibit 2B, and summarized in Section A of that Exhibit at page 10: "*The growth is concentrated in certain pockets, namely the downtown core and along the transit corridors, and is oriented vertically with a continuing trend of high-rise developments. This has resulted is a marked need for new housing, transit solutions, and infrastructure, all of which needs to be serviced by Toronto Hydro in the years to come*."

As outlined throughout the evidence in Exhibit 2B, distribution system planning is complex and relies on a long list of varied inputs and planning considerations. There is no single metric of growth relied upon to inform system planning.

QUESTION (B) :

b) Please reconcile the apparent discrepancy between the statement that the City of Toronto's population is growing, in absolute terms, more than other cities with Toronto Hydro's forecasts showing slowing system load growth rates and the Ontario Ministry of Finance's projections that population growth is slowing for the City of Toronto.

RESPONSE (B):

Based on the response in part (a) above, Toronto Hydro submits there is no discrepancy, as absolute growth and growth rates are referenced for different purposes in different contexts.

Both Reference 3 and Reference 4 are based on Statistics Canada data released in January 2023. Reference 3 looks at growth over the preceding 12-month period and concludes that Toronto's population grew by 138,240 people, which is second only to Dallas-Fort Worth-Arlington in the cities compared. Reference 4, on the other hand, is prospective and looks at population projections from 2022-2046. Reference 4 notes that Toronto's population is projected to rise from 3.03 million in 2022 to 4.20 million in 2046, which is the largest population gain among the census divisions, but that the rate growth of 37.7 percent is slightly slower than the provincial rate of growth of 43.6 percent.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-9

Reference: Exhibit 1B / Tab 1 / Schedule 1 /
Exhibit 1B / Tab 3 / Schedule 1 / pp. 8-21

Preamble:

Requesting clarification of components of individual PIM measures.

QUESTION (A):

a) Does the Total Recordable Injury Frequency PIM measure include subcontracted field resources or only Toronto Hydro employees?

RESPONSE (A):

Total Recordable Injury Frequency measure does not include subcontracted field resources. Only Toronto Hydro employees are included.

QUESTION (B):

b) Does the Emissions Reduction PIM measure include emission reductions (ex. Fleet reductions or building square footage reductions) resulting from the contracting out of work or business activities?

RESPONSE (B):

Toronto Hydro's Scope 1 emissions do not include emissions by its contractors. Similarly, Toronto Hydro's Net Zero 2040 Strategy,[1] which will contribute to the achievement of the Emissions Reduction PIM, does not include reducing Scope 1 emissions through the contracting out of work or business activities.

[1] Exhibit 2B, Section D7.

QUESTION (C):

c) Regarding Ref 2 please provide the data and calculations used to create Figure 1 and Figure 2. For Figure 1 provide the data by cause code and year including and excluding MEDs. Also include the calculation for the standard deviation.

RESPONSE (C):

Please refer to the Excel spreadsheet entitled "*1B-Staff-9 Appendix A.xlxs*" for tabular data used to prepare Figures 1 and 2, as filed, in addition to a breakdown of Figure 1 by major cause code (excluding MEDs), on a 5-year rolling average basis. The inclusion of MEDs was not considered for the reliability projections. For a detailed explanation of Toronto Hydro's Reliability Projection Methodology, see response to interrogatory 2B-SEC-42.

QUESTION (D):

d) Regarding Ref 2 Provide the detailed calculation for the 5 yr projected values of Figure 1 and Figure 2. Was each individual cause code projected? Please provide the projection per cause code? If a projection was not completed by cause code how were random failures (such as weather) versus non-random failures (such as aging defective equipment) incorporated into a single projection model? Did these projections incorporate the submitted investment plans as per the application?

RESPONSE (D):

See response to 2B-SEC-42 for more information regarding Toronto Hydro's reliability projections.

Refer to part (c) (above) for the projections broken down by Major Cause Code and supporting tabular data for the figures.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-10

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 33

Preamble:

Toronto Hydro has proposed funding for an Innovation Fund to support work that is exploratory and development in nature, where outcome is uncertain, but benefits could be significant.

QUESTION (A):

a) Please list grant funding that Toronto Hydro has applied for from different government agencies over the past 5 years, along with a list of what was granted.
   i. If Toronto Hydro has not applied, please explain why not?

RESPONSE (A):

The table below lists grant funding that Toronto Hydro has applied for from different government agencies over the past 5 years.

Table 1: Grant funding that Toronto Hydro has applied for from government agencies (5-years)

Agency	Grant/Fund	Project Name	Submitted	Granted
NRCan	Electric Vehicle Infrastructure Demonstration	MURB Parking Lot Charging Pilot	October 2019	No
NRCan	Electric Vehicle Infrastructure Demonstration	MS Fleet EV Charge Hub	October 2019	No
NRCan	Electric Vehicle Infrastructure Demonstration	Pantograph Demonstration Project	October 2019	No

Agency	Grant/Fund	Project Name	Submitted	Granted
NRCan	Zero Emission Vehicle Infrastructure Program	MURB/Workplace Chargers	June 2020	Yes $250,000
NRCan	Zero Emission Vehicle Infrastructure Program	Curbside and Fleet EV	June 2021	Yes $350,000
NRCan	Zero Emission Vehicle Infrastructure Program	Toronto Curbside EV Chargers	September 2021	No
NRCan	Zero Emission Vehicle Infrastructure Program	Customer Fleet Charging	September 2021	No
TAF	ZEVIP - SUB	CF-025 – Curbside EV	May 2022	Yes $103,000
IESO & OEB	Grid Innovation Fund & Innovation Sandbox (Joint Call)	Benefit Stacking Transmission & Distribution Non-Wires Alternatives Pilot	November 2021	Yes $2 million
IESO	Grid Innovation Fund	LSE Demonstration	November 2020	No
NRcan	Deep Retrofit Accelerator Initiative	n/a	April 2023	No
NRCan	Smart Grid Demonstration	Hosting Capacity Analysis Standardization	January 2024	In Progress
NRCan	Smart Grid Demonstration	EV Load Management Project	January 2024	In Progress

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-11

Reference: Exhibit 1B / Tab 2 / Schedule 1 / p. 34

Preamble:

Toronto Hydro states that it "decided to allocate 0.3 percent of the proposed revenue requirement to the Innovation Fund, which amounts to approximately $16 million over the 2025-2029 rate period."

QUESTION (A):

a) Please provide examples of the other jurisdictions that have this type of funding, describe their programs and with their rationale for their proposed funding levels.

RESPONSE (A):

Please refer to Toronto Hydro's response to interrogatory 1B-DRC-06 part (d).

QUESTION (B):

b) What was Toronto Hydro's rationale to conclude that 0.3% was appropriate?

RESPONSE (B):

Toronto Hydro's research revealed that utility investments across comparable innovation initiatives and research and development activities range from 0.3 to 1 percent of revenues. Recognizing the novelty of this proposal in the Ontario electricity distribution sector context, Toronto Hydro decided to adopt the low-end of this range.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-12

Preamble:

Reference 1 is reproduced below:

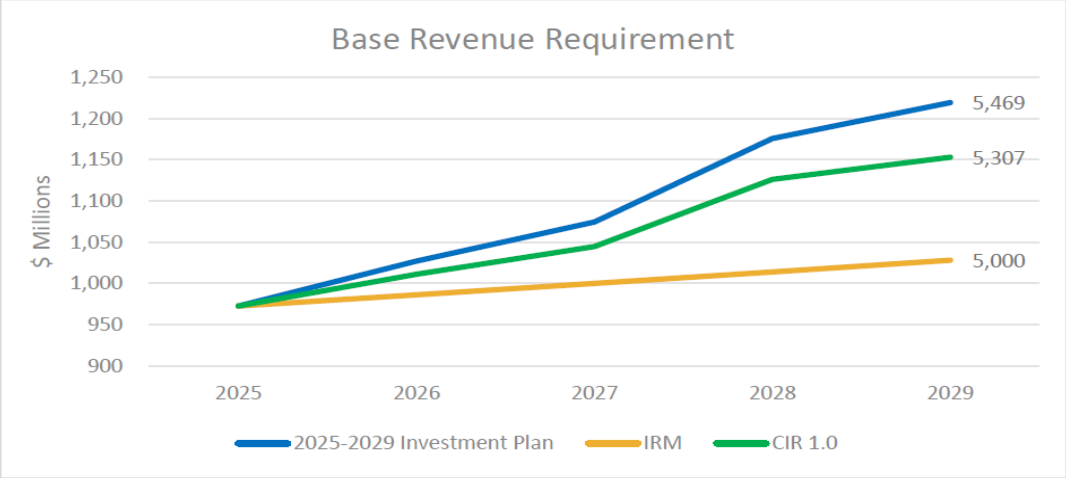

Figure 1: Cumulative 2025-2029 Base Revenue Requirement

QUESTION (A):

a) Please populate the following table, adding the proposed Custom Revenue Cap Index (CRCI):

Revenue Requirement ($ million, two decimal places)	**2025**	**2026**	**2027**	**2028**	**2029**
2025-2029 Investment Plan					
IRM					
Current Custom IR formula (Custom Price Cap Index (CPCI) / CIR 1.0)					
Proposed CRCI					

RESPONSE (A): Table 1: 2025-2029 Revenue Projection Scenarios ($ Millions)[1]

		2025	2026	2027	2028	2029	Total
A	2025-2029 Investment Plan	972	1,027	1,074	1,176	1,219	**5,469**
B	Revenue under IRM	972	986	1,000	1,014	1,028	**5,000**
C	Revenue under CIR1.0 with Custom Price Cap Index (CPCI)	972	1,011	1,044	1,126	1,153	**5,307**
D	Revenue under proposed Custom Revenue Cap Index (CRCI)	972	1,020	1,059	1,151	1,185	**5,387**
A-B	Revenue Deficiency under IRM	0	41	75	162	191	**469**
A-C	Revenue Deficiency under CIR1.0 with Custom Price Cap Index (CPCI)	0	16	30	50	66	**162**
A-D	Revenue Deficiency under the proposed CRCI	0	7	15	25	34	**81**

QUESTION (B) :

b) Please populate the following table with the values that correspond with developing Reference 1:

CPCI Components	2026	2027	2028	2029
I				
X – productivity				
X – stretch				
Xcap				
Cn				
Scap				
g				
CPCI				

RESPONSE (B):

Table 2: 2025-2029 Custom Price Cap Index (CPCI) Scenario

CIR 1.0	2026	2027	2028	2029
I - Inflation	2.00%	2.00%	2.00%	2.00%
X - Productivity	0.00%	0.00%	0.00%	0.00%
X - Stretch	-0.60%	-0.60%	-0.60%	-0.60%

Custom Price Cap Index (CPCI)	**3.76%**	**3.12%**	**7.64%**	**2.15%**

QUESTION (C) :

c) To what extent did Toronto Hydro consider other, non-Custom IR regulatory tools, such as, but not limited to, options discussed in Reference 3, to solve the funding gap identified throughout Reference 2. Please explain why Toronto Hydro rejected these other regulatory options.

RESPONSE (C):

Toronto Hydro considered all the non-custom regulatory mechanisms available under existing OEB policy. Toronto Hydro did not pursue the ICM or ACM options because the OEB policy is clear that: "*projects proposed for incremental capital funding during the IR term must be discrete projects, and not part of typical annual capital programs*."[2] The OEB Report goes on to say that "*[t] he use of an ACM is most appropriate for a distributor that: [a] does not have multiple discrete projects for each*

[2] https://www.oeb.ca/sites/default/files/uploads/Board_ACM_ICM_Report_20140918.pdf at pp. 13-14

of the four IR years for which it requires incremental capital funding; [b] is not seeking funding for a series of projects that are more related to recurring capital programs for replacements or refurbishments (i.e. "business as usual" type projects).

The vast majority of Toronto Hydro's capital expenditures as outlined in the Distribution System Plan at Sections E4-E8 consist of annual capital programs, rather than discrete projects. There are only a handful of discrete projects in Toronto Hydro's 2025-2029 Distribution System Plan that are not part of the utility's annual capital plan namely: Enterprise Data Center (Exhibit 2B, Section E8.1) , ADMS (Exhibit 2B, Section E8.4, page 22), AMI2.0 as part Metering (Exhibit 2B, Section E5.4), ERP (Exhibit 2B, Section E8.4, page 21), Stations Expansion (Exhibit 2B, Section E7.4). These projects total approximately $504.0 million out of the total $3,927.8 million capital expenditure plan. Applying for ACM treatment for these projects would not have been sufficient to carry out the necessary and prudent investments outlined in the 2025-2029 Distribution System Plan. In addition, it is key to note that there is no incremental funding available under ICM or ACM options for non-capital related expenditures. Approximately $66M of the revenue deficiency identified above is attributed to non-capital related revenue requirement expenses (i.e. OM&A and Other Revenue) that exceed revenue available to fund operations under a standard Price Cap IR framework.

QUESTION (D):

d) Please confirm that the IRM scenario in Reference 1 does not include consideration for the capital modules available to utilities on a Price-Cap IRM. Please add an "IRM with Capital Module(s)" scenario to both Figure 1 and the table in part a).

RESPONSE (D):

Confirmed. Please refer to the response in part (f) below.

QUESTION (E):

e) Based on the Capital Module regulatory mechanism, which projects or initiatives, would qualify? Please explain how they would apply.

RESPONSE (E):

Please refer to the response to part (c) above.

QUESTION (F) :

f) Please confirm that the revenue requirement projection presented in Reference 1 includes projects that would be subject to variance account treatment in the DRVA of the proposed plan. Please calculate the residual annual revenue requirement that would result if costs of generation protection monitoring and control, externally-initiated plant relocations and expansions, Hydro One contributions, metering, and non-wire alternatives were not funded by the index. Please then adjust this for Toronto Hydro's proposed X factor and place the results as a new row in the table of part a), or a new table, whichever suites Toronto Hydro.

RESPONSE (F):

Confirmed. Please see Table 3 below for the residual annual revenue requirement, adjusted for Toronto Hydro's proposed X-factor that would result of costs of the programs mentioned in the preamble were not funded by the index.

Table 3: Residual Revenue Requirement adjusted for X factor ($ Millions)[3] /C

		2025	2026	2027	2028	2029	Total
A	**Residual Revenue Requirement**	967	1,012	1,048	1,139	1,179	**5,346**
B	**Residual Revenue Requirement adjusted for the stretch factor**	967	1,005	1,033	1,115	1,146	**5,266**
A-B	**Variance**	**-**	**7**	**15**	**24**	**33**	**80**

[3] Based on updated evidence filed on April 2, 2024 where the total forecast 2025-2029 Revenue Requirement is $5,482.5 million. Please see Exhibit 1B, Tab 1, Schedule 3. /C

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-13

References: Exhibit 1B, Tab 2, Schedule 1, Section 3.2.2

EB-2014-0219, Report of the Board: New Policy Options for the Funding of Capital Investments: The Advanced Capital Module, September 18, 2014

Preamble:

Toronto Hydro has proposed an Innovation Fund to address needs that cannot be met by existing funding mechanisms. Toronto Hydro states that the variance account proposal and resultant rate rider will provide transparency to rate payers on their bill.

QUESTION (A):

a) Please summarize Toronto Hydro's evaluation of the Incremental and Advanced Capital Modules and articulate how these mechanisms are unable to fund the work Toronto Hydro proposes for the Innovation Fund.

RESPONSE (A):

Please see the response to interrogatory 1B-Staff-12(c).

QUESTION (B):

b) Please confirm it is Toronto Hydro's proposal, that if this proposal is approved, to identify the "Innovation Fund" as a separate line item on customer bills. Please identify which customer bills are proposed to display this charge. Please explain whether Toronto Hydro will request an exemption from the regulation on invoices for low volume customers to make this charge visible to them.

RESPONSE (B):

Toronto Hydro incorrectly used the term customer bills in the context of this evidence. The utility was referring to the Tariff Sheets for the different customer classes that are included in Exhibit 8. In the context of the Tariff Sheets, the Innovation Fund rate rider is separately identified and named.

QUESTION (C):

c) Please articulate how this proposed rate rider differs from, and is superior, to an Advance Capital Module rider to provide transparency, of any form.

RESPONSE (C):

Compared to an ACM rider, the Innovation Fund rider provides more specificity on the Tariff as to the investment purpose of the amounts being collected through the rate rider.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-14

References: Exhibit 1B, Tab 2, Schedule 1, Table 1
Report of the Board: Renewed Regulatory Framework for Electricity Distributors: A Performance-Base Approach, October 2012

Preamble:

Reference 1 provides a comparison of Toronto Hydro's current Custom Incentive Rate-setting Framework with that which is proposed in this application.

Reference 2 states:
"The Board expects a distributor's application under Custom IR to demonstrate its ability to manage within the rates set, given that actual costs and revenues will vary from forecast."

QUESTION (A):

a) Please explain and quantify which cost and revenue deviations Toronto Hydro is managing within the rates to be over the 2025-2029 rate term, given the proposed revenue growth factor, demand-related variance account, and a revenue cap approach.

RESPONSE (A):

As noted in the response to interrogatory 1B-Staff-3, under the proposed custom rate framework Toronto Hydro forecasts its costs (and revenues) for five years, and the utility has to manage its business within those forecasts even though actual costs may differ from forecasted costs. Over a five-year term, differences between forecasted and actual costs can, and in Toronto Hydro's experience over the last ten-years, do occur due to a multitude of business factors and operating conditions that the utility is responsible for managing. These factors and conditions include, but are not limited to:

i. Utility-specific cost pressures that exceed input price adjustments provided through the standard inflation factor;

ii. New and evolving regulatory and legislative requirements;
iii. Evolving customer expectations and requirements;
iv. Market-based conditions such as supply chain constraints and labour shortages;
v. Geopolitical instability and other impactful events such as the COVID-19 pandemic;
vi. Weather-related risks including the rising risk of adverse weather due to climate change;
vii. Changes in the overall business risk profile due to factors such as asset health, system utilization, cyber security, labour market, technological advancements, etc.; and,
viii. Coordination challenges and complexities associated with doing work in a dense, congested, and growing urban environment.

For the reasons noted in Exhibit 1B, Tab 2, Schedule 1 at pages 35 to 47, Toronto Hydro's 2025-2029 Custom Rate Framework proposes specific adjustment to manage deviations in cost and revenues associated with changes in customer demand. This adjustment is provided by the *Demand Related Variance Account (DRVA)* which seeks to protect ratepayers, the utility and its shareholder, from structural unknowns in forecasted costs and revenues related to demand growth in a time of unprecedented change and transformation in the economy and energy system. The RRF issued in October 2012 could not have contemplated these unprecedented changes. Given the uncertainty that is outlined in the evidence supporting this account, the DRVA is a mechanism that enables the utility to manage within the rates set for the 2025-2029 period without having to compromise customer and/or shareholder financial outcomes that could impede progress towards beneficial electrification and/or destabilize investor confidence in Ontario's regulatory system.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-15

References: Exhibit 1B, Tab 2, Schedule 1

EB-2007-0673: Report of the Board on 3rd Generation Incentive Regulation for Ontario's Electricity Distributors

Preamble:

In Reference 1, Toronto Hydro makes the following statements:

"Under a standard IRM scenario, Toronto Hydro's 2025-2029 capital investment plan would be underfunded by approximately 35% or $1.5B."

"The needs of Toronto Hydro's 2025-29 investment plan remain unmet under the current custom framework….[Its] investment plan would be underfunded by approximately $450 million."

"Adoption of a plan constrained by this funding envelope would force the utility into a sustainment plan that would be almost entirely reactive in nature, resulting in roughly an 8 percent deterioration in system reliability by the end of the rate period."

Table 2 of Reference 1, which is titled as "ROE Implications of the Existing Custom Framework" is reproduced below:

	2025	2026	2027	2028	2029
2025-2029 Investment Plan Revenue Requirement (A)	972	1,027	1,074	1,176	1,219
2025-2029 funding under the existing custom framework (B)	972	1,011	1,044	1,126	1,153
Variance (A) – (B)	-	16	30	50	66
ROE Impact (basis points) *	-	59.6	110.8	183.5	245.6

QUESTION (A):

a) Please provide a forecast of financial performance under a standard IRM scenario while maintaining capital expenditures as proposed in this application, detailing net income, depreciation, regulatory return on equity performance, and values which correspond to the 300 basis point dead band which may trigger a review under the OEB's rate-setting policy. Present these figures in a manner that supports comparison to the analysis contained in Table 2 of Reference 1.

RESPONSE (A):

Table 1 below provides a forecast of financial performance (ROE) under a standard IRM scenario while maintaining capital expenditures as proposed in this application.

Table 1: Financial Performance (ROE) under a standard IRM Scenario

	2025	**2026**	**2027**	**2028**	**2029**
2025-2029 Investment Plan Revenue Requirement (A)	972	1,027	1,074	1,176	1,219
2025-2029 funding under IRM (B)	972	986	1,000	1,014	1,028
Variance (C)=(A)-(B)	**-**	**41**	**75**	**162**	**191**
ROE Impact (basis points)	**-**	**151.8**	**276.2**	**599.6**	**708.4**

*Estimated where $27M per year equals approximately 100 basis points

Variance (C)	**-**	**41**	**75**	**162**	**191**
Tax impact (D) = (C) x 26.5%	-	11	20	43	51
Net Income Impact (C)-(D) (loss)	**-**	**30**	**55**	**119**	**141**

QUESTION (B):

b) Please calculate the expected change in reliability performance in the case where Toronto Hydro continues under its current custom framework, using the same methodology applied to estimate an 8% decline in reliability performance were Toronto Hydro to proceed with "a standard IRM scenario" discussed on page 13 of Reference 1 above.

RESPONSE (B):

Please see the response to 1B-SEC-21.

QUESTION (C):

c) Please discuss the acceptability of Toronto Hydro's financial performance were Toronto Hydro to continue under its current custom framework, with specific reference to the ROE impacts outlined in Table 2 of Reference 1 and the 300-basis point threshold at which a regulatory review may be initiated, in accordance with the policy established under Reference 2.

RESPONSE (C):

The financial performance associated with a continuation of the current rate framework is not acceptable. As noted in the evidence at Exhibit 1B, Tab 2, Schedule 1 at pages 14-15, the only way for Toronto Hydro to close the funding gap posed by a continuation of the current framework is through cost-reduction efforts that will *also* negatively impact customer outcomes and service levels. For this reason, a continuation of the current rate framework would effectively preclude the utility from having a reasonable opportunity (not guarantee) to earn the allowed rate of return. This is not a financially sustainable outcome for the next rate period, nor is it consistent with (i) customer needs and expectations, or (ii) the Fair Return Standard that is the bedrock of the regulatory compact.

As noted above, this is also not in the best interest of customers since the only reasonable option to manage financial performance under this outcome is to reduce prudent and necessary investments in the utility's grid, operations and workforce that will compromise outcomes that customers need and expect. For example, a deferral of work contained within the Grid Modernization Strategy at Exhibit 2B, Section D5 would mean that customers can expect a deterioration in reliability performance over the next rate period (see 1B-SEC-21), higher customer interruption costs and higher costs and system constraints in the next decade as the grid becomes more heavily utilized by customers due to electrification. Similarly, investments to increase grid capacity to connect and

enable beneficial electrification, including DER adoption, could be compromised – jeopardizing customer choice and impeding progress towards energy transition goals.

Toronto Hydro does not believe that the 300 basis points off-ramp is the appropriate test to assess whether a new (or existing) rate framework will yield just and reasonable rates and outcomes for customers and the utility when a rate plan is being established. To the best of the utility's knowledge, the 300-basis points test has never been used this way in forward-looking rate application. Rather, this test has been applied to evaluate and manage the financial performance during an incentive-rate period – the most recent example being the application of this 300-basis points threshold to determine whether distributors were eligible for relief during the COVID-19 pandemic. Applying a 300 basis point off-ramp test to determine the utility's revenue adequacy and resulting rates would compromise the financial viability of the electricity sector and weaken market confidence in Ontario's regulatory system.

QUESITON (D):

d) Please describe the actions Toronto Hydro would take if ROE results were to materialize as projected in Table 2.

RESPONSE (D):

If the ROE results in Table 2 were materialize as a result of the OEB approving a rate framework that constrains the utility's revenue through the imposition of a non-empirical stretch-factor and/or the denial of funding for prudent OM&A expenses that cannot be funded under IRM, Toronto Hydro would be faced with a difficult decision to reduce necessary investment in the grid, operations and its workforce. For the reasons noted above and supported by the evidence in Exhibits 1B, 2B and 4, this decision would put customer outcomes (e.g., reliability and customer service) and energy transition objectives at risk.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-16

Reference: Ontario Energy Board, Handbook for Utility Rate Applications

Preamble:

At page 26, Reference 1 states:

"Custom IR is not a multi-year cost of service; explicit financial incentives for continuous improvement and cost control targets must be included in the application."

QUESTION (A):

a) Please describe Toronto Hydro's proposals for continuous improvement within the rate term, with specific reference to its preference for targets to be established on a five-year basis rather than annually, as noted at page 31 of Reference 2.

RESPONSE (A):

Toronto Hydro's proposals for continuous improvements within the rate term are found both within and beyond the 2025-2029 Custom Scorecard and related targets that underpin the Performance Incentive Mechanism ("PIM").

Within the 2025-2029 Custom Scorecard and related PIM, Toronto Hydro has put forward various new performance measures and objectives that reflect the utility's ongoing commitment to continuous improvement. More specifically:

- reducing the duration of unplanned outages that customers experience;
- enhancing physical and cyber security threat detection and mitigation in accordance with NIST standards;
- advancing grid automation readiness for the horseshoe area of the grid by increasing remote operability of the distribution system and laying the foundation for self-healing;

- holding itself accountable for delivering demonstrative efficiency achievements commensurate with the expectations of the empirical stretch-factor proposed as part of the rate framework;
- tracking and reporting post-transactional customer satisfaction performance with respect to customer inquiries (phone and email), Key Accounts engagements, customer connections, and customer communications re planned outages and construction projects.
- tracking, reporting and resolving customer escalations in a timely manner.
- achieving and maintaining certification with international best practices (ISO) in various key management systems.
- reducing the company's GHG emissions in a paced and prudent manner
- expanding the scope of non-wires solutions by procuring 30MW of flexible capacity to address system capacity constraints.

The proposal for targets to be established on a five-year basis rather than annually reflect the necessary and practical considerations of: (i) operational complexity and uncertainty that the utility must manage in the normal course of business serving the needs of customers in a large, dense, urban environment; (ii) the multi-year nature of the work that utility needs to perform in order to achieve the target objectives reflects an integrated five-year plan (not five one-year plans); and (iii) the need to preserve operational flexibility within this integrated five-year plan to execute work programs effectively.

Outside of the 2025-2029 Custom Scorecard, Toronto Hydro's commitment to continuous improvement is detailed throughout the evidence. Notable examples include:

- Continuous improvement of the Asset management system, including:
    - Continue to improve the maturity of Toronto Hydro's asset risk management framework through the full implementation of the Condition Based Risk Management ("CBRM") methodology and fully embedding the Engineering Asset Investment Planning ("EAIP") solution within asset management processes, including a custom value framework to enable portfolio optimization.

- Develop Toronto Hydro's Asset Information Strategy to improve the quality of asset data and related data sources to support improved analytics & asset management decisions, as detailed in Exhibit 2B, D1.2.1
- Collect, store, classify, and integrate critical data to allow improvements in asset decision-making, increased operational forecasting and enable automation of processes
- Refine the Integrated Planning and Portfolio Reporting and Execution Work Program processes for increased integration with Toronto Hydro's EAIP tool

- Continuous improvement of operational and planning functions through Grid Modernization efforts as described in Exhibit 2B, Section D5.2, including:
  - Increase real-time system awareness efficiently through the use of monitoring technology, leading to enhanced fault location while allowing improved asset management and operational decision-making
  - Consolidate outage management and distribution management systems within an Advanced Distribution Management System ("ADMS") to establish a self-healing grid, optimize the integration and management of DERs, manage two-way flow of electricity, perform advanced outage management, manage DR programs, and enhance advanced analytics effectively
  - Improve monitoring, visibility, and forecasting of DER connections, allowing the utility facilitate DERs connections more efficiently and leverage DER connections to optimize the grid
  - Leverage advancement in advanced analytics, such as Machine Learning and Artificial Intelligence tools, to develop new descriptive, predictive, and prescriptive analytical capabilities to drive process efficiency and improve decision-making
- Continuous improvement with respect to reducing distribution system line losses and increasing system capacity to support electrification through paced investments in 4kv voltage conversions.

- Continuous improvement of operational efficiency, safety, and environmental objectives through the elimination of obsolete assets and system configurations as detailed in various capital programs within Exhibit 2B, Section E6.
- Continuous improvements with respect to process automation and business modernization is supported by IT initiatives that improve operational processes and enable responsiveness towards emerging electrification objectives as described in Exhibit 4, Tab 2, Schedule 17.
- Continuous improvement with respect to operational efficiency as evidenced throughout the programmatic evidence in Exhibit 4.
- Continuous improvement with respect to reducing restricted feeders and short capacity constraints to enable timely and efficient connection of DERs
- Continuous improvement with respect to proactive investments in reducing system capacity constrains to enable timely and efficient customer connections in areas of concentrated load growth.
- Continuous improvement with respect to the pursuit of innovative pilot projects that are aligned with the OEB's objectives as set out in the Framework for Energy Innovation, and the commitment to share learnings derived from these projects with the OEBs Innovation Sandbox as outlined in Exhibit 1B, Tab 4, Schedule 2.
- Continuous improvement with respect to core tools and processes that enable efficient day-to-day operation of the distribution system, as described in Exhibit 4, Tab 2, Schedule 5, p. 17-22 and Exhibit 4, Tab 2, Schedule 7, p. 18-23.
- Continuous improvement of the ways in which customers interact with Toronto Hydro, the information they have available to them, and the ease of interacting with Toronto Hydro, as described in Exhibit 4, Tab 2, Schedule 14, p. 39-41. This section also describes improvement of customer service efficiency and effectiveness of technology solutions, process optimization, and reporting. Examples of these improvements include:
    - Providing customer and staff a view of every interaction a person has had with Toronto Hydro including bills, calls, outages and connections,
    - Enhanced knowledge management systems and quality evaluation tools to train agents faster and service customers more consistently,

- Use of analytics and advanced technologies, such as artificial intelligence to identify potential issues and take steps to avoid the issue before the customer becomes aware,
- Advanced process management and control tools to identify when a customer service is at risk of being late or incomplete, and
- Evolution of new channels such as mobile application, chatbots, and the self service portal to manage customer interactions across each stage of their journey.

- Collections segment continuous improvement includes offering additional payment options for customers, improved outstanding debt management including due date notifications, and reporting, see Exhibit 4, Tab 2, Schedule 14, p. 40.
- Continuous improvement of the Low-Income Energy Assistance Program ("LEAP") by providing additional assistance and reaching a greater number of customers through higher grant amounts and funding, greater simplicity and assistance to customers during the sign-up process, and improved program awareness, see Exhibit 4, Tab 2, Schedule 19.

QUESTION (B):

b) What commitments, if any, does Toronto Hydro make to customers about improvements in cost and service performance to be achieved within the five-year term?

RESPONSE (B):

Please see the response above for a summary of numerous continuous improvement commitments that are form part of the utility's 2025-2029 investment plan underpinning this rate application.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-17

References: Exhibit 1B, Tab 2, Schedule 1, Table 5

Exhibit 1B, Tab 2, Schedule 1

Preamble:

Reference 1 is reproduced below:

Table 5: Efficiency Factor (0.15%) Revenue Reduction ($ Millions)

	2025	2026	2027	2028	2029
Revenue Requirement based on the 2025-2029 Investment Plan	972.4	1,027.0	1,074.4	1,175.7	1,219.2
Revenue Collected after 0.15% Efficiency Factor	972.4	1,025.5	1,071.3	1,170.9	1,212.2
Revenue Reduced by 0.15% Efficiency Factor	-	1.5	3.1	5.0	6.9

Note: There could be minor differences due to rounding.

In addition to the proposed 0.15% efficiency factor, Toronto Hydro also proposes a 0.6% performance incentive factor, and revenue growth factor of varying degrees for each of 2026 to 2029.

QUESTION (A):

a) Please confirm Toronto Hydro agrees with the following table produced by staff. If not, please provide Toronto Hydro's table for the revenue reduction in each year due to the proposed 0.6% performance incentive factor. For any changes to the values of the table, please provide all calculations to demonstrate the derivation of the number(s).

	2025	2026	2027	2028	2029
Revenue Requirement based on the 2025-2029 Investment Plan	972.4	1,027.0	1,074.4	1,175.7	1,219.2
Revenue Collected after 0.6% PIM factor	972.4	1,021.2	1,061.8	1,156.0	1,192.2
Revenue Reduction	-	6.2	12.6	19.7	27.0

RESPONSE (A):

Please see response to 1B-Staff-3 c), which demonstrates the revenue reductions resulting from application of the 0.6% incentive component of the X Factor. The response shows minor variances from OEB Staff's prepared table above.

QUESTION (B):

b) Please confirm Toronto Hydro agrees with the following table produced by staff. If not, please provide Toronto Hydro's table for the revenue enlargement in each year due to the proposed revenue growth factor. For any changes to the values of the table, please provide all calculations to demonstrate the derivation of the number(s).

	2025	2026	2027	2028	2029
Revenue Requirement based on the 2025-2029 Investment Plan	972.4	1,027.0	1,074.4	1,175.7	1,219.2
Inflation Adjusted RGF	-	3.61%	2.62%	7.43%	1.71%
Revenue Enlargement	-	35.1	62.0	141.9	162.0

RESPONSE (B):

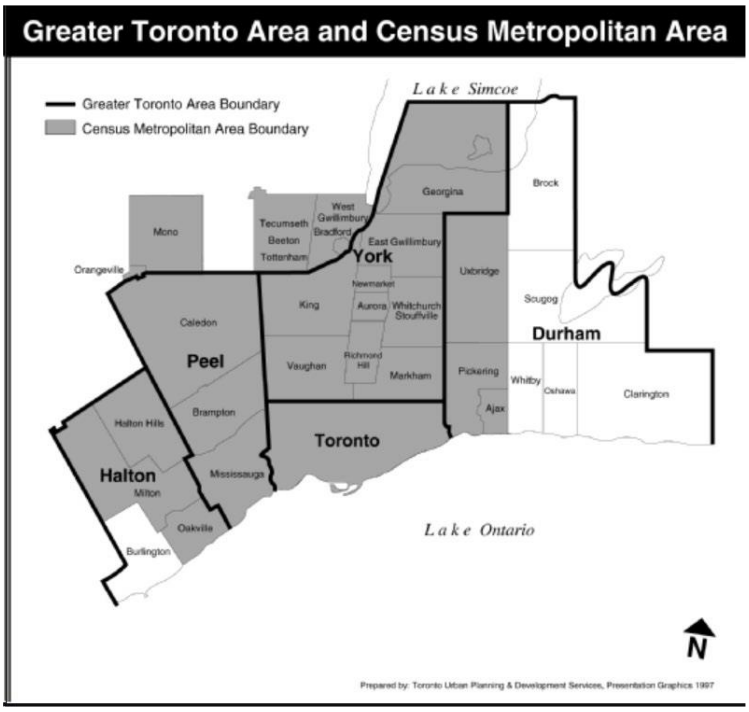
The table presented above would provide an accurate depiction of revenue enlargement resulting from the RGF in a scenario where the RGF was applied to unreduced revenue requirements year over year. In actual practice, the CRCI's inclusion of a two-component X Factor totaling 0.75% has the effect of reducing the base revenue requirement to which the CRCI is applied. One result of this, are RGF revenue enlargements which are smaller than those shown above. Table 1 below shows RGF revenue enlargements taking this dynamic into account:

Table 1: RGF Revenue Enlargement for 2025-2029 Period

	2025	2026	2027	2028	2029
Revenue Requirement based on 2025-2029 Investment Plan	972.4	1,027.0	1,074.4	1,175.7	1,219.2
Revenue for previous year post-CRCI (used for application of CRCI in present year)	n/a	972.4	1,019.6	1,059.1	1,151.0
Revenue Growth Factor (RGF)	n/a	3.61%	2.62%	7.43%	1.71%
RGF Revenue Enlargement	n/a	35.1	61.8	140.5	160.2

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-18



References: **Exhibit 1B, Tab 2, Schedule 1, Page. 7**
Exhibit 1B, Tab 2, Schedule 1, Table 3
Statistics Canada Map of Census Metropolitan Area 535 - Toronto, retrieved from: https://www12.statcan.gc.ca/census-recensement/geo/mapsartes/pdf/S0503/2016S0503535.pdf
Simplified Toronto CMA map: https://www.toronto.ca/wpcontent/uploads/2017/10/90c1-EDC-Map-GTA-CMA.png

Preamble:

Toronto Hydro states that "over the 2025-2029 period, its operations and capital investment needs are growing by approximately 37.5% due to a number of distinct and interrelated drivers." These drivers include:

"Responding to the extraordinary inflationary pressures experienced over the 2020-2024 period, wherein the non-residential Construction Index in the Toronto Census Metropolitan area rose 37.7% from Q1 2020 through Q1 2023."

Reference 3 is reproduced below (Statistics Canada Map of Census Metropolitan Area 535):

QUESTION (A):

a) Please provide details of the calculations that support the claimed need for 37.5% growth in "operations and capital investment needs." In particular, what definition of cost is used? If not the revenue requirement, why use an alternative definition of cost for this commentary?

RESPONSE (A):

Table 1 below provides a summary of Toronto Hydro's growth in capital and operational investments needs comparing actual/forecast expenditures in the current 2020-2024 rate term with the forecasted expenditures in the 2025-2029 rate term. The costs referenced in this table tie back to the expenditures outlined in OEB Appendix 2-AA and 2-AB (Capital) and OEB Appendices 2J (Operational).

Table 1: Comparison of 2025-2029 vs. 2020-2024 Expenditures ($ Millions)

	2020-2024	2025-2029	Variance ($)	Variance (%)
Capital Expenditures	2,787.4	4,001.8	1,214.4	43.6%
OM&A	1,460.7	1,856.3	395.6	27.1%
Total Expenditures	**4,248.1**	**5,858.1**	**1,610.0**	**37.9%**

Expenditures are a key aspect of financial management, and tracking them is essential for budgeting and financial planning. Revenue requirement is a concept in utility regulation and rate-setting processes – it reflects the total amount of money that a utility needs to collect from its customers in order to cover its costs (i.e. OM&A, depreciation, interest expense, return on equity and PILs/taxes).

QUESTION (B) :

b) Please explain Toronto Hydro's view regarding the relationship between the design of attrition relief mechanisms and the growth rate of revenue requirement for the years of the rate term that are affected by these mechanisms. Please confirm Toronto Hydro's proposed growth rate for revenue requirement in these years, i.e., 2026 to 2029.

RESPONSE (B):

An attrition relief mechanism is designed to address the utility's revenue deficiency over the rate term. Pleases see the response to 1B-Staff-12 where Toronto Hydro shows the revenue deficiency under standard Price Cap IRM.

The revenue deficiency is informed by two key considerations: (1) the growth rate of the revenue requirement over the rate period, and (2) the growth rate of the revenues to be collected from customers through existing rates over the rate term considering any expected increases in billing determinants per the utility load forecast.

QUESTION (C) :

c) Please explain how extraordinary inflation in 2020-2024 presages rapid cost growth for the 2026-2029 period.

RESPONSE (C):

The reference upon which this question was based seems to have been misinterpreted to mean that the extraordinary inflation in the current rate term is driving the rate of growth over the next rate term. Rather, as explained above in part (a), the referenced statement denotes the absolute growth in total expenditures comparing the current 2020-2024 rate term with the 2025-2029 rate term. The extraordinary inflation that the utility experienced in the current rate term is in part driving the absolute growth in in total expenditures in the next rate term compared to the current rate term.

QUESTION (D) :

d) Please identify what other indices Toronto Hydro considered for assessing inflation for the unit costs for power distribution system construction in Toronto Hydro's service territory. Please explain how Toronto Hydro determined the non-residential Construction Index in the Toronto Census Metro Area is the most relevant index of inflation in the unit cost of power distribution system construction in its service territory.

RESPONSE (D):

Toronto Hydro believes Reference 2 intends to refer to Exhibit 1B, Tab 3, Schedule 3, Table 3, which corresponds to the data point noted.

The reference is taken from a section of the evidence that provides a retrospective look at the steps taken by Toronto Hydro to complete its work programs and manage its business during a challenging time of 40-year high inflation in Canada, and the Toronto Area. Toronto Hydro was not able to locate any specific indices to assess inflation for the unit costs for power distribution system construction in Toronto Hydro's service territory. In the absence of a more specific index, Toronto Hydro believes

that the NRBCI is an instructive index for assessing the retrospective inflationary pressures of undertaking construction work in the Greater Toronto Area (GTA), which includes the City of Toronto.

QUESTION (E) :

e) Provide the filters and settings used on the Statistics Canada website to derive these values in Reference 2. Please detail the type of building and divisions selected. Explain why these filters and settings were selected and how all the categories selected are applicable to Toronto Hydro's inflationary pressures?

RESPONSE (E):

The settings selected on the Statistics Canada website were

a) Type of Building: Non-Residential Buildings
b) Division: Division Composite
c) Reference Period: Q1 2020 to Q2 2023

QUESTION (F) :

f) Please confirm the percentage land area of the Toronto Census Metropolitan Area that is served by Toronto Hydro.

RESPONSE (F):

Toronto Hydro has not completed a km^2 analysis of its service territory relative to the Toronto CMA.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-19

Reference: Exhibit 1B, Tab 2, Schedule 1, Appendix A

Preamble:

Page 2 of Reference 1, Toronto Hydro states:

> "the Company's proposed *changes* to the Rate Framework are generally consistent with how other electric *utilities* have responded to developments in the energy industry. [italics added]"

On page 3:

> "Given these developments in the energy industry, many regulatory jurisdictions have implemented changes to ratemaking frameworks and practices. These changes are designed to incorporate expanded objectives and priorities, such as clean energy goals, affordability, reliability, emission reduction, and utility financial integrity."

QUESTION (A):

a) Please confirm the following statements. If Toronto Hydro disagrees with any or all of these statements, please explain why.
   i. Toronto Hydro already operates under an approach to custom incentive rate-setting that it has dubbed CIR 1.0.
      1. This ratemaking system includes a price cap index formula with a C factor that effectively replaces capital revenue growth based primarily on inflation and productivity indexing with capital revenue growth based primarily on a cost forecast.
      2. The inflation measure in this formula includes a relevant input price index: the average weekly earnings on Ontario workers.

3. An asymmetrical Capital-Related Revenue Requirement Variance Account returns any and all capital-related revenue requirement savings to customers.
4. There is also a two-way variance account for miscellaneous externally-driven costs.

ii. Toronto Hydro's new CIR proposal entails the following changes from its old proposal.

1. A revenue growth factor ("RGF") would effectively replace OM&A as well as capital revenue growth based primarily on inflation and productivity indexing with growth that is based primarily on cost forecasts.
2. A revenue cap index would replace the price cap index, and a demand revenue variance account ("DRVA") would effectively establish weather-normalized revenue decoupling.
3. The DRVA would also establish two-way variance account treatment for a wide range of demand-sensitive costs.
4. The Capital-Related Revenue Requirement Variance Account would be discontinued.
5. There would, additionally be an Innovation Fund, a Getting Ontario Connected Act Variance Account, and PIM tied to customer service quality and various policy goals.

RESPONSE (A) - PREPARED BY SCOTTMADDEN:

i. Confirm.

1. Partially confirm. The C factor is subject to inflation and productivity factors.
2. Partially confirmed. The inflation factor includes a labour and non-labour component.
3. Confirm.
4. Confirm.

ii.

1) Partially confirm. The RGF factor is still subject to inflation and productivity factors.

2) Partially confirm. DRVA trues up billing determinants on a weather normalized basis.
3) Confirm.
4) Confirm.
5) Confirm.

QUESTION (B):

b) Does Toronto Hydro mean that each of these changes is individually consistent with industry trends or instead that many of these changes are consistent with industry trends?

RESPONSE (B) - PREPARED BY SCOTT MADDEN:

ScottMadden did not evaluate industry trends. Instead, ScottMadden evaluated Toronto Hydro's proposed custom IR plan for its relative consistency with other electric utility ratemaking frameworks and practices that support a clean energy transition. Please refer to the response to 1B-EP-23, part (a).

QUESTION (C):

c) Is Toronto Hydro stating that ratemaking in North America is moving away from the use of price and productivity indexing to escalate OM&A revenue and towards its escalation based on forecasts? If so, please substantiate.

RESPONSE (C) - PREPARED BY SCOTT MADDEN:

ScottMadden did not evaluate industry trends. Instead, ScottMadden evaluated Toronto Hydro's proposed custom IR plan for its relative consistency with other electric utility ratemaking frameworks and practices that support a clean energy transition. Please refer to the response to 1B-EP-23, part (a).

QUESTION (D):

d) Is Toronto Hydro stating that that ratemaking in North America is moving towards variance account treatment of most costs of demand growth, including the traditional costs of customer connections, billing, and collection? If so, please substantiate.

RESPONSE (D) - PREPARED BY SCOTT MADDEN:

ScottMadden did not evaluate trends in variance account treatment. Please refer to the response to 1B-EP-23, part (a).

QUESTION (E):

e) Please list the approved multi-year rate plans that Toronto Hydro thinks are most similar to Toronto Hydro's proposed CRCI plan and explain the similarities and differences.

RESPONSE (E) - PREPARED BY SCOTT MADDEN:

Please refer to Figure 1 in Exhibit 1B-2-1 Appendix A, (Review of Rate Framework), pp. 5-6.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-20

Reference: Exhibit 1B, Tab 2, Schedule 1, Appendix A, Pages 3-4.

Preamble:

Reference 1 states that:

> "The changing energy industry has prompted various modifications to ratemaking frameworks and practices. These changes are generally designed to provide cost recovery flexibility and stability to help address challenges related to the changing grid needs. Specifically, multi-year rate plans and performance-based regulation ("PBR") frameworks and practices have been modified as follows.
>
> 1. Attrition Relief Mechanisms ("ARMs") modified to reflect the scale and timing of investments.
>
> − For example, regulatory jurisdictions, such as the United Kingdom ("UK"), Australia, Philippines, and Malaysia, utilize a "building blocks" approach that reflects forecasted capital investments and operations, maintenance, and administration ("OM&A") expenditures within multi-year ratemaking frameworks. This approach better aligns cost recovery with the scale and timing of capital and OM&A needs."

QUESTION:

a) Please confirm the following statements. If Toronto Hydro disagrees with any statements, please explain why.

   i. Basing ARM escalation on cost forecasts is nothing new. This approach has, for example, been used for many years for OM&A and capital costs in New York and Great Britain and for capital cost in Australia.

   ii. The British energy utility regulator Ofgem has extensive experience with cost forecasting. Insofar as Ofgem's building block approach to ARM design is based on cost forecasts, is it therefore not necessarily based on utility forecasts.

iii. Stairstep rates in New York are usually the outcome of settlements.

iv. Indexing and forecasting are not the only established bases for escalation of capital revenue in ARMs. In particular, capital revenue has been based on a utility's recent average historical plant additions (sometimes adjusted for inflation) in the out years of multi-year rate plans (MRPs) in several jurisdictions that include Alberta, California, and Massachusetts.

v. Indexing is currently used or has recently been used to escalate OM&A revenue in a number of jurisdictions that include Australia, British Columbia, Ontario, Massachusetts, and Québec.

vi. Interest is growing, not diminishing, in indexed ARMs, as evidenced by recent developments in British Columbia, Connecticut, and Indiana ratemaking.

vii. Several MRPs have no explicit provision for OM&A revenue growth other than that which results from billing determinant growth and depreciation of plant value. Examples include the "tracker/rate freeze" ARMs of Cleco Power in Louisiana, Florida Power & Light, and Appalachian Power in West Virginia.

viii. The focus on the modernization of PBR rather than ratemaking generally sidesteps the reality that MRPs are increasingly popular in North America even though these may afford more risk of cost recovery than frequent rate cases. Jurisdictions that have recently adopted MRPs include British Columbia (for BC Hydro), North Carolina and West Virginia.

RESPONSE - PREPARED BY SCOTTMADDEN:

i. Confirm.

ii. Under the RIIO-ED2 price control, Ofgem sets regulated revenues and required outputs for the electricity distribution network operators using information obtained from the companies based on activities they intend to undertake in RIIO-ED2 and their associated costs. Companies provide this information in the form of a Business Plan, and utilize the

building blocks method to establish revenues based on forecasted capital and O&M expenditures for each year of the rate period.

iii. ScottMadden's review found New York utilities generally develop Joint Proposals (jointly sponsored by utilities and intervenors) based on capital spending and OM&A expense forecasts filed in their direct case. Joint Proposals are then filed before the New York Public Service Commission and subject to their approval. The Commission may approve, reject, or modify the Joint Proposals, which then forms the basis for setting electric utility rates in New York over the past several years.

iv. Utilization of historical data for capital spending forecasts in MYRP has generally been accompanied by some form of capital spending riders for electric utilities reviewed in the study.

For example, Massachusetts establishes a capital budget based on a historical five-year average of capital additions. However, the capital budget does not include capital spending for projects recovered through separate, non base rate mechanisms, such as solar, meter-related capital, and grid modernization projects.[1]

v. Confirm.

vi. ScottMadden did not evaluate trends in indexed ARMs.

vii. ScottMadden did not review the referenced utilities.

viii. ScottMadden did not review the referenced rate cases. Disagree with premise of the question. PBRs and MYRPs are not mutually exclusive. The building blocks method referenced in the report represents a form of multi-year ratemaking.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-21

References: Exhibit 1B, Tab 2, Schedule 1, Appendix A, Page 15

Exhibit 1B, Tab 2, Schedule 1, Appendix B

Preamble:

At Reference 1, Toronto Hydro identifies certain advantages of forecasting OM&A as well as capital costs.

Throughout Reference 2, Toronto Hydro cites Ofgem.

QUESTION:

a) Please explain Ofgem's Information Quality Incentive. Please explain the context under which the IQI was developed and implemented by Ofgem, particularly noting the regulatory risks it aims to address.

RESPONSE - PREPARED BY SCOTTMADDEN:

The Information Quality Incentive (IQI) provided an incentive to distribution companies to minimize variances between actual and forecast expenditures. The IQI mechanism was intended to address information asymmetry between Ofgem and electric distribution or network companies.

In RIIO-2, Ofgem replaced the IQI with a Business Plan Incentive (BPI) mechanism. Under BPI mechanism, companies present business plans that identify costs and outputs, such as service quality. The quality of the business plans are subject to rewards or penalties up to +/-2% of the utility revenues.[1]

[1] Jamasb, Tooraj. "Incentive Regulation of Electricity and Gas Networks in the UK: From RIIO-1 to RIIO-2." Economics of Energy & Environmental Policy, vol. 10, no. 2, Sept. 2021

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-22

Reference: Exhibit 1B, Tab 2, Schedule 1, Appendix B, Pages 3-11

Preamble:

At Reference 1, Toronto Hydro states that

"PBR mechanisms have been "modernized" to reflect energy transition.

- Modernized PBR mechanisms address cost recovery uncertainties that facilitate meeting policy objectives and utility financial health… (p. 3)
- Alternative Cost Recovery Mechanisms, such as cost trackers, provide cost recovery related to certain public policy goals (p. 5).

Modernized PBR mechanisms provide utilities with flexibility to address changing grid needs while maintaining safe and reliable service

- Address cost recovery challenges of achieving policy objectives
- Fund traditional and new investments to meet clean energy transition
- There is recognition that policy objectives cannot be achieved without ensuring cost recovery for necessary investments (p. 10)

Jurisdictions have implemented cost trackers for *traditional utility projects* and emerging cost categories (such as clean energy programs) (p. 11) [italics added]"

QUESTION:

a) Please confirm the following statements. If Toronto Hydro disagrees, please explain.

iii. In multiyear rate plans, regulators are increasingly approving cost variance accounts to encourage utility activities that advance public policy goals such as beneficial electrification and accommodation of distributed energy resources on the customer side of the meter. The cost of these activities is hard to predict accurately and utilities in some circumstances have weak incentives to pursue them. However, major expansions of distribution system (e.g. substation) capacity

to accommodate the energy transition have rarely been accorded tracker treatment in MRPs to date.

iv. Cost trackers for traditional utility capex in the States (e.g., distribution system improvement charges) have usually been approved not in the context of a multiyear rate plan but instead where the alternative is frequent rate cases. Roughly half of all US jurisdictions do not employ forward test years in rate cases.

RESPONSE - PREPARED BY SCOTTMADDEN:

iii. ScottMadden did not evaluate trends in cost variance accounts. Instead, ScottMadden evaluated Toronto Hydro's proposed custom IR plan for its consistency with other electric utility ratemaking frameworks and practices that support a clean energy transition.

iv. ScottMadden is unable to confirm the first sentence; however, one of the benefits of multiyear rate plans is to avoid frequent rate cases. Specifically, capital spending trackers are designed to achieve multiple benefits, including adequate cost recovery, address uncertainties related to the magnitude and pace of investments, and avoid frequent rate cases. There are several examples of adjustment clauses that recover investments in the distribution system as part of multi-year rate plans, such as in Hawaii and Massachusetts.

- Confirmed that approximately 50.00 percent of U.S. jurisdictions do not employ forward test years in rate cases.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-23

Reference: Exhibit 1B, Tab 2, Schedule 1, Appendix B, Pages 11 and 13

Preamble:

Reference 1 states the following regarding Hawaiian electric utility regulation:

- Hawaii's Exceptional Project Recovery Mechanism (EPRM) provides cost recovery certainty for eligible projects (primarily clean energy-related infrastructure and grid modernization investments) placed in service between rate cases (p. 11)
- The Commission has taken a broad approach to eligible projects, noting that "limiting eligible projects to pre-determined plans made in other dockets may limit the flexibility to address unforeseen events or take advantage of unexpected opportunities (e.g., improvements in technology, changes in consumption behavior, etc.)" (p. 11)
- The Hawaii PUC noted, "The PBR Framework approved in this D&O has been carefully designed to include multiple safeguards and review opportunities to protect the Companies' financial health from extreme hardship" (p. 13)

QUESTION:

a) Please confirm that the Hawaii Public Utilities Commission approved a revenue cap index formula that was much more favorable to consumers than the one that the Hawaiian Electric (HECO) companies requested.

RESPONSE - PREPARED BY SCOTTMADDEN:

Scott Madden did not evaluate whether the approved revenue cap index formula was much more favorable to consumers than the one HECO requested. Scott Madden found the approved revenue cap index formula is a ratemaking framework and practice used by electric utilities to support a clean energy transition.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-24

Reference: Exhibit 1B, Tab 2, Schedule 1, Appendix B, Page 20

Preamble:

Reference 1 provides a table that contains a taxonomy of "ARMs Cost Forecasting Methodologies" and includes the statement that a Forecasted/"Stairstep" methodology is "based on forecasted revenue requirements."

QUESTION (A):

a) For each item in the table, please explain the forecasting methodology employed for each attrition relief mechanism (ARM). For example, please explain how a "Rate Freeze" is a cost forecasting methodology for an attrition relief mechanism. Please do so for each item in the table.

RESPONSE (A) - PREPARED BY SCOTT MADDEN:

Please refer to the table below.

Attrition Relief Mechanism	Forecasting Methodologies
Rate Freeze	Rates are set for MYRP term based on a set revenue level. Revenue growth depends on growth in billing determinants.
Forecasted/ Stairstep	Rate adjustments based primarily on multi-year forecasts
Indexed ("I-X")	Rates or revenue adjusted annually to account for inflation less a productivity factor
Hybrid	Utilize a mix of indexing and other escalation methodologies, such as indexing O&M expenses and forecasting capital costs

QUESTION (B):

b) Please confirm that some approved stairstep and hybrid ARMs have not involved much if any capital cost forecasting. Budgets for most gross plant additions (or capex) have, for example, been set for several years at an average of recent historical capex or at the approved test year value (and these budgets have sometimes been adjusted for inflation). If Toronto Hydro disagrees with any of these statements, please explain why.

RESPONSE (B) - PREPARED BY SCOTTMADDEN:

ScottMadden is unable to confirm the general statement, but denies it with respect to utilities referenced in the report. The utilities referenced in the report generally rely on capital cost forecasting for rates based on the stairstep method.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-25

Reference: Exhibit 1B, Tab 2, Schedule 1, Appendix B, Page 21

Preamble:

Toronto Hydro provides information regarding the first generation of multiyear rate plans in Alberta ("PBR1") but not later generations. In the PBR1 plans, cost trackers provided supplemental capital revenue.

QUESTION:

a) Please confirm the following statement. Insofar as Toronto Hydro disagrees, please explain.

> The Alberta Commission has since approved two additional generic MRP design frameworks that it has called "PBR2" and "PBR3". In these frameworks the role of capital cost trackers and cost forecasting was greatly reduced. In each plan, most supplemental capital revenue has been provided by a "K-Bar" mechanism linked to the utility's recent historical capex. OM&A revenue has been escalated chiefly by a price cap index (for power distributors) or a revenue per customer index (for gas distributors).

RESPONSE - PREPARED BY SCOTT MADDEN:

Confirmed that the role of capital cost trackers and cost forecasting to provide supplemental capital revenue was reduced in PBR2 and PBR3 relative to PBR1. However, the role of capital cost trackers in PBR3 has not been greatly reduced as compared to PBR2. On the contrary, Alberta Utilities Commission (AUC) recognized the importance of the capital cost tracker to recover future investments related to the achievement of net-zero objectives. AUC also recognized the uncertainties related to the pace and scale of the investments, stating:

> "The Commission agrees that there is the potential for net-zero objectives to drive the need for additional expenditures during the PBR3 term, and that the level of

> uncertainty and risk associated with the need for and timing of net-zero objectives makes capital investments required to respond to any such objectives unsuitable for funding through the Type 2 K-bar mechanism."[1]

The PBR3 framework also includes supplemental capital funding through the K-bar mechanism which is a formulaic approach that provides utilities with additional capital funding calculated based on average recent historical capital additions.

Finally, cost forecasting is utilized to determine the going-in rates for the PBR3 framework. The AUC set the respective 2023 (rebasing year) revenue requirements for Alberta utilities based on approved forecasted costs.[2]

[2] Id., p. 10

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-26

Reference: Exhibit 1B, Tab 2, Schedule 1, page. 5

Preamble:

Toronto Hydro proposes to replace the Custom Price Cap Index in its current plan with a Custom Revenue Cap Index ("CRCI").

QUESTION (A):

a) Why does the CRCI formula not include an escalator for growth in the number of customers that Toronto Hydro serves and/or some other external metric of Toronto Hydro's operating scale?

RESPONSE (A):

The CRCI formula does not include such an escalator because growth is captured inherently through the revenue cap approach, relying on the billing determinants projected for each rate class in the five-year load and customer forecast in Exhibit 3, Tab 1. Please see part b) for more information.

QUESTION (B) :

b) Please confirm that, in the absence of such an escalator, the entire cost of customer growth must instead be addressed by some combination of forecasting and variance accounts.

RESPONSE (B):

In both a price cap and revenue cap, incremental revenues driven by billing determinant growth is based on the load and revenue forecast in Exhibit 3, Tab 1. The difference is with respect to how the forecasted growth is reflected in rates. In a price cap, the growth is captured through a top-line growth factor (i.e. g-factor). As noted in Exhibit 1B, Tab 2, Schedule 1 at page 21: *The g-factor*

translates billing determinant growth across customer count, kWh, and kVa in all rate classes into a simplistic top-line figure that is applied formulaically to base rates. As noted in Exhibit 1B, Tab 2, Schedule 1 at pages 21, in a revenue cap, [r]*ather than escalate rates themselves each year, and use a simplistic g-factor to account for expected billing determinant growth, Toronto Hydro proposes to escalate revenue requirement each year, and design rates for each revenue requirement on the basis of forecasted customer and load growth over the rate term.*

QUESTION (C) :

c) Please describe Toronto Hydro's view on the advantages and disadvantages of a growth escalator in a revenue cap index. Please discuss any additional considerations, highlighting advantages and disadvantages, in the context of rapid growth in the number of customers in classes that are especially costly to serve.

i. In the above context, please explain how common is it for Toronto Hydro to serve bulk-metered residential apartment buildings or condominiums or residential apartment buildings with a single or bulk meter?

ii. What costs does Toronto Hydro incur for the ownership of assets or the provision of services inside these buildings?

RESPONSE (C):

Toronto Hydro is unclear about the definition of a "growth escalator" within the context of the question. To the degree a growth escalator is an adjustment to rates to account for growth in billing determinants over the rate term, there are no advantages to such an inclusion, as the effect would be to inappropriately account for growth in billing determinants twice. Under a Price Cap, *rates* are escalated each year based on an index. Absent an adjustment for growth, (i.e. a g-factor), the result is that the utility will retain all increased revenues resulting from increased billing determinants. In EB-2014-0116 and EB-2018-0165 a g-factor was implemented to remove a forecast of this increased revenue, on the rationale that Toronto Hydro's 5-year forecast costs should include the forecast cost of growth.

Under a Revenue Cap, *revenue requirement* is escalated each year by an index. Subsequently, the escalated revenue for each rate class is divided by the billing determinant forecast for the year to determine the rates. This adjustment reduces the rates by the expected growth in billing determinants for the year in question. The end result is a downward adjustment to rates (assuming billing determinants are forecast to increase year over year), in the same manner a Price Cap g-factor implements a downward adjustment to rates. The core difference is that the g-factor implements the adjustment on a generic, system-wide basis, while the revenue cap approach calculates adjustments on a rate class specific basis, based upon specific forecast billing determinants.

Please see response to interrogatory 2B-ED-25 for information regarding the proportion of multi-residential buildings served by Toronto Hydro which are served via bulk meter. Toronto Hydro does not incur any costs for assets not owned by the utility. For bulk metered buildings (e.g. residential apartment buildings or condominiums), Toronto Hydro owns the main service connection cable from the main distribution system to the electrical demarcation service point with the customer and the bulk meter. Toronto Hydro does not own any assets beyond this electrical demarcation point including any part of the buildings own electrical infrastructure or distribution system (e.g. panelboards, switchboard, secondary wires, and any meter provided by a third party unit sub-metering provider).

QUESTION (D):

Funding for connections to large commercial establishments can be increased using a revenue-weighted index of growth in various customer categories, such as a scale escalator in a revenue cap index formula. Please accordingly divide the number of customers served by Toronto Hydro into residential and other and, if practicable, itemize as well the revenue and customers receive general service 1,000 to 4,999 KW and larger) for the forecast period and back to 2015.

RESPONSE (D):

Tables 1 and 2 provide 2015-2029 customer numbers and distribution revenue by rate class.

Table 1: 2015-2029 Customer Numbers

Year		Residential		Non-Residential						Total
		Residential	CSMUR	GS <50 kW	GS 50-999 kW	GS 1,000-4,999 kW	Large Use	Street Lighting	USL	
2015	Actual	610,971	55,997	70,561	10,427	439	44	1	866	**749,306**

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-27

Reference: Exhibit 1B, Tab 2, Schedule 1, Pages 26-27

Preamble:

Toronto Hydro states that

"Toronto Hydro proposes to replace the Ontario Average Weekly Earnings ("ON-AWE") inflation index within the OEB's inflation factor methodology with a custom Toronto Hourly Salary and Wages Index. This index can either be derived by the Conference Board of Canada ("CBC") economic data subscription service or can be reproduced by purchasing relevant tax data from Statistics Canada. For efficiency purposes, Toronto Hydro proposes to rely on the Conference Board of Canada index."

QUESTION (A) – (E):

a) Please provide a live spreadsheet (e.g., with formulas intact) with the calculations for the proposed custom Toronto Hourly Salaries and Wages Index and a detailed description of the methodology underlying these calculations, including but not limited, to the timeseries file IDs for the Conference Board of Canada data used in the calculations and any assumptions underlying the calculations.

b) Please confirm that the salary and wages data provided by the Conference Board of Canada are derived from tax data purchased from Statistics Canada such that whether the data are purchased from the Conference Board of Canada or Statistics Canada, the result will be the same. If not confirmed, please explain why.

c) Are tax data used in the construction of Statistics Canada's indexes for Average Hourly Earnings, Average Weekly Earnings, or fixed weighted index of average hourly earnings?

d) Please provide the live spreadsheet (e.g., with formulas intact) with the calculations for Toronto Hydro's Average Blended Salary Increase (Appendix 2-K) and a detailed description

of the methodology used for these calculations including any underlying assumptions (e.g., number of hours worked).

e) Please confirm that the Alberta Utilities Commission chose the fixed-weighted index of average hourly earnings as the labor price index for its inflation factor formula in PBR3. What is Toronto Hydro's view of this alternative?

RESPONSE (A) – (E):

Please see response to 1B-Staff-93.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-28

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 25

Preamble:

Toronto Hydro states that

"Aside from achieving the objective of providing funding certainty and stability in rates which is necessary to enable effective multi-year planning and operations, the RGF offers the added benefit of simplicity relative to the current C-factor since the entire revenue requirement is being escalated by the same inflation and productivity factors. [italics added]"

QUESTION:

a) Please confirm that firms in unregulated markets have achieved effective multiyear planning and operations without funding certainty and price stability. If not, please explain.

RESPONSE:

Toronto Hydro is unsure how this question applies to a proceeding to set rates for a regulated monopoly, and cannot comment on how unregulated organizations operate in a competitive market. However, it notes that the considerations of certainty and stability in rates are echoed in the Renewed Regulatory Framework objective of setting a more flexible (multi-year) approach to rate-setting that will: "(i) enhance predictability necessary to facilitate planning and decision-making by customers and distributors; (ii) better align rate-setting with distributor planning horizons; (iii) facilitate the cost-effective and efficient implementation of distributor multi-year plans that have been developed to achieve the outcomes for customer service and cost performance; and (iv) help to manage the pace of rate increases for customers."[1] [numbering added for organization]

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-29

Reference: Exhibit 1B, Tab 2, Schedule 1

Preamble:

Toronto Hydro proposes that future revenue from the PIM-DA rate rider, if achieved, should be exempt from Earnings Sharing Mechanism treatment.

QUESTION (A):

a) Please elaborate Toronto Hydro's proposal that the future PIM-DA riders be exempt from ESM treatment. Please also articulate Toronto Hydro's view of how this potential rider would qualify as "certain adjustments" cited on page 47 of Reference 1. What other Toronto Hydro riders are, or have been, exempt from ESM treatment.

RESPONSE (A):

The PIM is a *mechanism* that proactively reduces the utility's regulated allowed earnings to the benefit of customers. As such, achievement of the PIM and receipt of any resulting incentive amounts would only return Toronto Hydro to a position of earning its OEB-approved ROE. In other words, the PIM does not contribute to earnings in excess of OEB-approved ROE. Given the ESM is explicitly in place to protect against excessive overearnings, it would be inappropriate to subject incentives received under the PIM to ESM treatment. Consequently, any recognition of PIM-related revenue (that would be captured in the PIM-DA) should be adjusted/normalized out of the ESM calculation as an "*out-of-period items and to ensure there is no double counting.*"[1] This is consistent with how the 2012-2014 ICM rate riders (i.e. *out of period items*) were treated/adjusted for the purposes of the ESM calculation in the 2015-2019 custom rate period. If adjustments are not made, and the ESM is triggered, PIM-related earnings captured in the PIM-DA, would be clawed back

[1] EB-2018-0165, Decision and Order (December 19, 2019) at page 193.

through the ESM. This treatment leads to an outcome of penalizing the utility for lost revenues that is entitled to earn-back under the PIM as proposed.

QUESTION (B) AND (C):

b) Referencing only OEB policy and other OEB regulated utilities, please provide all examples known to Toronto Hydro where an incentive measure is exempt from that utility's ESM. Please articulate how Toronto Hydro's proposal is similar to these examples.

c) Referencing only OEB policy and other OEB regulated utilities, please provide all examples known to Toronto Hydro where an incentive measure is not exempt from that utility's ESM. Please articulate how Toronto Hydro's proposal is different from these examples.

RESPONSE (B) AND (C):

Toronto Hydro is not able to comment on the particulars of how other utilities handle their ESMs. The utility notes that ESMs were established by the OEB through adjudication of major rate applications, rather than as a matter of policy. In the 2016 Rate Handbook, the OEB only mentions ESMs under rate-setting considerations for distributors undergoing consolidation, which is not applicable to Toronto Hydro's circumstances. As noted above, Toronto Hydro's proposed ESM and its interaction with the PIM-DA is consistent with the OEB's decision in previous applications, and yields a fair and reasonable outcome where the ESM does not penalize Toronto for allowed earnings which its has proactively given up and proposed to earn-back through the achievement of performance outcomes under the PIM.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-30

Reference: Exhibit 1B, Tab 2, Schedule 1, Pages 3, 30

Preamble:

Toronto Hydro proposes to add a "pro-active 0.6% performance factor" to its revenue cap index formula. Toronto Hydro further states that this factor would provide customers with "a significant upfront rate reduction benefit of approximately $ 65 million over the 2025-2029 rate term." This factor is linked to the proposed custom scorecard.

QUESTION (A):

a) Please address the notion that if Toronto Hydro does not achieve the scorecard targets, the "up front rate reduction" constitutes compensation to customers for Toronto Hydro's poor performance. In this context, please explain Toronto Hydro's view of the nature of the proposed PIM. That is, does Toronto Hydro view the PIM proposal as an asymmetrical penalty-only PIM? Please explain.

RESPONSE (A):

Toronto Hydro does not agree with the characterization posed by this question. Toronto Hydro would make every effort to complete its plan. All the PIM does is shift the risk of completing the Plan away from the ratepayer and onto the utility. Its effect is to provide incremental benefits, and decreased risks to, ratepayers. The PIM was designed to be responsive to the OEB's guidance in the last decision (EB-2018-0165) with respect to *improving the balance of risk between customers and the utility*. For more information about how the PIM achieve this balance please refer to the utility's response to 1B-SEC-13.

QUESTION (B):

b) Please explain, from a ratemaking and design perspective, Toronto Hydro's view as to why is this ratemaking treatment preferable to separate ratemaking treatment of the PIM (e.g., a penalty-only PIM not linked to the X factor or to a $65 million rate discount in the first year of the plan)?

RESPONSE (B):

The proposed PIM is preferable to the two examples posed above for the following reasons:

- Toronto Hydro infers that "penalty-only" PIM, which is not linked to the X-factor, would operate such that in the event Toronto Hydro did not achieve targeted performance, amounts would be recorded in a deferral account for future disposition to ratepayers as a credit. This proposal is inferior to the proposed PIM, as customers would not receive the upfront benefit of lower rates during the next rate term. This approach would also place less risk on the utility and more risk on customers as they would be paying for benefits in rates that may or may not be achieved.
- Regarding the proposal of a "$65 million rate discount in the first year of the plan" Toronto Hydro assumes such an approach would work as a *one-time bill credit* of $65 million in 2025. This approach creates unnecessary rate volatility (i.e. lumpiness) in that it provides a short-term rate-relief in 2025 followed by a jump in rates in 2026 when the credit expires. This approach also places unnecessary pressure on the utility's liquidity (i.e. cash flows) by forcing the utility to increase borrowing in order to pay the one-time credit in 2025.

QUESTION (C):

c) Please describe whether and how Toronto Hydro established that customers accept the PIM cost and design.

RESPONSE (C):

Toronto Hydro's approach to application-specific customer engagement focuses on understanding customers needs and preferences with respect to investment priorities (Phase 1) and preferences

with respect to trade-offs between price and other outcomes (Phase 2). The insights that Toronto Hydro gained from customer engagement informed the development, refinement and finalization of the Plan, and the outcomes featured on the 2025-2029 Custom Scorecard, as described in Exhibit 1B, Tab 3, Schedule 1 at page 4. Customers were not directly consulted on the PIM design and cost because (as noted in the evidence and shown in the timeline provided in the response to 2B-SEC-32) the PIM was developed after the Plan was refined and finalized post Phase 2 Customer Engagement.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-31

Reference: Exhibit 1B / Tab 2 / Schedule 1 / pp. 30-31

Preamble:

Toronto Hydro states that

"Toronto Hydro carries the risk of achieving the performance outcomes since, if the targets are not achieved, Toronto Hydro cannot earn its approved return on equity ("ROE"). As such, the PIM is an asymmetrical incentive to the benefit of customers in that it provides Toronto Hydro with the opportunity (not the guarantee) to earn the approved ROE and make a fair return for its shareholder. It is aligned with the RRF, and responsive to the OEB's feedback in Toronto Hydro's 2020-2024 decision encouraging the utility to consider an alternative approach in the future that meets RRF requirements and improves the balance of risk between customers and the utility."

QUESTION (A):

a) Please confirm the following statements, explaining any disinclination to confirm statements.

i. If the proposed PIM were ultimately to result in a net penalty, this would compensate customers for Toronto Hydro's failing to achieve targets.

ii. Customer revenue under the proposed plan would in many cases fund activities, such as vegetation management and replacement of aging assets, that made achievement of the target possible.

iii. The asymmetrical design of the PIM improves the balance of risk between Toronto Hydro and customers in favor of customers.

RESPONSE (A):

i. Toronto Hydro disagrees with the characterization posed by the question. Please see the response to 1B-Staff-30(a).

ii. Yes, revenue collected from customers in exchange for the distribution services provided by Toronto Hydro funds the utility's capital and operations work programs. As stated in Exhibit 1B, Tab 3, Schedule 1, at page 5 the targets are based on Toronto Hydro's plan as-filed in this application.

iii. Yes. Please see the response to 1B-Staff-30(a).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-32

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 32

Preamble:

Toronto Hydro states that

"To implement the PIM, Toronto Hydro proposes a new deferral account - the Performance Incentive Mechanism Deferral Account (PIM-DA) - to record the PIM earnings. This account would be brought forward for review and disposition in the utility's next rebasing application, based on known (or forecasted) performance results for the 2025-2029 rate period. Only if the set performance targets are achieved (or forecasted be achieved with a high degree of confidence) by the end of the rate term would the incentive be recovered from customers in the next decade. [italics added]"

QUESTION:

On what ground would TH believe the likely outcome of performance on a specific measure ought to be sufficient to dispose of the balance in the account, rather than the actual results, regardless of when they are known?

RESPONSE:

If the likely outcome of achieving a target is *probable* based on the historical results (i.e. 2025-28) and the forecasted results for the bridge year (i.e. 2028-29), Toronto Hydro believes that it would be most efficient to deal with the disposition of the incentives associated with that target in the context of the rebasing application. As noted in the response to 1B-SEC-14, in the event that a target is forecasted to be achieved, but is not in fact achieved at year-end 2029, the utility would withdraw its request to recover the associated balances in the PIM-DA at the Draft Rate Order stage which normally occurs in the first quarter of the new rate period (i.e. Q1/2030).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-33

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 30

Preamble:

Toronto Hydro states that "Toronto Hydro carries the risk of achieving the performance outcomes since, if the targets are not achieved, Toronto Hydro cannot earn its approved return on equity."

QUESTION:

Please confirm that Toronto Hydro will have other means of achieving its target ROE, including accelerated efficiency gains and unexpectedly favorable external business conditions. If Toronto Hydro disagrees, please explain.

RESPONSE:

For clarity, the statement referenced above should have read: "Toronto Hydro carries the risk of achieving the performance outcomes since [*all things being equal*], if the targets are not achieved, Toronto Hydro cannot earn its approved return on equity."

While financial performance (ROE) can be impacted by factors such as changes in external business conditions, Toronto Hydro notes that such factors are both outside the utility's control and symmetrical (i.e. unfavourable conditions are equally as likely favourable ones). Please see the response to 5-Staff-315(a) for a list of the existing and emerging business risks that Toronto Hydro faces and must continue to manage to be successful in delivering its Plan and achieving its ROE.

With respect to the example of accelerated efficiency gains, it is unrealistic to expect that under a rate framework with the highest X-factor in the province as Toronto Hydro proposed in this application, Toronto Hydro would be able to achieve its allowed rate of return through accelerated efficiency gains. The various benchmarking studies and analyses filed in this application show that

Toronto Hydro exceeds the performance of its peers when the relevant operating conditions (e.g. dense urban environment) are taken into consideration, and even without factoring in those conditions is a good cost performer relative to its peers.

The proposed 0.75% X-factor yields a cumulative revenue reduction of approximately $81 million over the rate term, as shown in the response to 1B-Staff-03(b). Given the magnitude of this revenue reduction/deficiency resulting from the X-factor and Toronto Hydro's historical track-record of harvesting efficiency gains, the utility would not be able to achieve the allowed rate of return through accelerated efficiency gains.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-34

References: Exhibit 1B, Tab 3, Schedule 1, Table 1
Exhibit 1B / Tab 2 / Schedule 1, Appendix A
Report of the Board: Renewed Regulatory Framework for Electricity Distributors: A Performance-Base Approach, October 2012

Preamble:

Toronto Hydro proposes linking its custom scorecard to a performance incentive mechanism. At pages 17 and 18 of Reference 2, Toronto Hydro's evidence states that Toronto Hydro's proposed performance incentive mechanisms are consistent with similar mechanisms employed by other electric utilities.

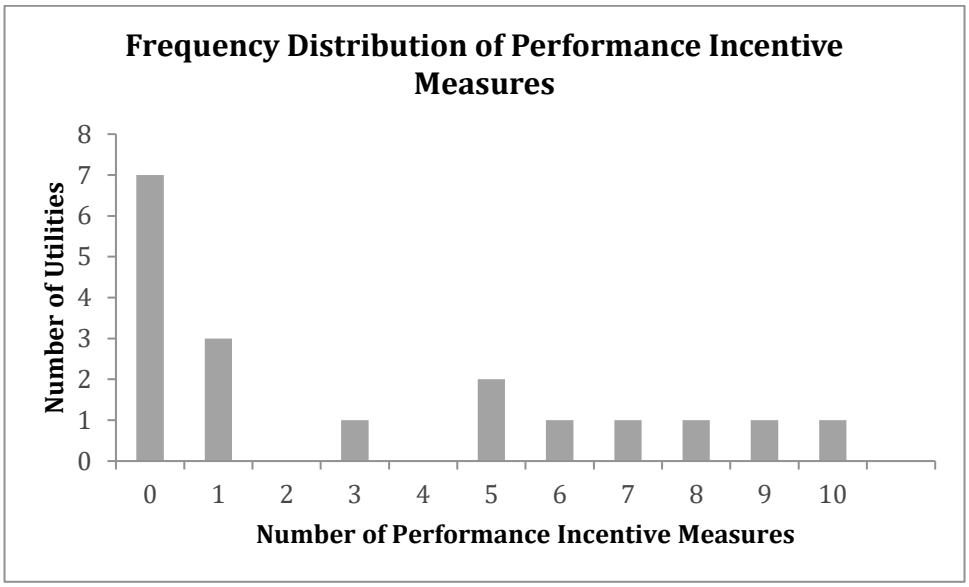
In the questions below, for any utilities that have a combined regulated business type, for example a utility with both electricity distribution and transmission, or electricity and gas distribution, or any other such combination, respond only in the context of their electricity distribution service. Also, for the questions below, only consider what has been approved through a decision and order, or equivalent regulatory action, and thus in place at this moment in time. Please do not include "proposals" or examples in a currently ongoing proceeding where the given utility has not previously had a performance incentive mechanism.

QUESTION (A):

a) Please identify how many utilities were considered as part of the jurisdictional review. How many jurisdictions/regulators/commissions? Please provide a list or table identifying each jurisdiction/regulator/commission and the number of utilities for each.

RESPONSE (A) - PREPARED BY SCOTTMADDEN:

Please refer to the table below.



Jurisdiction	Utility
Alberta	ATCO Electric
California	SDG&E
California	PG&E
Hawaii	Hawaiian Electric
Illinois	Ameren
Maine	Central Maine Power
Massachusetts	Eversource
Minnesota	Northern States Power Company
New Jersey	PSE&G
New York	Con Edison
New York	National Grid
North Carolina	Duke Energy
Nova Scotia	Nova Scotia Power
Ohio	AEP
Pennsylvania	PECO
Rhode Island	Rhode Island Energy
UK	General Review
Vermont	Green Mountain Power

QUESTION (B):

b) For all the utilities in the jurisdictional review, provide a distribution of the number of measures in the performance incentive, with a resolution of one for the distribution. For example, how many utilities have only one measure? Two measures? And so on. As a further example, Toronto Hydro has proposed 12 measures. Please include the number of utilities that do not have any such performance incentive and thus the number of measures would be zero.

RESPONSE (B) - PREPARED BY SCOTTMADDEN:

Please refer to the figure below.[1]

QUESTION (C):

c) For all the utilities in the jurisdictional review, provide a count of utilities with: no performance incentive, penalty only performance incentive, reward only performance incentive, and mix of penalty and reward incentives. Please confirm Toronto Hydro's definition of a "penalty only performance incentive" and a "reward only performance incentive."

[1] Alberta Utilities Commission. Decision 27388-D01-2023. 2024-2028 PBR Plan for Alberta Electric and Gas Distribution Utilities. October 4, 2023; Rulemaking 14-10-003, Decision 16-12-036, California Public Utility Commission, December 15, 2016; Docket No. 2018-0088, Decision and Order No. 37507 Instituting a Proceeding to Investigate a Performance-Based Regulation, Hawaii Public Utilities Commission; Illinois Commerce Commission, Docket 22-0487, Order, December 14, 2023; Maine Public Utilities Commission, Docket No. 2022-00152, Order Approving Stipulation, June 6, 2023; Massachusetts D.P.U. 22-22, Exhibit ES-METRICS-Rebuttal-1, June 13, 2022; Minnesota Public Utilities Commission, Docket No. E-002/CI-17-401, Order, September 18, 2019; New Hampshire Public Utilities Commission, Docket No. DE 23-039, Liberty Utilities Direct Testimony, May 5, 2023; Cases 19-E-0065 et al., Consolidated Edison Company of New York, Inc. - Rates, Order Approving Electric and Gas Rate Plans (issued January 16, 2020) (2020 Rate Order); New York Public Service Commission, Niagara Mohawk Rate Case, Order Adopting Terms of Joint Proposal, January 20, 2022; North Carolina, Docket E-2, Sub 1300, Order, August 18, 2023; Nova Scotia Utility and Review Board, Decision, M10431, February 2, 2023; Rhode Island Public Utilities Commission, Docket No. 4770, Order No. 24088, July 27, 2022; Ofgem, RIIO-2 Framework Decision, July 2018; Vermont Public Utilities Commission, Case No. 22-0175-TF, Order, August 31, 2022

RESPONSE (C) - PREPARED BY SCOTTMADDEN:

Please refer to the figure below.

Jurisdiction	Utility	Penalty Only Performance Incentive	Reward Only Performance Incentive	Penalty and Reward Incentives	Total Metrics
Alberta	ATCO Electric	-	-	-	0
California	SDG&E	-	1	-	1
California	PG&E	-	1	-	1
Hawaii	Hawaiian Electric	-	3	2	5
Illinois	Ameren	-	-	1	1
Maine	Central Maine Power	6	-	-	6
Massachusetts	Eversource	7	1	-	8
Minnesota	Northern States Power Co.	-	-	-	0
New Jersey	PSE&G	-	-	-	0
New York	Con Edison	-	7	-	7
New York	National Grid	-	9	-	9
North Carolina	Duke Energy	1	2	-	3
Nova Scotia	Nova Scotia Power	-	-	-	0
Ohio	AEP	-	-	-	0
Pennsylvania	PECO	-	-	-	0
Rhode Island	Rhode Island Energy	4	1	-	5
UK RIIO	General Review	-	-	10	10
Vermont	Green Mountain Power	-	-	-	0

Under 'penalty only' incentives, utilities are penalized (such as through a downward adjustment in allowed revenues) if a performance target is not achieved. There is no reward or penalty if a performance target is achieved.

Under 'reward only' incentives, utilities are rewarded (such as through an upward adjustment in allowed revenues) if a performance target is achieved. There is no reward or penalty if the performance target is not achieved.

QUESTION (D):

d) Regarding part c), please comment on any general trends in the jurisdictional scan regarding penalty or reward incentive mechanisms. For example, is there a trend or relationship regarding incentive measures that are reliability based and whether they are

penalty or reward focused? Similarly, is there a trend or relationship regarding incentive measures related to government or regulatory policy?

RESPONSE (D) - PREPARED BY SCOTTMADDEN:

ScottMadden's review did not evaluate general trends in penalty or reward incentive mechanisms. Please refer to the response to 1B-EP-23, part (a).

The report found PIMs are one of the ratemaking frameworks and practices used by utilities to support a clean energy transition. There are jurisdictions, such as New York, where incentive measures are tied to government policies.

QUESTION (E):

e) For all the utilities in the jurisdictional review, provide a count of the number of utilities that have and a count of the number of utilities that do not have a performance incentive mechanism in place, by the length of the multi-year rate period in their currently effective rate period. For utilities that have more than one type of business, provide information only for its electricity distribution service. For example, for a multi-year rate plan that was set for a period of two years, identify how many such electrical distribution utilities have an incentive, and how many do not, across the jurisdictional review.

RESPONSE (E) - PREPARED BY SCOTTMADDEN:

Please refer to the table below.

MYRP Plan Term	Utilities With Performance Incentives	Utilities Without Performance Incentives
2-Year Plan	1	0
3-Year Plan	4	2
4-Year Plan	3	1
5-Year Plan	3	1

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-35

Reference: Exhibit 1B, Tab 2, Schedule 1, Appendix A

Preamble:

Pages 17 and 18 of Reference 2 state that Toronto Hydro's proposed performance incentive mechanisms are consistent with similar mechanisms employed by other electric utilities.

QUESTIONS:

a) Please explain why the first question of Part D to Reference 1 uses the plural of "performance incentive mechanisms"? Is Toronto Hydro proposing one mechanism with multiple measures, or multiple mechanisms? Please explain.

b) If Toronto Hydro is proposing more than one mechanism, please list and describe each of the mechanisms in the context of part a).

RESPONSE (A) AND (B):

The plurality referenced above is a typographical error. Toronto Hydro proposes one mechanism with multiple measures.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-36

References: Exhibit 1B, Tab 2, Schedule 1, Section 3.2.3

Exhibit 9, Tab 1, Schedule 1, Section 9.2

Preamble:

With both references, Toronto Hydro proposes a subaccount to the DRVA to track externally driven capital expenditures. Toronto Hydro states it proposes a symmetrical variance account that protects both ratepayers and the utility from structural unknowns in forecasted costs and revenues. Toronto Hydro states this particular subaccount, is approved, would enable Toronto Hydro to respond to unforeseeable increases in demand-related investment needs without having to defer other priority work and put customer outcomes are risk. Toronto Hydro further states that this subaccount would protect ratepayers by ensuring that they do not pay for demand-driven work that can be deferred and that funds are not repurposed to manage variance in other programs.

QUESTION (A):

a) Please summarize the internal decision-making process that would, in the rate-setting term, evaluate Toronto Hydro's policy environment and decide to reduce capital expenditure as a response to the policy environment. Please provide examples.

RESPONSE (A):

Please refer to the evidence Exhibit 2B, Section D1 for an overview of Toronto Hydro's Asset Management (AM) process through which capital investment decisions are made. On page 18 of this evidence the utility describes how System Growth & Capacity Needs are assessed as part of the AM process. Every year, Toronto Hydro prepares a 10-year weather-adjusted peak demand forecast ("System Peak Demand Forecast") using a driver based, top-down forecasting methodology. This forecast underpins the stations capacity planning process which enables Toronto Hydro to identify

capacity availability and anticipated constraints at substations in relation to future load growth. Please refer to the Capacity Planning evidence in Exhibit 2B, Section D4 for more information.

QUESTION (B):

b) Please explain how Toronto Hydro would manage workforce capacity or other potential constraints, including such considerations as impact on centralized planning and coordination functions, in the face of increases in unforeseen or unforeseeable demand-related investments. Even if additional work were funded, please explain how incremental demand could be satisfied "without having to defer other priority work" while still delivering and completing the planned capital program.

RESPONSE (B):

Toronto Hydro would rely on the talent strategies identified in the Staffing evidence at Exhibit 4, Tab 4, Schedule 3 starting on page 22 to ensure that it has the resourcing capacity necessary to execute its work programs safely and effectively.

QUESTIONS (C) AND (D):

c) Please demonstrate, with examples from this current proceeding and by illustrative scenarios, how Toronto Hydro would determine a change in its stations expansion program or regional planning process was tied to an external factor and would lead to a debit entry in this proposed sub-account.

d) Please demonstrate, with examples from this current proceeding and by illustrative scenarios, how Toronto Hydro would determine a change in its stations expansion program or regional planning process was tied to an external factor and would lead to a credit entry in this proposed sub-account.

RESPONSES (C) AND (D):

The question infers that only certain types of variances would be recorded in the account. However, as all changes in demand are driven by external factors "*the Expenditure Variances subaccount would record [all] symmetrical revenue requirement impacts, including PILs, arising from the variance between 2025-2029 planned and actual expenditures"*[1] in the program.

Toronto Hydro would identify variances in the Stations Expansion program through the Asset Management planning processes noted in the response to part (a). For example, if the outputs of the annual System Peak Demand Forecast described in Exhibit 2B, Section D4 trigger the need for additional investment to address capacity constraints, Toronto Hydro would identify this change as a positive (debit) variance for the purposes of the account. Conversely, if the System Peak Demand forecast shows a reduction in peak demand the utility would reassess the need for certain investments, as was the case with the Scarborough TS expansion which was deferred from the 2025-2029 Investment Plan through the January 29, 2024 evidence update. This would result in a negative (credit) variance for the purposes of the account.

QUESTIONS (E) AND (F):

e) Please provide a list of all externally driven factors that occurred in the current 2020-2024 rate period that have or are anticipated to have a material impact on the need, pacing, or prioritization of Toronto Hydro's demand related expenditure plan.

f) For the items in part e), please identify commensurate measures or responses from the OEB. For any externally driven factors where the OEB provided a regulatory mechanism to respond to, identify any which Toronto Hydro decided to not use or pursue. For any such items, please explain why Toronto Hydro did not utilize the regulatory mechanism provided by the OEB.

[1] Exhibit 1B, Tab 2, Schedule 1 at page 36.

RESPONSES (E) AND (F):

In the current rate period, Toronto Hydro experienced a material increase in demand-related expenditures relative to its forecasted plan, as explained in Exhibit 2B, Section E4 and in the applicable program evidence, namely Customer Connections (Exhibit 2B, Section E5.1) and Load Demand (Exhibit 2B, Section E5.3). The demand-driven pressures in these programs were managed within the approved 2020-2024 capital envelope by reducing prudent and necessary investments in other areas of the plan, namely the underground and overhead renewal programs. For detailed evidence with respect to the uncertainty factors and considerations that may impact demand related investments in the 2025-2029 rate period please refer to the detailed evidence in Exhibit 1B, Tab 2, Schedule 1 at pages 37-46.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-37

Reference: Exhibit 1B, Tab 2, Schedule 1, p. 36

Preamble:

The DRVA would also include a Revenue Variance subaccount that "would record the revenue impacts resulting from weather-normalized variances in billing determinants (i.e. customer count, kWh and kVA)."

QUESTION (A):

a) Please provide more details of how the decoupling mechanism would work. For example, is Toronto Hydro proposing any caps on the amounts of refunds or surcharges to customers? When and how would true ups occur? Please provide numerical examples of how the true up and revenue adjustments would function.

RESPONSE (A):

To determine debits or credits to ratepayers as part of the proposed DRVA - Revenue Sub-Account, the following exercise would be completed:

- For the applicable period, compare (1) weather-normalized actual revenue to (2) forecasted revenue based the approved rates and billing determinants, for each rate class
- Determine the variance values between the actual and forecasted revenue for each rate class as noted above;
- Enter the resulting debit or credit into the Revenue Variances Sub-Account.

Toronto Hydro has not proposed any caps to debits or credits which would be entered into the Revenue Variance Sub-Account. Amounts placed in the DRVA would be brought forward for disposition in the utility's next rebasing application.

QUESTION (B) :

b) Please confirm that, in noting that the DRVA would be weather normalized, Toronto Hydro means that it would shield customers from the risk of high or low loads that result from unusual weather conditions. If not, please explain.

RESPONSE (B):

Not confirmed. The term "weather-normalized variances" refers to variances between weather-normal values. Toronto Hydro's billing determinant forecasts, by virtue of being a forecast, are weather-normalized. To calculate weather-normalized variances, actual billing determinants would be adjusted to reflect billing determinants for the year in question under a weather-normal scenario. As such, ratepayers and the utility would not be "shielded" from weather-driven variances in billing determinants.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-38

Ref 1: Exhibit 1B / Tab 2 / Schedule 1, Table 1

Preamble:

Toronto Hydro has proposed a custom incentive rate-setting framework, as summarized with Reference 1.

QUESTION(A):

a) For all parameters or components in Toronto Hydro's proposed custom framework, please provide a table identifying which of each is set as per established OEB policy and which of each is set as per the proposals set out in this application.

i) For example, Toronto Hydro proposes a 0% productivity factor in accordance with current OEB policy.

ii) For example, Toronto Hydro proposes the labour component of the industry-specific price index to be set as per this application.

RESPONSE (A):

Please see below a reproduction of the table noted in Reference 1 with the requested information.

Table 1 - Comparison of Current and Proposed Custom Rate Frameworks

	2025-2029 Custom Rate Framework	Basis for the Proposal as Requested by the IR
Year 1	Standard COS rebasing	**Consistent with OEB policy**: the RRF notes that going into PBR, distribution rates are set based on a cost of service review.[1]
Year 2	Custom Revenue Cap Index ("CRCI"): $I_n - X + RGF_n$	**Consistent with OEB policy**: the RRF provides a custom rate-setting method with an index informed by the distributor's five-year forecasts of costs and revenues.[2] **Consistent with OEB convention:** Since the RRF was implemented in October 2012, the OEB has approved 10 Custom IR rate plans, providing multi-year custom rate funding for incremental funding needs.[3] **Per this application:** Request for custom rate-funding for both capital and OM&A investments.
OM&A	Five-year plan funded through the Revenue Growth Factor ("RGF")	
Capital	Five-year plan funded through the Revenue Growth Factor ("RGF")	
Inflation	OEB Inflation Factor	**Consistent with OEB Policy**: Reliance on the OEB's annual inflation factor applicable to electricity distributors. Please see response to 1B-Staff-93.
X-Factor	0% Productivity Factor	**Consistent with OEB policy:** The OEB's annual stretch factor assignment continue to reference and rely on the 0% productivity factor in PEG's November 2013 Report.[4]
	0.75% Incentive comprised of a 0.15% efficiency factor and a 0.6% performance incentive mechanism.	**Consistent with OEB policy**: the Rate Handbook expects implementation of an X-Factor which is higher than the OEB-approved X-Factor for Price Cap IR.[5]

[1] RRF at page 11.
[2] RRF, p.18
[3] Custom IR approvals not including Ontario Power Generation and Hydro One's rejected / truncated EB-2013-0416 application: EB-2012-0459, EB-2014-0002, EB-2014-0101, EB-2014-0116, EB-2015-0004, EB-2015-0083, EB-2017-0049, EB-2018-0165, EB-2019-0261, EB-2021-0110
[4] Pacific Economics Group, Productivity and Benchmarking Research in Support of Incentive Rate Setting in Ontario: Final Report to the Ontario Energy Board, November 2013, p.53
[5] Handbook for Utility Rate Applications, p.26

	2025-2029 Custom Rate Framework	Basis for the Proposal as Requested by the IR
		Per this application: A proactive incremental 0.6% performance incentive factor plus an empirically-derived 0.15% efficiency factor combining to form the proposed 0.75% X-Factor. In addition, Toronto Hydro proposes the opportunity (not the guarantee) to earn-back the revenue reductions resulting from the incremental 0.6% performance incentive factor on the basis of performance against a balanced custom scorecard.[6]
Growth	CRCI sets rates annually based on projected growth in billing determinants in each rate class	**Consistent with OEB convention:** Under standard Price Cap IR, utilities establish test year rates based on their cost of service, and subsequently retain any increased revenue resulting from growth in billing determinants during the IR term. Custom IR applicants forecast their costs and revenues over the full IR term, which historically resulted in a "growth factor" reduction to Toronto Hydro's Custom Price Cap Index. The CRCI accomplishes the same outcome by allocating escalated revenue requirement across forecast billing determinants each year, and reducing the rates by the forecasted billing determinant increases. See 1B-Staff-26(c).
Deferral and Variance Accounts (DVAs)	Demand-Related Variance Account	**Consistent with OEB policy**: Chapter 2 Filing Requirements three-part test for establishing new DVAs. **DRVA – Expenditures Sub-Account is consistent with OEB convention in past Custom IR applications:** Similar symmetrical variance accounts include Toronto Hydro Externally Driven Capital,[7] Hydro Ottawa subset of System Access Capital Additions Revenue Requirement Differential Variance Account,[8] or Hydro One Externally Driven Distribution Projects Variance Account[9]

[6] Exhibit 1B, Tab 3, Schedule 1
[7] EB-2014-0116; EB-2018-0165
[8] EB-2019-0261
[9] EB-2021-0110

	2025-2029 Custom Rate Framework	Basis for the Proposal as Requested by the IR
		Per this application: DRVA—Revenue Sub-Account
	Performance Incentive Mechanism Deferral Account	**Consistent with OEB policy**: Chapter 2 Filing Requirements three-part test for establishing new DVAs; DER Filing Guidelines include a fixed target scorecard option for setting incentives related to use of DERs and non-wires solutions. **Per this application:** use of an existing regulatory mechanism (i.e. a deferral account) to implement an innovative incentive-based rate framework proposal
	Innovation Fund Variance Account	**Consistent with OEB policy**: Chapter 2 Filing Requirements three-part test for establishing new DVAs.
	Getting Ontario Connected Act Variance Account	**Consistent with OEB policy:** Chapter 2 Filing Requirements three-part test for establishing new DVAs; Generic account established by the OEB.[10]
	Earning Sharing Mechanism	**Consistent with OEB convention:** ESMs have been approved in all but one[11] of the Custom IR frameworks referenced above.
	Property Sales	**Consistent with OEB convention:** This account was mandated by the OEB in the 2020-2024 Custom IR decision.[12]

1

[10] EB-2023-0143 – Decision and Order (October 31, 2023), Electricity Distributor Accounting Order (002-2023).
[11] Oshawa PUC EB-2014-0101
[12] EB-2018-0165, Decision and Order (December 19, 2019) at page 2 and at page 188.

QUESTION (B) :

Please explain Toronto Hydro's position regarding the potential for a generic proceeding to issue a decision during the rate term that affects a parameter or component identified in part a) and whether Toronto Hydro would seek to update it in accordance with that policy or maintain it as per this proceeding. Please indicate Toronto Hydro's position in this regard for each item.

iii) For example, if a generic proceeding resulted in a non-zero productivity factor, how would Toronto Hydro respond?

iv) For example, if a generic proceeding resulted in a change to use a different labour inflation index, how would Toronto Hydro respond?

v) For example, if a generic proceeding established a new variance account, how would Toronto Hydro respond?

RESPONSE (B):

With the exception of variance accounts which may be established by the OEB on a generic basis to deal with urgent and/or important policy or business conditions changes that the sector faces (e.g. *Getting Ontario Connected Act Variance Account*), Toronto Hydro would not update the parameter/components noted in the chart above. In order for the rate framework to provide predictability and stability to manage within the rates set, Toronto Hydro and the OEB must be committed to the rate framework approved for the duration of the rate term.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-39

References: Exhibit 1B / Tab 2 / Schedule 1 / p. 1
Exhibit 1B / Tab 2 / Schedule 1 / pp. 8-9
Exhibit 8 / Tab 6 / Schedule 1

Preamble:

Toronto Hydro states in Reference 1 that one of the principles that guided development of its 2025-2029 Custom Rate Framework is to "maintain rate stability and funding predictability to enable effective multi-year utility and customer planning and decision making."

In Reference 2, Toronto Hydro states that "the investment priorities and associated outcomes are aligned with customers' needs and preferences, as demonstrated by the results of Toronto Hydro's two-phased customer engagement process.

Reference 3 shows the bill impacts for various Toronto Hydro customer classes.

QUESTION (A):

How are annual residential distribution rate service charge increases averaging 7% during the proposed plan consistent with the principle of rate stability?

RESPONSE (A):

Rate stability refers to the consistency/uniformity and predictability/certainty of rates or prices in a particular market or industry over a certain period. It is a measure of how much rates fluctuate and how well they remain relatively constant/uniform, providing consumers with a sense of predictability for planning and decision-making. Stable utility rates allow households to budget more effectively, as they can anticipate and plan for their ongoing expenses without significant fluctuations (i.e. swings up and down) in their utility bills. The year over year variations in the residential distribution bill-

impacts (sub-total A) are relatively uniform. By virtue of this application, the bill impacts also provide the utility and customers predictability for planning and decision-making over the 2025-2029 period.

QUESTION (B) :

Where do Toronto Hydro's customer survey results indicate that 7% annual rate increases are acceptable?

RESPONSE (B):

As noted in Exhibit 1B, Tab 5, Schedule 1, Appendix A at page 244, residential customers participating in Phase 2 customer engagement were presented with a workbook which included both annual and cumulative distribution rate impacts. Customers were not asked specifically to opine on the acceptability of the 7% annual rate increases as the rates presented to customers in the workbook were not yet smoothed.[1] Residential customers opined on the acceptability of the total distribution rate increase associated with Toronto Hydro's 2025-2029 draft plan by the end of the rate period. As noted in Exhibit 1B, Tab 5, Schedule 1, Appendix A at page 17, in total, 32,187 residential respondents completed the Phase 2 survey. Eighty percent of residential customers gave the draft plan social permission indicating either:

1. They think Toronto Hydro should accelerate spending beyond the level in the draft plan to deliver better system outcomes.
2. They support the proposed rate increase that is reflected in the draft plan, or
3. They feel that the proposed rate increase in the draft plan is necessary, even though they don't like the proposed increase.

[1] Rate smoothing occurs in the final stages of the rate-making process shortly before filing the application.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-40

Reference: Exhibit 1B, Tab 2, Schedule 1, Pages 10-11

Preamble:

Toronto Hydro states on page 10 that

"While the pace and nature of electrification required to decarbonize the economy remains unsettled, there is broad societal and public consensus that an energy transition is required to mitigate the existential and economic impacts of climate change."

Toronto Hydro states on p. 11 that

"system peak demand could grow significantly, or more moderately, depending on technology, policy and consumer choices that will be made in the future."

QUESTION (A):

a) Please confirm the following statements. If Toronto Hydro disagrees, please explain.

i. If beneficial electrification is a public policy priority, matching capacity to demand is one of the biggest cost management challenges facing North American electric utilities.

ii. With Toronto Hydro expecting brisk demand growth, peak load management will play a key role in cost containment.

iii. Just as it is prudent to lay the groundwork in the next five years for future capacity expansion, it is prudent to lay the groundwork for more dynamic load management options, including distribution rate design, that reduce the need for such expansions.

iv. The regulatory cost savings from the new multiyear rate plan will free up Company resources to reconsider rate designs and experiment with changes.

RESPONSE (A):

With respect to i) and ii) Toronto Hydro agrees that matching required system capacity to forecasted demand is a challenge facing the electricity sector, and that part of the response to this sector-wide challenge requires utilities to: (a) modernize the grid to integrate new technology that enhances system observability and controllability (see Exhibit 2B, Section D5); and (b) develop enhanced operational capabilities for load management to optimize system investments and manage costs, which includes the use of non-wires solutions, such as demand-side management programs, to complement traditional capacity planning tools, as well as rate design structure to create demand management incentives and pricing signals for customers.

Toronto Hydro has been a leader in Ontario in developing non-wires solutions capabilities by integrating the use of demand-side management into its planning process, as described in the evidence at Exhibit 2B, Section 7.2, summarized below in part (b), and further explained in the responses to interrogatories 1B-Staff-88 and 1B-Staff-89.

With respect to iii) and iv) Toronto Hydro supports an evolution towards more dynamic load management/rate design and is investing in capabilities (i.e. technology and people) to pursue experimentation in the future. However, the utility notes that distributor tariff sheets and cost allocation policies are regulated by the OEB under various codes and rate filing requirements. Outside of generic revisions to these codes and policies, utilities have an opportunity to propose changes to the rate design structures through rebasing applications, which typically take place every five-years. Thus, any experimentation that the utility may pursue on its own initiative and outside of previous approvals would have to be done under the parameters of the OEB's Innovation Sandbox.

Along with the Innovation Fund proposal outlined in Exhibit 1B, Tab 4, Schedule 2, the regulatory capacity and capabilities proposed in Exhibit 4, Tab 2, Schedule 18 would enable Toronto Hydro to innovate and experiment with new rate design structures for the next rate term.

QUESTION (B):

b) Is Toronto Hydro proposing peak load management initiatives in the next five years that are top quartile by industry standards? If not, why not?

RESPONSE (B):

For Toronto Hydro "peak load management" refers to strategies and measures employed by electric utilities and grid operators to effectively handle and mitigate the challenges associated with high demand periods. Below is a summary of generally accepted best practices and guidelines for peak demand management to ensure the reliability and stability of the electricity grid, and a brief explanation of corresponding proposals and considerations outlined in the application. In many of these areas, Toronto Hydro is taking a leadership position within the Ontario context and following in the footsteps of leaders in the North American and the UK contexts.

- **Demand Response Programs:** Implementing demand response programs allows utilities to manage peak demand by incentivizing consumers to reduce their electricity usage during periods of high demand. As discussed in more detail below, Toronto Hydro is a sector leader in utility-scale demand response in Ontario. Based on its experience, the utility has created a plan to utilize DERs for targeted load-management with quantifiable distribution benefits, and will continue to explore opportunities and develop capabilities to expand the use of non-wires in the 2025-2029 period and beyond. Please see below for more information.
- **Advanced Metering Infrastructure (AMI)**: The deployment of smart meters and advanced metering infrastructure enables more granular and real-time monitoring of electricity consumption. This data can be used to identify patterns, forecast peak demand, and implement targeted strategies for demand management. As one of the first utilities in Ontario to implement smart meters (AMI 1.0), having deployed them between 2006-2008, Toronto Hydro is investing in this technology in the next rate period and plans to replace approximately 680,000 meters with next generation AMI 2.0 meters between 2023-2028. Please see Exhibit 2B, Sections D5.2.2 and D5.3.1 for more information.
- **Energy Storage**: Integration of energy storage systems, such as batteries, can help utilities store excess energy during low-demand periods and release it during peak demand,

improving grid stability. Toronto Hydro is investing in grid-side energy storage systems to enable renewables, and explore other use cases in the process of achieving that objective. Please see Exhibit 2B, Section E7.2 for more information.

- **Pricing Signals**: Encouraging consumers and businesses to shift their electricity usage to off-peak hours can help balance the load on the grid. Toronto Hydro continues to work proactively with the OEB to implement new rate structures such as the Ultra-Low Overnight (ULO) rates and provide customer choice with respect to Time of Use (TOU) versus Tiered pricing.
- **Grid Modernization**: Investing in grid modernization technologies, such as telemetry and advanced control systems, enables utilities to monitor and control the flow of electricity more efficiently, contributing to better demand management. It also supports enhanced forecasting and planning to help utilities anticipate future peak demand scenarios and implement proactive measures to address them. Toronto Hydro's Distribution System Plan outlines a detailed Grid Modernization Strategy in Exhibit 2B, Section D5, and the utility's operations and workforce plan supports this strategy. Please see Exhibit 4, Tab 1, Schedule 1 and detailed in programmatic evidence in Exhibit 4, Tab 2, as well as the staffing evidence in Exhibit 4, Tab 4, Schedule 3.
- **Renewable Energy Integration**: Renewable energy sources, such as solar, can help diversify the sources of electricity generation. Improving the ability to monitor these resources and forecast anticipated generation can help utilities capture the value during system peaks, enhancing planning capabilities. This requires investment in grid modernization technology and capabilities as noted above.
- **Energy Efficiency Programs:** Promoting energy efficiency measures and technologies can reduce overall electricity demand, particularly during peak hours. Toronto Hydro continues to support the IESO's CDM framework, including Local Initiatives programs, and will identify opportunities to benefit-stack where appropriate.

Active Peak Load Management Initiatives at Toronto Hydro

Toronto Hydro's flagship NWS program, Local Demand response ("LDR"), has been running since 2018 and is intended to continue in the 2025-2029 rate period with a target to triple the amount of system capacity (30MW) procured from flexible resources to support six stations across the city.

The focus on the six identified stations (i.e., Finch TS, Manby TS, and Leslie TS, Cecil TS, Strachan TS, and Copeland TS) is due to the high potential for NWSs to defer or avoid capital expenditure in these areas, based on system needs. Cumulatively, these stations will require about 130 MVA of load-transfers in the next rate-period, and if Toronto Hydro is able to successfully procure 30 MW of demand response, this could help avoid about 25% percent of the total load required to be transferred in these areas.

Setting a 30 MW target for demand-side capacity to defer or displace 25% of traditional capacity investments is ambitious given the current DER market capacity and maturity. To the best of Toronto Hydro's knowledge, it is also unprecedented by any other local distribution company in Ontario, given that the OEB only recently published its Framework for Energy Innovation (January 2023), Filing Guidelines for DERs (April 2023) and Benefit Cost Assessment Framework (October 2023).

Sector-Wide Peak Load Management Projects and Thought Leadership

Toronto Hydro has also demonstrated leadership in the area of NWS through its Benefit Stacking Transmission and Distribution Pilot ("Benefit Stacking Pilot"), supported by the IESO's Grid Innovation Fund, and the Ontario Energy Board's (OEB's) Innovation Sandbox. Toronto Hydro identified an opportunity to build on the LDR program planned for Manby TS and Horner TS to examine how Toronto Hydro and other distributors can work with IESO to better coordinate the use NWSs to maximize value and lower resource acquisition costs. Toronto Hydro partnered with Power Advisory LLC and Toronto Metropolitan University's CUE, to create a project that explores how to efficiently procure and deploy DR capacity to address overlapping distribution and transmission system level needs.

Toronto Hydro is an active member of the Transmission-Distribution Coordination Working Group (TDWG), established to support the IESO, LDCs, DER owners, and aggregators to develop operational coordination protocols intended to improve DER integration into local and bulk markets. Toronto Hydro has volunteered to co-lead, in partnership with Alectra, the development of a Functional Assessment work package that identifies the operational functions, capabilities, and tools required for utilities to support such coordination. Details about this work and all the deliverables can be found on the IESO's website (https://www.ieso.ca/Sector-Participants/Engagement-Initiatives/Engagements/Transmission-Distribution-Coordination-Working-Group).

Future DER Usage and Capability Building at Toronto Hydro

As noted here and in the pre-filed evidence, the current scope of Toronto Hydro's NWS program applies to *dispatchable demand response*, and this is because Toronto Hydro has a high-degree of confidence that these resources can be deployed reliably to meet an identified grid need. To be able to leverage other types of DERs*, particularly non-dispatchable resources*, as part of distribution planning and system management, it is essential to first have well-developed tools for grid observability. As demonstrated through the work of the TDWG, distribution utilities in Ontario are in the process of identifying the level of DER visibility required to be able to reliably predict generation patterns and the resulting grid impact.

In addition to the procurement and use of NWSs, as well as thought leadership and collaboration with energy sector stakeholders, Toronto Hydro has also made a significant effort to track, monitor and observe DERs currently connected to its system. Developing this situational awareness will enable utilities to credibly and reliably factor in forecasted DER generation in future capacity planning activities. Toronto Hydro currently requires SCADA telemetry for all DERs greater than 50 kW, and is undertaking several projects, including the AMI 2.0 initiative, which could significantly improve monitoring capabilities for DERs (discussed in detail in Exhibit 2B Section D5.3.1). Please see Exhibit 2B Section D5.2.2.3 for more information.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-41

References: Exhibit 1B, Tab 2, Schedule 1, Section 3.2.3
Exhibit 9, Tab 1, Schedule 1, Section 9.2
EB-2010-0060: Review of Distribution Revenue Decoupling Mechanisms, Pacific Economics Group Research, LLC, March 2010

Preamble:

Toronto Hydro proposes a revenue variance subaccount as part of the proposed demand related variance account. Toronto Hydro proposes this subaccount to symmetrically record revenue variances resulting from differences between forecasted and actual billing determinants on a weather normalized basis, doing so by rate class. Toronto Hydro states this account would record the revenue impact due to variances in billing determinants, kVA, kWh, and customer count, as set out in Exhibit 3, Tab 1.

QUESTION (A):

a) Please explain any differences between the proposed normalization process and that used for forecasting customer load for rate setting purposes as part of this application. Please confirm all billing determinants Toronto Hydro proposes to weather-normalize, such as kVA, kWh, customer count, or other variables if applicable and not explicitly mentioned in the evidence. For each, please explain why it is appropriate to do so.

RESPONSE (A):

There are no differences between the proposed normalization process and the process used for forecasting customer load. Toronto Hydro confirms its intention to weather normalize only KWh and kVA and no other variable.

QUESTION (B) :

b) Please confirm whether Toronto Hydro proposes to only track variances on a weather normalized basis, or to also normalize for other identifiable variances in energy usage such as economic and population factors that are also captured in its load forecasting methodology.

RESPONSE (B):

Toronto Hydro proposes to track all variances on a weather normalized basis. Stated differently, no other normalizing calculations outside of weather normalization will be completed for the purpose of making entries to the Revenue Variances Sub-Account.

QUESTION (C):

c) Please identify the data sets that underly the proposed variance account normalization process. Historically, how often has Toronto Hydro reviewed and updated these data sets? Please describe the circumstances under which Toronto Hydro would review and update these data sets in the future.

RESPONSE (C):

Please see weather-related drivers such as CDD, HDD and dew point that underlie the proposed variance account normalization process, as outlined in Exhibit 3, Tab 1, Schedule 1, page 9 and Appendices A-B of Exhibit 3, Tab 1, Schedule 1. Historically, there were no revenues subject to similar symmetrical variance account treatment as the proposed sub-account. The HDD, CDD, and dew point regression coefficients defined in the load forecast of Exhibit 3 in the rate application, once approved will remain for the duration of the rate period.

QUESTION (D)

d) Identify any other data sets or assumptions that Toronto Hydro would utilize in this weather normalization process. Similar to b), when is the last time these data sets were updated. Under what circumstances would Toronto review and update these data sets?

RESPONSE (D):

Please see subpart c) above.

QUESTION (E) :

e) By way of both monthly summary tables and any underlying calculations and modelling, please demonstrate the proposed "weather-normalization process for actual billing determinants" and the resulting account additions for each of:

i. 2020 actual in comparison the forecast(s) that underly the rates in place that year, i.e., those of EB-2018-0165

ii. 2023 actual in comparison the forecast(s) that underly the rates in place that year, i.e., those of EB-2018-0165

iii. 2023 actual in comparison to the 2019 forecast(s) that underly this proceeding

RESPONSE (E):

Please refer to 1B-SEC-16, Table 2. These variances would have formed entries to the DRVA Revenue Variances Sub-Account, if the account were in place at the time.

QUESTION (F):

f) For part e), please explicitly identify inputs and outputs to the process, including any intermediate steps or steps where one model, tool, or methodology interacts with another in the overall process. Please identify which data items are held constant as the reference forecast(s) and which items are inputs based on actual data. For all inputs, identify the source. Please identify any data variables that are calculated, derived, or otherwise require a mathematical operation to perform the process to derive variance account entries. Please explain the basis for those operations. For example, if a piece of recorded data requires conversion or "normalization" identify the operation and the technical basis for the mathematical operation.

RESPONSE (F):

Please see the response to part c) above and 1B-Staff-37 a).

QUESTION (G):

g) Please confirm that, in accordance with footnote 40 in Reference 1 and Reference 3, Toronto Hydro is proposing a variance account that will allow revenues to track costs. Is Toronto Hydro proposing a variance account that allows revenues to fully track costs, or only partially? Please explain.

RESPONSE (G):

Toronto Hydro proposes to book variances in distribution revenue to the DRVA Revenue Variances Sub-Account on a weather normalized basis, that is, on a partially decoupled basis.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-42

Reference: Exhibit 1B, Tab 2, Schedule 1, Pages 36, 41

Preamble:

Toronto Hydro proposes a Demand-Related Variance Account ("DRVA") with two subaccounts (p. 36). An Expenditure Variances subaccount

"would record the symmetrical revenue requirement impacts, including PILs, arising from the variance between 2025-2029 planned and actual expenditures related to the following capital and operations programs: Customer Connections, Customer Operations, Stations Expansion, Load Demand, Non-Wires Solutions, Generation Protection Monitoring and Control and Externally-Initiated Plant Relocations and Expansions (collectively the "Demand-Related Investments")."

Toronto Hydro states on p. 41 that

"In circumstances where demand-related investments are lower than planned, the subaccount would protect ratepayers by ensuring that (i) they do not pay for demand-driven work that can be deferred, and (ii) funds are not repurposed to manage variances in other aspects of the plan that are not driven by demand."

QUESTION (A):

a) Please provide analysis which demonstrates that the use of a variance account best serves customers from a cost perspective, including, but not limited to, the aggressive use of load management and other techniques to efficiently accommodate demand growth and other changes in system use.

RESPONSE (A):

In circumstances where demand-related investments can be adjusted down based on updated forecasting inputs, the subaccount would protect ratepayers by ensuring that (i) they do not pay for

demand-driven work that can be deferred, and (ii) funds are not repurposed to offset variances in other aspects of the plan that are not driven by demand. Such circumstances can occur due to a number of factors, including the impact of greater use of load management techniques, material changes in economic conditions that slow down the pace of growth in forecasted demand, or market constraints that alter the adoption of electrified technologies such as EVs. For more information about the use of "use of load management techniques" please see Toronto Hydro's response to interrgoatory 1B-Staff-40.

QUESTION (B):

b) Why is it necessary to track the entirety of these various costs when
ix) a sizable share of these costs will result from normal demand growth;
x) a customer growth escalator can address many/most costs of customer connections and customer operations with minimal regulatory cost or diminution of cost-containment incentives;
xi) variance account treatment is less controversial and likely to be approved for costs of NWAs, beneficial electrification, generation protection monitoring and control, Getting Ontario Connected Act compliance, and externally-initiated plant relocations and expansions.

RESPONSE (B):

Please refer to Exhibit 1B, Tab 2, Schedule 1 at pages 37 to 46 for detailed evidence of the need and justification for the Expenditure Variance Subaccount.

Implicit in this question is an assumption that what was "normal load growth" in the past will continue in the future. It is evident that the future will not be like the past in terms of load and demand. For example, and as noted in the above-referenced evidence at pages 38-39, Toronto Hydro saw a significant increase in the volume and complexity of load connections in the current rate period. From 2020 to 2022, high voltage connections (which often require system expansion work) increased by 27.6 percent, with a substantial increase in larger commercial and multi-use projects

requiring greater than 10 MVA of demand load per project, as well data centers with larger loads (e.g., 30-50 MVA) than ever before. These circumstances resulted in gross expenditures in the Customer Connections program that are expected to be approximately 1.75 times greater than the forecast that formed the basis of 2020-2024 rates. As a result, capital in-service additions related to demand-driven investments in System Access were approximately $153 million (32.5 percent) greater than the amounts included in base rates in the current period.

A "*customer growth escalator*" does not address the business concern underlying the proposed DRVA. As noted in the above-referenced evidence at page 35, due to a confluence of external factors (i.e., policy, technology and consumer behaviour changes) Toronto Hydro is entering a period of unprecedented change and transformation, as customers, communities and governments at all levels are actively embarking on an energy transition to mitigate the existential and economic impacts of climate change. Decarbonization is expected to create new roles for electricity, including as an energy source for transportation and building heating systems. While there is certainty that fundamental change is ahead, there are degrees of uncertainty about how that change will unfold (e.g., the pace and adoption of electrified technologies such as EVs and heat pumps; the role of low-emission gas; and the scale of local vs. bulk electricity supply). A "*customer growth escalator"* would fail to address the noted concerns with respect to uncertainty and variability in demand, and would not provide Toronto Hydro the necessary flexibility to manage demand-driven aspects of its plan in order to protect both rate payers and the utility from structural unknowns in forecasted costs and revenues.

Toronto Hydro believes that many of the same considerations which render the listed programs/priorities more likely to be approved for variance account treatment, apply to the other programs that form part of the DRVA Expenditure Account proposal, as detailed in Exhibit 1B, Tab 2, Schedule 1 at pages 37 to 46:

- **Customer Connections and Customer Operations:** Investments in these programs are driven by the utility's fundamental obligation to serve customers who want to connect to the system. In addition to enabling beneficial electrification, the need for investment is also

driven by other important policy considerations, including governments' priorities to accelerate transit and housing development.[1]

- **Stations Expansions and Load Demand:** Investments in these programs are subject to an ongoing regional planning process. Outputs of that process, which may extend beyond the timelines for adjudicating this application, or additional updates to regional plans that may be necessary during the 2025-29 rate term, could modify planned investments under the Stations Expansion and Load Demand programs. For example, Station Expansion projects such as Scarborough TS and Load Demand investments in the Horseshoe area of the grid, which were deferred through the evidence updated filed on January 29, 2024 may have to be pulled forward if needs in these areas of the grid exceed current expectations due to either (or both) *normal demand growth* and *beneficial electrification*.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-43

Reference: Exhibit 1B, Tab 3, Schedule 1, Page 10

Preamble:

Toronto Hydro states: "While the projection suggests that Toronto Hydro's investment plan is sufficient only to maintain Outage Duration as measured by the custom SAIDI metric over the 2025-2029 period, the utility challenged itself to set a modest improvement target, recognizing the importance of outage duration to customers when it comes to reliability performance. To set an achievable improvement target, Toronto Hydro calculated the statistical variability of the historical rolling five-year average (relative to the historical trendline), and on this basis applied two standard deviations to the most recent five-year historical reliability (48.2 min), resulting in an improvement target of 46.2 min."

QUESTION (A):

a) Does Toronto Hydro expect more or fewer scheduled outages for the 2025-2029 period than the previous 5-year period?

RESPONSE (A):

Toronto Hydro expects an increase in the number of scheduled outages during the 2025-2029 rate period compared to the 2020-2024 rate period. This increase is driven by the increase in expenditures within the 2025-2029 Distribution System Plan ('DSP') required deliver on the objectives of the plan.

QUESTION (B):

b) What were Toronto Hydro's projections of SAIDI using the IRM Scenario in the previous application?

RESPONSE (B):

Toronto Hydro did not include a SAIDI projection for an IRM scenario as part of its reliability projections in its previous rate application.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-44

References: **Exhibit 1B, Tab 3, Schedule 1, Pages 3 and 4**
Exhibit 1B, Tab 3, Schedule 1, Table 1
Amended and Restated Shareholder Direction Relating to Toronto Hydro Corporation retrieved from:
https://www.torontohydro.com/documents/20143/411589/Shareholder-Direction THC.pdf/4b8173bf-751e-82df-8593-90c61f33550c?t=1554134778000

Preamble:

Toronto Hydro proposes an incentive mechanism that would allow it to "earn-back" forgone revenue by achieving specific targets. Toronto Hydro proposes targets related to, generally, system reliability, customer service, environmental initiatives, and initiatives related to enhancing the grid for the future. The City of Toronto, as shareholder, has set objectives and principles to guide the Toronto Hydro Corporation, and thus, Toronto Hydro. The objectives and principles include providing a reliable and effective distribution system and operating Toronto Hydro in an environmentally responsible manner consistent with the City of Toronto's energy and climate change policies. The City of Toronto has established numerous energy and climate change policies that Toronto Hydro references throughout this application.

QUESTIONS (A) AND (B):

a) Please explain why Toronto Hydro propose a supplemental incentive mechanism to meet objectives established by its shareholder.
b) Please explain why the objectives and principles set by Toronto Hydro's shareholder are insufficient for Toronto Hydro to meet the reliability, customer service, environmental, and grid enhancement initiatives set out in its 2025-2029 investment plan.

RESPONSES (A) AND (B):

The proposed incentive mechanism applies to distribution-related business activities that are subject to rate regulation by the OEB in accordance with the *Ontario Energy Board Act, 1998*. Toronto Hydro has proposed a plan which meets the needs of its customers and its system within the present-day context of a pending energy transition. This plan is aligned with and responsive to the shareholder's objectives, which is also the municipal authority governing Toronto Hydro's service territory.

Over the upcoming 2025-2029 rate term, the proposed performance incentive mechanism (PIM) reduces the utility's revenue by approximately $65 million, relative to the revenue required to fund capital and operations work programs as part of the 2025-2029 Investment Plan. The PIM puts at risk approximately 14% of the incremental revenue that the utility needs to fund the 2025-2029 Investment Plan, compared to standard Price-Cap IR as shown in the response to 1B-Staff-12.

In the absence of a performance incentive that provides Toronto Hydro the opportunity (not the guarantee) to recover this lost revenue in order to be able to earn its allowed regulated rate of return, the utility would be faced with a difficult decision to reduce prudent and necessary investment in the grid, operations and its workforce putting customer outcomes, grid needs and shareholder objectives at risk.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-45

References: Exhibit 1B, Tab 3, Schedule 1

Exhibit 1B, Tab 3, Schedule 3

Preamble:

On page 42 of Reference 1, Toronto Hydro states that it "expects to achieve efficiencies of approximately $5.6M per year by 2024, consisting of $1.5M of cost reductions and $4.1M in cost avoidances."

On page 16 of Reference 2, Toronto Hydro states that the 2025 rebasing revenue requirement "is approximately $5.7M lower than it otherwise would be if Toronto Hydro had not undertaken" more than 30 initiatives which constitute a collective value of "over $23 million in costs that the utility expects to avoid or reduce by the end of the rate term."

QUESTION (A):

a) Please explain whether the $5.6 million figure of Reference 1, and the $5.7 million figure of Reference 2 denote the same annual savings activities.

RESPONSE (A):

Confirmed. $5.6 million in 2024 annual savings escalated for inflation (2%) results in $5.7 million in 2025 annual savings.

QUESTION (B):

b) Please explain the relationships between the $23 million, $4.1 million, and $1.5 million cited.

RESPONSE (B):

$4.1 million and $1.5 million are annual figures applicable to 2024, whereas $23 million is the cumulative five-year total from 2020-2024.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-46

Reference: Exhibit 1B / Tab 3 / Schedule 1, Table 1

Decision and Order, EB-2018-0165, December 19, 2019, Table 4

Preamble:

Toronto Hydro has proposed a 2025-2029 custom scorecard with 12 measures. In its EB-2018-0165 Decision and Order, the OEB set a 2020-2024 custom scorecard with 15 measures.

QUESTIONS (A) – (C):

a) Please confirm, by a list identifying each, which items in the proposed 2025-2029 custom scorecard are exactly the same measure as the 2020-2024 scorecard measure, without considering the target itself.
b) Please list and explain the rationale supporting all measures that have the same or similar name, but Toronto Hydro proposes a different definition of the measure for 2025-2029.
c) For each applicable measure, please explain the rationale supporting the removal of a 2020-2024 scorecard measure from the 2025-2029 scorecard.

RESPONSE (A) – (C):

The 2025-2029 scorecard represents an evolution over the 2020-2024 scorecard. Reliability, customer service, efficiency, safety and environmental outcomes continue to be key areas of performance focus in the 2025-2029 scorecard, but the measures that the utility has proposed to reflect these outcomes have evolved in accordance with the expanded investment objectives, customer needs and priorities, changing business conditions and the rate framework that underpins the plan.

Direct similarities between the two scorecards can be found with respect to reliability (SAIDI & SAIFI) and safety (TRIF) metrics. For 2025-2029 Toronto Hydro proposes to measure SAIDI excluding

scheduled outages, Loss of Supply and Major Event Day (rather than on SAIDI Defective Equipment as in the 2020-2024 period) for the following reason, which is articulated in the evidence at Exhibit 1B, Tab 3, Schedule 1 at page 9: *Toronto Hydro intends to improve Outage Duration performance … compared to historical performance. This objective aligns with customer needs and priorities based on the Phase 1 Customer Engagement survey results which revealed that when it comes to reliability performance all customers (except Key Accounts) prioritize reducing the overall length of outages rather than the overall number of outages.*"

As requested, the table below explains the continuity and concordance of the 2020-2024 scorecard metrics in the 2025-2029 scorecard.

2020-24 Custom Measures	Continuity to 2025-29 Custom Scorecard
Customers on eBills	Since 2013, Toronto Hydro converted approximately 381,000 customers, exceeding its target of reaching 347,000 customers on eBills by 2024. [1] Although Toronto Hydro intends to continue to monitor and proactively manage this metric[2], the initial penetration targets have been exceeded, and practices and cultures to drive further eBill adoption are well established. What's more, this metric measures one input that is relevant to the customer experience. Consistent with evolving to focus on measuring outcomes that matter to customers, Toronto Hydro is replacing this metric with two customer satisfaction and experience metrics.
Network Units Modernization	The Network Condition Monitoring and Control program is winding down in 2026. This measure was replaced with a complimentary grid automation readiness metric.
FESI-7	Toronto Hydro is supportive of developing more granular reliability metrics. However, recent upgrades to the utility's network management system and analytics had a material impact on the number of very small outages captured by record keeping systems, making it impractical to carry-over these measures without sufficient historical data to re-baseline
FESI-6 Large Customers	

[1] Exhibit 1B, Tab 3, Schedule 2 at Section 3.1 (page 22).
[2] Exhibit 4, Tab 2, Schedule 4 at Page 4.

2020-24 Custom Measures	Continuity to 2025-29 Custom Scorecard
	performance that meaningfully reflects customer-specific reliability experience.
MAIFI	As noted in the pre-filed evidence in EB-2018-0165, Toronto Hydro cannot track this metric accurately. As Toronto Hydro modernizes its system, the incremental observability will capture more momentary interruptions making it impractical to carry-over this measure without sufficient historical data to re-baseline performance.
System Capacity	Toronto Hydro did not include this metric because there is greater uncertainty as to the timing and specific location of capacity constraints on the grid. Please see Exhibit 2B, Section D4. The utility is replacing this metric with one that focuses on timely customer connections to the grid.
System Health (Asset Condition) – Wood Poles	Performance is managed as part of the Asset Management System which Toronto Hydro intends to certify under internally recognized standards (ISO55001). The reliability performance impact of these metrics is reflected in the proposed SAIFI (Defective Equipment) and SAIDI measures.
Direct Buried Cable Replacement	
Average Wood Pole Replacement Cost ▪	Replaced with a comprehensive Efficiency Achievements custom measure, which includes a target that is tied to the utility's empirical stretch-factor proposed as part of the custom rate framework.
Vegetation Management Cost per Km	
Oil Spills Containing PCBs	Performance is managed as part of the Environmental Management System which is certified with international standards under ISO14001.
Waste Diversion Rate	

QUESTION (D) :

For each measure and target on the proposed custom scorecard, please identify which initiatives would not be pursued in the absence of a performance incentive related to the initiative. For each such measure, please explain why not.

RESPONSE (D) :

The 2025-2029 Investment Plan, its performance objectives, and the Custom Rate Framework are an integrated proposal to meet the needs of Toronto Hydro's system and customers. The performance incentive mechanism (PIM) is a complimentary part of this proposal to improve the balance of risk between the utility and ratepayers. The PIM itself does not drive or justify the need for specific investments or initiatives within the plan. For more information please see 1B-Staff-52(a).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-47

References: Exhibit 1B, Tab 3, Schedule 1
Report of the Board: Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach, October 2012

Preamble:

With Reference 1, Toronto Hydro describes its overall PIM proposal as an outcomes-based performance framework. Toronto Hydro provides some explanation for the proposed performance measures within this framework.

QUESTION (A):

a) Regarding system security, Toronto Hydro proposes to earn a performance incentive for the completion of a range of cybersecurity projects. Please explain why the completion of planned projects, which represent milestones rather than a measurable outcome, merits an incentive payment within an outcomes-based performance framework.

RESPONSE (A):

Toronto Hydro disagrees with the characterization of cybersecurity improvements as "milestones." Completion of each cybersecurity project *is* an important outcome, as they enhance Toronto Hydro's cybersecurity posture, and reduce exposure to threats. Further, cybersecurity threats are dynamic in nature, and are expected to vary widely in number and variety over time; limiting the degree to which pre-emptive targets for threat defence can be credibly established. Toronto Hydro's targets seek to reward the desired outcome (i.e. robust and resilience cybersecurity) rather than measure against a hypothetical baseline wherein cybersecurity is inadequate.

QUESTION (B):

b) Similarly, regarding grid automation readiness, Toronto Hydro proposes to earn a performance incentive for carrying out projects. Please explain why the completion of planned projects merits an incentive payment.

RESPONSE (B):

Similar to the above, Toronto Hydro submits the achievement of a state of grid modernization readiness is a desired outcome, which unlocks significant value for customers (e.g., improved reliability), while providing a core building block for proliferation of more electrified technologies and the connection of an increasing numbers of DERs onto its system. The use of an incentive mechanism, as is the case with all functioning incentive mechanisms, improves the prospects of Toronto Hydro maintaining the focus and commitment required to realize this important outcome, in a business environment marked by consistent competition for funding and management focus.

QUESTION (C) :

c) Regarding grid automation readiness, please explain the contribution of the 23 projects included in the custom measure, including manual FLISR, to Toronto Hydro's expected reliability performance over the term.

RESPONSE (C):

The 23 projects refer to the technology required to enable manual FLISR at all 20 transformer stations in the Horseshoe area, plus three software enhancements to enable auto FLISR. These projects are not expected to contribute materially to Toronto Hydro's reliability performance in the 2025-2029 period. However, Toronto Hydro does expect them to contribute materially to reliability performance in 2030 and beyond, once auto FLISR is operational.

QUESTION (D) :

d) Please explain any overlap between the PIM measures related to reliability and related to the results associated with grid automation readiness outlined in c)

RESPONSE (D):

The Grid Automation Readiness measure includes the subset of SCADA switch installations from the Contingency Enhancement program (Exhibit 2B, Section E7.1.3.1) that are required to enable automatic FLISR implementation across 90% of the Horseshoe beginning in 2030. These switches will provide some modest reliability benefits during the 2025-2029 period, and are therefore included in the reliability projections that underpin the Outage Duration and Outage Frequency PIM targets.

QUESTION (E) :

e) Toronto Hydro provides a qualitative rationale for the selection of 99% as a target for timely connection of new services, which mentions expected growth in demand, DER connections and expected complexity. Please explain whether there is a quantitative basis for selecting a 99% target for timely connections of new services and provide it as part of this response.

RESPONSE (E):

Yes, the quantitative basis for selecting a 99% target is Toronto Hydro's 2014-2022 average performance on this metric, which has been 98.36%.

To maintain performance at this level, despite the growth and electrification challenges expected during the 2025-2029 rate period, Toronto Hydro will continue a range of initiatives focused on enhancing timely customer communication, streamlining project planning, optimizing workflows, improving coordination with internal and external stakeholders, and refining asset investment planning.

QUESTION (F) :

f) Please provide annual results for TH's on-time performance related to new connections since 2014, both in aggregate and for the three connection categories identified.

RESPONSE (F):

Connection Type (weighting)	2014	2015	2016	2017	2018	2019	2020	2021	2022
Low Voltage (70%)	91.49%	96.91%	97.67%	98.32%	99.80%	99.74%	99.73%	99.86%	99.89%
High Voltage (20%)	100.00%	100.00%	100.00%	98.41%	100.00%	99.28%	100.00%	99.26%	99.19%
DER Connections and assessments (10%)	98.56%	100.00%	100.00%	86.75%	100.00%	100.00%	100.00%	96.16%	94.63%
Combined Performance	93.90%	97.83%	98.37%	97.18%	99.86%	99.68%	99.81%	99.37%	99.22%

QUESTION (G) :

g) Please explain the justification for a performance outcome associated with maintaining current customer satisfaction levels in the context of the OEB's statement that "the [Renewed Regulatory Framework] is intended to elevate utility performance by creating incentives for superior performance."

RESPONSE (G):

As noted throughout Toronto Hydro's application, the business environment in which it is operating is marked by both increasing complexity and workload. The result is a heightening of competition for funding and management attention when circumstances materialize in the rate term, necessitating targeted incentives for the most important objectives expected of the utility. As noted in the question, the OEB expects superior performance. An appropriate and targeted incentive will significantly increase the probability Toronto Hydro is able to maintain superior customer satisfaction.

QUESTION (H) :

h) Please provide in table form annual data, from 2014 to 2022, on Toronto Hydro's success in resolving escalated customer inquiries within 10 days.

RESPONSE (H):

	2014	2015	2016	2017	2018	2019	2020	2021	2022
Escalation Resolution Percentage within 10 Days	97.13%	95.63%	97.13%	98.17%	98.53%	98.52%	98.28%	98.71%	99.46%

QUESTION (I) :

i) Please quantify transportation fuel savings over the 2025-2029 period arising from the adoption of electric vehicles in accordance with projections indicated in the table entitled 'GHG Emissions (Scope 1') on page 37 of Reference 1.

RESPONSE (I):

Toronto Hydro estimates the following approximate efficiency savings for the 2025-2029 rate period:

- 110,000 litres in fuel savings;
- $168,000 in fuel expenditure savings; and
- 266 tonne to carbon dioxide equivalent ("tCO2e") greenhouse gas reductions.

QUSTION (J) :

j) Please confirm whether emissions from contracting out of work or business activities, that could reduce fleet size or building square footage, are included. Please explain Toronto Hydro's choice.

RESPONSE (J):

Please refer to Toronto Hydro's response to 1-Staff-9(b).

QUSTION (K) :

k) Please explain whether Toronto Hydro will quantify emissions reductions from the portion of its vehicle fleet that will not be electrified, such as through reduced idling time. If it does not plan to do so, please explain why.

RESPONSE (K):

Yes, Toronto Hydro will continue to monitor and take measures to reduce emissions from the portion of its vehicle fleet that will not be electrified, including through reducing idling time.

QUESTION (L) :

l) Please provide the business case underpinning Toronto Hydro's decision to pursue ISO 550001 certification, including any calculations, estimates or representations of the benefits and costs of doing so.

RESPONSE (L):

Toronto Hydro's decision to pursue ISO 55001 certification is based on the need to continuously improve in asset management, align with internationally recognized best practices and voluntarily be held accountable through independent audits. A formal cost benefit analysis was not undertaken for this initiative; however, Toronto Hydro qualitatively assessed the benefits of pursuing the ISO 55001 Certification prior to undertaking this initiative as the benefits were aligned with Toronto Hydro's goals to continuously improve in asset management. Please refer to Exhibit 2B, Section D1, pages 2 to 3 for Toronto Hydro's commitment to achieving ISO 55001 Certification.

QUESTION (M) :

m) Please provide the business cases underpinning maintenance of ISO 140001 and 450001 certifications, including costs and benefits of doing so or failing to do so.

RESPONSE (M):

The maintenance of the ISO 14001 and 45001 certifications is intended to re-enforce the ongoing framework that enables Toronto Hydro to focus on achieving legal compliance, demonstrating continual improvement, preventing employee injuries, and protecting the environment.
The direct costs associated with completing the audit needed to maintain these ISO certifications averaged $17,025 annually from 2021-2023. These certifications have led to significant benefits including mitigating EHS risks, reduction in injuries and improving environmental performance, all

of which has a positive impact on productivity, costs, and organizational reputation. The ongoing maintenance of the ISO standards following the annual audit increases Toronto Hydro's accountability and ensures that the elements of the ISO standards are maintained, legal compliance is achieved and continual improvement opportunities are pursued.

QUESTION (N) :

n) Does the Total Recordable Injury Frequency PIM metric include subcontracted field resources or only Toronto Hydro employees?

RESPONSE (N):

Please refer to Toronto Hydro's response to 1B-Staff-9(a).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-48

Reference: Exhibit 1B, Tab 3, Schedule 1

Preamble:

On pages 2, 7, and 43 of Reference 1, Toronto Hydro has proposed a stretch or efficiency factor of 0.15%, valued at $16.4 million over the term. Achieving the stretch factor is forecast to represent a sustained savings of $6.9M per year by 2029. Toronto Hydro has assigned a performance incentive to the achievement of these forecast efficiency achievements, valued at 15% of the $65M total PIM performance factor.

QUESTION (A):

a) Please confirm the value of the PIM attached to efficiency savings, which appears to be $9.75M (15% of $65M).

RESPONSE (A):

The total proposed incentive is $65 million based on performance against a balanced scorecard. 15% of scorecard achievement is assigned to Efficiency Achievements. 15% of $65 million is $9.75 million.

QUESTIONS (B) AND (C):

b) Please recalculate the value of the stretch factor net of the achievement of the PIMs, or confirm that it is 0.09% ((9.75/16.4)*(0.15)). Please show all calculations.

c) Please explain the rationale for this stretch factor design and net value, including its interaction within the PIMs framework, and with reference to the OEB's standard stretch factor values.

RESPONSE (B) AND (C):

The empirically-derived stretch factor of 0.15% proposed for the 2025 to 2029 rate term is not, and will not be net of any PIM achievement. Customers will directly receive the benefits of reduced rates through the 2025 to 2029 term as a result of the 0.15% stretch factor, which will not be adjusted for any PIM achievement. The purpose of the Efficiency Achievement metric, as articulated on page 42 of Exhibit 1B, Tab 3, Schedule 1, is "*holding the utility accountable for delivering sustained (and quantifiable) efficiency benefits to customers in the next rebasing application*."

The purpose of the Efficiency Achievement metric is to improve the incentive signals which are otherwise naturally embedded in incentive regulation; specifically, near-term cost control. One potential route to financial incentives under standard incentive regulation is the pursuit of short-duration cost cutting, or the deferral of important capital work which will ultimately result in back-logged and increased spending in subsequent years. The Efficiency Achievement metric requires that the utility demonstrate the achievement of sustained savings which would persist into subsequent rate terms. Please see 1B-SEC-20 (f) for more information.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-49

Reference: Exhibit 1B, Tab 3, Schedule 1

Preamble:

Table 18 of Reference 1, which outlines the net present value (NPV) of the benefits of capital deferral and avoidance based on the Local Demand Response (LDR) program proposed for the scored, is reproduced below.

	Deferred Capital	Avoided Capital
Parameters	$2.50 million in load transfer capital investment deferred for 5 years at an operational cost of $0.71 million	$7.50 million in load transfer capital investment avoided over the life of the assets (48 years) at an operational cost of $4.99 million
Costs	NPV of the operational costs of the non- wires solution (2025-2029): $0.57 million + NPV of the revenue requirement associated with the load transfer capital investment to be made in 2030: $1.80 million = $2.37 million NPV Costs	NPV of the operational costs of the non- wires solution (2025-2029): $4.00 million
Benefits	NPV of revenue requirement associated with capital investment deferred from 2025-29: $2.42 million *Less (-)* NPV Costs: $2.37 million *Equals (=)* $55.07 thousand NPV Benefits	NPV of revenue requirement associated with capital investment avoided in 2025 over the 48-year EUL: $7.27 million *Less (-)* NPV Costs: $4.00 million *Equals (=)* $3.27 million NPV Benefits
Total NPV Benefits =$3.32 million		

Table 19 of Reference 1 is reproduced below.

	Deferred Capital	Avoided Capital
Approach	Quantify the net present value (NPV) of the foregone ROE associated with the deferred and avoided capital investments.	
Parameters	$2.50 million in load transfer capital investment deferred for 5 years (i.e. from 2025 to 2030)	$7.50 million in load transfer capital investment avoided over the estimated useful life (EUL) of the assets (48 years)
Lost NPV of ROE	NPV of foregone ROE: $0.99 million *Less (-)* NPV of ROE associated with capital investment in 2030: $0.73 million *Equals (=)* $0.26 million NPV of Foregone ROE[29]	NPV of Foregone ROE: $2.97 million
Total NPV of Foregone Revenue: $3.23 Million		

QUESTION:

Please provide detailed calculations that show the derivation of all amounts shown in tables 18 and 19.

RESPONSE:

Please find attached as an appendix to this response a live spreadsheet with the detailed calculations requested. In the process of preparing this interrogatory response Toronto Hydro discovered a minor typographical error in Table 19. The Total NPV of Foregone Revenue is $3.22 million, and not $3.23 million as stated in the written evidence.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-50

Reference: Exhibit 1B, Tab 3, Schedule 1

Preamble:

In Reference 1, Toronto Hydro provides some information regarding local demand response (LDR).

QUESTION:

Please explain the basis for the assumption that "5 years of LDR is sufficient to avoid the capital investment," citing examples or direct experience if available.

RESPONSE:

The assumption of 5 years is based on experience and engineering planner judgement. As noted in Exhibit 2B Section E.7 on pages 10-12, Toronto Hydro has been successful in avoiding incremental load transfers in the Manby TS and Horner TS service areas through the application of targeted demand response. This has allowed Toronto Hydro to reassess the need for these load transfers each year and make the decision to defer them. By the end of the five-year rate-period, the load transfers were no longer necessary. The assumption of five years is subject to change based on the specific area targeted and was selected for the purpose of planning based on the best available assumptions and information at this time.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-51

Reference: Exhibit 1B, Tab 3, Schedule 1

Preamble:

In Reference 1, Toronto Hydro provides some information regarding new High Voltage and Low Voltage connections. Toronto Hydro provides the value of the benefit of the connection on the basis of overall average loads for the given customer groups.

Question (A):

a) For a representative sample of new HV and LV connections, please provide the actual average customer load during the first 21 days following a new HV connection, and 13.5 days following a new LV connection.

RESPONSE (A):

Toronto Hydro is unable to derive a representative sample within the timelines for responding to interrogatories. As explained in more detail in part (b) below, a representative sample would require a relatively large number of data points. Extracting this information entails a labor-intensive manual effort as the data cannot be processed automatically. To be helpful, below Toronto Hydro provides a few examples (categorized by rate class) of customer load during the first days following a new connection.

Table 1: Examples (by rate class) of customer load in the first days following a new connection

HV Connections – Large Users
There have been four customers connected in 2021-2023. 1. A customer was connected in 2022. A new customer owned substation for existing customer was installed and connected. Average load for this customer in the first 21 days was 1.25MW. 2. A customer was connected in 2022. The connection was completed three months prior to the opening to the public. The average load in the first 21 days since the connection was 14kW, with a max demand of 22kW.

HV Connections – GS 1MW-5MW
There have been about 30 customers connected each year in 2021-2023. 1. A condo tower in Etobicoke was connected in the Fall of 2021. At time of connection, the tower was in the final stages of the construction. The average load in the first 21 days since the connection was 52kW, with a max demand of 119KW. 2. A metal fabrication manufacturing site was switched from overhead supply to underground supply and a new pad-mounted transformer was installed in spring 2022. The average load in the first 21 days was 104kW, with a max demand of 471kW. 3. A condo tower was connected in Summer 2022. Construction started about seven years ago and is nearing its completion. The average load in the first 21 days was 21kW, with a max demand of 70kW.
HV Connections – GS 50KW-1000KW
There have been about 90 customers connected each year in 2021-2023. 1. A complex of townhouses was connected in Spring of 2023. The project was in the development for more than 10 years, construction started in 2020, and at the time of the connection, the complex was still under construction. The average load in the first 21 days since the connection was 33kW, with a max demand of 75KW. 2. A two-storey office-industrial building was connected in Fall 2023. The building was in the final stages of its completion. The average load was 20kW, with a max demand of 64kW. 3. A condominium complex was connected in Spring 2023. The condominium is still under construction. The average load in the first 21 days since the connection was 34kW, with a max demand of 84KW.
LV Connections
There have been more than 5,000 LV connections in the recent years. 1. House in Etobicoke, connected in November 2023. The average load in the first 13.5 days was 0.24kW, with a max demand of 1.25kW. 2. House in Old Toronto, connected in August 2023. The average load in the first 13.5 days was 0.11kW, with a max demand of 2.28kW. 3. House in North York, connected in January 2023. The average load in the first 13.5 days was 0.02kW, with a max demand of 0.32kW.

QUESTION (B):

b) For part a), please provide the total number of new HV and LV connections to identify the proportion of the representative samples relative to the total.

RESPONSE (B):

The table below lists the total number of HV and LV connections reported to the OEB through RRR:

Table 2: Number of HV and LV Connections

Year	LV Connections	HV Connections
2019	5826	138
2020	7041	87
2021	4932	135
2022	5260	123

To determine whether a data sample is representative or not, several key pieces of information are needed. These data help ensure that the sample accurately reflects the broader population from which it is drawn, thereby allowing for generalizations to be made with a reasonable degree of confidence. The challenge of achieving representativeness is particularly pronounced in the context of new service connections, where the diversity of customer types necessitates a larger sample size to draw accurate conclusions.

HV connections have diverse customer categories, including Large users (5MW+), GS 1MW-5MW, and GS 50KW-1000KW customers. Each category requires a representative sample to accurately reflect its population. Large User connections are occasional and distinct, making it difficult for a small number of samples from this group to represent the entire category. Similarly, the 1MW-5MW connection category encompasses a wide range of customers, such as industrial sites, hospitals, educational institutions, and residential buildings, each with unique characteristics. The GS 50KW-1000KW category also presents a challenge due to the varied nature of its customers, who differ in physical size, capacity, and energy needs.

The representativeness of data is critical in dynamic areas like energy consumption, where the timing of data collection can significantly influence the accuracy of insights. A representative sample must account for seasonal variations and different days of the week to capture the full spectrum of energy consumption patterns among HV and LV connections.

Furthermore, the greater the variability in characteristics of interest within the population, the larger the sample size required to capture this diversity accurately. In the case of new HV and LV

connections, variability can arise from differences in consumption patterns, peak loads, and the effects of industry-specific factors on energy usage.

QUESTION (C):

c) Please recalculate the value of the benefit of connection, using the same customer interruption cost and other inputs, but based on the actual average load in those post-connection periods rather than the overall average loads of these customer groups.

RESPONSE (C):

As noted above, due to time constraints and the manual process required for data extraction, Toronto Hydro is unable to gather hundreds of data samples for HV and LV connections to compile a representative sample. Furthermore, undertaking such an extensive sampling effort is unlikely to yield significant insights.

The load immediately following connection may not accurately represent the customer's operational load. This initial period is often used for business setup or residential preparations rather than full-scale operations or living, leading to a discrepancy between immediate and operational energy usage. Delays in electrical connections can have cascading effects on subsequent phases of the construction and setup process, such as postponing heavy equipment installation, delaying testing and commissioning, and affecting the issuance of occupancy permits. Electrical connections are critical to the timely progression of these stages, highlighting their broader economic significance to customers.

This concept is illustrated by LV connection examples in part b), where the observed electricity consumption significantly increased after the initial low-usage period. For instance, a house in Etobicoke showed an average consumption increase to 1.8kW in the eight days following an initial period of 0.24kW, or seven times higher consumption. Similarly, increases were observed in Old Toronto and North York (respectively, 40 and 15 times higher), demonstrating the potential delay in occupancy and normal electricity usage that could result from postponed connections.

Given these considerations, Toronto Hydro maintains that using an average load for the purpose of benefit calculation remains the most appropriate approach for the purpose of a macro-level benefits analysis. This method acknowledges the variability and uncertainty inherent in the early stages of a new connection and provides a more stable and reliable basis for calculating connection benefits. While the desire for precise data is understandable, it is important to recognize that the benefits derived from new connections are indicative (not exact), and that the purpose of the analysis is to reflect the broader economic and social impacts of Toronto Hydro's services, acknowledging that delays in electrical connections can significantly influence the overall timelines and plans of businesses and residents.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-52

Reference: Exhibit 1B, Tab 3, Schedule 1, Table 1

Preamble:

With Reference 1, Toronto Hydro shows the proposed 2025-2029 custom scorecard with 12 measures and targets.

QUESTION (A):

a) Please reproduce Reference 1 with the following information:

i. A column which indicates the total revenue requirement during the rate term of all identified key programs associated with the delivery of the result, as detailed throughout Reference 1.

ii. A column which indicates the dollar value of the PIM at proposed weight and total PIM envelope of $65M as proposed.

iii. A column which indicates the calculated value of customer benefits realized in the 2025-2029 period (as identified in Table 21, p. 57, or elsewhere if applicable).

iv. A column which indicates the ratio of iii) to ii) for each proposed PIM

RESPONSE (A):

Please see attached a table which lists each of the 12 scorecard metrics and targets, alongside a column which assign a proportion of the proposed $65 million incentive to each metric, and a column which assigns a proportion of quantifiable benefits realized over 2025 to 2029, as presented in Exhibit 1B, Tab 3, Schedule 1.

Toronto Hydro cannot assign portions of its total revenue requirement to each metric on the custom scorecard as there is not a one to one relationship between expenditures in these programs and achieving specific performance metrics. Multiple programs contribute to multiple

performance objectives and it is not possible to attribute specific costs to specific measures and targets. Toronto Hydro also notes that the request appears to infer that the capital and operational programs detailed in this application are proposed on the basis and justification of target achievement and associated economic benefits for customers. This is not the case. The capital and OM&A program budgets proposed stand on their own merits, on the basis of the detailed evidence submitted in Exhibits 2B and 4 describing the processes, needs, inputs, and other factors relied on to conclude that the proposed 2025 to 2029 investment plan is the appropriate plan to meet the needs of Toronto Hydro's system and customers. The performance incentive is a complimentary proposal to improve the balance of risk between the utility and ratepayers in responsiveness to the OEB's feedback in the last rate application.

QUESTION (B):

b) Please Discuss:

i. The proportion and significance of the PIM and its weighting within the PIM framework, relative to the proportion and significance of identified key programs, as provided in part i) above, in the context of Toronto Hydro's overall spending plan. Please evaluate how well the scope and value of its proposed PIMs correspond with the scope and value of Toronto Hydro's key spending and investment areas within its plan.

ii. The rationale and basis for the proportions of costs and benefits calculated in iv) above, including variations in the observed ranges.

iii. For any value where iii) is less than or equal to i), please explain Toronto Hydro's rationale for the particular PIM proposed, including its weight.

RESPONSE (B):

Please see a) above with respect to the comparison of program costs and PIM incentives and benefits. With respect to the PIM incentive relative to quantified benefits, the benefits received by customers outweigh the cost of the PIM incentive in all scenarios, with the lifetime benefits significantly outweighing the size of the PIM. This analysis does not take into account numerous

measures and targets (e.g. Customer Satisfaction, Customer Escalations, TRIF, Security Enhancements, Grid Automation Readiness, ISO Certification) which although cannot reliably quantified nonetheless provide long-term value to customers.

Performance	Weight	Measures	Five-Year Target	Incentive	Quantified Benefits (2025-2029)	Quantified Benefits (Lifetime)	Ratio: Incentive vs. 2025-29 Benefits	Ratio: Incentive vs. Lifetime Benefits
System Reliability & Resilience	**15%**	**Outage Duration:** System Average Interruption Duration Index (SAIDI) excluding Major Event Days (MEDs), Loss of Supply (LoS) and Scheduled Outages	46.2 minutes (five-year average)	$9.8	$32.5	$605.2	3.33	62.02
	10%	**Outage Frequency:** System Average Interruption Frequency Index (SAIFI) - Defective Equipment	0.38 – 0.45 (five-year average)	$6.5	$6.5 - 21.6	$182.5 - 413.4	1.00 - 3.32	28.05 - 63.55
	5%	**System Security Enhancements:** Deliver initiatives that enhance Toronto Hydro's physical and cyber security posture against the NIST framework	100% by 2029	$3.3	n/a	n/a	n/a	n/a
Customer Service & Experience	**10%**	**New Services Connected on Time:** Percentage of new connections and service upgrades completed on time consisting of Low Voltage Connections (70%), High Voltage Connections (20%) and DER Connections (10%)	99% (five-year average)	$6.5	$31.7 - 142.6	$31.7 - 142.6	4.87 - 21.92	4.87 - 21.92
	5%	**Customer Satisfaction:** Post-transactional customer satisfaction surveys for Customer Inquiries (Phone & Email), Key Accounts Engagements, Customer Connections, and Communications (Outages & Construction Projects)	Maintain historical baselines	$3.3	n/a	n/a	n/a	n/a
	5%	**Customer Escalations Resolution:** Percentage of customer escalations resolved within 10 business days.	98% (five-year average)	$3.3	n/a	n/a	n/a	n/a
Environment, Safety and Governance	**10%**	**Total Recordable Injury Frequency (TRIF):** Injuries per 100 employees (or 200,000 hours worked) per year.	0.83 (five-year average)	$6.5	n/a	n/a	n/a	n/a

Performance	Weight	Measures	Five-Year Target	Incentive	Quantified Benefits (2025-2029)	Quantified Benefits (Lifetime)	Ratio: Incentive vs. 2025-29 Benefits	Ratio: Incentive vs. Lifetime Benefits
	5%	**Emissions Reductions:** Tonnes of CO2e emissions produced by Toronto Hydro's fleet and facilities.	2.5 kilo tonnes CO2 emissions in 2029	$3.3	$0.2	$1.5	0.06	0.46
	5%	**ISO Compliance and Certification:** Achieve and maintain certification with select ISO governance standards, specifically achieve ISO 55001 (60%), and maintain ISO14001 (20%) and ISO45001 (20%).	100% by 2029	$3.3	n/a	n/a	n/a	n/a
Efficiency & Financial Performance	**15%**	**Efficiency Achievements:** Sustained efficiency benefits for customers that will produce a lower revenue requirement in the next rebasing application.	$6.9 million per year by 2029	$9.8	$16.4	$50.7	1.68	5.20
	10%	**Grid Automation Readiness:** Completion of milestones to enable the automation of the overhead system in the horseshoe areas of the grid starting in 2030.	100% by 2029	$6.5	n/a	n/a	n/a	n/a
	5%	**System Capacity (Non-Wires):** Flexible system capacity procured through demand response offerings.	30 MW by 2029	$3.3	$3.1	$21.0	0.95	6.77
			Total	**$65.0**	**$90.4**	**$892.6**	**1.39**	**13.73**
					$216.4	**$1,234.4**	**3.33**	**18.99**

High Range | Low Range

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-53

Reference: Exhibit 1B, Tab 3, Schedule 1

Preamble:

At page 6 of Reference 1, Toronto Hydro states "only if the set performance targets are achieved….by the end of the rate term would the incentive be recovered from customers."

QUESTIONS (A) – (C) :

a) Please explain Toronto Hydro's proposal for recovery of the PIM-DA account balance in the event that not all performance targets are achieved in full. For instance: what amounts, if any, should be paid in the event that only some targets are achieved in full?

b) Does Toronto Hydro propose partial disposition in the event that a particular target is partially achieved?

c) In determining the amount for disposition, does Toronto Hydro propose that outperformance in one area should compensate for underperformance in another?

RESPONSES (A) – (C):

The proposed design of the PIM reflects a series of stacked, binary targets with financial incentives allocated explicitly to each metric. As such, Toronto Hydro does not propose any partial incentive for partial achievement of targets, and performance on one metric will not have any impact (positive or negative) on the performance or financial outcomes of other metrics. Please see response to the response to 1B-Staff-54 for more information, including comments relating to the potential for a reward associated with over-performance.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-54

References: Exhibit 1B, Tab 3, Schedule 1, Pages 12-13

Preamble:

Toronto Hydro details its proposed PIM in Tab 3 Schedule 1. Key attributes include the following.

• The incentive factor term of the revenue cap index formula would include a 0.6% performance factor that has an estimated value to customers of $ 65 million during the five years of the proposed plan.

• The PIM would give Toronto Hydro a means to earn back the $ 65 million depending on its performance as measured using 12 metrics.

• The potential revenue impact of each metric is a share of the $ 65 million.

• Results of the PIM metrics would be detailed on a Custom Scorecard.

• Rewards would be based on performance over the five years of the plan and would be considered in the next rebasing.

QUESTION (A):

a) For each PIM performance category j in year t, suppose that

$\bar{M}_j^{Actual}$ = Toronto Hydro's average value of metric 2025-2029
M_j^{Target} = target value of the metric
α_j = share of the maximum $65 million penalty

i. Does one of the following formulas accurately characterize the proposed net reward from the PIM?

i. $Net\ Penalty = \max\left[65 - SUM_j \alpha_j \cdot 65 \cdot \left(\frac{\bar{M}_j^{Actual}}{M_j^{Target}}\right), 0\right]$

ii. $Net\ Penalty = SUM_j \max\left[\alpha_j \cdot 65 - \alpha_j \cdot 65 \cdot \left(\frac{\bar{M}_j^{Actual}}{M_j^{Target}}\right), 0\right]$

$= SUM_j \max\left[(\alpha_j \cdot 65) \cdot \left(1 - \frac{\bar{M}_j^{Actual}}{M_j^{Target}}\right), 0\right]$

ii. If not, please provide an alternative formula that does provide an accurate characterization.

RESPONSE (A):

Since it is meant to hold the utility accountable for achieving target performance outcomes, Toronto Hydro's proposal is based on a threshold test, such that if the utility does not achieve the target performance on a particular metric the incentive is not met. This ensures that the utility is not able to earn-back the incentive associated with an individual metric if the performance is below the target.

The following formula can be used to determine the incentive amount for each individual metric. The total entry to the PIM-DA will be the sum of this formula completed for each individual metric.

$$\text{Earnback}_j = \text{IF}(M_j\text{Actual} \geq M_j\text{Target}, \alpha_j * 65, 0)$$

$$\text{PIM-DA Credit} = \text{SUM}(\text{Earnback}_j)$$

QUESTION (B):

b) Please confirm that the design of the PIM would only permit Toronto Hydro to earn back the $65 million value of the proactive 0.6% performance factor. Explain any disinclination to affirm.

RESPONSE (B):

Confirmed.

QUESTION (C):

c) Does this PIM design preclude the use of metrics that should be paired with rewards? Is there merit in permitting rewards in some performance areas?

RESPONSE (C):

The design of the PIM can be altered to include incentives/rewards for superior performance as envisioned by the Renewed Regulatory Framework at page 61. This can be done by enabling the utility to earn incremental incentives (i.e. in excess of $65 million) for achieving higher than target performance on metrics or by setting incremental objectives/goals for the utility to meet in the next rate term, provided that the utility can do so within the overall revenue requirement approved for the purpose of setting rates.

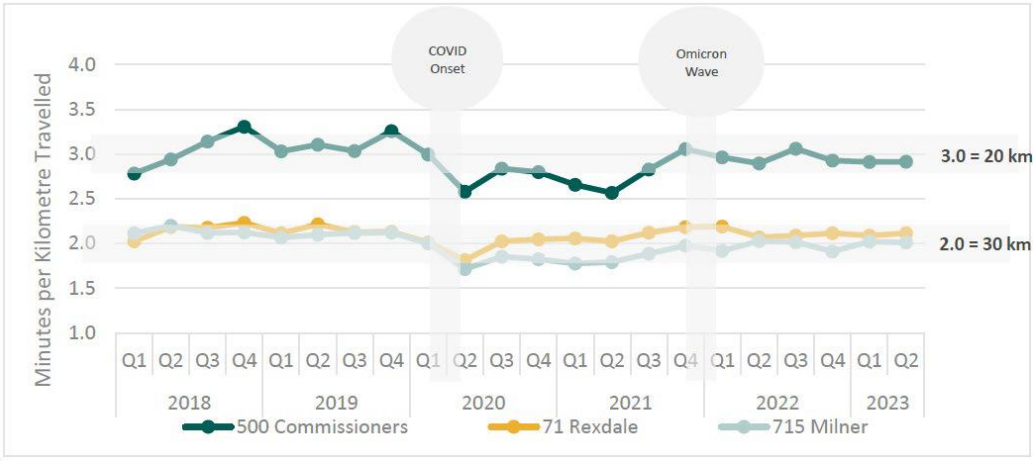
QUESTION (D):

d) Why does demand response receive only a 5% weight in the PIM given the sizable capacity additions that the Company suggests are looming for the energy transition?

RESPONSE (D):

The 5% target for non-wires system capacity is weighed proportionally to the NPV of the efficiency benefits provided by the achievement of the target, as summarized in Table 18 of the referenced evidence.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES



INTERROGATORY 1B-STAFF-55

References: Exhibit 1B, Tab 3, Schedule 3, Pages 7-8

THESL_Drive Time Data_20240207

Preamble:

Toronto Hydro provides Figure 1 outlining drive times per kilometer from its 3 work depots; Figure 1 is reproduced below.

QUESTION (A):

a) What drive trips were incorporated into the data for the analysis? Does the data utilize include only the drive time to and from the job site? Does it include any ancillary driving activities?

RESPONSE (A):

The data includes all driving to and from work sites, as well as all ancillary commuting. Omitted from the analysis is any time driven within the designated home zone and any driving/commuting time for vehicles that were taken out of service for five days or more in a given month.

QUESTION (B):

b) What was the calculated average drive time per work activity?

RESPONSE (B):

Drive time includes all driving activity outside of the home zone; Toronto Hydro currently does not possess the capability to distinguish the subset of drive time related to work activity and therefore does not have the data to calculate average drive time per work activity.

QUESTION (C):

c) What was the average drive distance per work activity?

RESPONSE (C):

As noted in the response to subpart (b), Toronto Hydro currently does not possess the capability to distinguish the subset of drive time related to work activity and therefore does not have the data to calculate average drive distance per work activity.

QUESTION (D):

d) What is the percentage of time driving of the overall work activity?

RESPONSE (D):

As noted in the response to subpart (b), Toronto Hydro currently does not possess the capability to distinguish the subset of drive time related to work activity and therefore does not have the data to calculate the percentage of drive time corresponding to work activity.

QUESTION (E):

e) What was the total number of trips used for the calculation of each field depot?

RESPONSE (E):

Drive time includes all driving activity outside of the home zone; the data set in Reference 2 provides a summary of each month for each vehicle by distance and drive time. Toronto Hydro does not have visibility into the total number of trips beyond this data.

QUESTION (F):

f) What is defined as the Home Zone?

RESPONSE (F):

The home zones are defined as Toronto Hydro work centres or stations. Each vehicle is assigned to a work centre or station to track their home zone.

QUESTION (G):

g) Are cars used for typical field work activities or more for supervision and administrative purposes? Why are cars included in the calculations?

RESPONSE (G):

Cars are used for general administrative purposes, supervision, by employees that do not require field work equipment at their job site, such as for media and public relations purposes, or to conduct field work activities where equipment is not required to be transported to the work site or is transported in larger vehicles by other crew members travelling to the same job site. Although cars constitute a small portion of Toronto Hydro's vehicle fleet (2.5% or 9 out of 359 vehicles), the utility includes them in its fleet-related productivity initiatives to monitor and continuously improve efficiency across the board.

QUESTION (H):

h) In Ref 2 why are there multiple entries per vehicle in a given month in the yearly data tabs? What does each row signify?

RESPONSE (H):

Each row signifies monthly usage for each vehicle; multiple entries reflect a change in the vehicles' assigned home zone.

QUESTION (I):

i) Would 5km or less of driving for a vehicle in a given month be representative of typical drive times for field productivity?

RESPONSE (I):

No, Toronto Hydro does not consider 5 kilometres or less to be representative of typical vehicle operations. Distances driven by fleet vehicles is not an indicator of field productivity because field work is achieved when the vehicle is parked at the worksite.

QUESTION (J):

j) Was the drive time per kilometer benchmarked against another city or utility?

RESPONSE (J):

No.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-56

Reference: Exhibit 1B, Tab 3, Schedule 3, Page 12

Preamble:

Toronto Hydro provide Table 3 which is reproduced below:

QUESTION (A) AND (B):

a) Provide the filters and setting used on the Statistics Canada website to derive these values? Please detail the type of building and divisions selected?

b) Explain why these filters and settings were selected and how all the categories selected are applicable to Toronto Hydro's inflationary pressures?

RESPONSE (A) AND (B):

Please refer to Toronto Hydro's response to interrogatory 1B-Staff-18 part (e).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-57

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Pages 15-16

Preamble:

PEG wishes to better understand the Toronto Hydro cost data used in Clearspring's benchmarking study.

QUESTION (A):

a) Please discuss what labor costs besides salaries and wages might be present in Toronto Hydro's O&M expenses used in the study.

RESPONSE (A):

Besides salaries and wages, labour costs as presented in Toronto Hydro's O&M expenses used in the study include: performance pay, overtime, leaves such as vacation, sick time, and statutory holidays, and other contractual obligations such as stand-by pay, and shift premiums.

QUESTION (B):

b) What types of cost are included in the pension and benefits expenses that Clearspring removed from the Company's O&M expenses?

RESPONSE (B):

Pension and benefit expenses include: Toronto Hydro's portion of OMERS contribution, post-employment benefits, payroll taxes, Canadian Pension Plan ("CPP") and Employment Insurance ("EI") contributions made by Toronto Hydro, and other employee benefits which includes: medical, dental, and group life insurance.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-58

Reference: Exhibit 1B, Tab 3, Schedule 3. Appendix A, Page. 19

Preamble:

The sample period for the power distributor cost research is the twenty-one years from 2000 to 2021. There are data from 78 US distributors in the sample.

Data for 9 of the sampled utilities are excluded from the total cost benchmarking sample only in 2021, the final year of the dataset[1].

QUESTION (A):

a) Please explain why data for 9 utilities were excluded only in 2021.

RESPONSE PROVIDED BY CLEARSPRING (A):

Five of the 2021 observation exclusions are due to implausible substation data. The five are PacifiCorp, Madison Gas & Electric, Kentucky Utilities, Portland General Electric, and Public Service of New Hampshire. Three other utilities were excluded in 2021 due to reported OM&A expenses decreasing by an implausible amount of 90% or more with two of them reporting negative OM&A expenses. These three are Pennsylvania Electric, Southwestern Public Service, and Nevada Power. Duke Energy Ohio was excluded due to reporting zero customers in 2021.

Clearspring conducted a sensitivity analysis regarding the five exclusions in 2021 due to substation data. We used the 2020 value for the number of substations and capacity and included the 2021

[1] Data for 3 additional utilities are excluded from the sample for longer periods. These are California utilities that experienced massive wildfire damage. PEG and Clearspring have discussed and agreed to exclude these data in other proceedings.

observations into the sample to test the impact of excluding the 2021 observations. The impact on Toronto Hydro's benchmark results was essentially zero. The 2025 to 2029 benchmark score decreased to -23.0% from -22.9% indicating the exclusion of the utilities in 2021 does not meaningfully impact the study.

QUESTION (B):

b) Were there additional major omissions with publicly available data which could potentially have been included in the sample, but were excluded altogether? If so, please provide the reasons for the exclusion of each. For example, did Clearspring exclude any subset of utilities because they are small?

RESPONSE PROVIDED BY CLEARSPRING (B):

There are no systematic exclusions to utilities based on size or other common characteristics with plausible data and variable values that were processed and available in the modeling dataset. Given the U.S. investor-owned utility dataset utilized by Clearspring in the study, there are no extremely small utilities in the sample and the econometric model is able to adjust for the modeled service territory conditions of Toronto Hydro.

QUESTION (C):

c) Why did the sample not include 2022 data?

RESPONSE PROVIDED BY CLEARSPRING (C):

The project timeline was not able to accommodate a 2022 data update.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-59

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Pages 20-21 and 38

Preamble:

The model parameters presented in the report result from a sample that excluded Toronto Hydro. While PEG acknowledges that excluding the subject utility is the appropriate way to estimate the model that is actually used for benchmarking Toronto Hydro's cost performance results (and to do the same for each individual company's results), it is common in econometric benchmarking for the model development and presentation to be based on the entire sample.

QUESTION (A):

a) Please provide the econometric model parameter estimates that result when Toronto Hydro is included in the estimation.

RESPONSE (A) – PREPARED BY CLEASPRING:

Please see the table below which provides the reported parameter estimates alongside the requested parameter estimates.

Variable	Reported Parameter Estimates	Requested Parameter Estimates
Constant	12.735	12.766
Customers (N)	0.512	0.530
Peak Demand (D)	0.397	0.388
Area (A)	0.050	0.051
N*N	0.490	0.635
D*D	0.840	0.878
A*A	0.036	0.042
N*D	-1.297	-1.468
N*A	0.096	-0.009
D*A	-0.112	-0.020
% Electric	0.152	0.146
Standard Deviation of Elevation	0.012	0.010
% OH*% Forest	0.052	0.055
% Congested Urban	22.256	12.095
% AMI	0.060	0.047
Dx Work (% Tx Lines Above 50 kV)	0.157	0.147
O&M Scope Variable	0.088	0.081
# of Dx Substations	0.071	0.059
Capacity of Dx Substations	0.011	0.014
Trend	-0.005	-0.005

QUESTION (B):

b) Please comment on whether any changes in the parameter estimates when Toronto Hydro is excluded are of a magnitude which indicates a possible problem with the variable or model specification.

RESPONSE (B) – PREPARED BY CLEASPRING:

The parameter estimate differences do not indicate a possible problem with the variable or model specification. In fact the opposite is true, the differences indicate that the variables and model specification is robust. All the first order parameter estimates continue to be highly statistically significant with minor tweaks in the values due to including Toronto Hydro. The percent congested urban is the possible exception to this, while it remains highly statistically significant the magnitude of the variable value does change noticeably. This is due to the unavoidable fact that Toronto Hydro is an extreme outlier in the challenges it encounters with serving a congested urban core. Only Consolidated Edison of New York City encounters a similar type of condition. It is expected in econometric modeling that either including or excluding an outlier utility would meaningfully impact that variable's parameter estimate. This does not indicate a model specification problem. It does illustrate that, ideally, it would be helpful if it were possible to include more utilities with similar service territory conditions of Consolidated Edison or Toronto Hydro in order to make Toronto Hydro less of an outlier within the dataset and still include the appropriate cost challenge variable, however, that is not a feasible option.

Clearspring also notes that we are in agreement with PEG that the model used for benchmarking should not include the studied utility so that the benchmark is fully external to the cost performance of the studied utility. The reason the percent congested urban variable declines when Toronto Hydro is inserted in the sample is because Toronto Hydro has an extremely large congested urban cost challenge combined with strong cost performance (i.e., actual costs are well below model-expected costs). If Toronto Hydro's cost performance was average, the change in the congested urban variable would be far less pronounced. Toronto Hydro's strong cost performance

and outlier status is not a reason to assume the model specification or variable construction is problematic.

Cunningham, M., Hirschberg, J., and Giovani, A. (Quantonomics) (2023), Memorandum to the Australian Energy Regulator/Australian Competition and Consumer Commission, Subject: Opex Cost Function - Options to Address Performance Issues of Translog Models, October 25.
https://beta.aer.gov.au/system/files/2023-11/Quantonomics%20%E2%80%93%20Memorandum%20%E2%80%93%20Opex%20Cost%20Function%20Development%20%E2%80%93%20October%202023.pdf

Preamble:

Clearspring's power distributor cost model has three scale variables: the number of customers served, a peak load variable, and area. This model also includes second-order (quadratic and translog) terms for these variables. This treatment adds six scale-related variables to the model for a total of nine and results in custom cost elasticities with respect to scale variables for Toronto Hydro.

An ongoing discussion in Ontario Custom IR proceedings is whether a rolling average of past peak demands or a ratcheted peak demand variable are better for a power distributor cost model.

An important result of cost theory is that cost should rise monotonically with output.

QUESTION (A):

a) What are the estimated custom cost elasticities with respect to these three scale variables for Toronto Hydro?

RESPONSE PROVIDED BY CLEARSPRING (A):

We calculated the first derivative with respect to each output to calculate the custom elasticities. The equation for the custom customer elasticity that we calculated is, thus, the first order

customer coefficient plus the coefficient on the quadratic customer variable times the natural log of the mean-scaled customer value plus the coefficient on interaction with customers and peak demand multiplied by the natural log of the mean-scaled peak demand variable plus the coefficient on the interaction with the customers and service area variable multiplied by the natural log of the mean-scaled service area variable. For the custom peak demand elasticity and the area elasticity we conducted the same calculation procedure but using the peak demand and area first order, quadratic, and interaction terms.

Since the custom elasticities do not change in any way that would be material to this analysis from year to year for the same utility, the 2021 values for Toronto Hydro are calculated to be 0.235 for customers, 0.895 for peak demand, and -0.062 for service area.

QUESTION (B):

b) Parameter estimates for output variables may be assessed for consistency with the monotonicity condition predicted by cost theory. Reference 2 is an example of such a study in a report to the Australian Energy Regulator. Are Clearspring's scale variable parameter estimates in each year of the sample consistent with the monotonicity conditions predicted by cost theory? Do any other sampled companies have violations?

RESPONSE PROVIDED BY CLEARSPRING (B):

Given the flexibility of the translog cost function it leaves open the possibility of specific output variable elasticities being negative as the model adjusts for economies of scale and interactions with other output variables. In the case of Toronto Hydro it is the service area custom elasticity that is negative. This means that the cost benchmark for Toronto Hydro would decline in the model if Toronto Hydro somehow added service territory area to its service territory variable value. Yet, in the real world, it is difficult to imagine how this would occur and Toronto Hydro at the same time not adding customers and peak demands. The additions of the customers and peak demands would raise Toronto Hydro's benchmark costs likely more than the service area variable would

reduce it. There are other instances of custom output elasticities being negative within the sample. The majority of them are regarding the service area variable, similar to Toronto Hydro.

QUESTION (C):

c) The peak load variable that Clearspring uses in its model is a rolling average of past peak load values. Up to ten past values are averaged to the extent that data are available. If the sample period were shortened by ten years, wouldn't this permit ten-year averages for all years? If ratcheted peak demand was then calculated the same way for Toronto Hydro as for the sampled US distributors, why would a moving average peak demand variable be better than a ratcheted peak demand variable?

RESPONSE PROVIDED BY CLEARSPRING (C):

To accommodate all ten years within the ten-year sample average, Toronto Hydro's first year must be 2011 since its first year of peak demand data is 2002. The sample has peak demand data collected from 1994, indicating that 2003 could be the first year where a rolling average variable would have ten years available to calculate it.

Clearspring's sample begins in 2000 which matches the start year that we used in the last distribution total cost benchmarking research for Hydro One in EB-2021-0110. In Clearspring's report in that proceeding we explained the rationale for using an average peak demand variable rather than a ratcheted one. One reason includes Clearspring considering the merits of and then responding to intervenors who in the past questioned how it makes sense that a ratcheted peak demand variable can never decrease even after years of falling peak demands. The total cost research is focused on the long-run total costs of utilities. This is why capital costs are included into the analysis and Clearspring goes back to the 1940's to gather cost data and determine those costs. To say that utilities will never adjust costs downward to declining peak demands is not accurate and so the peak demand variable should be able to decline if that is the reality of the situation. Clearspring agrees there will be a lag and a residual cost impact to prior high peak demand values which is why we used the 10-year rolling average approach. The second rationale for the rolling

average peak demand variable versus the ratcheted approach is that a lot of the focus on the benchmarking research results in this context are on the projected years of 2025 to 2029. Those peak demands are weather normalized expectations, or averages, around the probabilities of extreme or mild weather outcomes. Since the peak demand forecasts themselves are essentially averages, using a variable that is itself an average is the more consistent approach in Clearspring's view.

QUESTION (D):

d) Did Clearspring try ratcheted peak demand as an alternative to the rolling average? If so, which had stronger statistical support?

RESPONSE (D) PROVIDED BY CLEARSPRING:

Yes, Clearspring did calculate the variable. The first order ratcheted peak demand variable while still highly statistically significant is less so than the 10-year rolling peak demand used by Clearspring. The t-stat on the ratcheted peak demand is 13.82 versus a t-stat of 22.16 for the rolling average variable. This indicates that it is the rolling average variable that has the stronger t-statistic.

QUESTION (E):

e) Does the company believe that the number of customers it reports on the RRR is significantly affected by high rise housing where the building is only counted as one "customer"? If so, please provide a rough estimate of the number of unmetered residential customers (1 dwelling = 1 customer) that are jointly served from a single meter. Is serving one customer with 100 tenants more costly than serving 100 separately-metered and separately sited households? If so, why?

RESPONSE (E):

As discussed in lines 18-23 on page 11 of Exhibit 4, Tab 1, Schedule 1, Toronto Hydro serves far more electricity users through bulk-metering and competitive sub-metering arrangements than its

actual customer count indicates and the utility estimates that it serves at least 340,000 end-consumers behind bulk meters.

Serving 100 separately metered and sited households (e.g. in a multi-unit residential building suite metered by Toronto Hydro), typically drives some additional billing, payment processing and customer contact costs due to the greater number of account holders, compared to a single bulk metered customer with 100 tenants/occupants behind the meter. Other than these costs related to account transactions, there is no material OM&A cost difference between the two types of customers.

QUESTION (F):

f) Did Clearspring consider using other normalization factors other than number of customers due to the stated concern regarding the quantity of high-rise building? What other normalization factors were considered but rejected? If no other normalization factors were considered, why not in consideration of Toronto Hydro concerns regarding using customer count?

RESPONSE (F) PROVIDED BY CLEARSPRING:

We did identify this challenge as a possible candidate for a business condition variable or other possible correction, however, no feasible normalization factors surfaced because of the lack of data visibility into the sampled utilities regarding this condition. Not including a normalization factor that adjusts for this cost challenge likely disadvantages Toronto Hydro in the benchmarking research.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-61

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 34

Preamble:

Clearspring used an employment cost index ("ECI") for the utility industry as the wage rate trend index for US utilities in its sample. The wage rate trend index chosen for Toronto Hydro was Ontario Average Weekly Earnings ("AWE").

The wage rate level chosen for Toronto Hydro was based upon 2011 Census data.

QUESTIONS (A)

a) Why was the Ontario AWE chosen as the wage rate trend index for Toronto Hydro?

RESPONSE (A)– PREPARED BY CLEASPRING:

The Ontario AWE was used to escalate Toronto Hydro's wage rate levels because it is the index used in Clearspring's prior benchmarking research in Ontario and was the index used in the Hydro One Joint Report put forth by Clearspring and Pacific Economics Group (PEG). The index was also deemed appropriate and used in the 4th Generation IR benchmarking and productivity research, and the index is one of two components in the inflation factor. It is Clearspring's understanding that PEG has also used the Ontario AWE to escalate Ontario distributor wage levels in its other Ontario benchmarking research.

QUESTIONS (B)

b) Please confirm that, in its recent "PBR3" decision, the Alberta Utilities Commission decided to replace the Alberta AWE with Statistics Canada's Alberta fixed weighted index ("FWI") of average hourly earnings in its inflation factor formulas for jurisdictional energy distributors.

RESPONSE (B) – PREPARED BY CLEASPRING:

Confirmed.

QUESTIONS (C)

c) Did the AWE or the FWI yield more plausible estimates of wage rate inflation in Ontario and Canada during the recent recession and recovery?

RESPONSE (C)– PREPARED BY CLEASPRING:

The Alberta Utilities Commission (AUC), in the context of that generic proceeding, determined that the FWI was the better index to use within the inflation factor calculation for PBR3.

QUESTIONS (D)

d) Is the methodology for the US Employment Cost Index (ECI) used in Clearspring's study more similar to the Ontario FWI for average hourly earnings or the AWE that Clearspring used?

RESPONSE (D)– PREPARED BY CLEASPRING:

The FWI appears not to be influenced by occupational and hours worked changes. It is Clearspring's understanding this better aligns with how the U.S. ECIs are calculated.

QUESTIONS (E)

e) Did Clearspring use forecasted values of AWE in its benchmarking in some years (other than 2023) where actual values are now available? Is this a problem with other variables in its cost benchmarking study as well? If so, which?

RESPONSE (E)– PREPARED BY CLEASPRING:

Clearspring would not characterize this as a problem. Rather, as time elapses it is possible to update values in the model. As new data becomes available, all of the time variant variables can be updated.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-62

References: Ref 1: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 30-31

Ref 2: Exhibit 1B, Tab 2, Schedule 1

Preamble:

Clearspring provides benchmarking values for SAIFI, SAIDI and CAIDI.

QUESTIONS (A)

a. Why is there the expectation that the SAIDI benchmark value increase with time? What is the physical justification for this versus theoretical modelling? Please provide empirical quantitative evidence and not qualitative correlation explanation.

RESPONSE (A) – PREPARED BY CLEASPRING:

This stems primarily from the CAIDI benchmark increasing due to the congested urban variable increasing for Toronto Hydro over time. As congestion increases, the time required to respond increases. The empirical quantitative evidence is the highly statistically significant congested urban variable present in the CAIDI model.

QUESTIONS (B)

b) How does the proposed benchmark and forecasted SAIFI, CAIDI and SAIDI values differ in consideration of Toronto Hydro's proposed IRM as compared to the IRM scenario in Reference 2?

RESPONSE (B)– PREPARED BY CLEASPRING:

Reference 2: IRM Scenario

SUPPLEMENTAL RESPONSE – PREPARED BY TORONTO HYDRO:

Regarding the Updated Investment Plan tables provided above, please see Toronto Hydro's response to 2B-SEC-42, part (c).

Regarding the IRM Scenario tables provided above, Toronto Hydro notes that a substantial deterioration in unplanned outages under the IRM scenario is offset by a material improvement in Scheduled Outages in the projection methodology. This large swing results from the application of Toronto Hydro's limited approach to projecting Scheduled Outages. As discussed in Exhibit 2B, Section E2, pages 16-19, Toronto Hydro's recent and ongoing implementation of more advanced network management and utility analytics capabilities has led to the capture of more detailed and accurate outage information, with the most significant impacts being on the Scheduled Outage cause code. These impacts began in 2022, and for this reason, Toronto Hydro is not able to rely on a multi-year statistical approach to forecast Scheduled Outages. The best-efforts approach that Toronto Hydro applied in order to provide a Scheduled Outages projection for Clearspring's benchmarking study was to take the actual SAIDI and SAIFI impacts from Scheduled Outages in 2022, and relate those impacts to the dollars invested in the subset of programs that overwhelmingly drive Scheduled Outages. The utility then applied this simple ratio to the magnitude of future planned spending. In reality, the utility expects that the ratio of Scheduled Outage impacts to spending will vary materially from year-to-year depending on the mix of project work executed. The application of such a limited and linear approach for Scheduled Outages to an expenditure reduction of the magnitude contemplated in the IRM scenario is of limited value. A reduction in spending of this magnitude would result in a fundamentally different operational reality than the one captured by Toronto Hydro's historical reliability performance.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-63

Reference: Exhibit 1B, Tab 3, Schedule 3, Page 33

Preamble**:**

Toronto Hydro states that increase in costs occurred in 2019 and 2020 due to switching from bi-monthly billing to monthly billing.

QUESTION (A):

Provide detailed explanation of increase in Billing O&M cost from 2018 to 2022 of more than double 2018 customer billing costs.

Explain how productivity and economies of scale was not achieved with the adjustment of billing period?

RESPONSE (A):

The Billing O&M costs provided in Table 10 do not provide a consistent representation of Toronto Hydro's unit cost per customer over the 2018-2022 period. The key contributing factors are: 1) the introduction of monthly billing costs into the calculation; and 2) enhanced mapping precision between the Ontario Energy Board USoA accounts 5315 and 5320 following the utility's conversion from the its legacy accounting system, Ellipse, to its current accounting system, SAP, in 2019.

As shown in Table 1, when USoA accounts 5315 and 5320 are combined from 2018 to 2022, Toronto Hydro's costs are accurately represented, including the impact of monthly billing starting in 2020. Other variances are explained throughout Exhibit 4, Tab 2, Schedule 14.

Table 1: Combined USoA Accounts – 2018 to 2022

Accounts ($ million)	2018 Actual	2019 Actual	2020 Actual	2021 Actual	2022 Actual
Combined USoA accounts 5315 and 5320	23.3	22.2	26.4	25.1	28.5

As shown above, costs are relatively flat during the period of 2018 to 2022, when normalized for the inclusion of $4.8 million in incremental costs for the conversion from bi-monthly billing to monthly billing in 2020. A detailed discussion of the impact on costs related to the mandatory transition to monthly billing can be found in Toronto Hydro's 2020-2024 CIR rate application.[1]

The vast majority of costs associated with billing customers monthly are not subject to economies of scale benefits. For example, postage, paper and printing, and payment processing costs, which combined make up 64% of the incremental operational costs, are directly related to the number of bills sent.

To minimize the incremental labour costs, Toronto Hydro undertook a number of initiatives, including automation, process improvements, outsourcing and campaigns to drive ebill adoption. An example was the replacement of "gatekeeper systems" which gather and transmit data from meters to Toronto Hydro's billing system, which resulted in more timely and accurate data being gathered automatically and reduced the labour (and associated costs) required to manually collect and estimate hard to read meters. Along with the higher transactional volumes, labour economies of scale were further improved through these initiatives, such that the FTE per 100,000 bills issued reduced from approximately 4.5 FTEs in 2015 to 3.0 FTEs in 2020.

[1] EB-2018-0165, Exhibit 9, Tab 1, Schedule 1, Page 20 to 31

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-64

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 36-37

Preamble:

The service price approach that Clearspring uses to calculate capital costs, prices, and quantities depends on asset price indexes such as Handy Whitman construction cost indexes. It also depends on the assumed rate of decay.

QUESTIONS (A)

a) Please explain the rationale for escalating post-2021 asset prices in Ontario by a 50/50 average of Conference Board projections of growth in the Ontario AWE and the gross domestic product implicit price index ("GDP-IPI"). Why wasn't the Conference Board of Canada's forecast of the Implicit Price Deflator, Business gross fixed capital formation, Non-residential structures for either Ontario or Canada used? Did Clearspring consider incorporating forecasts of Handy Whitman indexes that are available from S&P Global? What other indexes for asset price forecasts were considered if any?

RESPONSE (A)– PREPARED BY CLEASPRING:

In an effort to manage the extent of methodological differences and build upon rather than depart from the foundation laid in the Hydro One Joint Report, Clearspring only considered using the same 50/50 average projections used in the Hydro One distribution total cost benchmarking research by both Clearspring and PEG.

QUESTIONS (B)

b) The assumed 4.59% rate of decay was taken from the TCB benchmarking work in 4th GIR and it applied to all Ontario distributors. Did Clearspring consider other decay rates that

might be more appropriate for Toronto Hydro and US distributors? If so, what were they and how did the results differ with an alternative specification?

RESPONSE (B) – PREPARED BY CLEASPRING:

No, Clearspring only considered using the 4.59% rate of decay number. Clearspring and PEG both agreed to and used the 4.59% rate of decay in the 4th GIR research and in all subsequent electric distribution cost benchmarking studies by both consultants within Ontario. Concern regarding the appropriateness of this assumption has not been raised by PEG, or any intervenors, to Clearspring's knowledge in any of the prior CIR applications containing econometric total cost benchmarking research.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-65

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page 34

Preamble:

The price of materials and services is an important cost driver for many utilities in an age when a sizable share of utility OM&A expenses often takes the form of outsourced services. PEG notes the use of a propriety macroeconomic price index such as the GDP-PI as a stand-alone proxy for trends in the prices of materials and services that utilities use.

QUESTION (A):

a) For a selected year in the 2020 to 2022, please provide a break-down of all components of the OM&A expenses, explicitly showing and defining the OM&A expenses of Toronto Hydro exclusive of salary and wage and pension and benefit OM&A that take the form of outsourced services. If not unduly burdensome, please also provide an estimate for additional prior years of the sample period and years in the 2025 to 2029 forecast period.

RESPONSE (A):

Table 1 below shows OM&A costs that take the form of outsourced services for 2020 to 2023 actuals, to 2024 Bridge and 2025 to 2029 forecast period.

Table 1: 2020-2029 Outsourced OM&A Costs ($ Millions)

Actual				Bridge	Forecast				
2020	**2021**	**2022**	**2023**	**2024**	**2025**	**2026**	**2027**	**2028**	**2029**
118.7	134.9	139.2	146.0	151.0	159.2	162.7	164.7	169.5	173.7

QUESTION (B) :

b) What are Toronto Hydro's four biggest uses of outsourced services?

RESPONSE (B):

Toronto Hydro's four biggest uses of outsourced services in 2023 were: distribution system maintenance, information technology support, customer care operations, and facilities management.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-66

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 18

Preamble:

Clearspring's distribution cost model also includes a scope of electric services provided variable.

QUESTIONS (A)

a) Did Clearspring consider any alternative specifications for this scope variable? If so, what were the results?

RESPONSE (A)– PREPARED BY CLEASPRING:

In the recent Hydro One Joint Report, PEG suggested and discussed the merits of the OM&A-based scope variable that measures the ratio of distribution to distribution, transmission, and generation activities. We investigated and were persuaded by PEG that the new scope variable is preferable to the plant-based variable we initially used in the Hydro One research. We therefore agreed, in the Joint Report, to use the scope variable put forward by PEG. Given that we had already investigated the merits and agreed that this was the best approach to the variable, we did not consider for inclusion any other scope variable.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-67

Reference: Exhibit 1B , Tab 3, Schedule 3, Appendix A, Page. 18

Preamble:

Mr. Fenrick's new model adds two substation variables that he has not used in prior power distributor cost benchmarking studies he has submitted in OEB proceedings. However, he previously used a substation variable in a transmission cost benchmarking model he prepared for a Hydro One proceeding (EB-2021-0110).

QUESTIONS (A)

a) Please confirm whether the US substation data used in this study reflect the corrections to the double-counting issue PEG identified in Clearspring's transmission substation variable during the Hydro One proceeding (see EB-2021-0110 Exhibit M Appendix B.2)?

RESPONSE (A)– PREPARED BY CLEASPRING:

Yes, that was Clearspring's intention. With the understanding that there are hundreds of thousands of addresses to filter and not all of them are labeled consistently from company to company, year to year, or even within a year. In the case that Clearspring missed some of the distribution substations and double-counted them, this would likely have the impact of disadvantaging Toronto Hydro's benchmark score.

QUESTIONS (B)

b) Please describe how stations were identified in cases in which either no T or D identifier was available or a station was not exclusively designated as distribution.

RESPONSE (B)– PREPARED BY CLEASPRING:

If the station did not have a clear identifier as being either T or D or if it was designated as both or had no designation, we included the station as unknown. We then divided that station as half being T and the other half D.

QUESTIONS (C)

c) Please explain the rationale for the ".5" multipliers in the formulas for "nsub", "mva" and "ntrans". Was this to divide stations designated as T&D?

RESPONSE (C)– PREPARED BY CLEASPRING:

Yes, plus dividing unknown stations between T and D.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-68

References: Ref 1: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 40
Ref. 2: ACIL Allen, "Opex Partial Productivity Study 2022" report to Australian Gas Networks (Victoria and Albury), Multinet and Ausnet, June 16, 2022

Preamble:

PEG believes that discussions in ratemaking proceedings of the properties of alternative econometric estimators should be theoretically correct even if the use of a particular imperfect estimator in research is reasonable.

Mr. Fenrick states in Reference 1 that "Two common issues arise in multivariate regression using real world data: heteroscedasticity and autocorrelation. Neither of these issues causes the coefficient values to be biased or less precise."

QUESTIONS (A)

a) Please confirm that, in statistical theory, heteroskedasticity and autocorrelation cause ordinary least squares ("OLS") coefficient estimates to be less precise than the appropriate generalized least squares ("GLS") estimator.

RESPONSE (A)– PREPARED BY CLEASPRING:

Clearspring cannot confirm this. Autocorrelation and heteroskedasticity causes the standard error estimates to be less precise, but not the coefficient estimates themselves. Autocorrelation and heteroskedasticity, along with cross-sectional correlation will distort the standard errors of the parameter estimate, even though the parameter estimate itself remains unbiased and cannot be improved upon. For this reason, Clearspring conducts the Driscoll-Kraay ("DK") method to correct the standard errors due to autocorrelation, heteroskedasticity, and cross-sectional correlation. The DK method does not influence the parameter estimates (which is what is used to calculate the

benchmark) and only adjusts the standard errors of the variable. The ordinary least square (OLS) parameter estimates are used in the DK approach, and these parameter estimates are not manipulated based on underlying assumptions like they are when using a GLS estimator. The DK approach is the more modern and transparent approach to dealing with autocorrelation, heteroskedacity, and cross-sectional correlation.

We would further add that these older GLS or Feasible GLS (FGLS) methods that are sometimes employed are inappropriate on an unbalanced or balanced dataset where the time periods (T) are fewer than the cross sections (N), which is the case in this benchmarking dataset. Please see p. 4 of the following journal article: https://journals.sagepub.com/doi/pdf/10.1177/1536867X0700700301 where the author states:

> *In an early attempt to account for heteroskedasticity as well as for temporal and spatial dependence in the residuals of time-series cross-section models, Parks (1967) proposes a feasible generalized least-squares (FGLS)–based algorithm that Kmenta (1986) made popular. Unfortunately, however, the Parks–Kmenta method, which is implemented in Stata's xtgls command with option panels(correlated), is typically inappropriate for use with medium- and large-scale microeconometric panels for at least two reasons. First, this method is infeasible if the panel's time dimension, T, is smaller than its cross-sectional dimension, N, which is almost always the case for microeconometric panels. Second, Beck and Katz (1995) show that the Parks–Kmenta method tends to produce unacceptably small standard error estimates.*

In that same section on p. 5 the author states:

> *Therefore, Driscoll and Kraay's approach eliminates the deficiencies of other large-T–consistent covariance matrix estimators such as the Parks–Kmenta and the PCSE approach, which typically become inappropriate when the cross-sectional dimension N of a microeconometric panel gets large.*

QUESTIONS (B)

b) Please confirm that, in the Reference 2 study by an Australian utility consultant, benchmarking results using a feasible GLS estimator are preferred to results using OLS.

RESPONSE (B)– PREPARED BY CLEASPRING:

Yes, the Australian consultant compared OLS with FGLS, and preferred FGLS although did not mention the newer DK method. The report stated that when hetereoskedacity and autocorrelation are present OLS is inefficient, although it remains unbiased (p. 12). The report continues on page 12 to say that in the context of this type of research the interval estimation and hypothesis testing can no longer be trusted from OLS.

Clearspring fully agrees with these statements, which is why we use the DK method which does not insert potential bias into the coefficient estimates themselves (which enter the calculation of the benchmarks) like FGLS, rather the DK corrects the variance-covariance matrix in calculating improved standard errors (which only are relevant in this context for including or excluding explanatory variables based on statistical confidence testing, that is to say interval and hypothesis testing).

QUESTIONS (C)

c) The ACIL Allen report also favors stochastic frontier benchmarking over econometric benchmarking with OLS. What is Clearspring's view?

RESPONSE (C)– PREPARED BY CLEASPRING:

As stated earlier, the report did not evaluate econometric benchmarking using DK corrected standard errors. The ACIL Allen report seemed to favor stochastic frontier analysis (SFA) and econometric benchmarking with FGLS over OLS but, again, did not evaluate the DK method as Clearspring used in our research. Using and evaluating OLS only seems to indicate to Clearspring that the consultant might not be fully aware of the newer DK method and how it corrects the

standard errors and fixes the problems of hypothesis and interval testing that they cite as the shortcoming for the OLS method.

Regarding SFA generally to econometric benchmarking, in our view, SFA still requires sophisticated modeling but then additionally requires a highly questionable exercise in trying to separate out the error term into the components of random noise and inefficiency. Trying to estimate the frontier of the production curve would be fraught with inaccuracy and assumptions that, to Clearspring, would be unhelpful and lead to far more methodological disagreements and misleading conclusions. Better to compare firms, in our view, to the model expectations estimated by a well-specified econometric model which are centered around the mean to compare and contrast utility performance. This makes results less dependent on a fewer number of firms near the frontier because it is established off of the mean of the data rather than the frontier of that data. As even this report states on page 14,

> *"Because of the error term into two separate components, estimation of SFA cost models are more computationally demanding than conventional econometric methods. Moreover, separating random and inefficiency components of the error term requires a large number of data points."*

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-69

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 40

Preamble:

On page 40, Clearspring says "Under the assumptions of the model, this coefficient value (obtained from the OLS estimation procedure that Clearspring uses) is considered an unbiased estimator of the relationship."

The finite sample properties of time series data in OLS require strict exogeneity.[1] This is a strong assumption and if it fails, model parameters estimated with OLS are not unbiased. This strict exogeneity assumption is unlikely to be met in this model due to use of proxy variables, the likely presence of measurement error, and known omitted relevant variables such as system age.

Rather than claiming unbiased parameters, it may be more appropriate to claim consistency of the OLS parameter estimates. This assumption only requires contemporaneous exogeneity[2], which is more plausible for these data and models. PEG believes that the type of retrospective, observational time series data needed for distributor benchmarking will only ever meet claims of consistency, which can be appropriate and sufficient.

To further clarify, PEG is not implying Clearspring's choice of model estimation method is incorrect or inappropriate; rather PEG believes Clearspring's specific claim of unbiased parameters is incorrect. Importantly, as a result of the conclusions above, PEG believes that other estimation

[1] This means that the error term (which by definition must contain all measurement error in the variables, all omitted variables, and any sample bias) is uncorrelated with all explanatory variables in every time period, past and future.
[2] For contemporary exogeneity, the only necessary claim is that the error term is uncorrelated with the variables in the same time period (with no claims about past or future correlation required).

methods such as Feasible Generalized Least Squares may also meet claims for consistency in the estimated model parameters and can be an appropriate choice for distributor benchmarking.

QUESTIONS (A)

a) Please confirm whether Clearspring agrees with this assessment of the requirements of the sample properties for the unbiasedness of OLS parameters, as stated in the Preamble.

RESPONSE (A)– PREPARED BY CLEASPRING:

Clearspring's view is that, as PEG implies, both OLS and FGLS would not meet this definition of strict exogeneity from a technical perspective. However, as the preamble alludes to, this is an extremely technical position that should not impact the choice of estimators or put into question the value of econometric benchmarking. In normal parlance of practioners of applied econonmetrics, it is common to state that OLS is an unbiased estimator. We would point to interrogatory 1B-Staff-68 where the question referenced a report from an Australian consultant. That report also claimed that OLS remained unbiased even in the presence of autocorrelation and heterskedacity.

QUESTIONS (B)

b) Does Clearspring believe its model meets the definition of strict exogeneity?

RESPONSE (B)– PREPARED BY CLEASPRING:

Strictly speaking, no, but this is not be a concern as it is well-established that the estimator is an appropriate and proper method to use. We would suggest that no econometric benchmarking model put forth in any jurisdiction has met this strict definition.

QUESTIONS (C)

c) If yes, please provide Clearspring's theory and data to support this answer.

RESPONSE (C)– PREPARED BY CLEASPRING:

Please see response to part (b).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-70

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 22

Preamble:

Clearspring states that "The first order terms of all variables have the theoretically expected signs and are statistically significant at a 90% level of confidence, except for the distribution substation variable which is significant at an 85% confidence level. In fact, all the other first order explanatory variables are statistically significant at a 99% confidence level. The adjusted R-Squared of the model equals a robust 0.977."

QUESTIONS (A)

a) Please confirm that the use of panel data is known to result in artificially high R-Squared values.

RESPONSE (A)– PREPARED BY CLEASPRING:

Confirmed, however, the explanatory of the model is quite strong regardless of the exact R-Squared value and the variables themselves display extremely high statistical significance.

QUESTIONS (B)

b) Please confirm that in the portion of the report quoted above, Clearspring meant to say the distribution substation capacity variable is significant at an 85% confidence level.

RESPONSE (B) – PREPARED BY CLEASPRING:

Confirmed.

QUESTIONS (C)

c) Given the lower significance of the substation capacity variable, please explain Clearspring's decision to include it.

RESPONSE (C)– PREPARED BY CLEASPRING:

As we stated in footnote 17 of the Clearspring benchmarking report, the distribution substation capacity fell below our typical 90% confidence level and came in at an 85% level. Since the variable is on the borderline of statistical significance and the theoretical basis for the variable impacting costs is straightforward, we believed it would be helpful to intervenors to see the model with the variable. As stated in the footnote, the results are not significantly impacted by the inclusion of the variable.

QUESTIONS (D)

d) Did Clearspring test any alternative forms of this variable (e.g., MVA per substation)?

RESPONSE (D)– PREPARED BY CLEASPRING:

No.

QUESTIONS (E)

e) Were other variables considered in the modelling that had parameter estimates with significance in the 75% to 90% range but were excluded from the model? If so, what were they?

RESPONSE (E)– PREPARED BY CLEASPRING:

No. Clearspring focused efforts on continuing the model specification that stemmed from the Hydro One Joint Clearspring/PEG Report and exploring if we could add to it by including the substation variables and the time variant urban variable.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-71

References: Ref 1: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 18

Ref 2: EIA 861: https://www.eia.gov/electricity/data/eia861/

Preamble:

Clearspring states that

"The percentage of smart meters variable measures the percentage of customers that have an installed smart meter. Smart meters enable hourly or sub-hourly interval use data to be collected from the meter. While installing more capable meters and the necessary infrastructure is expected to increase distribution costs, these meters enable time-of-use ("TOU") electricity rates that can create efficiencies mainly in the realm of power supply."

QUESTIONS (A)

a) Does Clearspring's definition of smart meters exclude meters that only permit automated meter reading?

RESPONSE (A)– PREPARED BY CLEASPRING: Yes, the smart meter data only includes those meters designated as Advanced Metering Infrastructure (AMI) on the EIA-861 form and does not include those meters designated as Automated Meter Reading (AMR).

QUESTIONS (B)

b) Please confirm that Clearspring relied solely on Form EIA-861 for smart meter data beginning in 2007. If confirmed, please explain why the number of AMI meters for Arizona Public Service in 2007 in the Clearspring working papers is nearly double that reported in the EIA-861 in that year. If not confirmed, please identify your data source.

RESPONSE (B)– PREPARED BY CLEASPRING:

Clearspring did rely solely on the Form EIA-861 for the smart meter data beginning in 2007. Regarding the cited example of Arizona Public Service, we agree that the number in the Clearspring dataset is nearly double (290,769 AMI meters) than what the EIA-861 form reports (154,300 AMI meters). Given that much of this data was processed several years ago, we are unsure regarding why the discrepency is present. In responding to this interrogatory, Clearspring examined the 2007 AMI data. In addition to the APS example, we also noticed that Pacific Gas and Electric (PG&E) was given a zero value in 2007 when the EIA-861 reports 136,469. All other 2007 observations appeared correct. To assure these two data errors did not meaningfully influence the model or results, we modified the AMI data and variable for APS and PG&E. Regarding APS, we also needed to change the 2008 value because due to the 2007 data error we previously extrapolated 2008 data so that AMI meters in 2008 would not decline from the wrong 2007 value. Given the correction, this extapolation is no longer necessary and we removed it. The APS percent AMI value in 2007 shifted from 26.766% to 14.204%, the APS value in 2008 shifted from 29.350% to 17.424%, and the 2007 PG&E value shifted from 0.000% to 2.629%.

After making those three changes, we re-ran the total cost benchmarking model and there were very minimal changes to the parameter estimates and the Toronto Hydro result of -22.9% in the CIR period of 2025 to 2029 was unchanged.

QUESTIONS (C)

c) What data source did Clearspring use to get values for the percentage of smart meters variable for years prior to 2007?

RESPONSE (C)– PREPARED BY CLEASPRING:

Clearspring did not gather AMI data for years prior to 2007 with the exception of PPL. PPL had, by far, the largest AMI deployment in the dataset by 2007. PEG had raised this to our attention in a prior application and we inserted estimates for years prior to 2007 based on PEG's information. Given the lack of AMI deployment from the rest of the dataset, we have not deemed it necessary to gather AMI data prior to 2007 and have assumed values of 0 for those years, except for PPL. To

illustrate why gathering the data is unnecessary prior to 2007 note that the modeling dataset has 75 U.S. utilities in 2007. Out of those 75, 66 of the utilities had zero AMI meters in 2007. Seven had deployments of less than 1% of their system (six of those seven with deployments of less than 0.3%). For the remaining two utilities (APS and PPL), the dataset does include estimates for PPL for prior years. APS deployment numbers are still relatively low in 2007 at 14.204% and while it is possible they had some AMI meters deployed prior to 2007, we have already tested the model sensitivity to a change in the APS number and we are confident that the model and the results would not be impacted in a meaningful way.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-72

Refrences : Ref 1: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 17

Ref 2:

https://www.eia.gov/naturalgas/ngqs/#?year1=1997&year2=2022&company=Name

Preamble:

Clearspring states that "The percentage of electric customers measures the percentage of electric customers served by a utility out of total gas and electric customers. This variable measures the economies of scope available from serving both electric and gas customers."

The query system at Ref 2 shows that Dominion Energy South Carolina had natural gas volumes for residential, commercial, and industrial customers for the 1997-2022 period.

QUESTIONS (A)

a) Please confirm that beginning in 2019, South Carolina Electric & Gas began filing FERC Form 1s as Dominion Energy South Carolina Inc.

RESPONSE (A)– PREPARED BY CLEASPRING:

Confirmed.

QUESTIONS (B)

b) Please explain why Dominion Energy South Carolina (f/k/a South Carolina Electric and Gas) has a percent electric value of 100% in all years.

RESPONSE (B)– PREPARED BY CLEASPRING:

Likely due to the name change, Clearspring did not account for the gas customers in the variable. After making this correction, the model is essentially the same with minor changes and Toronto Hydro's CIR 2025 to 2029 results slightly improve to -23.8%.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-73

References: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Pages 25-29

Exhibit 2B, Section C, Page 4

Preamble:

On page 25 of Ref. 1, Clearspring states

"Several jurisdictions, including Ontario in recent years, exclude extraordinary events from reliability statistics, with the goal of reducing year over year volatility due primarily to extreme weather. If a day is excluded, it is denoted as a major event day ("MED"). The bulk of MEDs stem from major storms. These severe storms vary in number and intensity from year to year."

On p. 4 of Ref. 2, Toronto Hydro presents System Level SAIFI reported in several ways: total SAIFI, SAIFI excluding Loss of Supply ("LOS"), SAIFI Excluding Major Event Days ("MEDs"), SAIFI excluding MEDs and LOS, and SAIFI Excluding MEDs, LOS, and Scheduled Outages.

QUESTION (A):

a) Please confirm that the Toronto Hydro reliability data are for five minute sustained outages, exclude loss of supply outages, and exclude outages for Major Event Days based on the IEEE 2.5 beta methodology. If not confirmed, please explain. Were planned outages also excluded? Are any other characteristics of the outage definition notable?

RESPONSE (A):

Toronto Hydro provided reliability data as requested by Clearspring. This included SAIDI and SAIFI annual reliability data (historical and forecasts), excluding Major Event Days (consistent with IEEE-1366 Standard Beta Method), under a five-minute interruption basis. Loss of Supply and Scheduled Outages interruptions were included.

RESPONSE (A) PROVIDED BY CLEASPRING:

The reliability data are for five minute sustained outages, include loss of supply outages and exclude Major Event Day outages based on the IEEE 2.5 beta methodology.

Planned outages are included in the indexes to align with the U.S. dataset. No other characteristics are notable as we defined the data for Toronto Hydro consistent with the dataset definitions.

QUESTION (B):

b) What versions of SAIFI and CAIDI were used in Clearspring's research for the sampled US utilities (e.g., did the data include or exclude loss of supply or transmission outages, were planned outages included or excluded)?

RESPONSE (B) PROVIDED BY CLEASPRING:

The reliability indexes in the U.S. dataset includes loss of supply and planned outages.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-74

Ref 1: Exhibit 1B / Tab 3 / Schedule 3 / Attachment A/ pp. 25-28

Preamble:

PEG is seeking to better understand the sample and data Clearspring used in its reliability benchmarking models.

QUESTION (A):

a) Please provide the location of the calculations in the working papers that show how Clearspring combined reliability data for US utilities that serve multiple states into a single value for each year. If this information is not included in the working papers, please provide these.

RESPONSE (A) PROVIDED BY CLEASPRING:

Please see the included Excel spreadsheet file named 1B-Staff-74 Excel File, being provided on a confidential basis.

QUESTION (B):

b) Please confirm that the database takes the form of an unbalanced panel. Please provide the rationales for excluding some observations of each utility that contributed data for the model.

RESPONSE (B) PROVIDED BY CLEASPRING:

Confirmed. Observations were excluded in the reliability dataset when they were excluded in the total cost dataset, based on the exclude variable. Additional observations were excluded due to missing or implausible reliability data values.

QUESTION (C):

c) Please explain why the data for some US utilities were excluded from the reliability sample entirely.

RESPONSE (C) PROVIDED BY CLEASPRING:

Observations in the reliability dataset are only excluded due to the total cost exclude variable or due to missing or implausible reliability data observations.

QUESTION (D):

d) What is the source for Toronto Hydro's forecasted SAIDI, SAIFI, and CAIDI? What assumptions underlie these forecasted values?

RESPONSE (D):

Please refer to Toronto Hydro's response to interrogatory 2B-SEC-42 for a description of Toronto Hydro's reliability projection model. The results produced from this model are aligned with IEEE 1366 definitions. To align with US reliability reporting standards, sustained interruptions lasting longer than five minutes in duration were considered for the purpose of the Reliability Benchmarking Study. CAIDI projections were derived from the SAIDI and SAIFI projections (i.e., CAIDI = SAIDI / SAIFI).

For the reliability projections provided to Clearspring, Toronto Hydro included projections of Loss of Supply and Scheduled Outage events. Toronto Hydro's approach for Loss of Supply was to set the projections for SAIDI and SAIFI equal to the most recent five-year average. For Scheduled Outages, the utility calculated the ratio of for each of 2022 actual SAIFI and SAIDI for the Scheduled Outages cause code over the capital spending in 2022 for the programs most responsible for scheduled outages, and applied that ratio to future planned spending. Please refer to 1B-Staff-62, part (b) for additional information on Scheduled Outages.

QUESTION (E):

e) If now available, please provide the 2023 actual SAIDI, SAIFI, and CAIDI values for Toronto Hydro.

RESPONSE (E):

Please see below for Toronto Hydro's 2023 SAIDI, SAIFI, and CAIDI values, based on a 5-minute threshold for sustained outages consistent with the Reliability Benchmarking Study (Exhibit 1B, Tab 3, Schedule 3, Appendix A). For more information, see response to 1B-Staff-73.

Table 1 – Actual SAIDI, SAIFI and CAIDI values for 2023

Metric	2023 Result
SAIDI (A)	51.55 Minutes
SAIFI (B)	1.12
CAIDI (A/B)	45.83 Minutes

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-75

References: Ref 1: Exhibit 1B, Tab 3, Schedule 3, Attachment A, Page. 25-28

Ref 2: EB-2019-0261, Exhibit 1, Tab 1, Schedule 12, Attachment A, Page. 28-29

Preamble:

On pages 27-28 Clearspring stated

"Clearspring did not change the variables for either the SAIFI or CAIDI models that were included in the prior Toronto Hydro research, except to take out the percentage AMI variable in the CAIDI model because it was not statistically significant. The procedure for estimating the two reliability models is much the same as the procedure for the cost models, except that different variables are used."

QUESTIONS (A)

a) Please explain why the Clearspring model was not updated when:

i. several years of additional data are available;

ii. Mr. Fenrick subsequently presented different reliability models in a Hydro Ottawa proceeding;

iii. the literature on reliability modelling has grown; and

vi. it is usually possible to improve a model when revisiting the issue with fresh eyes after several years.

RESPONSE (A)– PREPARED BY CLEASPRING:

Research efforts focused on making refinements and incremental improvements to the total cost benchmarking model. Clearspring did not expend time attempting to improve the reliaiblity model. This decision to use resources elsewhere in the research was due to two reasons. First is the limited focus on the reliability results in past proceedings. The reliability benchmark results, to Clearspring's knowledge, have not been mentioned prominently in prior Board decisions and no

suggestions on improvement ideas have been made. This point was illustrated during the most recent Hydro One custom IR proceeding where Clearspring did not conduct econometric reliablility benchmarking and this did not seem to be an issue. The second reason is that the findings for SAIFI and CAIDI in relation to Toronto Hydro are both large and have been consistent. SAIFI results have consistently been above benchmarks by large amounts, CAIDI results are the opposite. In Clearspring's view, any improvements or model enhancements are very likely to produce that same conclusion. If, for example, SAIFI is found to be 80% or 120% above benchmarks rather than the 99.4% that we reported, to our thinking this will have no impact on the conclusion that Toronto Hydro's SAIFI metrics are considerably higher than benchmarks. The same is true for CAIDI only with the opposite conclusion that the Company's CAIDI is considerably below benchmarks.

QUESTIONS (B)

b) Did Clearspring not consider the variables (e.g., congested urban in the SAIFI model and rural density, percentage of plant underground, and average wind speeds above 20 MPH in the Hydro Ottawa CAIDI model) included in its SAIFI and CAIDI models from the previous Hydro Ottawa proceeding (EB-2019-0261)? If Clearspring did consider these variables, please provide the results and associated working papers.

RESPONSE (B)– PREPARED BY CLEASPRING:

Please see the response to part (a). We did not consider other variables but updated the data and provided the same models as in the prior Toronto Hydro application.

QUESTIONS (C)

c) Please confirm that the 2025-2029 average value in Table 11 for SAIFI (% difference) should be 94.9% rather than 99.4%.

RESPONSE (C) – PREPARED BY CLEASPRING:

The 99.4% number is the correct one. The % SAIFI Difference column needs to be re-calculated. Below is the table after making that calculation.

Year	SAIFI (Actual)	SAIFI (Benchmark)	SAIFI (% Difference)	CAIDI (Actual)	CAIDI (Benchmark)	CAIDI (% Difference)
2005	0.93	0.46	70.2%	76.59	110.00	-36.2%
2006	1.11	0.46	88.1%	64.98	110.73	-53.3%
2007	1.14	0.47	89.7%	69.12	111.59	-47.9%
2008	1.08	0.46	85.0%	67.40	112.68	-51.4%
2009	0.95	0.46	72.8%	84.13	113.75	-30.2%
2010	0.98	0.46	75.5%	77.30	115.32	-40.0%
2011	1.05	0.45	83.9%	80.13	117.26	-38.1%
2012	0.88	0.45	67.4%	68.06	118.66	-55.6%
2013	0.95	0.45	75.8%	70.61	120.35	-53.3%
2014	0.92	0.45	72.6%	63.76	123.09	-65.8%
2015	0.97	0.44	78.4%	64.04	125.48	-67.3%
2016	0.93	0.45	73.3%	59.71	128.08	-76.3%
2017	1.09	0.45	87.7%	53.14	129.25	-88.9%
2018	1.09	0.46	86.3%	53.25	130.44	-89.6%
2019	0.95	0.45	73.7%	50.39	132.46	-96.6%
2020	1.11	0.45	91.1%	50.77	135.21	-98.0%
2021	1.20	0.44	100.2%	48.55	136.49	-103.4%
2022	1.24	0.43	105.1%	45.75	138.95	-111.1%
2020-2022 average	**1.18**	**0.44**	**98.8%**	**48.36**	**136.88**	**-104.1%**
2023	1.28	0.43	108.2%	42.76	141.81	-119.9%
2024	1.19	0.43	100.8%	51.28	144.87	-103.9%
2025	1.19	0.43	100.7%	51.49	148.16	-105.7%
2026	1.18	0.43	99.9%	51.54	151.67	-107.9%
2027	1.17	0.43	99.3%	51.68	155.43	-110.1%
2028	1.17	0.43	98.8%	51.85	159.47	-112.3%
2029	1.16	0.43	98.2%	51.96	163.82	-114.8%
2025-2029 average	**1.17**	**0.43**	**99.4%**	**51.70**	**155.71**	**-110.2%**

QUESTIONS (D)

d) Clearspring's working papers show that it had the data for SAIFI and SAIDI, but had to calculate CAIDI in its code. Why did Clearspring present an econometric model for CAIDI rather than SAIDI?

RESPONSE (D)– PREPARED BY CLEASPRING:

The relationship between the reliability indexes is that SAIDI equals the product of SAIFI and CAIDI. This is similar to why a load forecaster tends to model customers and model use per customer separately and then multiplies the results together to forecast sales. Separating the models based on the frequency of outages and then duration per outage is the best way to model the impacts of frequency and duration, in Clearspring's view. If SAIDI was modeled alone, which can be done, this would be less than optimal because SAIDI includes both components of frequency and duration in its definition. This is the same approach we used in the last Toronto Hydro application.

QUESTIONS (E)

e) Form EIA-861 has data on whether outages are recorded automatically (e.g., yes/no). Did Clearspring consider using these data in its reliability benchmarking results? If so, please provide these models and associated working papers.

RESPONSE (E)– PREPARED BY CLEASPRING:

No.

QUESTIONS (F)

f) Why don't the SAIFI and CAIDI models include trend variables?

RESPONSE (F)– PREPARED BY CLEASPRING:

Trend variables could be considered in the models, however, trend variables in reliability models can be larger than their total cost counterparts. When projecting out-of-sample benchmarks to

2029 this can make the benchmarks volatile. For this reason, Clearspring is generally reluctant to insert trend variables into reliability models.

QUESTIONS (G)

g) Why isn't the IEEE MED Definition variable in the CAIDI model?

RESPONSE (G)– PREPARED BY CLEASPRING:

Please see response to part (a). The results for Toronto Hydro would improve by less than 2% if the IEEE variable were included in the CAIDI model.

QUESTIONS (H)

h) Why is the number of customers included in the CAIDI model when it has a p-value of 0.341?

RESPONSE (H)– PREPARED BY CLEASPRING:

In prior reliability benchmarking work, we have left the customer variable in regardless of the level of statistical significance. This is analogous to treating it as a second order quadratic or interaction term in the total cost model. The same approach is used for SAIFI. This is because SAIFI and CAIDI are the sum of outages or outage duration divided by either total customers or total outages.

The results for Toronto Hydro would change by less than 0.5% (they would get slightly better relative to the CAIDI benchmark) if the number of customers is excluded in the CAIDI model.

QUESTIONS (I)

i) Please provide the adjusted R-squared values for each model. Are these values robust?

RESPONSE (I)– PREPARED BY CLEASPRING:

The adjusted R-squared is 0.417 for the SAIFI model and 0.205 for the CAIDI model. Yes, they are robust in that the models help to explain the variation of reliability outcomes and are able to adjust for certain challenges and characteristics that impact the reliability metrics.

QUESTIONS (J)

j) Does Clearspring have any insights as to why Toronto Hydro is an extreme outlier in both the SAIFI and CAIDI models? Does this speak to the possibility that the models are missing some relevant variables or have other possible errors?

RESPONSE (J)– PREPARED BY CLEASPRING:

Clearspring cannot speak to the engineering or any other underlying causes for these results. In our view, the models are informative and helpful and we would be surprised if other relevant variables or methodological changes had a large directional impact on the results. While we acknowledge that there may other relevant variables that could be included in the model and those may end up being enhancements, we do not believe that Toronto Hydro being an outlier in the two models is itself evidence of any possible errors.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-76

Reference : Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 10

Preamble:

"Both Clearspring and PEG used the Driscoll-Kraay ("DK") method in the Joint Report and Clearspring continues to use the DK method for this study."

PEG would like to clarify that the estimation method is pooled Ordinary Least Squares ("OLS"), which is followed by Driscoll-Kraay corrections to the standard error estimates. While the dataset consists of panel data, pooled OLS treats each company's data for each variable as though it all occurs in one time period. As a result, each coefficient estimate reflects the variable's average effect on distributor cost over the entire 20-year sample period.

QUESTIONS (A)

a) Please confirm the estimation method and standard error adjustment method Clearspring used in its econometric benchmarking.

RESPONSE (A)– PREPARED BY CLEASPRING:

Confirmed. The Driscoll-Kraay (DK) estimation procedure includes estimating parameter estimates using the pooled OLS procedure and then correcting the standard error estimates for autocorrelation, hetereoskedacity, and spatial correlations.

QUESTIONS (B)

b) Please confirm that, other than the sample-wide yearly cost trend coefficient estimate, the individual coefficients produced by the pooled OLS model reflect a time-indifferent average of the variable's effect.

RESPONSE (B)– PREPARED BY CLEASPRING:

Correct. While many of the variables themselves change over time (i.e., are time variant) the estimate of the impact of the variables is indifferent to the year of that variable value. Clearspring is of the view that using this newer DK method that uses pooled OLS for parameter estimation but produces robust standard error estimates in the presence of a autocorrelation, hetereoskedacity, and spatial correlations is the most straight-forward approach. The alternative of Generalized Least Squares requires the researcher to make assumptions on how to modify the underlying data prior to estimation. There is no need for that step and it introduces the possiblity of a bias and incorrect assumption. Far better, in Clearspring's view, to use the DK method which sidesteps those issues.

QUESTIONS (C)

c) If (b) is confirmed, does Clearspring consider this to be a strength or weakness for its model?

RESPONSE (C)– PREPARED BY CLEASPRING:

A strength. Rather than modifying the underlying data prior to estimation, it is a strength of conducting the DK estimation procedure that pooled OLS can be used which requires no assumptions or modifications to the underlying data but still produces robust standard error estimates.

QUESTIONS (D)

d) If (b) is confirmed, does Clearspring have any concerns about the implications of a two-decade sample period?

RESPONSE (D)– PREPARED BY CLEASPRING:

No. Generally the more data the model has access to the better. There has been no pronounced structural shift in the electric distribution industry during this time period that would cause us to

question the 2000 start year. This is the same start year used in the most recent Hydro One distribution benchmarking research conducted by Clearspring.

QUESTIONS (E)

e) Did Clearspring consider or test the model using a shorter sample period? If so, please provide results.

RESPONSE (E)– PREPARED BY CLEASPRING:

No, we did not consider there to be a need to test for different sample periods. We purposed to remain consistent with the Hydro One Joint Report research that Clearspring and PEG put forth. Consistency in the start year from study to study is helpful and starting in 2000 seems an appropriate year to begin the dataset from.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-77

Reference : Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 40

Preamble:

Clearspring says "This is important because it means the researcher does not need to worry about correcting the coefficient values: they are not misleading." Clearspring goes on to claim that the "standard correction procedure" for dealing with serial correlation and heteroskedasticity was to "figure out the nature of each problem" and "strategically [weight] the regression."

QUESTIONS (A)

a) Please confirm that there are numerous standard statistical tests and procedures, available as programmed commands within any modern econometric software program, to identify and rule out the presence of different forms of serial correlation and heteroskedasticity.

RESPONSE (A)– PREPARED BY CLEASPRING:

Confirmed. The older method of FGLS does have programmed commands in standard econometric software programs that allow the researcher to insert their own assumptions on the correlation of the lags. These programmed procedures and inputted assumptions will then modify the underlying data within the statistical program to produce alternative parameter estimates.

QUESTIONS (B)

b) Please confirm that it is proven that researchers can consistently (the same statistical claim which applies to time-series model parameters) estimate the rho-squared - a.k.a. the autocorrelation coefficient - in the model and thus it can be appropriate to use.

RESPONSE (B)– PREPARED BY CLEASPRING:

The autocorrelation coefficient can be estimated after making an assumption that the residuals are only correlated by one lag instead of multiple lags. This assumption then forms the basis to transform the underlying data and, thus, the parameter estimates themselves and the benchmark results. Just because an AR(1) autocorrelation coefficient can be estimated does not mean, however, it is the best estimation method to use. The newer DK method which requires zero assumptions by the researcher and does not impact the underlying data and thus the results, yet still corrects the standard errors (which are the issue in the presence of autocorrelation and hetereoskedacity), should be the preferred approach.

QUESTIONS (C)

c) Please confirm that if specific forms of serial correlation and/or heteroskedasticity are identified, there are programmed systematic procedures which correct for the problem in a clear and reproducible way.

RESPONSE (C)– PREPARED BY CLEASPRING:

Yes, the DK method is the best method for doing that in terms of being both clear and reproducible. It uses pooled OLS which requires no assumptions or modifications of the underlying data and then is able to adjust the standard errors appropriately.

QUESTIONS (D)

d) Please confirm that the systematic procedures for serial correlation and heteroskedasticity do not, in fact, alter the regression estimation procedure, but instead make the appropriate systematic corrections to the data which will then result in different coefficient values.

RESPONSE (D)– PREPARED BY CLEASPRING:

Yes, FGLS is a systematic procedure that does alter the underlying data prior to the estimation procedure after an assumption of how to adjust the data is made by the researcher. It does result

in different coefficient values and that is the problem. There is no reason to alter the coefficient values and introduce possible wrong assumptions into the estimation procedure.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-78

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 23

Preamble:

In previous econometric models of total distribution cost presented on behalf of Toronto Hydro (two studies with different samples in 2014, and one study in 2019), Mr. Fenrick has found the Company to be a superior cost performer in early years followed by a markedly large, steady deterioration in cost performance going forward and through the forecast period. These models all predicted Company performance in the forecast period to be generally in the "average" range. The 2014 model with the US-only sample and the 2019 model produced largely similar results. Clearspring's updated model of distribution cost improves Toronto Hydro's entire series of historic and forecasted cost performance by 13-29% across the board compared to the previous models.

QUESTIONS (A)

a) What in Clearspring's view are the main drivers of this wholesale cost performance shift for Toronto Hydro?

RESPONSE (A)– PREPARED BY CLEASPRING:

The refinements and improvements made to the model and methodology are the main driver. This includes the refinement to the percent urban core variable to enable it to be time variant. This refinement increased the explanatory power of the variable and given that Toronto Hydro has a high value for the variable this will have a large impact on its benchmark score. This is especially true for the forecasted periods where Toronto Hydro's cost challenges are increasing relative to the sample because of the fast-growing nature of the city it serves. The new refinement in the variable is now able to capture the increasing cost challenge Toronto Hydro faces and adjust for future years. Other refinements since the last Toronto Hydro proceeding such as adding the substation variables, subtracting out pension and benefits, moving the capital benchmark year back to 1947,

not including Ontario distributors to allow better cost and variable definitions, new scope variable, updating data for 2017-2021, and the distribution work variable also impact the scores in either direction but to a lesser extent than the refinement and improvement to the percent congested urban variable.

QUESTIONS (B)

b) Are there any material differences in variables or methods between this work and that done earlier not discussed in the current Clearspring report?

RESPONSE (B)– PREPARED BY CLEASPRING:

No, the material differences are referred to in the Clearspring Report. As indicated in the report, Clearspring replicated the methodology found in the Hydro One Joint Clearspring/PEG Report research after the conferral process with PEG. Other than refining the congested urban variable and adding the two substation variables, the variables and methodology is the same as that in the Joint Report.

QUESTIONS (C)

c) Did any other utilities common to the sample have similar shifts?

RESPONSE (C)– PREPARED BY CLEASPRING:

There were a handful of utilities that had similar sized shifts in both directions.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-79

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Pages 11, 35-36

Preamble**:**

When using a service price approach to the calculation of capital costs, calculation begins in a "benchmark" year in which the capital quantity is the ratio of plant value to an average of asset prices in prior years.

QUESTION (A):

a) The computer code shows that various capital benchmark years were used for US distributors. Please explain why.

RESPONSE (A) PREPARED BY CLEASPRING:

Two capital benchmark years for the U.S. distributors are used: 1947 and 1959. Most of the utilities have a capital benchmark year starting in 1947. Seven utilities had missing capital data from 1947 to 1959, in those cases we used a 1959 capital benchmark year.

QUESTION (B):

b) The OEB's Ontario total cost benchmarking work uses pre-2002 Toronto Hydro data in the capital cost calculations whereas the Clearspring study does not. Please discuss why the exclusion of the pre-2002 data leads to more accurate capital stocks than its inclusion. Does Toronto Hydro have actual values for any plant additions data that were estimated in the Ontario total cost benchmarking work? If so, please provide.

RESPONSE (B) PREPARED BY CLEASPRING:

It is Clearspring's understanding that the pre-2002 data used on the OEB total cost benchmarking work is extrapolated and is essentially an unknown assumption regarding when the plant additions

occured and at what level prior to 2002. Clearspring prefers the approach of using the actual data that begins in 2002.

RESPONSE (B) BY TORONTO HYDRO:

Table 1 below presents the gross capital additions for 2000-2001. However, within the amounts presented below, due to the lack of detailed records, Toronto Hydro believes that unregulated gross capital additions and changes in Construction Work in Progress (CWIP) are included, both of which are inconsistent with the cost definitions used by Clearspring in the benchmarking report. Prior to July 1999, the businesses of Toronto Hydro were owned and operated by the Toronto Hydro-Electric Commission, due to which gross capital additions prior to 2000 cannot be provided.

Table 1: 2000-2001 Gross Plant Additions ($M)

	2000	2001
Gross Plant Additions	164.9	131.6

QUESTION (C):

c) Given the general inaccuracy of benchmark year cost calculations and Clearspring's recent benchmark year for Toronto Hydro (2002), should benchmarking results for some of the early years since 2002 be disregarded or downplayed?

RESPONSE (C) PREPARED BY CLEASPRING:

This is a valid point. The earlier year results will contain an unknown influence because of the recent capital benchmark year. This lessens as time increases and actual fixed asset plant additions are added to the capital calculation making it more accurate as more years accumulate from 2002.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-80

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 34

Preamble:

Toronto Hydro states that "To construct the overall OM&A input price we weighted each sub]index using the customized labour and non-labour cost shares calculated from the FERC Form 1 data or based on data provided to us from Toronto Hydro."

QUESTIONS (A)

a) The SST code in the provided working papers has a remark indicating a 70% weight for Toronto Hydro labor in the calculation of the O&M price index whereas the data files and formulas suggest a 40% value was used in the historical period. Please confirm that the 70% labor weight is no longer used in the calculations.

RESPONSE (A)– PREPARED BY CLEASPRING:

The SST code remark is a relic of past projects. Clearspring requested from Toronto Hydro to estimate its OM&A payroll costs as a percentage of OM&A. The Company was able to do this for 2020 to 2029. The 2020 value is 40%, so we used that value for 2020 and prior. The specific year estimates for 2021 to 2029 are used. These can be seen on row 33 in the OM&A Forecast worksheet found in the Excel file titled THESLdata2025 found in the working papers.

QUESTIONS (B)

b) If a 40% share is instead used, what is the basis for this calculation?

RESPONSE (B)– PREPARED BY CLEASPRING:

Please see the response to part (a).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-81

References: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page. 22-23, 38

Preamble:

In order to make econometric projections of Toronto Hydro's proposed cost, Clearspring needed to obtain forecasts of labor OM&A, non-labor OM&A, and asset prices.

Clearspring did not provide a detailed description to address these in its report or in the working papers.

QUESTIONS (A)

a) Please provide full descriptions and Timeseries File IDs for each of the input price forecasts that Clearspring used in its research.

RESPONSE (A)– PREPARED BY CLEASPRING:

Clearspring purchased from the Conference Board of Canada the GDP-IPI with the ID of PGDP and the following description : Implicit Price Deflator - GDP at Market Prices (2012=1.0) and the AWE with the ID of RLAWWIO and the following description : Average Weekly Wages & Salaries Per Employee, Ontario ($, Industrial Composite).

QUESTIONS (B)

b) Please explain why forecasts from January 23, 2023, were used when the report was dated October 31, 2023?

RESPONSE (B)– PREPARED BY CLEASPRING:

Clearspring did not purchase forecasts after the January 23, 2023 date. During this time period is when we conducted the majority of our data collection efforts.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-82

Reference: Exhibit 1B, Tab 3, Schedule 3, Page 38

Preamble:

Toronto Hydro states that the ION meter is more expensive than a typical meter and implies small installed quantities of ION meters can have a material effect on Meters CAPEX unit costs.

QUESTION (A):

a) Why is the ION meter being utilized and has a lower cost alternative been investigated and considered?

RESPONSE (A):

As discussed on page 6 of Exhibit 2B, Section 5.4, ION meters provide benefits such as easier data access for customers, enhanced data analytics granularity, and improved power quality data analysis. Through the ION meter, customers have access to enhanced data such as power factor, voltage, power consumption, and waveform analysis. The customer is able to access the meter at any time and export data directly into their energy management systems. In addition, the ION meter provides customers the benefits of power factor correction and the implementation of sag mitigation technology. For example, Toronto Hydro leveraged sag data to help a customer take corrective action on their under voltage protection, prevent multiple outages, and minimize the customer's lost production time.

At the time Toronto Hydro chose to begin installing ION meters in limited circumstances, lower cost alternatives that provided similar benefits and were Measurement Canada certified were not available.

QUESTION (B):

b) What percentage of installed meters in each of 2018 to 2022 were ION meters?

RESPONSE (B):

Please see Table 1.

Table 1 – Percentage of ION Meters Installed Between 2018-2022 Period

Year	Total Installations	ION Meter Installations	Percentage of ION Meter Installations
2018	28,395	31	0.109%
2019	26,182	43	0.164%
2020	24,688	10	0.041%
2021	12,241	2	0.016%
2022	19,603	5	0.026%

QUESTION (C):

c) What is the cost difference between an ION meter and a typical meter?

RESPONSE (C):

The installed cost of an ION meter is approximately $9,300 compared to the installed cost of a typical meter at approximately $1,500.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-83

References: Exhibit 1B, Tab 3, Schedule 3, Appendix C

Preamble:

In its unit cost benchmarking study, UMS Group states that the seven asset categories represent 52% of the planned capital budget and that the five maintenance programs represent approximately 57% of the preventive and predictive maintenance costs.

QUESTION (A):

a) Please show the detailed calculations to derive the above percentages.

RESPONSE (A):

The percentage for the planned capital budget represented by the seven asset categories is based on Toronto Hydro's ISA data for 2020 to 2022. The unit cost methodology outlined as part of the updated approach in interrogatory response 1B-AMPCO-09 is followed to exclude demand driven programs and outliers from the population. The total cost corresponding to the seven asset categories is then divided by the total cost of all assets represented in the ISA data for that year. The average of the three years is taken resulting in a percentage of 48%.

Upon further review, Toronto Hydro identified that the original denominator used in the calculation underrepresented the total cost as it did not consider the exhaustive asset classes in the ISA data. This consequently resulted in the percentage change from 52% to 48%.

Table 1: Calculation of 7 Asset Categories' Percentage of Planned Capital Budget

	2020 – 2022 ($M)
UMS Provided Capital Assets	262.7
Filtered Total Cost View*	551.5
%	48%

**Total costs after unit cost methodology has been applied*

For the five maintenance programs, summation of the actual spend under these five programs was divided by the total spend under the Preventative and Predictive maintenance portfolio for each of the years between 2020 – 2022, and average percentage was obtained resulting in a percentage of 56%. This represents a decrease of approximately 1% from the original calculation following review and update of the total spend under the Preventative and Predictive programs used in the calculation.

Table 2: Calculation of 7 Asset Categories' Percentage of Planned Capital Budget

	2020 – 2022 ($M)
UMS Provided Maintenance Costs	28.6
Total Preventative and Predictive Programs	51.0
%	56%

QUESTION (B):

b) Please show the detailed calculations to derive the respective percentages for the 2025-2029 period.

RESPONSE (B):

Forecasted values are not available for the 2025-2029 period and Toronto Hydro did not forecast the unit costs in the UMS Unit Cost Benchmarking Study. Toronto Hydro forecasts volumes and total costs at a segment/program level using program-specific methodologies and is unable to forecast the 2025-2029 period in a manner that can be relatable to the unit cost as the unit cost methodology utilizes ISA data from completed projects.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-84

Reference: Exhibit 1B, Tab 3, Schedule 3, Section 3.0

Preamble:

In Reference 1, which is titled "2020 to 2024 Productivity Achievements," Toronto Hydro states it has achieved more than $2.2 billion of savings since 1999 through the amalgamation of the six utilities that served the former municipalities that now make-up the City of Toronto.

QUESTION:

Of the cited $2.2 billion in savings generated by the utility since Toronto Hydro was created in 1999, please quantify the new savings that were actually, as opposed to being forecast, realized since 2020.

RESPONSE:

Please see Toronto Hydro's response to 1B-AMPCO-07.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-85

Reference: Exhibit 1B, Tab 3, Schedule 3, section 3.1

Preamble:

Toronto Hydro provides forecast reduced expenditures and forecast avoided operating costs for several corporate projects.

QUESTIONS (A):

a) Please complete the following table to identify the actual realized reduced expenditures in each year:

Project	2020	2021	2022	2023
Enterprise Resource Planning, Enterprise Connect, and People Connect				
e-Tailboard				
Streetlight Management System Project				
Non-conformance Reporting				
Electronic Red Construction Folder				
Accounts Payable Processing Automation				
Storm Prediction Impact Tool				
SAP Business Warehouse Project				

RESPONSE (A):

As requested, the table below lists the cost reduction benefits from 2020-2023 for the noted projects.

Project	2020 ($000)	2021 ($000)	2022 ($000)	2023 ($000)	Total ($000)
Enterprise Resource Planning, Enterprise Connect, and People Connect	$1,150	$1,150	$1,150	$1,532	$4,982
e-Tailboard	N/A	N/A	$6	$6	$12

Project	2020 ($000)	2021 ($000)	2022 ($000)	2023 ($000)	Total ($000)
Streetlight Management System Project	N/A	N/A	N/A	N/A	N/A
Non-conformance Reporting	N/A	N/A	N/A	N/A	N/A
Electronic Red Construction Folder	N/A	$25	$32	$33	$90
Accounts Payable Processing Automation	N/A	$164	$170	$179	$513
Storm Prediction Impact Tool	N/A	$6	$10	$10	$26
SAP Business Warehouse Project	N/A	N/A	N/A	N/A	N/A

Note : The above amounts have been rounded to the nearest thousand.

QUESTIONS (B):

b. Please complete the following table to identify the actual realized cost avoidance in each year:

Project	2020	2021	2022	2023
Enterprise Resource Planning, Enterprise Connect, and People Connect				
e-Tailboard				
Streetlight Management System Project				
Non-conformance Reporting				
Electronic Red Construction Folder				
Accounts Payable Processing Automation				
Storm Prediction Impact Tool				
SAP Business Warehouse Project				

RESPONSE (B):

As requested, the table below lists Cost Avoidance benefits from 2020-2023 for the noted projects.

Project	2020 ($000)	2021 ($000)	2022 ($000)	2023 ($000)	Total ($000)
Enterprise Resource Planning, Enterprise Connect, and People Connect	$305	$612	$990	$716	$2,623

Project	2020 ($000)	2021 ($000)	2022 ($000)	2023 ($000)	Total ($000)
e-Tailboard	N/A	N/A	$725	$309	$1,034
Streetlight Management System Project[1]	N/A	N/A	$628	$659	$1,287
Non-conformance Reporting	N/A	N/A	$400	$420	$820
Electronic Red Construction Folder	N/A	N/A	$245	$257	$502
Accounts Payable Processing Automation	N/A	N/A	N/A	N/A	N/A
Storm Prediction Impact Tool	N/A	N/A	$3	$3	$6
SAP Business Warehouse Project	N/A	$18	$41	N/A	$59

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-86

References: Exhibit 1B, Tab 3, Schedule 1, Section 3.2.2
Report of the Board: Renewed Regulatory Framework for Electricity Distributors: A Performance-Base Approach, October 2012

Preamble**:**

On page 10 of Reference 1, Toronto Hydro reports that its investment plan is "sufficient only to maintain outage duration as measured by the custom SAIDI metric over the 2025-29 period" (p.10), yet set a target two standard deviations below this level - 2 minutes lower than historical 5 year average of 48.2 minutes.

On page 16 of Reference 1, Toronto Hydro proposes to maintain outage frequency and has established a target range enveloping its most recent five-year historical outage frequency measure of 0.42. Regarding outages, its investment plan is to invest "the minimum level necessary to manage asset condition"; this intent is informed by customers' prioritization of reduced outage duration rather than frequency.

QUESTION (A):

a) Please explain what actions and management decisions Toronto Hydro would need to undertake in order to achieve the 46.2 minute SAIDI target attached to the performance incentive mechanism.

RESPONSE (A):

Toronto Hydro's Asset Management Process (refer to Exhibit 2B, Section D) combined with the necessary funding and resources to execute the work programs outlined in the 2025-2029 investment plan, and the performance incentives proposed in Exhibit 1B, Tab 3, Schedule 1 will enable the utility to attain the proposed System Reliability targets for Outage Duration and Outage Frequency.

QUESTION (B):

b) Please confirm whether the steps in a) are included in Toronto Hydro's investment plan.

RESPONSE (B):

Yes. All of the above are part of the 2025-2029 investment plan and rate application.

QUESTION (C):

c) Please explain under what conditions the steps in a) would be included in Toronto Hydro's plan, and whether any other work would not be carried out if the steps in a) were undertaken.

RESPONSE (C):

Please refer to the response in part a.

QUESTION (D):

d) In the event Toronto Hydro follows its investment plan, which is not sufficient to achieve this target, and it achieves this target nevertheless, to what factors could its success be attributed?

RESPONSE (D):

Toronto Hydro cannot comment on a hypothetical future scenario the parameters of which are unclear and speculative. The utility notes however that in its experience as a performance-drive

organization, the achievement of the targets can be attributed to a combination of operational management, innovative approaches, adaptability, collaboration, and risk management. Effective decision-making is at the crux of all these factors. In a balanced incentive regime, where performance targets are set in a challenging but achievable way, the utility is encouraged to optimize decision-making towards achieving performance objectives.

In a regulatory regime that focuses predominately on financial/cost outcomes, decisions are optimized to manage profitability, efficiency and cost containment. Over time and/or under certain circumstances (e.g., the utility faces new requirements or rising cost pressures) this may compromise the utility's ability to achieve target service quality performance objectives.

Toronto Hydro believes that both types of incentives are important to drive effective decision-making and ensure that there is an appropriate balance of risk/reward in the regulatory framework. That is why its proposed X-factor includes both an empirical-based efficiency factor and a performance-focused incentive mechanism. For more information, please refer to the Rate Framework evidence in Exhibit 1B, Tab 2, Schedule 1 at pages 29-33.

QUESTION (E):

e) Please explain why an incentive is warranted in the circumstances referenced above.

RESPONSE (E):

Please see response to (d) above.

QUESTION (F):

f) Regarding outage frequency please explain why an incentive is required or justifiable to prevent deterioration from current service levels and investing "the minimum level necessary."

RESPONSE (F):

Refer to response in part d).

QUESTION (G):

g) Please discuss the proposal to maintain outage frequency in the context of the OEB's statement in Reference 2 that "The [Renewed Regulatory Framework] is intended to elevate utility performance by creating incentives for superior performance."

RESPONSE (G):

In Toronto Hydro's view, the quoted statement must be considered holistically when evaluating the effectiveness of the performance incentive regime. To apply this statement in a wholesale manner to each and every performance objective would run contrary to other important considerations in the RRF: *"The renewed regulatory framework is a comprehensive performance-based approach to regulation that is based on the achievement of outcomes that ensure that Ontario's electricity system provides value for money for customers.*"

With respect to value for money for customers, the RRF's customer focus outcome encourages distributors to provide services "*in a manner that responds to identified customer preferences*." With this customer focus outcome in mind, the target to maintain (rather than improve) Outage Frequency reflects the key consideration that customers in all classes (except Key Accounts) prioritize outage duration over frequency, and expect the utility to balance reliability performance with price and other key outcomes. Please see Exhibit 1B, Tab 5, Schedule 1 for more information about Toronto Hydro's application-specific customer engagement results that informed development of the 2025-2029 Investment Plan underpinning this application.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-87

References: Exhibit 1B, Tab 3, Schedule 1, Page 48

Exhibit 2B, Section E7.2

Preamble:

Toronto Hydro states the use of Local Demand Response (LDR) to avoid capital spent on load transfers resulting in significant long-term savings for ratepayers.

QUESTION (A):

a) Please provide the benefit-cost analysis, or equivalent document, that supports Toronto Hydro's selection of target stations for demand response and those which have not been proposed, including: Fairbank TS, Finch TS, Bathurst TS, Manby TS, Leslie TS, Cecil TS, Strachan TS, and Copeland TS.

RESPONSE (A):

As noted on pages 8 and 9 of the updated (January 29th, 2024) Exhibit 2B, Section E7.2, the Flexibility Services program will target Finch TS, Manby TS, Cecil TS, Strachan TS, Leslie TS and Copeland TS. The program is not currently focused on Fairbank TS or Bathurst TS, but should the opportunity and need arise to target these stations, Toronto Hydro will investigate the possibility of doing so. A key feature of the Flexibility Services program is that it can easily adapt in terms of scope and location to meet the most pressing system needs. The program target areas will shift based on needs, as has been the case in previous LDR programs.

As noted in Toronto Hydro's response to the OEB's stakeholder consultation on the *Benefit – Cost Analysis Framework for Addressing Electricity System Needs* (EB-2023-0125), submitted on February 1, 2023, Toronto Hydro applies pre-screening criteria when selecting potential applications of NWSs, and selects projects that can be clearly defined and linked to a system need.

These projects are then put through a cost-benefit analysis to ensure the application of NWSs is cost-effective. For more information on the cost-benefit analysis that has been undertaken for the selected stations, please see Interrogatory 1B-Staff-89.

QUESTION (B):

b) Please list any other LDR projects that were considered but rejected for the 2025 to 2029 period.

RESPONSE (B):

As described in Exhibit 2B, Section E7.2, the Flexibility Services program (i.e. LDR) directly supports Load Demand by identifying opportunities to defer or avoid bus-level load transfers when and where it is appropriate. As noted in the evidence, all stations that are targeted for bus-level relief in 2025-2029 were evaluated and considered for the LDR program. Some of these stations are excluded (i.e. Dufferin TS, Terauley TS, Esplanade TS, Horner TS and Windsor TS) as the planned transfers are either carry-over projects that were deferred in 2020-2024, or projects where overloading is not the primary driver. The work planned for these stations is described in Exhibit 2B, Section E5.3. All six of the remaining stations that are expected to require bus-level load transfers in the 2025-2029 period (i.e. Finch TS, Manby TS, Cecil TS, Strachan TS, Leslie TS and Copeland TS) will be targeted for LDR capacity.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-88

References: Exhibit 1B, Tab 3, Schedule 1, Section 2.4.3, Pages 46-56

Exhibit 2B, Section E7.2.1

Preamble:

Toronto Hydro provides details of its proposed system capacity (non-wires) proposals, including the LDR and performance incentive structure. Toronto Hydro proposes a budget of $5.7 million to deploy an expanded version of its LDR initiative to address system capacity constraints and procure 30 MW of flexible system capacity to displace and defer the need for load transfers in the Horseshoe North area over the 2025-2029 term.

QUESTION (A) AND (B):

a) Please discuss what considerations Toronto Hydro undertook about expanding the LDR program greater than 30 MW, including cost, impact on neighboring stations, ability to procure necessary capacity and any subsequent changes to performance incentive structures.
b) Please discuss the rationale for limiting LDR capacity at 30 MW for the 2025 to 2029 period.

RESPONSE (A) AND (B):

Toronto Hydro considered the following key factors in setting the 30 MW target:

Resource Availability: Toronto Hydro's experience shows that procurement of targeted demand response ("DR") for the purpose of capital deferral/avoidance is most successful when targeting areas with a higher penetration of large loads (e.g., 1 MW or more, or large groupings of 100 kW or more customers), as these customer types are more likely to be able to curtail on demand. The utility selects stations with a high penetration of these customer types when possible, and sets achievable targets that reflect the anticipated availability of DR amongst these customers. During the 2020-2024

rate period, Toronto Hydro set a target of 10 MW for a group of two stations (Manby TS and Horner TS), and even this modest target proved to be challenging from a procurement perspective (see below for details). For a group of six stations, Toronto Hydro set an ambitious goal of 30 MW (10 MW per 2 stations), which reflects both the utility's experience and commitment to continuous improvement with respect to non-wires solutions.

Market Dynamics: Local Demand Response ("LDR") is subject to market forces that could impact the outcome of the program. In the current Etobicoke Pilot, the utility intended to procure 10MW but could only secure 4 MW for the first summer (2023). This a reflection of available market capacity, particularly as many resources are already committed to other programs (e.g., IESO's Capacity Auction, the Industrial Conservation Initiative ("ICI"). Aggregators (i.e., participants in LDR) expressed that significant time and effort is required to acquire capacity for new programs, and that the average time required to onboard new capacity for a new program could be anywhere between 6 to 12 months, resulting is some participants choosing to stick with existing market obligations and forego participation in new programs. These are important factors to consider when setting reasonable targets for non-wires solutions ("NWS").

Other Considerations: In setting the 30 MW target, Toronto Hydro also considered the cost recovery impacts of acquiring DR capacity (please see Exhibit 2B Section E7.2 for details) in addition to many other urgent and important operational requirements that the utility must address in the next rate term as summarized in the OM&A Overview evidence at Exhibit 4, Tab 1, Schedule 1, and detailed throughout the programmatic evidence in Exhibit 4, Tab 2. The utility also considered the ongoing regulatory uncertainty with respect to performance incentives and cost recovery for investments that are needed to develop capabilities in this emerging area of focus. Coupled with the operational and market risks identified above, these considerations led Toronto Hydro to set a challenging but achievable target of 30MW.

QUESTION (C):

c) Please discuss what considerations are required if the LDR program was to be leveraged to alleviate long-term capacity needs for the various stations identified.

RESPONSE (C):

For DR to replace a permanent, long-term capacity investment, Toronto Hydro needs confidence that this market-based product can deliver the same safety and reliability requirements as a tried and tested conventional wires solution at a cost-effective price. At this time, adequate volumes of DR resources are not available to meet these requirements. As noted in part (a), it can be difficult to procure even 10 MW of DR. To avoid larger scale, long-term station investments, Toronto Hydro would need to procure upwards of 50 MW in one station area. Furthermore, to rely on DR at this scale, Toronto Hydro would need to pay a high $/MW-day daily capacity payment along with potential energy payments, for each day that the resource is relied upon. As the market matures and more resources become available, Toronto Hydro will evaluate the feasibility and cost-effectiveness of using DR to replace longer-term capacity investments.

QUESTION (D):

d) Please discuss and provide any analysis undertaken to consider similar LDR initiatives in other areas of Toronto Hydro's system that have identified constraints, including Horseshoe East and West. Please indicate why similar projects have not been proposed for additional areas on the system.

RESPONSE (D):

As described in Exhibit 2B, Section E7.2, the Flexibility Services program (i.e. LDR) directly supports Load Demand by identifying opportunities to defer or avoid bus-level load transfers when and where it is appropriate. As noted in the evidence, Toronto Hydro evaluated all the stations that are targeted for capacity bus-level relief in 2025-2029, including those in Horseshoe East and West, as well as

Downtown.[1] From this evaluation, the utility selected six stations that are expected to require bus-level load transfers in the 2025-2029 period (i.e. Finch TS, Manby TS, Cecil TS, Strachan TS, Leslie TS and Copeland TS) for LDR capacity. The target areas could shift based on system needs, similar to previous LDR programs, because as noted in Exhibit 2B, Section E7.2 on pages 8-9, the ability to easily adapt in terms of scope and location to meet the most pressing system needs is a key feature of the Flexibility Services program.

QUESTION (E):

e) Please discuss what considerations and analysis was conducted by Toronto Hydro related to CDM programs being offered in its service territory, including those in partnership with other entities, including the IESO and the Local Initiatives Program during the 2025-2029 period.

RESPONSE (E):

Toronto Hydro has not proposed its own local programs under the 2021-2024 CDM framework. However, the utility continues to support programs delivered by IESO under the Local Initiatives Program. This includes outreach and marketing support for programs such as Coolsaver, BizEnergySaver, and the upcoming heat pump program. Given the effort and success of centrally delivered CDM, at this time, Toronto Hydro is focused on building on and supporting the IESO's efforts rather than duplicating programs. Toronto Hydro remains open to collaborating on future CDM programs with the IESO, and exploring opportunities for benefit-stacking where possible.

Toronto Hydro's own efforts in the realm of demand-side management, focus on targeted and credible opportunities where capital deferral or avoidance through non-wires solutions can be identified and measured. This is based on a ground up analysis of system needs, and the targeted deployment of demand-side management program called Local Demand Response ("LDR"), as outlined in detail in the evidence at Exhibit 2B, Section E7.2.

[1] This did not include certain stations (i.e. Dufferin TS, Terauley TS, Esplanade TS, Horner TS and Windsor TS) for which projects carried over from 2020-2024. The work planned for these stations is described in Exhibit 2B, Section E5.3.

QUESTION (F):

f) Please discuss the Benefit Stacking Pilot that is supported by the IESO Grid Innovation Fund and OEB's Innovation Sandbox, including project timelines and how Toronto Hydro expects to apply findings from the pilot project.

RESPONSE (F):

Toronto Hydro has partnered with Power Advisory LLC and Toronto Metropolitan University's Centre for Urban Energy (CUE) to create a project that explores how to effectively and efficiently procure and deploy DR capacity to address overlapping distribution and transmission system level needs. This project is called the Benefit Stacking Transmission and Distribution Pilot ("Benefit Stacking Pilot") and is supported by the IESO's Grid Innovation Fund, and the Ontario Energy Board's (OEB's) Innovation Sandbox. The project began in June 2022 and will be completed by March 2025. An overview of the Benefit Stacking Pilot was provided on pages 12 and 13 of Exhibit 2B Section E7.2.

In its first year (2022), the pilot was focused on designing the program, developing rules, contracts, measurement and verification, and the settlement processes. During this period, Toronto Hydro also ran a procurement for DR capacity to be deployed in Summer 2023.

Last year (2023) was focused on testing the program by deploying DR capacity in the summer, resulting in four dispatch events, with each event yielding close to 5 MW of DR capacity. Throughout the year, the utility's partner Toronto Metropolitan University (TMU) created several tools and platforms to enable auction-based procurement, dispatch coordination, and automated measurement, verification and settlement. Additionally, 6 MW of DR was procured for future deployment.

In summer 2024, Toronto Hydro intends to dispatch this capacity utilizing the TMU tools and upon completion of these events, the utility and its partners will analyze the results.

The utility will apply the learnings from this pilot to inform future LDR programs in its service territory and provide insights to the electricity sector on transmission-distribution coordination.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-89

References: Exhibit 1B, Tab 3, Schedule 1, Section 2.4.3, Pages 49-55
OEB Filing Guidelines for Incentives for Electricity Distributors to Use Third-Party DERs as Non-Wires Alternatives, March 28, 2023
OEB Draft Benefit-Cost Analysis Framework for Addressing Electricity System Needs, December 2023

Preamble:

Toronto Hydro has proposed a performance incentive related to the LDR program as well as has conducted a Benefit Cost Analysis on the proposal. As part of this analysis, Toronto Hydro outlines the NPV of the benefits of capital deferral and avoided based on the LDR program based on a set of assumptions informed by prior experience with load transfer projects.

QUESTION (A):

a) Please provide any data from Toronto Hydro's existing LDR program that supports the assumption of 75% of load transfer projects in scope can be avoided entirely, while 25% deferred for at least 5 years.

RESPONSE (A):

The LDR program that is currently underway is targeting two stations, Manby TS and Horner TS. As described on page 11 in Exhibit 2B Section E7.2, the consideration of LDR as an NWS has enabled planners to avoid all incremental load transfers that would otherwise have been carried out in order to manage Manby TS between 2022 and 2024.

This experience has confirmed that adding the consideration of NWSs to the load demand project selection and scoping process introduces the opportunity to re-prioritize capital work. As a result, in cases where the LDR can successfully be procured, load transfers that are intended to manage

capacity constraints during an interim period (prior to executing a permanent wires solution) can be avoided.

Looking ahead at 2025-2029, as described in on pages 8 and 9 in Exhibit 2B Section E7.2, Toronto Hydro is targeting 30 MW at a group of six stations. Each of these stations currently has an estimated volume of load transfers that could materialize. The high range is 175 MVA and the low range is 100 MVA. Based on the diversity of needs at these stations, it is not prudent to assume that 100% of the load transfers targeted by the procurement of 30 MW of DR can be entirely avoided. Engineering judgement was utilized to estimate that 75% could be avoided, while 25% could be deferred. Note that this estimate, and the resulting BCA, provides a conceptual understanding of the difference in value and benefit that arises in cases where capital is entirely avoided versus capital being deferred. The figures could change based on the actual load demand projects targeted, as well as the ability to procure DR capacity. This is to be expected when considering the use of third-party owned, market-based solutions to address dynamic demand-related system needs.

QUESTION (B):

b) Please discuss the impacts to the analysis, including operational cost figures, summarized in Table 18 using different assumptions, including 50% of load transfer projects in scope are avoided entirely while 50% are deferred for at least 5-years; and, if 100% of projects are avoided entirely.

RESPONSE (B):

Table 1 below restates the analysis applying an assumption that 50% of load transfer projects in scope are avoided entirely while 50% are deferred for at least 5-years.

Table 1

	Deferred Capital	**Avoided Capital**
Parameters	$5.00 million in load transfer capital investment deferred for 5 years at an operational cost of **$1.43 million**	$5.00 million in load transfer capital investment avoided over the life of the assets (48 years) at an operational cost of **$4.28 million**
Costs	NPV of the operational costs of the non-wires solution (2025-2029): **$1.14 million** + NPV of the revenue requirement associated with the load transfer capital investment to be made in 2030: **$3.59 million** = **$4.74 million** NPV Costs	NPV of the operational costs of the non-wires solution (2025-2029): **$3.43 million**
Benefits	NPV of revenue requirement associated with capital investment deferred from 2025-29: **$4.85 million** *Less (-)* NPV Costs: **$4.74 million** *Equals (=)* $110.14 thousand NPV Benefits	NPV of revenue requirement associated with capital investment avoided in 2025 over the 48-year EUL: **$4.85 million** *Less (-)* NPV Costs: **$3.43 million** *Equals (=)* **$1.42 million** NPV Benefits
	Total NPV Benefits = $1.53 million	

Table 2 below restates the analysis applying an assumption that 100% of load transfer projects in scope are avoided entirely.

Table 2

	Deferred Capital	Avoided Capital
Parameters	**n/a**	**$10.00 million in load transfer capital investment avoided over the life of the assets (48 years) at an operational cost of $5.70 million**
Costs	**n/a**	**NPV of the operational costs of the non-wires solution (2025-2029): $4.57 million**
Benefits	**n/a**	**NPV of revenue requirement associated with capital investment avoided in 2025 over the 48-year EUL: $9.69 million *Less (-)* NPV Costs: $4.57 million *Equals (=)* $5.12 million NPV Benefits**
	Total NPV Benefits = $5.12 million	

The analysis presented in the tables above aligns with Toronto Hydro's understanding that capital avoidance of load transfers constitutes the primary source of economic benefits for the LDR program. At the same time, while deferral of load transfers may ultimately provide small (but positive) economic benefits, this approach can provide operational flexibility to areas of grid that face demand volatility or uncertainty. In these more dynamic circumstances that the utility could be faced with in the next rate period as customers adopt new technologies, deferring load transfers through LDR can be a prudent strategy even if the economic benefits are relatively small. Postponement or deferral of load transfers "buys time" to let the uncertainty and volatility settle before making the decision to undertake a load transfer investment that will add cost to the rate base for many years. Postponement can also result in the decision to avoid the related capital expenditures should it become apparent that such work is no longer needed.

QUESTION (C):

c) Please discuss any consideration or analysis Toronto Hydro has conducted on its BCA analysis following the OEB's release of the draft BCA Framework. If Toronto Hydro has conducted any analysis using the OEB's BCA Framework examples, please provide.

RESPONSE (C):

Overall, the BCA methodology that Toronto Hydro applied is aligned with the draft BCA framework released by the OEB. The largest source of difference is the 'Pre-Assessment' Criteria, which Toronto Hydro addressed in its February 1, 2024 comments to the OEB in EB-2023-0125.[1] Toronto Hydro intends to continue to evolve its BCA methodology to maintain alignment with the OEB framework as it evolves and takes shape.

QUESTION (D):

d) Please clarify if the WACC was used as the sole discount rates as part of the BCA analysis to calculate net present values, or if additional discount rates (e.g., social discount rate, inflation rate) were used.

RESPONSE (D):

WACC used for the BCA analysis is a nominal weighted average cost of capital, that includes inflation. Assuming that inflation will be around 2% post 2025, the real WACC used for the BCA is 4.17%.

QUESTION (E):

e) Please discuss the analysis and consideration Toronto Hydro conducted related to possible bulk system benefits related to the proposed LDR program.

[1] https://www.rds.oeb.ca/CMWebDrawer/Record/835141/File/document

RESPONSE (E):

Toronto Hydro's assessment of NWS benefits applies to distribution systems needs and value. Bulk value assessments have not been included as part of Toronto Hydro's DSP at this time, as there is no established framework for capturing this value.

QUESTION (F):

f) Please confirm that if successful, the LDR program will not require Toronto Hydro to raise the capital required for the traditional wires solution, either in whole or in part, depending on the level of transfer projects entirely avoided or deferred.

RESPONSE (F):

Confirmed for the proposed 2025-2029 program.

QUESTION (G):

g) Please provide the factors and considerations that led Toronto Hydro to the conclusion that the Shared Savings Mechanisms incentive options were not sufficient to level the playing field between the LDR program and load transfers.

RESPONSE (G):

Please see the evidence in Exhibit 1B, Tab 3, Schedule 1 at pages 53-54. To arrive at this conclusion, Toronto Hydro assessed the foregone opportunity to earn a regulated rate of return ("ROE") on the capital investments avoided and deferred, using an NPV approach. The resulting analysis presented in Table 18 of the evidence shows that the LDR target to procure 30MW results in foregone utility ROE of approximately $3.2 million due to the deferral and avoidance of load transfer capital expenditures. By comparison a 50:50 shared saving mechanism based on the calculated NPV of benefits associated with the proposed target ($3.3 million) yields an incentive of approximately $1.7 million. Compared to the foregone revenue of $3.2 million, and the operational and market

risk and complexity associated with a successful delivery of the LDR proposal, Toronto Hydro did not find the shared savings outcome acceptable.

QUESTION (H):

h) Please discuss how the LDR program will be evaluated to verify its performance and calculate total costs and benefits, after the fact, and determine final net benefits.

RESPONSE (H):

The LDR program's success will be evaluated on the basis of capacity procured, cost of DR ($/MW-day), capacity deployed, and avoided or deferred load transfers in each station area targeted by the program. The methodology utilized in the BCA provided will be recalculated annually to evaluate cumulative program success throughout the rate-period.

QUESTION (I):

i) Please discuss the proposed method for determining final incentive value for the LDR program if it will be based on final actual or forecast values.

RESPONSE (I):

Consistent with the fixed incentive option outlined at page 8 of the OEB's *Filing Guidelines for Incentives for Electricity Distributors to Use Third-Party DERs as Non-Wires Alternatives*, Toronto Hydro's proposal is that the final incentive value will be based on actual versus forecast "*amount [MW] of system capacity provided by third-party owned DER solutions that would otherwise have to be provided by a wires solution.*"

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-90

References: Exhibit 1B, Tab 3, Schedule 1, Page 10
Exhibit 2B, Section A, Page 2
Exhibit 2B, Section E2, Page 23
Exhibit 2B, Section D3, Page 40
Exhibit 2B, Section D3, Page 53

Preamble:

In determining its SAIDI target excluding LoS, MEDs and Scheduled Outages, Toronto Hydro appears to be conflating the stated customer desires of maintaining overall system reliability with the stated customer desires of addressing long outage durations which are primarily caused by MEDs.

QUESTION (A):

a) Please provide a list of projects that contribute to achieving the SAIDI target of 46.2 shown in Figure 1 in Reference 1, and the contribution of each project to achieving that target.

RESPONSE (A):

Please refer to Table 3 (Exhibit 1B, Tab 3, Schedule 1, pages. 12 to 15) for a breakdown of key investments contributing to the achievement of the Outage Duration performance target. Toronto Hydro is unable to provide a specific list of projects that will contribute to successfully achieving the target by the end of 2029, as those projects have yet to be planned, designed, and issued for execution. Toronto Hydro typically issues detailed scopes of work for capital projects 12-18 months ahead of construction.

QUESTION (B):

b) Please reconcile the stated customer preference of reducing the impact of MEDs against Toronto Hydro's stated target of improving SAIDI excluding LoS, MEDs and scheduled outages. Why should the target for SAIDI excluding LoS, MEDs and scheduled outages not be maintained at 48.2 minutes as per stated customer preference?

RESPONSE (B):

Major Event Days ('MEDs') and outages caused by extreme weather are not one and the same. The investments that Toronto Hydro plans to make to improve SAIDI will have benefits for outage duration during adverse and extreme weather events, whether those events meet the statistical classification threshold for MEDs or not.

As stated in the OEB's RRR,[1] "such [Major] events disrupt normal business operations and occur so infrequently that it would be uneconomical to take them into account when designing and operating the distribution system." The IEEE 1366 standard[2] clarifies the intended purpose of Major Event Day classification is "to allow major events to be studied separately from daily operation, and in the process, to better reveal trends in daily operation that would be hidden by the large statistical effect of major events". In essence, MEDs are a way of classifying statistical outlier events that would otherwise obscure and distort average performance statistics. MEDs are inherently difficult to predict, highly variable in their circumstances and outcomes, and not suited to reliability performance target setting.

As stated in the evidence (Exhibit 1B, Tab 3, Schedule 1, page 9), for the 2025-2029 period, Toronto Hydro intends to improve Outage Duration performance as measured by the custom SAIDI metric compared to historical performance. This objective aligns with customer needs and priorities identified through Phase 1 of Toronto Hydro's Customer Engagement which highlighted that when it comes to reliability performance, all customers (except Key Accounts) prioritize reducing the overall length of outages rather than the number of outages. For more information on the outputs

[1] Ontario Energy Board: Electricity Reporting and Record Keeping Requirements ('RRR')
[2] IEEE Std 1366-2022: IEEE Guide for Electric Power Distribution Reliability Indices

of the customer engagement process, in particular reliability priorities, please refer to Exhibit 1B, Tab 5, Schedule 1, Appendix A at page 8).

QUESTION (C):

c) Please provide a capital and O&M budget that would achieve a target SAIDI of 48.2 minutes.

   i. Please provide the list of capital projects that are not required or are reduced as part of maintaining a 48.2 minute SAIDI target.

RESPONSE (C):

As illustrated by the IRM scenario in Exhibit 1B, Tab 3, Schedule 1, at page 10, Toronto Hydro would be unable to maintain historical performance of 48.2 (2018-2022 average) without incremental investment. The reliability projection for Toronto Hydro's proposed capital expenditure plan suggests that the utility's investment plan is only sufficient to maintain Outage Duration as measured by the custom SAIDI metric over the 2025-2029 period. However, the utility challenged itself to set a modest improvement target, recognizing the importance of outage duration to customers when it comes to reliability performance as noted in part (a). As such, the entirety of the 2025-2029 Investment Plan (approximately $4.0 billion in capital and supporting OM&A expenditures) is required to support expanding, modernizing and sustaining the foundations of the grid and essential to managing Outage Duration performance in the next rate period.

QUESTION (D):

d) Please provide an updated Figure 1 (with supporting tabular data) that separates SAIDI (excluding LoS, MEDs, and scheduled outages) between the Horseshoe and Downtown areas.

RESPONSE (D):

Please note, Toronto Hydro forecasted SAIDI system-wide for the purpose of the Performance Incentive Mechanism and cannot break the forecast into Horseshoe and Downtown. In lieu of that,

the figure below shows historical contribution of each region (Horseshoe and Downtown Core) to SAIDI (Excluding Loss of Supply, Major Events, and Scheduled Outages). See table below for the tabular data.

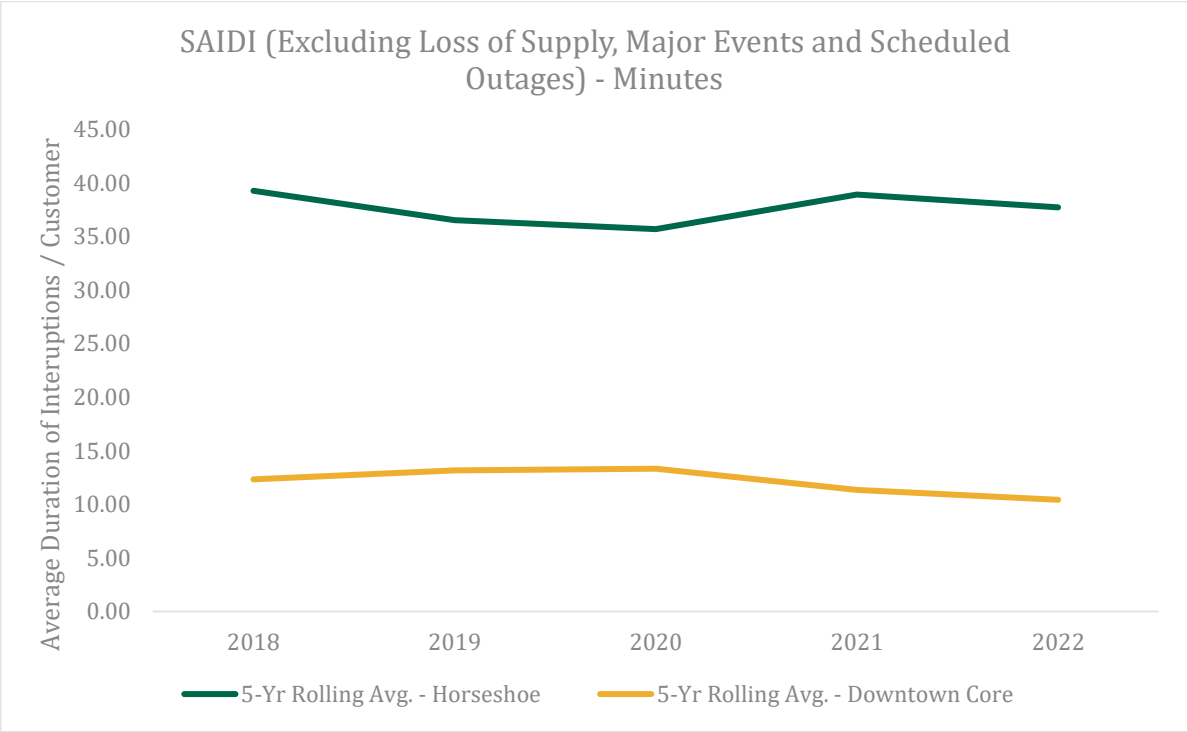

Figure 1: Historical SAIDI Contribution by Region (excluding LoS, MEDs and scheduled outages)

Breakdown of SAIDI Contribution	2018	2019	2020	2021	2022
5-Yr Rolling Avg. – Downtown Core	**12.33**	**13.19**	**13.33**	**11.35**	**10.43**
5-Yr Rolling Avg. – Horseshoe Region	**39.28**	**36.54**	**35.70**	**38.93**	**37.73**

QUESTION (E) AND (F):

e) Please provide a capital, O&M budget, and resultant SAIDI & SAIFI that would result from a target increase in rates that is the same as the rate increases of the past 5 years.

f) Please provide a capital, O&M budget, and resultant SAIDI & SAIFI that would result from a target increase in rates that is the same as the forecast rate of inflation for the next 5 years.

RESPONSE (E) AND (F):

To determine these values, the utility would need to undertake a bottom-up planning exercise to assess and evaluate the implications of the proposed reductions on its business plan. It is not possible to complete such an exercise within the context of IRs. Please see response to 1B-SEC-21.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-91

References: Exhibit 1B, Tab 3, Schedule 1, Pages. 16-18
Exhibit 2B, Section A, Page. 2

Preamble:

Please refer to Figure 2 from Reference 1 and the associated commentary, and that Toronto Hydro notes in Reference 2 that its key objectives and outcomes for the execution of this plan included "Replacing assets at a pace sufficient to maintain reliability with historical levels of performance and to maintain system health in line with 2017 condition".

QUESTION (A):

a) Please update Figure 2 from Reference 1 and provide the supporting tabular data and the associated calculation of target SAIFI (Defective Equipment) starting in 2013 and ending in the year 2029.
   i. If a revised target SAIFI (Defective Equipment) based on the 10-year average is higher than the 5 year average in the original Figure 2, please provide updated capital (and O&M if applicable) budgets that would achieve this revised SAIFI (Defective Equipment) target.
   ii. Please provide the list of capital projects (and their capital costs) that are not required or are reduced as part of meeting the revised SAIFI (Defective Equipment) target.

RESPONSE (A):

Please see below for Figure 2, updated in a manner which reflects a target setting approach conducted on a 10-year rolling average basis instead of the filed 5-year rolling average basis (as stated in the evidence under Reference 1). Refer to Appendix A for the supporting tabular data. Under a 10-year rolling average approach, the theoretical target range would be between 0.44 and 0.49 for SAIFI (Defective Equipment).

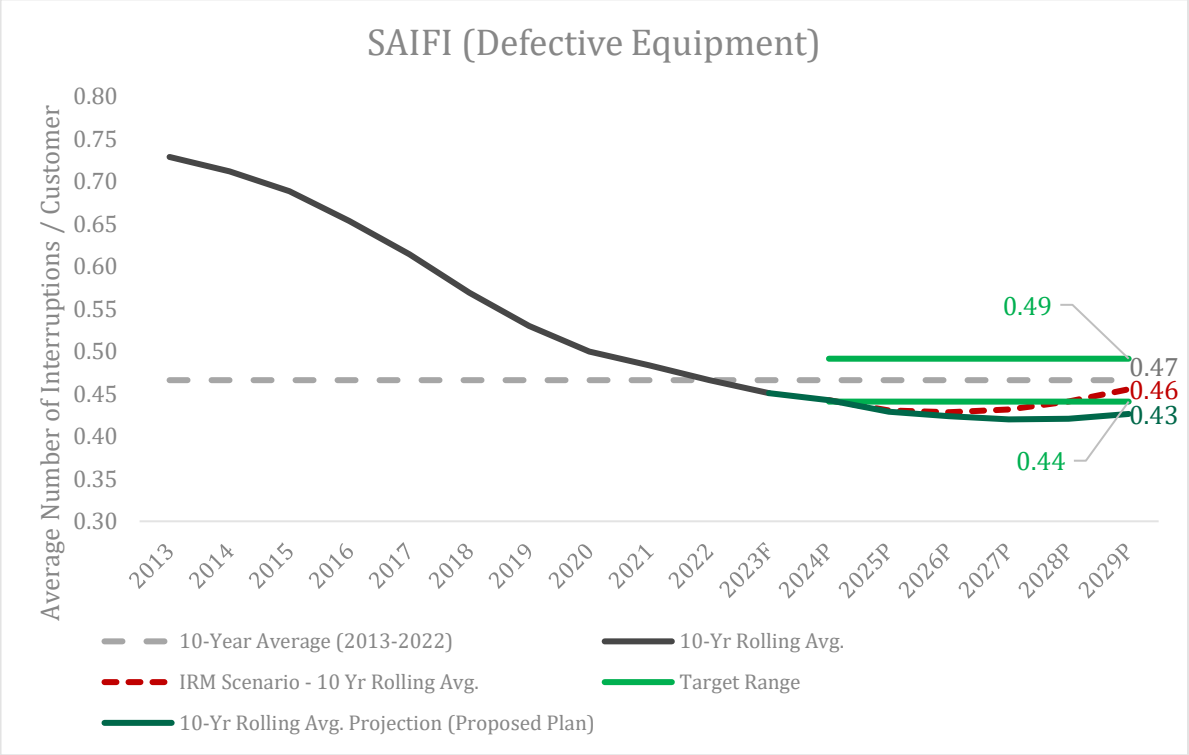

Figure 2: Historical and Projected SAIFI (Defective Equipment) – 10-year Rolling Basis

Toronto Hydro notes that setting reliability targets on a five-year average basis is aligned with the OEB's Electricity Distributor Scorecard approach. Settling reliability targets on a five-year rolling average basis is a common practice in the sector because it allows utilities to track performance over a relatively short time frame while still smoothing out short-term fluctuations and providing a reasonable basis for planning. Expanding the rolling average to 10-years presents several challenges that makes it less valid:

- **Relevance of data:** A 10-year rolling average includes data that is less relevant to current conditions and technology standards.
- **Risk of masking recent trends and investment impacts:** A 10-year rolling average smooths out recent performance fluctuations to the extent that it can mask important trends or issues that need immediate attention within the context of five-year investment planning. It also increases the historical inertia in the measure from year-to-year, making it less

meaningful as performance incentive that can be influenced through actions taken in the next five years.

- **Changing customer expectations:** Customer expectations for reliability change over time due to many factors. A 10-year rolling average may not capture these changing expectations as effectively as a shorter time frame. Applying a 10-year rolling average approach to Toronto Hydro's data would result in a target that would represent significant deterioration in reliability performance compared to the recent five-year average. This outcome would not be aligned with the result of Toronto Hydro's Customer Engagement.

i. Toronto Hydro is unable provide a business plan corresponding to the theoretical 10-year average target. Please see response to 1B-SEC-21.

ii. Please see response to part (a), part (i). A target set on the basis of a 10-year rolling average represents a significant deterioration in reliability. The target would in fact be worse than the reliability performance projected under a high-level IRM scenario measured on the same 10-year average basis. As discussed in Exhibit 1B, Tab 3, Schedule 1, an IRM funding level would translate to a capital plan that would be almost entirely reactive in nature. This level of investment would erase much of the improvement achieved in the last 10-years and set Toronto Hydro on a long-term path of higher costs and worse reliability.

QUESTION (B):

b) Please provide an updated Figure 2 starting in 2013 (with supporting tabular data) that separates SAIFI (Defective Equipment) between the Horseshoe and Downtown areas.

RESPONSE (B):

Please note, Toronto Hydro forecasted SAIFI (Defective Equipment) system-wide for the purpose of the Performance Incentive Mechanism and cannot break the forecast into Horseshoe and

Downtown. In lieu of that, the figure below shows historical contribution of each region (Horseshoe and Downtown Core) to SAIFI (Defective Equipment). See the table below for tabular data.

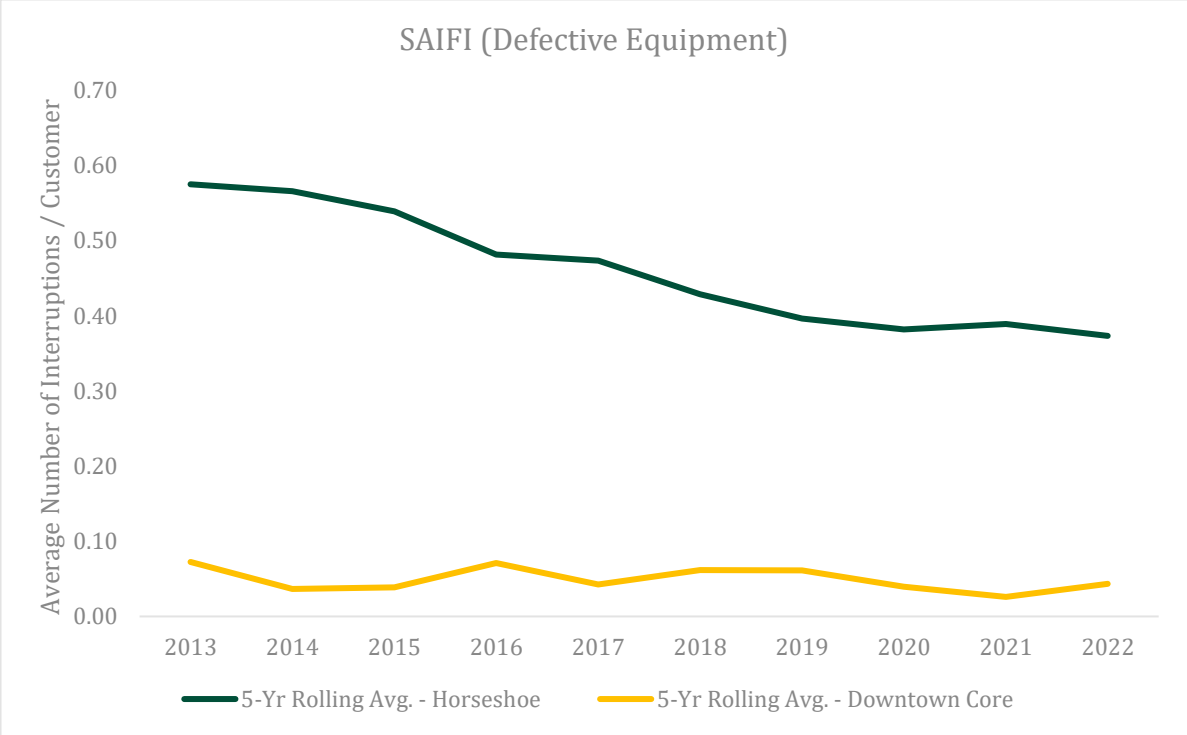

Figure 2: SAIFI (Defective Equipment) – Horseshoe and Downtown areas

Table 1: SAIFI (Defective Equipment) – Horseshoe and Downtown areas

SAIFI (Defective Equipment) Contribution	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
5-Yr Rolling Avg. - Downtown Core	0.07	0.04	0.04	0.07	0.04	0.06	0.06	0.04	0.03	0.04
5-Yr Rolling Avg. - Horseshoe	0.58	0.57	0.54	0.48	0.47	0.43	0.40	0.38	0.39	0.37

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-92

Reference: Exhibit 1B, Tab 2, Schedule 1, Pages 25, 26

Preamble:

Toronto Hydro stated that to allow for updates of the annual inflation factor in rates without double-counting the impact of inflation, Toronto Hydro adjusted the Revenue Growth Factor (RGF) by removing a 2% forecasted annual inflation factor for the 2026 to 2029 period. Toronto Hydro stated that it is presenting the RGF as an increase in revenue requirement, on an inflation-adjusted basis for rate-setting purposes.

Toronto Hydro also noted that there is "current volatility in national and global inflation, which may or may not subside over the 2025 to 2029 rate period."

OEB staff notes that the Canadian consumer price index rose 3.4% in December from a year ago, following a 3.1% increase a month earlier, as reported by Statistics Canada in January 2024.

QUESTION (A):

a) Please explain the basis for the 2% forecasted annual inflation that will adjust the RGF.

RESPONSE (A):

The 2% inflation that was applied to adjust the RGF/CRCI was based on the Bank of Canada's projection for inflation as presented in the quarterly monetary policy reports, which consistently indicated throughout 2023 that inflation will reach the 2% target by the end of 2024 or middle of 2025.[1] The actual inflation factor that Toronto Hydro proposes to apply in the CRCI during the annual

[1] https://www.bankofcanada.ca/publications/mpr/

rate update applications (i.e. 2021-2024) is the OEB's annually published Inflation Factor, made up of 70% GDP-IPI-FDD and 30% Ontario Average Weekly Earnings.[2]

QUESTION (B):

b) Please explain how the 2% forecasted annual inflation relates to capital expenditures, gross plant additions, and OM&A expenses.

RESPONSE (B):

The 2% inflation factor referenced above is a rate-making mechanism for the purposes of establishing an index (i.e., the CRCI) that can be applied to set rates mechanistically during the outer years of the rate period (i.e., 2026 to 2029). This approach is consistent with standard incentive regulation before the OEB which relies on broad indices (rather than bottom-up cost forecasts) to capture variances in costs driven by business market conditions.

For planning purposes (i.e. to forecast the capital expenditures and OM&A expenses outlined in Exhibits 2B and 4 that form the revenue requirement presented in Exhibit 6), Toronto Hydro relied on different assumptions for the different components of the plan:

- Internal labour costs: Forecasting for these costs was based on existing negotiated labour agreements. In cases where there are no existing agreements for certain groups of employees, Toronto Hydro relied on historical rolling forecast to estimate future labour-related costs.
- Non-Labour Related Costs: These costs were estimated assuming an annual 2% inflationary increase over the 2026-2029 period.

[2] In 1B-Staff-93, Toronto Hydro withdrew its request for a custom labour component for the inflation factor.

QUESTION (C):

c) Please explain why a higher amount than 2% to adjust the RGF may be more appropriate, given that inflation remains trending in Canada at a rate greater than 3% and Toronto Hydro also noted that inflation may not subside over its rate term.

RESPONSE (C):

Toronto Hydro does not believe that a higher amount would be more appropriate because the Bank of Canada's latest monetary policy report, issued in January 2024, continues to note that *"[t]he Bank projects that inflation will stay around 3% through the first half of 2024, returning to [the 2%] target in 2025.*" In any event, applying a higher amount to adjust the RGF at this stage of the rate-setting process leads to the same outcome on a forecast basis since the proposed RGF has been inflation adjusted so that the actual inflation factor prevailing at the time of the annual rate update can be added back in to set rates for the upcoming year. Table 3 of the Rate Framework evidence at Exhibit 1B, Tab 2, Schedule 1 at page 25 (reproduced below for ease of reference) sets this out:

Table 3: 2026-2029 Revenue Growth Factor ($ Millions)

	2025	2026	2027	2028	2029
Base Revenue Requirement (BRR)	972	1,027	1,074	1,176	1,219
Difference	-	55	47	101	44
RGF before Inflation Adjustment	-	**5.61%**	**4.62%**	**9.43%**	**3.71%**
Forecast Inflation Factor (%)	-	(2.00%)	(2.00%)	(2.00%)	(2.00%)
RGF after Inflation Adjustment	-	**3.61%**	**2.62%**	**7.43%**	**1.71%**

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-93

References : Exhibit 1B, Tab 2, Schedule 1, Page. 3, 23, 26, 27, Table 4

THESL_4_T04_S02 - OEB Appendix 2-K_20240208

Preamble:

Toronto Hydro explained that the CRCI includes an inflation factor component. Toronto Hydro stated that the inflation factor (I) is aligned with the OEB's methodology. However, Toronto Hydro noted that it includes an alternative Toronto-based salary and wages index to establish the labour component of the inflation factor to better reflect the real cost drivers of attracting and retaining talent in the Toronto labour market.

Toronto Hydro noted that the inflation factor will be updated annually as per the OEB's standard methodology, with an alternate labour index for Toronto salary and wages.

Toronto Hydro proposes to replace the Ontario Average Weekly Earnings (AWE) inflation index within the OEB's inflation factor methodology with a custom Toronto Hourly Salary and Wages Index. This index can either be derived by the Conference Board of Canada (CBC) economic data subscription service, or can be reproduced by purchasing relevant tax data from Statistics Canada.

Toronto Hydro stated that for efficiency purposes, it proposes to rely on the CBC index. In its evidence, Toronto Hydro has provided "Table 4: 2016-2022 Labour Inflation" which is reproduced below.

Toronto Hydro Table 4: 2016-2022 Labour Inflation

	Statistics Canada Average Weekly Earnings (AWE) Ontario	Toronto Hydro Average Blended Salary Increase (Appendix 2-K)	Conference Board of Canada Toronto Hourly Salary & Wages
2016	2%	1.2%	4.9%
2017	2.6%	2.5%	3.3%
2018	1.1%	3.2%	0.2%
2019	1.9%	3.7%	3.4%
2020	2.9%	3.9%	5.4%
2021	2.8%	3.8%	1.5%
2022	7%	4.6%	4.3%
2016-2022 Average	**2.9%**	**3.3%**	**3.3%**

Question(s):

a) Please provide and summarize Toronto Hydro's analysis of the pros and cons of a custom Toronto Hourly Salary and Wages Index using the CBC economic data as compared to "relevant tax data" from Statistics Canada. Please identify what is meant by relevant tax data and provide an explanation as to the rationale supporting its relevance.

b) Please provide the webpage links to the specific CBC economic data subscription service and the relevant tax data from Statistics Canada that Toronto Hydro references in its application. Please explain step-by-step the process Toronto Hydro used to derive the amounts shown in the column "Conference Board of Canada Toronto Hourly Salary & Wages."

c) As Toronto Hydro is proposing to rely on the CBC index, please confirm that the relevant output from CBC index is identical to the "relevant tax data from Statistics Canada". If this is not the case, please explain, including the impacts on the numbers shown in the above Table 4.

d) Please provide the source data and all calculations that support the data in Toronto Hydro's Table 4.

e) Please confirm that the amounts shown in Toronto Hydro's Table 4 relating to "Toronto Hydro Average Blended Salary Increase (Appendix 2-K)" relate to salary and wage increases only and exclude benefits. If this is not the case, please explain.

f) Please show how the amounts shown in Toronto Hydro's Table 4 "Toronto Hydro Average Blended Salary Increase (Appendix 2-K)" are derived based on Toronto Hydro's Appendix 2-K.

g) Please demonstrate, by way of calculations using one example, the flow through impacts of Toronto Hydro's proposal in each year of the term for each of the three labour inflation parameters considered in Toronto Hydro's "Table 4: 2016-2022 Labour Inflation".

RESPONSE :

In the course of validating the table above, Toronto Hydro discovered an error with respect to the data that formed the basis of the referenced table. Part of this data came from Appendix 2-K (i.e. 2016 and 2017) and other historical assumptions (i.e. 2018-2022) that were not derived from Appendix 2-K. When the full dataset (i.e. 2016-2022) is normalized per Appendix 2-K, the year-over-year increases per FTE is lower than the historical assumptions included in the original table (please see the Table below). This is because the cost per employee in Appendix 2-K is impacted by other variables such as overtime and volume of retirements that Toronto Hydro experienced historically as it replenished its aging workforce (i.e. when higher direct compensation cost of employees are replaced by lower direct compensation cost employees this yield a lower average cost per employee). As such, Toronto Hydro has decided to withdraw the custom labour inflation proposal. The evidence will be updated to reflect this change.

	Statistics Canada Average Weekly Earnings (AWE) Ontario	Toronto Hydro Average Blended Salary Increase (Appendix 2-K)	Conference Board of Canada Toronto Hourly Salary & Wages
2016 Actual	2%	1.2%	4.9%
2017 Actual	2.6%	2.5%	3.3%
2018 Actual	1.1%	5.7%	0.2%
2019 Actual	1.9%	0.8%	3.4%
2020 Actual	2.9%	1.9%	5.4%

	Statistics Canada Average Weekly Earnings (AWE) Ontario	Toronto Hydro Average Blended Salary Increase (Appendix 2-K)	Conference Board of Canada Toronto Hourly Salary & Wages
2021 Actual	2.8%	4.0%	1.5%
2022 Actual	7%	2.6%	4.3%
2016 - 2022 Average	**2.9%**	**2.7%**	**3.3%**

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-94

References: Exhibit 1B, Tab 2, Schedule 1, Table 4

OEB Letter, 2024 Inflation Parameters, June 29, 2023

Preamble:

In its evidence, Toronto Hydro has provided "Table 4: 2016-2022 Labour Inflation" which is reproduced below.

Toronto Hydro Table 4: 2016-2022 Labour Inflation

	Statistics Canada Average Weekly Earnings (AWE) Ontario	Toronto Hydro Average Blended Salary Increase (Appendix 2-K)	Conference Board of Canada Toronto Hourly Salary & Wages
2016	2%	1.2%	4.9%
2017	2.6%	2.5%	3.3%
2018	1.1%	3.2%	0.2%
2019	1.9%	3.7%	3.4%
2020	2.9%	3.9%	5.4%
2021	2.8%	3.8%	1.5%
2022	7%	4.6%	4.3%
2016-2022 Average	**2.9%**	**3.3%**	**3.3%**

As noted in the OEB Letter, 2024 Inflation Parameters, the OEB's methodology uses a labour component "Average Weekly Earnings (AWE) - All Employees - Ontario."

OEB staff has calculated the Statistics Canada AWE Ontario using the OEB's methodology in the table below.

Table 1B-1: Statistics Canada AWE Ontario using the OEB's Methodology

Table 1B-1: Statistics Canada AWE Ontario using the OEB's Methodology

	Statistics Canada AWE - downloaded January 7, 2024	Average % Annual Change - arithmetic growth rate	Average % Annual Change - logarithmic growth rate
2015	$ 963.37		
2016	$ 974.41	1.1%	1.1%
2017	$ 993.23	1.9%	1.9%
2018	$ 1,022.00	2.9%	2.9%
2019	$ 1,049.72	2.7%	2.7%
2020	$ 1,126.30	7.3%	7.0%
2021	$ 1,166.72	3.6%	3.5%
2022	$ 1,194.21	2.4%	2.3%
Average		3.1%	3.1%

OEB staff observes that the OEB typically uses the logarithmic growth rate in its calculations, as noted in the OEB Letter, 2024 Inflation Parameters, June 29, 2023, Appendix.

As set out in the EB-2021-0212, OEB 2022 IPI Generic Proceeding, Procedural Order No. 1, Fact Sheet, August 27, 2021, the calculations of the "Annual % Change" ….are based on the logarithmic growth rate, as opposed to the arithmetic growth rate.

QUESTIONS (A) – (C):

a) Please explain whether the years noted in Toronto Hydro's Table 4 represent rate years rather than calendar years. If yes, please restate Toronto Hydro's Table 4 with data relating to calendar years, as opposed to rate years. If no, please explain what is being shown.

b) Please reconcile the numbers shown in "Table 1B-1: Statistics Canada AWE Ontario using the OEB's Methodology" to the "Statistics Canada Average Weekly Earnings (AWE) Ontario" values shown in Toronto Hydro's Table 4.

c) Please confirm that Toronto Hydro agrees with the values and calculations shown in "Table 1B-1: Statistics Canada AWE Ontario using the OEB's Methodology". If this is not the case, please update this table.

RESPONSES (A) – (C):

Please see Toronto Hydro's response to 1B-Staff-93.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-95

References: **Exhibit 1B, Tab 2, Schedule 1, Table 4**

Filing Requirements for Electricity Distribution Rate Applications – 2023 Edition for 2024 Rate Applications, Chapter 2, Cost of Service. December 15, 2022, Page 6

Preamble:

OEB staff notes that the impact of Toronto Hydro's proposal to replace the Ontario AWE inflation index with a custom Toronto Hourly Salary and Wages Index has an immaterial impact on Toronto Hydro's revenue requirement.

OEB staff's calculations demonstrating the immaterial impact are shown below. OEB staff has incorporated the values shown in the above "Table 1B-1: Statistics Canada AWE Ontario using the OEB's Methodology" derived by OEB staff,

Table 1B-2: OEB Staff's Calculations of Immaterial Impact of Toronto Hydro's Proposal

Toronto Hydro's Table 4 – Conference Board of Canada Toronto Hourly Salary & Wages 2016-2022 Average	3.3%
Less: OEB staff's Table 1B-1: Statistics Canada AWE Ontario using the OEB's Methodology 2016-2022 Average	3.1%
Difference	0.2%
Multiplied by the OEB's standard weighting of the inflation factor labour component of 30% for electricity distributors	30%
Equals an approximate net impact of 0.06% on Toronto Hydro's revenue requirement	0.06%
Toronto Hydro's 2025 Base Revenue Requirement as per RRWF	$972,362,213
Approximate net impact of 0.06% on Toronto Hydro's revenue requirement	$583,417
Toronto Hydro's materiality threshold	$1,000,000

As noted in the OEB Letter, 2024 Inflation Parameters, the labour component weighting used in the OEB's calculations of inflation parameters is 30% for electricity distributors.

As per the filing requirements, Toronto Hydro's materiality threshold is $1 million.

QUESTION (A) AND (B):

a) Please confirm that Toronto Hydro agrees with the values and calculations shown in "Table 1B-2: OEB Staff's Calculations of Immaterial Impact of Toronto Hydro's Proposal". If this is not the case, please update this table, showing all associated calculations.

b) Please elaborate whether Toronto Hydro agrees or disagrees with OEB staff's demonstration that the impact of Toronto Hydro's proposal to replace the Ontario AWE inflation index with a custom Toronto Hourly Salary and Wages Index has an immaterial impact on Toronto Hydro's revenue requirement.

RESPONSE TO (A) AND (B):

Please see response to 1B-Staff-93.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-96

References: Exhibit 1B, Tab 2, Schedule 1, Page. 26

Preamble:

Toronto Hydro stated that substituting the labour component of the inflation factor with a Toronto-specific index is responsive to the consideration that labour is a key cost driver within the utility's plan.

Toronto Hydro noted that a Toronto-specific labour index could be more suitable to account for the localized inflationary cost pressures that the utility faces in the 2025-2029 rate period.

Toronto Hydro observed that while it is not possible to predict what these pressures would be, or how they would differ regionally, the historical trend over the last six years (i.e. 2016 to 2022) suggests that regional differences may be a factor.

QUESTIONS (A) AND (B):

a) Please explain why Toronto Hydro should be treated differently than other Ontario electricity distributors in respect of the labour component of Toronto Hydro's proposed inflation factor.
b) Please provide an OEB precedent (including EB#) where the OEB approved a region-specific labour component of the inflation factor.

RESPONSES (A) AND (B):

Please see response to 1B-Staff-93.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-97

References: Exhibit 1B, Tab 3, Schedule 1, Pages. 37-38 and Table 13 (Summary)
Exhibit 2B, Section E8.2, Pages. 18-20 (Facilities Reductions)
Exhibit 2B, Section E8.3 (Fleet)
Exhibit 4, Tab 2, Section 11 (Fleet)
Exhibit 4, Tab 2, Section 12 (Facilities reductions)

Preamble:

Toronto Hydro indicates that to further reduce its fleet and facilities emissions to 2.5 kt of (Scope 1) CO2e by 2029, it plans to: 1) electrify 50% of its fleet by the end of the rate term, and 2) reduce GHG emissions produced at its work centers by 3% annually through fuel switching, conservation and energy efficiency measures.

QUESTION (A):

a) Please confirm that Toronto Hydro's scorecard measure titled "Emissions Reductions" which it has proposed a 5% overall weight, includes the proposed activities to electrify 50% of its fleet and reduce GHG emissions at its work centers by 3% each year.

RESPONSE (A):

Confirmed.

QUESTION (B):

b) Please discuss and define how Toronto Hydro will consider its fleet to be electrified.

RESPONSE (B):

Toronto Hydro considers vehicles in its fleet to be electrified if they are an electric vehicle ("EV"), plug-in hybrid electric vehicle ("PHEV"), or hybrid vehicle. Hybrid vehicles include heavy duty vehicles equipped with an electric power take off.

QUESTION (C):

c) Please confirm that the 3% annual GHG reductions from Toronto Hydro work centers is an incremental annual target and that by 2029, a minimum GHG emissions reduction of 15% will have been achieved.

RESPONSE (C):

Confirmed.

QUESTION (D):

d) Please discuss what baseline Toronto Hydro proposes to establish in order to calculate annual GHG emissions reductions. For example, does Toronto Hydro proposes that annually, 3% net incremental GHG emissions reductions will take place relative to 1990 (consistent with the City of Toronto's TransformTO Net Zero Strategy)?

RESPONSE (D):

Toronto Hydro will use its 2019 emissions as the baseline.

QUESTION (E):

e) Please discuss and provide the criteria Toronto Hydro proposes to use to determine and verify that it has achieved 3% GHG emissions reductions from improvements at its work centers during the 2025 to 2029 term.

RESPONSE (E):

Please refer to Toronto Hydro's methodology for calculating scope 1 emissions outlined in the response to 1B-SEC-20, subpart (e). The utility will annually determine its emissions levels using this methodology and hold its Facilities Management programs accountable for achieving the 3% GHG emissions reductions.

QUESTION (F):

f) Please discuss how site closures will be included in the calculation of GHG emissions reductions as part of this scorecard item.

RESPONSE (F):

Toronto Hydro does not anticipate a site closure to affect Scope 1 emissions in the 2025-2029 rate period, as the utility's facilities-related emissions are only attributable to its work centres, which will remain in operation for the duration of the rate period. All stations facilities are already 100% reliant upon electrical appliances and amenities.

QUESTION (G):

g) Please provide the detailed plan and decision-making process that Toronto Hydro will use to identify, analyze and prioritize the capital improvements targeted at reducing GHG emissions at its work centers, including fuel switching and improving building efficiency.

RESPONSE (G):

Please refer to the detailed evidence laid out in the following documents:

- Exhibit 2B, Section E8.2, subsection E8.2.3.3 "Work Centres" at pages 18-20;
- Exhibit 4, Tab 2, Schedule 12, subsections 5 "Facilities Maintenance Services Segment" and 7 "Utilities & Communications Segment" at pages 8-12 and 17-18, respectively;
- Exhibit 2B, Section D6 "Facilities Asset Management Strategy"; and
- Exhibit 2B, Section D7, subsection "Toronto Hydro's Facilities Emissions" at pages 4-6.

QUESTION (H):

h) Please discuss if all GHG emissions related capital improvements are proposed to be funded through rates or if any portion will be funded by the shareholder.

RESPONSE (H):

Toronto Hydro proposes to fund all capital improvements listed in the references to be funded through rates, net of capital contributions or revenue offsets from all available government and other rebates the utility is able to obtain. For an overview of funding that Toronto Hydro leveraged in the 2020-2024 rate period, please see the response to 3-DRC-14(c).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-98

References: Exhibit 1B, Tab 3, Schedule 2, Table 1, Page. 1

Exhibit 2B, Section D5, Pages 4, 14-17

Preamble:

Regarding stated investments to improve SAIDI and SAIFI in the above referenced sections.

QUESTION (A):

a) Are Toronto Hydro's historical investments in grid sensor, remote-operable switches, smart meters and SCADA controlled switches (advancing "self-healing" grid operations) the primary drivers for the improvements achieved in SAIDI and SAIFI since 2013?
   i. If not, what are the primary drivers of the improvements?
   ii. If yes, please discuss the impact that continued investment in these activities at the same pace will have on improvements in SAIDI and SAIFI results.

RESPONSE (A):

Out of the technologies listed in the question, only remote-operable switches (which are the same as SCADA controlled switches) have had a material impact on reliability since 2013. Specifically, these switches have had a positive impact on SAIDI. Remote operable switches require operator intervention, meaning that they do not typically result in reductions in the frequency of sustained interruptions, and therefore do not have a material impact on SAIFI. As noted in Exhibit 2B, Section E7.1.3.1, page 7, analysis of 2018-2022 reliability data shows that the average duration for outages on feeders with less than three SCADA tie-points was approximately 707 minutes per year per feeder, whereas the average duration of those feeders with three or more SCADA tie-points was approximately 496 minutes. As part of Toronto Hydro's reliability projections for 2025-2029, the utility quantified estimated improvements from SCADA switch installations (see response to interrogatory 2B-SEC-42 for more details).

Regarding the other technologies referenced in the question, Toronto Hydro has not broadly deployed grid sensors, except within its network system (see Exhibit 2B, Section E7.3 for details and benefits), and its existing, first-generation smart meters do not possess "last gasp" technology, meaning that they do not have the capabilities to assist with outage restoration efforts.

(i) Regarding the primary drivers of reliability improvement in the historical period, in addition to the relevant modernization investments discussed above, Toronto Hydro's System Renewal and System O&M investments have been foundational to mitigating asset risk, eliminating obsolete assets and system configurations, and ultimately improving both SAIDI and SAIFI performance since 2013. For additional details on Toronto Hydro's historical performance from 2018 to 2023, please see Exhibit 2B, Section C.

QUESTION (B):

b) Please compare the historic and forecast substantial reliability improvements in SAIDI and SAIFI achieved by Toronto Hydro with the improvements reported by the US Department of Energy for utilities that implemented FLISR.

RESPONSE (B):

To clarify, Toronto Hydro has not yet implemented automated FLISR, nor is Toronto Hydro anticipating benefits from automated FLISR during the 2025-2029 period. For longer-term reliability improvements pertaining to automated FLISR, please refer to the response to 2B-Staff-162.

QUESTION (C):

c) Are the forecast substantial incremental reliability improvements "three to seven percent for SAIFI and four to seven percent for SAIDI on the overhead system"?

i. If not, what are the forecast substantial incremental reliability improvements for SAIDI and SAIFI?

RESPONSE (C):

The percentages referenced are associated with the forecasted improvements at the end of the 2025-2029 period upon the completion of additional SCADA switches and new mid-line recloser installations, as described in the System Enhancements program (Exhibit 2B, Section E7.1).

For longer-term reliability improvements pertaining to Fault Location Isolation and Service Restoration ("FLISR"), also referred to as Distribution Automation ("DA"), please refer to Toronto Hydro's response to interrogatory 2B-Staff-162.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-99

References: Exhibit 1B, Tab 4, Schedule 1, Pages 1-20
Exhibit 1B, Tab 4, Schedule 2
Exhibit 2B, Section D5

Preamble:

In its description of innovation over the 2020 to 2024 rate period, Toronto Hydro describes its approach to building innovative strategies across numerous dimensions of its business including the creation of an Innovation Sandbox.

QUESTION (A):

a) Please explain how Toronto Hydro funded its Innovation Sandbox, how it measured success of the initiatives and provide additional details on which initiatives have been scaled into normal operations.

RESPONSE (A):

The Innovation Sandbox was self-funded by Toronto Hydro over the 2020-2024 rate period. Success of pilot projects developed through Toronto Hydro's Innovation Sandbox is assessed against a set of criteria that is determined as a part of project approval prior to launch. If deemed successful upon completion of proof-of-concept, the project is recommended for full-scale adoption.

Descriptions of projects that have been tested through the Innovation Sandbox and scaled into normal operations can be found at Exhibit 1B, Tab 4, Schedule 1 at pages 2-3.

QUESTION (B):

b) Outside of its sandbox, please explain how Toronto Hydro determines what innovative pilots it will fund and how it assesses when an initiative is ready for scale?

RESPONSE (B):

Outside of the Sandbox, Toronto Hydro has proposed an Innovation Fund, along with an associated Governance Framework, which is described in Exhibit 1B, Tab 4, Schedule 2.

QUESTION (C) :

c) Please explain how Toronto Hydro determines which initiatives fall under the heading of innovation and why this isn't considered a part of normal utility management. For example, under System Observability: Network Condition, Monitoring and Control (1.2 of above noted scheduled), Toronto Hydro references how it continues to advance its Network Condition Monitoring and Control to increase situational awareness the low voltage distribution network.

RESPONSE (C):

As outlined in Exhibit 1B, Tab 4, Schedule 1 and Schedule 2 at page 4, initiatives under the heading of innovation are designed to test new technologies, advanced capabilities, and alternative strategies that are more early stage, exploratory and developmental in nature. These explorations can lead to innovation that is then scaled up into normal utility operations. The Network Condition Monitoring and Control (NCMC) initiative exemplifies this approach. Initially conceived as an innovation project, NCMC has proven successful and has since been integrated into Toronto Hydro's standard utility operations. Furthermore the insights gained, skills honed, and benefits realized through the NCMC program have led to the continued implementation of system observability technologies, as outlined in the Grid Modernization Strategy detailed in Exhibit 2B, Section D5, and summarized in Exhibit 1B, Tab 4, Schedule 1 at section 2.1.

QUESTION (D):

d) Please explain how the areas in which Toronto Hydro plans to test specific new distribution capabilities in the upcoming rate period differ from the areas explored and funded previously by Toronto Hydro in the current rate period (during which it did not have an Innovation Fund).

RESPONSE (D):

The internal sandbox was launched to engage and encourage employees to bring forward ideas for proof-of-concept projects that are novel and provide value to customers across all areas of the company's business and processes. This initiative empowers employees to embrace change and fosters a culture of innovation, meaning a solution-oriented mindset that obstacles can be overcome through creative problem-solving. Please refer to Exhibit 1B, Tab 4, Schedule 01, Section 1.1 for more details on about the internal Sandbox.

The proposed Innovation Fund represents a more targeted approach to the innovation that is required to address the fundamental changes in the energy landscape and manage the uncertainty driven by the imperatives of decarbonizing key sectors of the economy through electrification. Particularly in response to expectations set by the Ontario Energy Board (OEB) regarding Distributed Energy Resource (DER) integration, as outlined in the Framework for Energy Innovation (FEI) report. The Innovation Fund addresses needs that are not adequately met by existing funding mechanisms. In this way, the Innovation Fund would be complementary to existing funding mechanisms insofar as they relate to innovation.

Key differentiators for the Innovation Fund supported projects include an emphasis on adapting operational practices to manage DERs effectively, modifying planning processes to incorporate non-utility-owned DER solutions, and prioritizing the development of skills and knowledge within the organization.

Additionally, the projects under the Innovation Fund are expected to deploy inventive solutions aligned with the OEB's definition of innovation, focusing on leveraging new technologies, innovative business practices, and enhancing distribution services for the benefit of customers. This strategic alignment ensures that Toronto Hydro remains at the forefront of industry advancements and delivers value to stakeholders. Please refer to Exhibit 1B, Tab 4, Schedule 02, Section 3 for more details on Areas of Innovation.

QUESTION (E):

e) Please explain why Toronto Hydro requires both the support of the Future Energy Scenarios tool as well as the Innovation Fund to stress test grid modernization investments in the 2025-2029 rate period.

RESPONSE (E):

The Future Energy Scenarios is a model that was created to help Toronto Hydro understand possible changes to future peak demand under different scenarios, and was used to stress-test whether the utility's capacity plan can accommodate energy transition needs (e.g. building heating electrification) in the early part of the next decade, if required.

The Future Energy Scenarios inform possible grid modernization investments as they relate to the various scenarios. For more information, please refer to Exhibit 2B Section D4.

The proposed Innovation Fund is funding mechanism for exploring innovative capabilities that can help Toronto Hydro better adapt to fundamental changes taking place in the energy system as a result of the transition, by leveraging technology to achieve expanded benefits for customers. It is an important part of Toronto Hydro's approach to innovation because it addresses needs that are not adequately met by existing funding mechanisms. For more information, please refer to Exhibit 1B Tab 4 Schedule 2.

In summary, the Future Energy Scenarios is a tool for planning and conceptualizing innovative approaches relating to peak demand management, while the Innovation Fund provides the necessary funding to scope, design and execute innovative pilot projects.

QUESTION (F):

f) The four pilot areas tagged for the Innovation Fund were identified as part of the Grid Modernization Strategy in reference 3. What focus areas of the strategy do they fall under

and can Toronto Hydro please explain why they can't be incorporated into the initiatives already planned?

RESPONSE (F):

The four pilot projects (as described in Exhibit 2B Section D5 Appendix I) would fall under the *Grid Readiness* focus area of the Grid Modernization Strategy. However, these projects are distinct from other initiatives which are proposed in the Grid Readiness focus area, which Toronto Hydro proposes would be funded through normal mechanisms as they may be deployed as standard distribution system solutions or IT projects. Whereas existing mechanisms tend to support spending where the beneficial outcomes are more proven or certain, the proposed Innovation Fund would be able to support work that is more early stage, exploratory and developmental in nature. The four pilot project concepts fall into this earlier stage and exploratory category and were considered to be too nascent to deploy as standard distribution system solutions. They were also identified as posing a funding risk because more developmental work is needed to test the technologies and prove related beneficial outcomes for Toronto Hydro's system.

It is important to note that funding these pilot project ideas through the Innovation Fund would allow Toronto Hydro to determine the funding implications in real time based on the facts of each project or initiative. Thereby, Toronto Hydro would be able to design and implement pilot projects and other exploratory initiatives more effectively.

QUESTION (G):

g) Please provide any additional analysis of comparable jurisdictions innovation funding amounts, other than those included in the application (i.e., Ofgem, New York, Enbridge Gas).

RESPONSE (G):

Please refer to Toronto Hydro's response to interrogatory 1B-DRC-06 part (d).

QUESTION (H):

h) Please provide more details regarding the proposed governance framework, including titles and responsibilities of the steering committee members, anticipated timelines for review of each project, how innovation projects will be staffed (e.g., will existing staff people be leveraged, will new FTEs be dedicated to pilot project owner roles, etc.), and if Toronto Hydro proposes to keep the OEB and industry updated on its progress so opportunities and lessons learned can be considered.

RESPONSE (H):

Please see Toronto Hydro's response to interrogatory 1B-DRC-06 part (i).

QUESTION (I):

i) Please discuss the likelihood of the innovation fund exceeding the requested $16M. If so, what mechanisms does Toronto Hydro propose be put in place to ensure that any additional funding is appropriate and will provide benefits to ratepayers.

RESPONSE (I):

Toronto Hydro cannot speculate on the likelihood of actual expenditures exceeding the requested funding amount since it has not commenced the pilot selection and design phases of the Governance Framework, which is where the projects will be scoped, and workplan and budgets created. For further discussion, please refer to Toronto Hydro's response to interrogatory 1B-CCC-46 part (h).

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-100

References: Exhibit 1B, Tab 5, Schedule 1, Pages 8-10

Exhibit 2B, Section E2, Page 5

Preamble: In Reference 1 Toronto Hydro states Phase 2 of the customer engagement "solicited detailed customer feedback on the $5.9 billion draft plan… In direct response to customer feedback, Toronto Hydro challenged itself to reprioritize certain investment, and reduce the overall capital plan by approximately $70 million, as further described in Exhibit 2B, Section E2."

In reference 2 Toronto Hydro states it "set upper limits of $4,000 million for the capital plan and $1,900 million for the operational plan over the 2025-2029 period".

QUESTION (A):

a) OEB staff are unclear where in Exhibit 2B, Section E2 the $70M reduction to the $5.9 billion draft plan is described. Please reference the section of the application that outlines the $70 million reduction Toronto Hydro made in response to the Phase 2 customer engagement or provide the description.

RESPONSE (A):

Please refer to Exhibit 2B, Section E2.1.3 at pages 10-11. Please see response to 2B-SEC-54 for additional details.

QUESTION (B):

b) Please confirm that the $70M reduction is reflected in the capital and OM&A budgets presented in Exhibit 2, Exhibit 4 and the Exhibit 2 excel models.

RESPONSE (B):

Toronto Hydro confirms that the $70 million reduction is reflected in the capital budget presented in Exhibit 2B and OEB Appendices 2-AA and 2-AB.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-101

References: Exhibit 1B, Tab 5, Schedule 1, Appendix A
A Renewed Regulatory Framework for Electricity Distributors: A Performance Based Approach, October 2012

Preamble:

With Reference 1, Toronto Hydro provides the summary of its customer engagement. On page 1 of this report, Innovative Research Group, Inc. provides context regarding the importance of meaningful customer engagement, citing OEB policy documents. The statement is made that the OEB's "consumer-centric" approach to rate applications requires electricity distributors to demonstrate that their services are provided in a manner that responds to identified customer needs and preferences.

Footnote 1 is duplicated below: OEB Renewed Regulatory Framework for Electricity Sections 2.4.2, 5.0, and 5.0.4.

QUESTION (A):

a) Please confirm that, in footnote 1, Innovative Research Group, Inc, intended to reference the OEB's October 2012 report A Renewed Regulatory Framework for Electricity Distributors: A Performance Based Approach. If not, please identify which report is referenced.

RESPONSE (A) – PREPARED BY INNOVATIVE:

On review, we confirm that this particular footnote contains an incorrect reference and should instead refer to the 2016 Handbook for Utility Rate Applications.

QUESTION (B):

b) Please provide, as attachments to this interrogatory response, section 2.4.2, section 5.0, and section 5.0.4 of the "OEB Renewed Regulatory Framework for Electricity."

RESPONSE (B) – PREPARED BY INNOVATIVE:

As noted above, the references in the footnote are in error. Given that, we have not provided sections as attached but rather cite below some of the important references in the Handbook, including:

- **Reference to customer focus as one of four categories of outcomes under the RRFE**.
  "Customer Focus: Customer engagement is now an explicit and important component of the regulatory framework. Utilities are expected to develop a genuine understanding of their customers' interests and preferences and reflect those interests and preferences in their business plans. Utilities are expected to demonstrate value for money by delivering genuine benefits to customers and by providing services in a manner which is responsive to customer preferences (p2)."
- **Reference to the role of customer preferences in the Business Plan**.
  "The OEB expects the business plan to be informed by the utility's engagement with customers (p6)."
- **Role of customer expectations in the OEB review**.
  "A utility's proposals are expected to demonstrate the alignment of the utility's strategic objectives with its current and future customers' expectations for reliable and reasonably priced service (P9)."
  "The business plan should demonstrate that the utility's goals are appropriately aligned with the needs and preferences of its customers (p10)."
- **Expectation of customer engagement**.
  "Customer engagement is foundational to the RRF. Enhanced engagement between utilities and their customers provides better alignment between utility plans and customers' needs and expectations. Today's customers are more informed and more active participants in their energy services. They should have a say in shaping utility plans,

particularly given the customer's role in conservation efforts and the customer focused nature of future technological innovation. Customers should also help determine the pace of utility investment (p11).

… Utilities are expected to develop a genuine understanding of their customers' interests and preferences and integrate those interests and preferences into their plans. (p11)

Customer engagement is expected to inform the development of utility plans, and utilities are expected to demonstrate in their proposals how customer expectations have been integrated into their plans, including the trade-offs between outcomes and costs. (p11)

The OEB expects a utility's rate application to provide an overview of customer needs, preferences and expectations learned through the utility's customer engagement activities. (p12)"

QUESTION (C):

c) Please identify where, in Toronto Hydro's view, Reference 2 identifies a "consumer-centric" approach to rate applications. Please articulate Toronto Hydro's view as to the relative weight and priority of customer "needs and preferences" in relation to each of prices, adequacy, reliability, and quality of electricity service.

RESPONSE (C) – PREPARED BY INNOVATIVE:

The above response (b) addresses the "customer-centric" aspect of the OEB direction.

The primary role of identifying customer needs and preferences is to help Toronto Hydro set priorities among investments after meeting this primary consideration. While the 2016 Handbook for Utility Rate Applications already requires applications provide "A focus on cost effective delivery of outcomes that matter to customers", the engagement helps Toronto Hydro to understand the

range of investments customers would like Toronto Hydro to address and the pace at which Toronto Hydro should implement those investments.

RESPONSE (C) – PREPARED BY TORONTO HYDRO

For Toronto Hydro's position on the balance between price and progress towards other outcomes that customers expect, please refer to the response to Interrogatory 1B-CCC-48(a).

QUESTION (D):

d) Please explain Toronto Hydro's definition of "customer needs and preferences." How does Toronto Hydro distinguish between needs and preferences? How would Toronto Hydro prioritize these compared to economic efficiency and cost effectiveness?

RESPOND (D) – PREPARED BY INNOVATIVE:

On page 4 of the Customer Engagement Executive Summary, customer needs are defined as "understanding the gap between the services and experience customers want and the services and experience customers are receiving". Within the customer engagement, needs are identified in the Phase 1 survey by asking "Is there anything in particular you would like Toronto Hydro to do to improve its services to you?". Needs are also identified on an ongoing basis across the entire customer service team.

Preferences in this engagement include three broad categories:

- What outcomes matters to customers and how important is each outcome (this is the means by THESL can ensure its goals are aligned with customer preferences per multiple references on pages 10 and 11 of the OEB Handbook).
- Trade-offs between competing outcomes (see the reference to trade-offs on p11 of the OEB Handbook).
- Pacing of specific initiatives (see the reference to pacing on p11 of the Handbook).

Cost effectiveness and efficiency are not in conflict with customer needs and preferences. In fact, they are important customer considerations. Customers generally raise cost effectiveness and efficiency in the context of delivering reasonable distribution rates and comments to this effect can be seen in the various comment box summaries in the report. Customers expect Toronto Hydro to find efficiency whenever possible and want to see customer benefits associated with new investments.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-102

References: Exhibit 1B, Tab 6, Schedule 3, Appendix A, Pages 11-13, 17

Preamble:

Several of Clearspring's recent models have contained an urban congestion variable of general form AreaCongested Urban / AreaTotal. In this study, Clearspring has created time-variant values for this variable using data on the number of tall buildings ("skyscrapers") in various urban areas. Skyscrapers are defined as buildings with a height of at least 100 meters.

Adding the high-rise building data to the congested urban variable appears to boost the elasticity estimate for this variable. This matters to Toronto Hydro's score because it has an unusually high value for the variable.

QUESTION (A):

a) Please confirm that the sensitivity of the parameter estimates for the congested urban variable to the inclusion in the sample of one company (Consolidated Edison of New York) that has an extremely high value is disadvantageous.

RESPONSE PROVIDED BY CLEARSPRING (A):

Consolidated Edision is a strong peer to Toronto Hydro and important to include in a benchmark study of Toronto Hydro. It is true that it would be helpful, if it were possible, to add more utilities similar to Consolidated Edison and Toronto Hydro to the sample, however, that is not currently feasible. Both Clearspring and PEG have agreed on the need to and importance of including the percent congested urban variable for the most recent benchmarking applications. In fact, both consultants have used the same percent congested urban variable in their models for the last three applications (Toronto Hydro's last one, Hydro Ottawa, and Hydro One). During the experts' Hydro

One joint conferral process, the inclusion of the percent congested urban variable was not controversial or a concern raised by PEG.

QUESTION (B):

b) Please provide Toronto Hydro's cost performance scores and rankings with and without the congested urban variable in the model.

RESPONSE PROVIDED BY CLEARSPRING (B):

Clearspring is of the view that the score and ranking without the congested urban variable is not a valid or appropriate comparison because it leaves out a known, highly statistically significant, and impactful cost challenge from the analysis. Both Clearspring and Board Staff's benchmarking expert, PEG, have included the congested urban variable in its total cost benchmark models in the last three Custom IR applications involving econometric benchmarking. This was the last Toronto Hydro application (EB-2018-0165), Hydro Ottawa's CIR application (EB-2019-0261), and Hydro One's CIR application (EB-2021-0110). Clearspring recognizes that the variable is quite impactful on the benchmark score of Toronto Hydro and without the variable the score increases. This makes sense, as serving a highly urbanized service area is going to increase costs substantially. A benchmarking analysis without a proper percent congested urban adjustment is not valid in evaluating performance and is not Clearspring's model, nor has it been PEG's model in recent applications.

QUESTION (C):

c) Why were Atlantic City Electric (serving Atlantic City, NJ), Puget Sound Energy (serving Bellevue, WA), Consumers Energy (serving Grand Rapids, MI), and Connecticut Light and Power (serving Hartford, CT) assigned zero values for this variable? All of these cities had skyscrapers higher than 100 meters.

RESPONSE PROVIDED BY CLEARSPRING (C):

Constructing the congested urban variable involved a large effort which required meticulous mapping of city blocks and streets. For this reason, only cities with populations above 200,000 were examined. The cities cited above did not pass that threshold.

QUESTION (D):

d) Please confirm that some utilities serving cities with congested urban areas (e.g., El Paso, TX) do not have skyscrapers that are at least 100 meters tall. Does that suggest that the 100-meter basis for the skyscraper definition is optimal?

RESPONSE PROVIDED BY CLEARSPRING (D):

The first sentence of the question is confirmed. The congested urban variable was constructed based on examining areas of cities that had building clusters of 7 stories or higher. The optimal basis for the skyscraper definition would, therefore, be 7 stories. However, the Council on Tall Buildings and Urban Habitat (CTBUH) does not provide complete building data under 100m, and indicates that building data under 150m may be incomplete in its dataset. Based on this, balanced with the desire to include the shorter skyscrapers because of the 7 story criterion used in the construction of the variable, we used the cut-off at 100m as being a reasonable approach.

QUESTION (E):

e) Did Clearspring produce results using alternative minimum heights for skyscrapers? If so, please provide these results.

RESPONSE PROVIDED BY CLEARSPRING (E):

No. We only gathered and collected the 100m and above dataset and use that as the basis for variable escalation.

QUESTION (F):

f) Please provide the full skyscraper database (e.g., including skyscrapers less than 100 meters in height) so PEG can undertake its own sensitivity analyses.

RESPONSE PROVIDED BY CLEARSPRING (F):

Clearspring does not have an expanded database other than the one provided in the working papers, as we only gathered the 100m and above dataset for the large cities that were served by our sampled utilities and that was provided in the working papers.

QUESTION (G):

g) Please confirm that Clearspring only included data for at most congested urban areas in a single city of a utility's service territory. If a utility served multiple metropolitan areas with one or more congested urban zones (e.g., Pacific Gas & Electric serves the cities of San Francisco and San Jose, two of the twenty largest cities in the United States), was only the metro area with the largest congested urban zones counted?

RESPONSE PROVIDED BY CLEARSPRING (G):

This is not confirmed. We included data for multiple cities in the case where a utility served multiple large cities with skyscrapers above 100m. In the case of PG&E this included both San Francisco and Oakland. San Jose does not have any buildings above 100m according to the CTBUH.

QUESTION (H):

h) For metropolitan areas with sizable suburban business districts (e.g., St. Louis, MO), did Clearspring include the suburban business districts in its calculations?

RESPONSE PROVIDED BY CLEARSPRING (H):

We only used the major city data. If there are buildings above 100m but outside of the city of St. Louis then they were not counted.

QUESTION (I):

i) Did Clearspring confirm that all of the qualifying skyscrapers are served by the utility and located in the congested urban area?

RESPONSE PROVIDED BY CLEARSPRING (I):

We used the full building count for the city and did not locate every single skyscraper and assure it was within the service area of each utility. Given that this data is only used to escalate the urban variable this level of analysis was not required, in Clearspring's opinion.

QUESTION (J):

j) Did Clearspring change the estimated size of the congested urban data for any utilities since the last Toronto Hydro Custom IR proceeding? If so, please provide the new maps.

RESPONSE PROVIDED BY CLEARSPRING (J):

The congested urban variable is the same as used by Clearspring and PEG in the most recent Hydro Ottawa and Hydro One applications. There were a handful of very small refinements made in the Hydro Ottawa application which was the next iteration of Ontario Clearspring benchmarking research right after the prior Toronto Hydro proceeding. No new maps were produced since the changes were so minor. The changes made in the Hydro Ottawa proceeding from the Toronto Hydro proceeding in the percent congested urban were all less than 0.1% changes in the variable value. For example, Toronto Hydro's value was refined and increased by 0.001%.

RESPONSES TO ONTARIO ENERGY BOARD STAFF INTERROGATORIES

INTERROGATORY 1B-STAFF-103

References: Exhibit 1B, Tab 7, Schedule 3, Appendix A, Pages 22-24

Preamble:

While Clearspring did not present a table of the rankings of each utility in the sample, cost performance data are automatically produced as part of obtaining the values for Toronto Hydro's performance evaluation and forecasting.

QUESTION (A):

a) In the econometric model for total distribution cost, where does Toronto Hydro rank among the sampled utilities?

RESPONSE PROVIDED BY CLEARSPRING (A):

Ranking Toronto Hydro's last three historical years to all of the sample's last three historical years results in a ranking of 6th out of the 79 utilities in the sample (when including Toronto Hydro).

QUESTION (B):

b) How does this compare to their rankings in previous power distribution total cost econometric models and studies authored by Mr. Fenrick?

RESPONSE PROVIDED BY CLEARSPRING (B):

In the last Toronto Hydro CIR application, Toronto Hydro's last three historical years ranked 15th out of the 90 utilities in the sample.

INTERROGATORY 1B-AMPCO-6

Reference: Exhibit 1B, Tab 2, Schedule 1, Page. 34

QUESTION:

Toronto Hydro indicates it carefully considered the amount of funding requested for this proposal and based on research, the utility decided to allocate 0.3 percent of the proposed revenue requirement to the Innovation Fund, which amounts to approximately $16 million over the 2025-2029 rate period. This is the low end of a range found in research of comparable ratepayer-funded initiatives aimed at facilitating innovation by utilities and regulatory bodies in other jurisdictions, as well as general data on utility spending for research and development activities.

Please provide a description and details of comparable ratepayer-funded initiatives in other jurisdictions and the corresponding funding amounts.

RESPONSE:

Please see Toronto Hydro's response to interrogatory 1B-DRC-06 part (d).

With respect to Figure 9: 2020 - 2024 Efficiency Achievements (Actual and Forecast), please provide the data and underlying calculations and assumptions used.

RESPONSE:

Table 1 below provides the data behind Figure 9: 2020 – 2024 Efficiency Achievements (Actual and Forecast). Table 2 below provided a breakdown of each initiative along with an explanation of how the benefits were calculated for each particular initiative.

Table 1: 2020-2024 Efficiency Achievements Summary ($ Millions)

Year	2020	2021	2022	2023*	2024*	Total
Cost Reduction	1.16	1.83	1.74	1.45	1.52	**7.70**
Cost Avoidance	1.49	1.58	3.72	3.90	4.10	**14.79**
Total	**2.65**	**3.41**	**5.46**	**5.35**	**5.62**	**22.49**

Table 2: 2020-2024 Efficiency Achievements Breakdown by Initiative ($ Millions)

Productivity Initiative	Cost Reduction or Avoidance Calculation	Total Benefit ($ Millions)
Enterprise Resource Planning, Enterprise Connect, and People Connect	Amount saved through the avoidance of maintenance costs connected to the legacy systems and the hours saved through the automated functionalities multiplied by the standard labour rate.	10.57
e-Tailboard	Amount saved through the avoidance of costs associated with the legacy process (tangible, paper-copy tailboards) and the number of hours saved	2.28

Productivity Initiative	Cost Reduction or Avoidance Calculation	Total Benefit ($ Millions)
	through the use of electronic tailboard creation and use multiplied by the standard labour rate.	
Streetlighting Management System Project[1]	Amount saved through the avoidance of streetlight work management costs following the existing, legacy system reaching end of life.	1.98
Non-conformance Reporting	Number of hours saved through the automated and streamlined process associated with progressing beyond the legacy system multiplied by the standard labour rate.	1.26
Electronic Red Construction Folder	Amount saved through the digitization of the existing red construction folder process and the number of hours saved through the use thereof multiplied by the standard labour rate.	0.89
Accounts Payable Processing Automation	Number of hours saved through the introduction of an automated solution for the invoicing process multiplied by the standard labour rate.	0.70
Storm Prediction Impact Tool	Number of hours saved by utilizing the procured IBM weather dashboard to support disaster response decision making multiplied by the standard labour rate.	0.06
SAP Business Warehouse Project	Amount saved through the implementation of the SAP tool to the business warehousing process.	0.15
Find It Fix It Program	Amount saved for key underground and overhead maintenance programs based on the number of find-it fix-it items completed	2.95

[1] This benefit is associated with Toronto Hydro Energy Services Incorporated (THESI)

Productivity Initiative	Cost Reduction or Avoidance Calculation	Total Benefit ($ Millions)
Regulatory Intelligence Subscription Service	Annual payrolls costs (0.5 FTE) avoided by having access to this subscription service, plus avoided costs related to outsourcing regulatory intelligence research and analysis to higher cost external service providers.	0.40
Porcelain Insulator Replacement Initiative	Year-over-year decrease in cost for insulator washing program.	0.20
Equipment Failure Analysis Dashboard	Year-over-year decrease in time for equipment failure analysis multiplied by the standard labour rate.	0.04
Standardized Outage Tracking Process	Amount of overtime expenses avoided due to the standardized nature of outage tracking which avoided overtime hours of contractor work, including the removal of major rescheduling triggers.	0.06
Online Training	Number of hours saved by delivering a course virtually multiplied by the standard labour rate.	0.59
RISE 360	Number of courses developed using RISE 360 multiplied by $7,500 per course.	0.09
Classroom Maximization	Number of training hours in both the PLT lab and at Parkdale multiplied by $55/hr and $110/hr, respectively.	0.07
CenarioVR	Number of scenarios developed using CenarioVR multiplied by 6000/course plus the number of attendees multiplied by 2.5 and then multiplied by the standard labour rate.	0.04
Change Order Billing Process	The time difference between monthly billing reviews and the review of change orders during closeout review multiplied by the standard labour rate.	0.03
Total efficiency benefits yielded by the above initiatives.		**22.5**

With respect to Figure 4, please provide the MAIFI values for each of the years 2018-2023.

RESPONSE:

Please see Table 1 below for MAIFI results from 2018 to 2023 (excluding major events).

Table 1: MAIFI (excluding Major Events) 2018-2023

Year	MAIFI
2018	2.78
2019	2.85
2020	3.18
2021	3.39
2022	3.36
2023	3.34

RESPONSES TO ASSOCIATION OF MAJOR POWER CONSUMERS IN ONTARIO INTERROGATORIES

INTERROGATORY 1B-AMPCO-9

Reference: Exhibit 1B, Tab 3, Schedule 2, Page. 35

In 2021, Toronto Hydro refined its unit cost methodology with respect to wood poles and applied the new methodology retrospectively to ensure year-over-year comparability in the results.

QUESTION (A):

a) Please provide the two methodologies and discuss the differences.

RESPONSE (A):

The two methodologies used by Toronto Hydro for unit costs can be summarized as the following:

Table 1: Summary of Refined Unit Cost Methodology

Previous Approach (pre-2021)	Updated Approach
ISA Data for the respective year is formatted and cleansed to exclude demand driven programs and to group costs and quantities by project and asset type	Unchanged
Unit cost calculated by taking the total cost of the project divided by quantity of the project for that particular asset type	Unchanged
Exclude outliers (top and bottom 10^{th} percentiles)	Unchanged
Aggregate the unit costs and divide by the number of projects	Aggregate the total costs and total quantities from all projects corresponding to that asset type
Sum of all unit costs across projects divided by the number of projects	Compute the average unit cost by dividing total costs by total quantities

Toronto Hydro observed higher volatility in the unit costs when using the former method, particularly in the case when projects had low quantities.

QUESTION (B):

b) Please provide the wood pole unit cost for the years 2018 to 2023 based on the original methodology.

RESPONSE (B):

Please see the table below for the 3-year weighted average wood pole unit costs aligned with the original methodology.

Table 2: Wood Pole Unit Costs 2018 to 2023 – Original Methodology

2018	2019	2020	2021	2022	2023
$7,332.6	$7,639.4	$7,778.7	$7,846.6	$7,973.5	$8,178.6

QUESTION (C):

c) Please explain the difference between the average wood pole replacement cost for the years 2020-2022 in Table 3 at 1B-3-2 page 22 and the wood pole preplacement data in Figure 14 at 1B-3-2 page 35.

RESPONSE (C):

Table 3 in Exhibit 1B, Tab 3, Schedule 2 provides the 2020-2024 Custom Measure results for 2020-2022 which are reported annually as part of Toronto Hydro's MD&A. The 2021-2022 unit costs are derived on the basis of the previous methodology to ensure consistency with 2020 unit cost results (these align with the unit costs in part (b)). On the other hand, Figure 14 utilizes the updated methodology, deriving the three-year weighted average from 2020 to 2022.

RESPONSES TO ASSOCIATION OF MAJOR POWER CONSUMERS IN ONTARIO INTERROGATORIES

INTERROGATORY 1B-AMPCO-010

Reference: Exhibit 1B, Tab 3, Schedule 3 p.13

Toronto Hydro slowed down the pace of work in the Underground Downtown, Underground Horseshoe, and Overheard Renewal programs by approximately 22 percent leading to a $189 million reduction compared to forecasted budgets for these programs in the 2020-2024 rate application.

QUESTION (A):

a) Please discuss the process Toronto Hydro undertook to reprioritize the capital work and investment levels and conclude where to slow the pace of work.

RESPONSE (A):

Toronto Hydro's Asset Management Process is described in detail in Exhibit 2B, Section D1. This is the overarching process that the utility leverages to implement, track and adjust its capital expenditure plan. More specifically, the utility makes adjustments to short- and long-term plans at appropriate frequencies through the complimentary Program Management & Execution and Investment Planning & Portfolio Reporting ("IPPR") processes (as depicted in Section D1.2). The annual IPPR process produces final recommendations for updated programmatic investment levels. Management arrives at these recommendations by making trade-offs, ultimately working to balance various risks and outcomes in alignment with corporate objectives, including funding constraints.

QUESTION (B):

b) Please provide the impact of the change on the forecast outcomes of each program.

RESPONSE (B):

Toronto Hydro's 2025-2029 investment plan for the referenced programs accounts for the current state of the distribution system. As a result of deferrals within the referenced programs, the current state of the system is worse than it would have been had all work been completed in accordance with the 2020-2024 plan. This contributes to greater investment needs in 2025-2029 to maintain asset condition demographics and reliability performance, and address various asset risks (e.g., safety). (Toronto Hydro refers to this as the "snowplow" effect, where delayed investment within a rate period results in a greater increase in investment needs in the next period.) For a detailed discussion of the relevant program-specific investment needs and variances within the 2020-2024 period, please refer to Exhibit 2B, Sections E6.2, E6.3, and E6.5.

QUESTION (C):

c) Please discuss if incentive payments are impacted by the change.

RESPONSE:

As noted in response to part (b), deferrals within the referenced programs have led to the current state of the system being worse than it would have been had all work been completed in accordance with the plan. This has had an inherent effect on the reliability forecasts that Toronto Hydro used to inform the reliability targets which underpin the Performance Incentive Mechanism. For a detailed discussion of how asset condition demographics and reliability performance trends have influenced Toronto Hydro's 2025-2029 Capital Expenditure Plan (and associated expectations regarding reliability performance in the next rate period), please see Exhibit 2B, Section E2.2.1.

RESPONSES TO ASSOCIATION OF MAJOR POWER CONSUMERS IN ONTARIO INTERROGATORIES

INTERROGATORY 1B-AMPCO-11

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix A, Page 14

QUESTION:

With respect to the data in Table 2, Clearspring forecasts that Toronto Hydro's average SAIFI over 2025-2029 (1.17) is stable compared to the 2020-2022 average (1.18). However, Clearspring's average projections for CAIDI show a slight decline in 2025-2029 (51.70) compared to the 2020-2022 (48.36). In Table 3, Clearspring forecasts a slight decline in SAIDI.

Please discuss the drivers for the forecast decline in SAIDI/CAIDI.

RESPONSE:

Toronto Hydro provided Clearspring with projected SAIFI and SAIDI performance for the 2025-2029 period (refer to 1B-Staff-73 for more details). Projected CAIDI performance was derived by dividing SAIDI by SAIFI. Scheduled Outages were the most significant driver that contributed to the slight decline in SAIDI performance (2025-2029 Average vs. 2020-2024 Average). Scheduled Outages are projected to increase due to a larger capital work program. For more information, please refer to 1B-Staff-74, part (d), and 1B-Staff-62, part (b).

All other cause codes are projected using the historical five-year average with the exception of Defective Equipment, which did not contribute to the decline in SAIDI. Defective Equipment was modeled by projected failures and interruption impacts at an asset class level based on asset demographics and the expected benefits of the reliability-related Grid Modernization investments, as detailed in Toronto Hydro's response to interrogatory 2B-SEC-42.

RESPONSES TO ASSOCIATION OF MAJOR POWER CONSUMERS IN ONTARIO INTERROGATORIES

INTERROGATORY 1B-AMPCO-12

References: EB-2018-0165, Exhibit 1B, Tab 2, Schedule 1, Appendix B
Exhibit 1B, Tab 3, Schedule 3, Appendix C

Preamble:

At Reference #1, Toronto Hydro filed a UMS Unit Costs Benchmarking Study. At Reference #2, Toronto Hydro filed an updated UMS Unit Costs Benchmarking Study dated October 2023.

QUESTION (A):

a) Please explain why unit costs for OH Switch Replacement and Switchgear Replacement were included in the EB-2018-0165 study but not included in the October 2023 UMS Study.

RESPONSE PROVIDED BY UMS GROUP (A):

We used the list of asset classes from the previous application (EB-2018-0165) as a starting point for discussion and applying our industry experience, we reviewed the viability of gaining consistency across utilities for each Asset Class and Maintenance Program. Citing significant variability in the selection, installation, and accounting for overhead switches, we opted to remove that category from the study. With respect to Switchgear Replacement, though initially targeted for inclusion in the previous application (EB-2018-0165 1B-2-1 Appendix B), it was ultimately removed from consideration as the number of these replacements within each utility were too few and sporadic to enable viable comparisons.

RESPONSE PROVIDED BY TORONTO HYDRO (A):

In identifying asset types to include for benchmarking, Toronto Hydro sought to ensure major asset classes that accounted for considerable expenditures in the 2020-2022 period were included. Although switches are critical components within the overhead distribution system, they do not

pose the same level of asset deterioration pressures to the overhead system as Wood Poles at the current time as discussed in Exhibit 2B, Exhibit 6.5.3.1. In addition, the focus of the Overhead System Renewal program remains on eliminating PCB at-risk transformers through spot replacement approaches while managing reliability concerns through rebuilds. In selecting the asset classes to benchmark, Toronto Hydro also attempted to align to the Activity Based Performance Benchmarking ("APB") asset classes where appropriate, which was another driver for not including OH Switch Replacement within the benchmarking study.

QUESTION (B):

b) Please provide the unit costs for OH Switch Replacement and Switchgear Replacement if calculated as part of UMS' work for the October 2023 study but not included in the report.

RESPONSE PROVIDED BY UMS GROUP (B):

The OH Switch Replacement and Switchgear Replacement was excluded from the October 2023 study, and thus there was no calculation for unit cost.

QUESTION (C):

c) Please provide the drivers for the increase in unit costs in the October 2023 UMS study compared to the EB-2018-0165 UMS Study for the following asset categories: UG Cable, Pole Top Transformers, Padmount/UG Transformer, Network Transformer Replacement and Breaker.

RESPONSE PROVIDED BY UMS GROUP (C):

We have noted a general increase in costs across the industry over the past three years, driven largely by inflation (including its effect on commodity prices), supply chain challenges (limited manufacturing capability and excessive lead times, causing demand to exceed supply resulting in increased prices), and COVID related policies, most notably the requirement that individuals be in separate vehicles thus increasing crew size and fleet / heavy equipment costs. We understand that

the industry is only recently beginning to relax COVID-related restrictions, but inflation and supply chain issues have remained an issue.

RESPONSE PROVIDED BY TORONTO HYDRO (C):

For Toronto Hydro, the increases can be attributed to various factors, including but not limited to inflation and supply chain impacts discussed in Exhibit 1B, Tab 3, Schedule 3, and asset-specific variability such as seen with stations assets discussed in Exhibit 2B, Exhibit 2B, Section E6.6.4.1.

QUESTION (D):

d) Please explain the basis for adding Cable Chambers to the asset category in the October 2023 UMS Study.

RESPONSE PROVIDED BY UMS GROUP (D):

Cable Chambers were added with the intention of providing a more diverse and representative sample set of THESL's work, particularly given the amount of civil work being performed. Of the asset classes to be considered, cable chambers represented one that would be most conducive to conducting industry comparisons.

RESPONSE PROVIDED BY TORONTO HYDRO (D):

Toronto Hydro found it prudent to add Cable Chambers to the asset categories within the latest UMS Unit Costs Benchmarking Study due to the continued and increasing investments required for managing this asset class over the long term. Toronto Hydro is proposing to invest 162 percent more in this asset class in 2025-2029 in comparison to the 2020-2024. The asset classes' health demographics also indicate that sustained investments will be required over the long term. Cable Chambers also represent a key investment in civil assets within Toronto Hydro's Underground Renewal – Downtown program and the overall System Renewal category. As such, including Cable Chambers in the study increases the proportion of total investment that is covered by the UMS Unit Costs Benchmarking Study.

QUESTION (E):

e) There were 17 electric utilities in the Peer Group Panel in the EB-2018-0165 study and only 12 electric utilities in the October 2023 UMS study. Please explain and discuss any impact on the results.

RESPONSE PROVIDED BY UMS GROUP (E):

The difference in number of participants for this study as compared to that conducted for the EB-2018-0165 application is reflective of utilities' willingness / capacity to dedicate resources to this effort. As always, we casted a wide net across the North American utilities and experienced the normal churn of some accepting but having to back out as the required completion date neared, and others declining at the initial offering, citing either overriding priorities or general policies not to participate in such endeavors. When we embark on these types of efforts, we prefer a peer group as large as possible, one that has at least 10 to 12 participants to achieve the level of directional accuracy that is called for in focused studies of this type.

QUESTION (F):

f) On page 8 of the UMS report in EB-2018-0165, UMS provides Table II-1 that shows the Fully Normalized Benchmark Comparisons. Please provide the same table using the data in the October 2023 UMS Study.

RESPONSE PROVIDED BY UMS GROUP (F):

Regarding our study in the EB-2018-0165 filing the Board provided THESL and UMS Group constructive feedback that questioned various aspects of the 2018 normalization formula. To be responsive to the Board's questions and feedback, we simplified our normalization efforts to focus on those criteria accepted by the Board in 2018 (i.e., metric and USD to CAD conversions and differences in accounting practices). However, as requested by this question: if we were to have applied the normalization adjusters for other factors as was done in the previous study (modified somewhat to reflect improvements in benchmarking practices), the following comparisons,

generally favoring THESL (as THESL's higher congestion undoubtedly has a negative effect on productivity), would have resulted:

Table II – 1: Fully Normalized Benchmark Comparisons (October 2023 UMS Study)

			Median	Percent from Median
Asset Categories				
Wood Pole	Each	$8,317	8,317	0.0%
UG Cable (XLPE)	Per Meter	$131	131	0.0%
Pole Top Transformer	Each	$18,691	18,687	0.0%
Pad mount / UG Transformer	Each	$37.373	37,129	0.7%
Network Transformer / Protector	Each	$127,649	130,085	-1.9%
Breaker	Each	$37,983	41,040	-7.4%
Cable Chambers / Manholes	Each	$136,409	139,607	-2.3%
Maintenance Programs				
Vegetation Management	Per Line KM	$2,175	2,140	1.6%
Pole Test and Treat	Each	$17	19	-8.1%
Overhead Line Patrol	Per Line KM	$23	26	-9.9%
Substation Maintenance	MVA	$1,712	1,712	0.0%
Building Vault Inspection	Each	$258	271	-5.0%

QUESTION (G):

g) On page 29 of the UMS report in EB-2018-0165, UMS provides Table C-2 which shows the % of Labour and Non-Labour costs. Please provide the same table using the data in the October 2023 UMS Study.

RESPONSE (G) PROVIDED BY UMS GROUP:

Per your request, the following table is provided:

Table C-2: Labour and Non-Labour Cost Split (October 2023 UMS Study)

Asset Category / Capital	A	B	C	D	E	F	G	H	I	J	K	L	THESL

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-8

Reference: Exhibit 1B, Tab 1, Schedule 1 at page 3

The evidence states that the Investment Plan makes the minimum investments necessary (the "least regrets" investments) to maintain key outcomes in the near term while also making paced and deliberate progress in readying the grid and utility operations for the future irrespective of the path the energy transition takes. How does Toronto Hydro demonstrate to the OEB that it is making the minimum investments necessary? What are "least regrets" investments?

RESPONSE:

Please refer to Exhibit 2B, Section D4 starting on page 9 for an explanation of the least regrets planning approach and how it translates into balanced investments as part of the 2025-2029 Distribution System Plan. Please also see Toronto Hydro's responses to interrogatories 1B-DRC-03 and 1B-Staff-4(d).

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-9

Reference : Exhibit 1B, Tab 1, Schedule 1, Page 1

QUESTIONS (A) – (G):

Toronto Hydro has referred to a number of City of Toronto initiatives. Please provide a brief summary of each of these initiatives. Please indicate, specifically, how each of these initiatives has impacted Toronto Hydro's revenue and cost forecasts for the rate plan term:

a) Transform TO
b) Net Zero Existing Building Strategy
c) Electric Vehicle Strategy
d) Toronto Green Standard
e) Home Energy Loan Program
f) Energy Retrofit Loans
g) City of Toronto Green Will Initiative

RESPONSE (A) – (G):

Initiative	Summary Description
Transform TO	The TransformTO Net Zero Strategy responds to the climate emergency by focusing on a new target of net zero GHG emissions community-wide by 2040. The strategy outlines the rationale behind the net zero pathway and opportunities needed to successfully reach the net zero target. The Strategy presents a set of 2030 interim targets for community-wide emissions and City corporate targets.
Net Zero Existing Building Strategy	Building on the TransformTO strategy, the Net Zero Existing Building Strategy presents the background information and set recommended building-scale actions and the city-wide policies necessary for the City of Toronto to transform its existing building sector.
Electric Vehicle Strategy	As one of the key goals identified in Transform TO, the Electric Vehicle strategy identifies a range of actions to help the City achieve its 2050 goal of having all transportation powered by zero carbon energy sources. This strategy is one of

Initiative	Summary Description
	many initiatives informing Toronto's approach to sustainable transportation and focuses on activities for passenger light duty vehicle electrification.
Toronto Green Standard	The Toronto Green Standard is Toronto's sustainable design and performance requirements for new and city-owned developments. The Standard performs an important role as a market transformation tool to progressively push development beyond the minimum standards of the Ontario Building Code towards Toronto's zero-emission targets set in TransformTO.
Home Energy Loan Program	To help make it easy and affordable for homeowners to pay for home improvements, Toronto homeowners can borrow up to $125,000 to cover the cost of a variety of applicable home energy improvements.
City of Toronto Green Will Initiative	Connect building portfolio owners with the City of Toronto and other buildings owners to share experiences and best practices to reduce greenhouse gas emissions.

Critical climate change mitigation and adaptation efforts demand a bigger, more efficient and more resilient system that will serve customers for generations to come. In combination with many other business and customers inputs which are detailed throughout the evidence in Exhibits 1B, 2B and 4, the above-noted climate change mitigation initiatives informed Toronto Hydro's strategic direction and investment priorities for the 2025-2029 planning period – to get the grid and its operations ready and able to support long-term societal decarbonization imperatives. For more information about how Toronto Hydro's application enables energy transition via electrification please refer to Toronto Hydro's response to 1B-PP-08.

The Electric Vehicle Strategy specifically impacted Toronto Hydro's cost and revenue forecasts. To align with the goals of TranformTO to have 100% of light duty vehicles to be zero emission by 2050, the City of Toronto Electric Vehicle Strategy outlines interim goals by passenger vehicles. From these goals, the Strategy converted targets to EV sales goals. Toronto Hydro incorporated the City EV Strategy sales targets in the System Peak Demand Forecast found in Exhibit 2B, Section D4 and revenue forecast in Exhibit 3. Please refer to Exhibit 3, Tab 1, Schedule 1, Section 10 and Appendix J for more details on the integration of EV forecasts into Toronto Hydro's revenue load forecast.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-10

Reference: Exhibit 1B, Tab 1, Schedule 1, Page 7

QUESTION:

Toronto Hydro's evidence is that approximately one quarter of the utility's grid equipment continues to operate past useful life. An additional 11% is expected to reach that point by 2030 unless the utility invests in upkeeping system infrastructure in the 2025-2029 period. How does Toronto Hydro calculate the level of the utility's grid equipment operating past its useful life.

Please indicate the level of grid equipment operating past its useful life in 2018. What level of capital spending was proposed at that time to deal with assets operating beyond their useful life. How does that compare to the level being proposed during the rate plan period?

RESPONSE:

Toronto Hydro considers an asset to be operating past useful life if the asset remains in service at an age that is greater than its useful life. To calculate the percentage of Assets Past Useful Life ("APUL"), Toronto Hydro compares the age demographics of its asset population to the useful life of each asset type.

By 2018, approximately 24 percent of the asset population was operating past its useful life with an additional 9 percent by the end of the forecast period (2025). The level of capital spending proposed as part of the 2020-2024 Rate Application was approximately $2.8 billion.[1] Out of which, approximately $1.8 billion was proposed for System Renewal and Metering related investments that would have had the largest impact on addressing assets operating past their useful lives with some contribution from System Access and System Service investments as well.

[1] EB-2018-0165, U-VECC-71

By 2023, approximately 25 percent of the asset population was operating past its useful life with an additional 11 percent by the end of the forecast period (2030). As part of the 2025-2029 CIR Rate Application, Toronto Hydro is proposing approximately $2.2 billion in System Renewal and Metering related investments which is a 27 percent increase compared to the last rate application.

Details on the increased investment can be found in Exhibit 2B, Section E2.2 (page 15) and Section E4.2 (pages 16 and 18).

Please note that Toronto Hydro utilizes the APUL metric as a simple, high-level indicator meant to represent the age demographics of all assets. However, APUL is not intended to furnish detailed insights into the age distribution and condition of assets within a specific class. Such granular details are crucial for assessing the extent of System Renewal investment necessary on a programmatic level. For comprehensive information on this, please refer to the System Renewal programs detailed in Section E6 of the Distribution System Plan (Exhibit 2B). Please also refer to interrogatory response 2B-SEC-44 for a comprehensive discussion regarding expected asset demographic changes over the 2025-2029 period with investment.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-11

Reference : Exhibit 1B, Tab 1, Schedule 1, p. 9

QUESTION:

Toronto Hydro's population is expected to grow by approximately 23.8 % between 2021 and 2031, a marked increase from the 6.8% growth over the prior decade. Please specify how that increased growth has impacted Toronto Hydro's cost and revenue projections for the rate plan.

RESPONSE:

Please see the Customer Connections capital program in Exhibit 2B, Section E5.1 at pages 4 to 6 for an explanation of how population growth impacted the capital expenditure plan. Addressing the pressures of population growth within the City of Toronto requires a concerted effort between the government, the private sector (e.g. developers) and Toronto Hydro. As the need for accommodation (and supportive services such as transit, hospitals, office, etc.) increases, new building connections and service upgrades increase. This yields a greater demand for access to Toronto Hydro's distribution system (e.g. more condominiums, large multi-use developments) which is reflected in the increase of customer connection capital expenditures since 2020 above previous forecasts. The growth of these developments is projected to continue through the 2025-2029 period and is reflected in Toronto Hydro's customer connections forecast.

Increases in capital expenditures associated with Customer Connections also drive costs in the Customer Operations program at Exhibit 4, Tab 2, Schedule 8.

Please see the load and customer forecast in Exhibit 3, Tab 1, Schedule 1 at page 4 for an explanation of how population growth impacted the revenue forecast.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-12

Reference: Exhibit 1B, Tab 1, Schedule 1, Page 10 - 11

Toronto Hydro's evidence refers to extreme weather events and states, "As evidenced by recent events (outlined in Table 3 below), extreme weather has become a regular operating condition that the utility must consider and manage in its day-to-day operations and long-term planning activities. With the frequency and intensity of adverse weather increasing due to climate change, Toronto Hydro's grid and operations must become more resilient to this challenge." Please explain how the frequency and intensity of adverse weather increasing has impacted Toronto Hydro's operating and capital costs for the years 2025-2029.

RESPONSE:

Please refer to the following evidence for a general summary of how the frequency and intensity of adverse weather increasing impacts the distribution system:

- Exhibit 2B, Section D2, Subsection D2.1.2, "Climate and Weather"

Specific program level impacts are discussed in the following evidence:

- Exhibit 2B, Section E6.7 – Reactive and Corrective Capital Program
- Exhibit 4, Tab 2, Schedule 4 – Corrective Maintenance Program
- Exhibit 4, Tab 2, Schedule 5 – Emergency Response Program
- Exhibit 4, Tab 2, Schedule 6 – Disaster Preparedness Management Program.

QUESTION :

Toronto Hydro expects to have over 4,400 DER connections by the end of the decade which represents a 67% increase compared to 2022. Please explain, specifically, how the forecast of DERs was derived. How does this impact capital and operating costs for the years 2025-2029? Please provide a full list of DER connection projects for the years 2020-2029. Please include all assumptions.

RESPONSE:

Please see Exhibit 2B, Section E5.1 at page 13 for an explanation of how the forecast was derived and a summary of the projects by year and by capacity.

Capital investments to support DER enablement are detailed under the Generation Protection, Monitoring and Control (Exhibit 2B, Section E5.5), the Non-Wires Solutions (Section E7.2) and Stations Expansion – Sheppard TS (Section E7.4) programs.

Operational investments to support DER maintenance and corrective costs are detailed in the Customer Location Maintenance segment of the Preventative and Predictive Station Maintenance Program at Exhibit 4, Tab 2, Schedule 3 starting on page 8. Operational investments to support system planning related to DER connections are detailed in the System Planning segment of the Asset and Program Management program at Exhibit 4, Tab 2, Schedule 9 starting on page 15.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-14

Reference: Exhibit 1B, Tab 1, Schedule 1, Page 12

Since 2015 Toronto Hydro has served the needs of a growing city, evolving customer and policy demands, and an aging system while addressing intensifying challenges identified above with a staffing complement that is essentially flat from 2015-2024. Over this period Toronto Hydro's replenished a large wave of retirements. It has also "rightsized" its workforce through continuous improvements in productivity, including harmonizing key jobs to create a more agile compliment of staff and automating manual processes to increase employee output levels.

QUESTION (A):

a) Please explain, in detail, how Toronto Hydro determined that a 25% increase was appropriate.

RESPONSE (A):

Please refer to the evidence at Exhibit 4, Tab 1, Schedule 1 at pages 25-50 for a detailed overview of the planning considerations, needs and drivers of the operations and workforce plan. Please refer to the Staffing evidence Exhibit 4, Tab 4, Schedule 3 for more information about the workforce plan.

Toronto Hydro considered the following quantitative and qualitative factors in determining the reasonableness of the 25% workforce increase proposed in this application:

1. FTE-normalized benchmarking analysis presented in the OM&A Overview evidence at Exhibit 4, Tab 1, Schedule 1, which shows that Toronto Hydro has a comparatively lean staffing contingent compared to its Ontario peers using publicly available OEB yearbook data

2. FTE trending which shows that forecasted FTE trends (e.g. FTE/CAPEX and FTE/customer as shown below in Figure 1 and 2, respectively) are keeping in line with (or better than) historical ratios.
3. Increasing volumes and complexity of work requirements across programs/portfolios as presented in the programmatic evidence and summarized in the OM&A Overview evidence.
4. The ability to train and safely absorb new staff (i.e., apprentices) into the utility's operations.
5. Professional judgement of senior utility leaders who have extensive experience managing operational requirements in the areas of construction, engineering, grid operations, customer operations, IT, finance, human resources and public, legal and regulatory affairs.

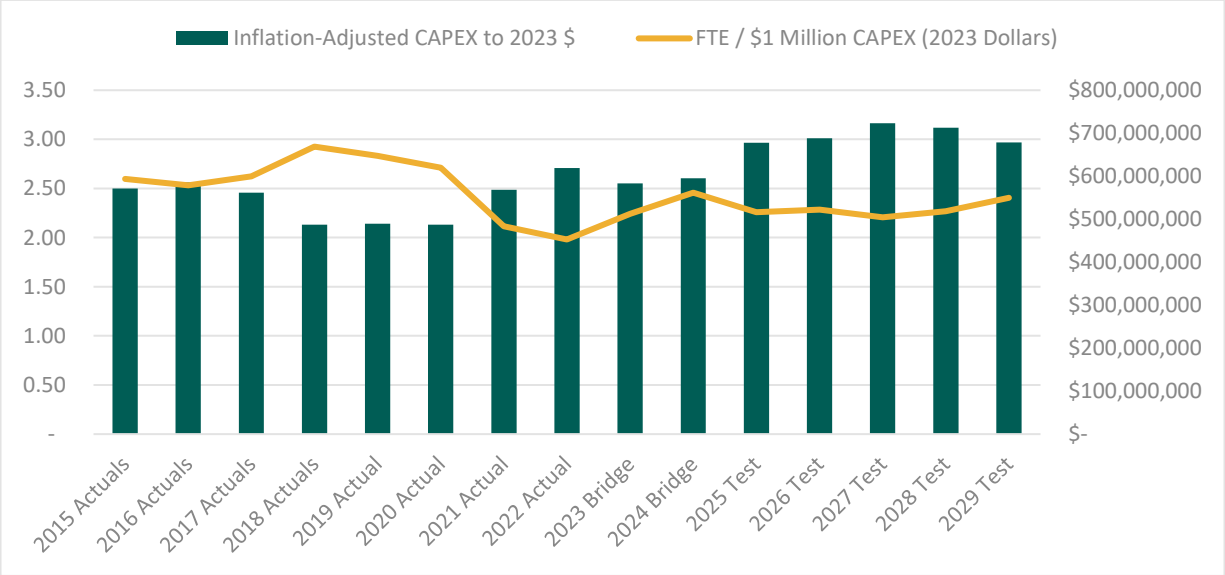

Figure 1: FTE per $1 million CAPEX 2015 – 2029

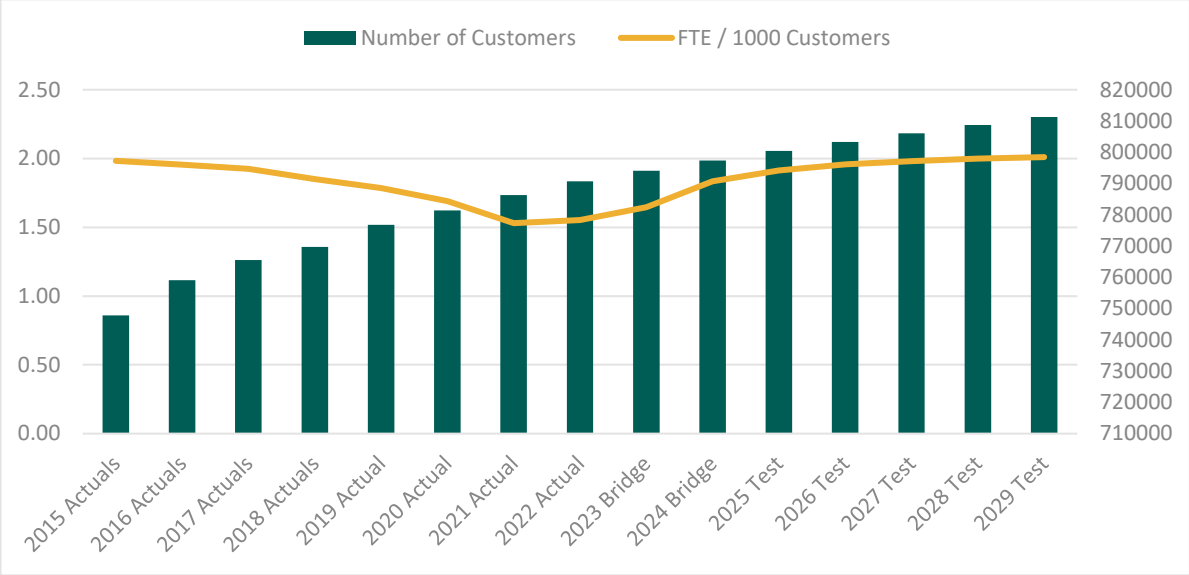

Figure 2: FTE per Customer 2015 – 2029

QUESTION (B):

b) If the staff compliment was the "right size" in 2024, how can that staffing level now be deemed inadequate?

RESPONSE (B):

The reference above notes Toronto Hydro's staffing complement is essentially flat from 2015 to 2024, and that this was made possible through productivity improvements (e.g., process automation, job harmonization, outsourcing) which enabled the utility to right-size (i.e. constrain) staffing levels over this period of time. The reference does not mean to suggest or imply that the staffing complement was right-sized in the year 2024 specifically, but rather, that it was right-sized over this period of time. However, it is no longer possible to operate with the historical staffing levels as business conditions are changing and the utility needs more resources to deliver its work programs, comply with legal and regulatory requirements and meet customer needs safely, reliably and efficiently.

QUESTION (C):

c) When did Toronto Hydro determine it was no longer possible to meet its obligations without additional staffing resources?

RESPONSE (C):

Workforce requirements were assessed through the utility's integrated business planning process which is described in the evidence at Exhibit 4, Tab 1, Schedule 1 starting at page 25. Please refer to interrogatory: (i) 2B-SEC-32 for a chronology of the business planning process and (ii) 4-CCC-58(d) for more information about the workforce planning part of the process.

QUESTION (D) :

d) What is the overall impact on the 2025 revenue requirement of increasing its workforce relative to 2024?

RESPONSE (D):

The 2025 revenue requirement impact of increasing workforce by 68 FTE relative to 2024 levels is approximately $6.5M.

Reference: Exhibit 1B, Tab 1, Schedule 1, Page 26, Table 9

QUESTION:

Table 9 sets out Toronto Hydro's OM&A programs for the period 2025-2029. The CCC is interested in comparing this to the prior period. For each of those programs please provide the forecast and actual spending levels for the period 2020-2024. Please provide the year-by-year numbers as well as the total.

RESPONSE:

Please see Toronto Hydro's response to interrogatory 4-SEC-89 subpart (c).

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-16

Reference: Exhibit 1B, Tab 1, Schedule 1, Page. 33

QUESTION (A):

a) Toronto Hydro points to "notable" improvements in cost-efficiency achieved over the last decade.

Please explain how the $200 million which will be returned to customers by the end of the decade was calculated. Please explain how the $132 per customer amount was calculated.

RESPONSE (A):

Table 1: Calculation of $200 Million Returned to Customers

CIR Period	Account	DVA Balance ($ Millions)	Monthly Rate Rider ($)	Clearance Period	Amount paid per customer ($)
2015-2019[1]	Operating Centres Consolidation Program ("OCCP")	72.5	- 1.48	34 months	- 50.32
2020-2024[2]	OCCP	73.7	- 2.13	22 months	- 46.86
2020-2024	50/60 Eglinton	11.8	- 0.34	22 months	- 7.48
Sub-total		**158.0**	**n/a**		**- 104.66**
2025-2029[3]	OCCP	33.4	- 1.73	12 months	- 20.76
2025-2029	50/60 Eglinton	10.7	- 0.14	48 months	- 6.72
Total		**202.0**	**n/a**		**- 132.14**

[1] EB-2014-0116 – Decision and Rate Order (March 1, 2016)
[2] EB-2018-0165, DRO Reply Submission and Draft Rate Order Update at Page 13 of 32.
[3] Exhibit 9, Tab 3, Schedule 1 – Rate Rider Table

QUESTION (B):

b) Please explain how the $26 million reduction related to fleet was calculated. Is this an annual amount?

RESPONSE (B):

The $26 million reduction related to fleet is an aggregate figure for the 2017-2023 period and is not an annual amount. Toronto Hydro calculated it as follows (dollar figures rounded to the nearest thousand or million):

Table 2: Calculation of $26 million Fleet Reduction[4]

	(a)	(b)	(c)	(d)	
Vehicle Type	**Average Capital Replacement Cost by Vehicle Class ($)**	**Number of Units**	**Total Cost Avoidance by Class ($ millions) (a x b)**	**Average OPEX Cost per Year by Vehicle Class ($)**	**Replacement Cost Savings 2017-2023 ($ millions) (c + d) X (7 years) X (# of vehicles per class)**
Light Duty	51,000	62	3.2	4,000	1.7
Heavy Duty	296,000	49	14.5	13,000	4.4
Equipment	113,000	21	2.4	2,000	0.3
Total			**20**		**6.4**

In responding to this interrogatory, Toronto Hydro discovered an error in the original evidence referenced. The $26 million figure calculated above relates to an earlier, outdated fleet vehicle reduction count of 132 vehicles. The correct number of vehicles that Toronto Hydro replaced during the 2017-2023 period is 163 vehicles which, using the above methodology, corresponds to a total OPEX cost savings of $9.2 million and capital cost avoidance of $30.5 million, for a total of $39.7 million.

[4] Variances due to rounding may exist

QUESTION (C):

c) What is the total number of Toronto Hydro customers and the number of those customers on e-billing. How many customers are expected to convert to e-billing during the rate plan term by year. What are the expected annual savings from further conversion to e-billing? Have these savings been incorporated into the forecasts? If not, why not?

RESPONSE(C):

As of 2022, Toronto Hydro had a total of 790,699 customers[5] out of which 381,490 were on ebills. By 2029, Toronto Hydro expects to have 487,917 customers on ebills, with the annual forecast as follows:

Table 3: Number of Customers and Incremental new customers on ebills

	2022	2023	2024	2025	2026	2027	2028	2029
Number of customers on ebills at year end	381,490	404,854	427,275	442,135	455,413	466,433	478,664	487,917
Incremental number of new customers on ebills	30,497	23,364	22,421	14,860	13,278	11,020	12,231	9,254

Based on the above forecast of incremental eBill conversion, Toronto Hydro expects annual savings to increase between $0.1 million and $0.2 million each year over the 2025-2029 period, with cumulative savings adding up to approximately $2 million. Savings resulting from transitioning customers to ebills are primarily seen in forecast paper, printing, and postage costs, offset by the cost of producing an ebill. The 2025-2029 OM&A cost forecast for the Customer Care program in Exhibit 4, Tab 2, Schedule 14 is net of these savings.

[5] Exhibit 1, Tab 1, Schedule 3, Table 5.

QUESTION (D):

d) Please provide an explanation as to how the $23 million in expected cost reductions by the end of 2024.

RESPONSE (D):

For details on the $23 million in expected reduced or avoided costs by the end of 2024, please see Exhibit 1B, Tab 3, Schedule 3, at Section 3, pages 15-27.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-18

Reference: Exhibit 1B, Tab 1, Schedule 1, Page 34

Please provide a complete list of all jurisdictions that Toronto Hydro drew on when developing its Custom Scorecard Measures. Please provide materials setting out the mechanisms and frameworks being used in those jurisdictions.

RESPONSE:

In developing its Custom Scorecard measures, Toronto Hydro drew upon Hawaii, Washington, Massachusetts, New York and the UK. The resulting scan grouped Key Performance Indicators (KPIs) identified in these jurisdictions into 62 categories, which Toronto Hydro organized into the four categories outlined in the OEB's Renewed Regulatory Framework (RRF) of Customer Focus, Operational Effectiveness, Public Policy Responsiveness, and Financial Performance. This analysis was relied upon as a starting point for Toronto Hydro to assess common metrics which were applicable to Toronto Hydro's circumstances and investment plan, as well as metrics which Toronto Hydro had confidence in its ability to measure consistently and accurately.

The scan of KPIs described above was not relied upon in establishing Toronto Hydro's mechanisms and/or rate framework. Exhibit 1B, Tab 2, Schedule 1, Appendix B provides a jurisdictional scan completed by ScottMadden Management Consultants which is specific to Modernized Performance-Based Regulation; describing associated mechanisms and frameworks across various jurisdictions. Please also see response to 1B-SEC-19 (a), which lists jurisdictions examined by ScottMadden, and outlines core aspects of their respective frameworks.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-20

Reference: Exhibit 1B, Tab 1, Schedule 3, Page. 6, Table 6: Capital Investment expenditures by Categories

QUESTION:

Please provide the actual Capital Investment Expenditures by Categories for the period 2020-2024.

RESPONSE:

Please refer to Appendix B to Toronto Hydro's response to interrogatory 2A-Staff-104.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-21

Reference: Exhibit 1B, Tab 1, Schedule 3, Page 7-8

QUESTION :

Please confirm that Toronto Hydro's rate increased from $4,514.8 million in 2020 to $5,596.5 in 2024. Please confirm that with the January 29, 2024 update Toronto Hydro's rate base is going from $5,900 million in 2025 to $7,590.8 in 2029. Please explain how Toronto Hydro has the capacity to increase its rate base so significantly in the forecast period relative to the prior period.

RESPONSE:

Toronto Hydro notes that the appropriate reference for 2020 rate base is the actual amount of $4,534.1 million as presented in the same table referenced in the question. The remaining references to rate base made in the question are accurate.

Please see the Staffing Evidence in Exhibit 4, Tab 4, Schedule 3 at for detailed information about Toronto Hydro's 2025-2029 workforce plan and resourcing strategy.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-22

Reference: Exhibit 1B, Tab 1, Schedule 3, Page 10

Please provide Toronto Hydro's approved and actual debt rates and costs and return on equity for the years 2020-2023.

RESPONSE:

Please find the table below:

Table1: 2020-2023 Approved and Actual Debt Rates and Costs and Return on Equity

	2020	2021	2022	2023
Approved Debt Rate	3.64%	3.64%	3.64%	3.64%
Actual Debt Rate	3.52%	3.36%	3.36%	3.63%
Deemed ROE	8.52%	8.52%	8.52%	8.52%
Achieved ROE	5.90%	7.08%	7.44%	6.80%[1]

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-23

Reference: Exhibit 1B, Tab 2, Schedule 1

In the EB-208-0165 Decision and Order the OEB encouraged Toronto Hydro to consider an alternative rate-setting approach in the future to better balance the risk between the customers and the utility. Please provide a complete list of the Custom Rate Frameworks that Toronto considered in addition to the one proposed. Please address why these frameworks were not adopted by Toronto Hydro. Please explain how this plan would differ from a five-year cost of service approach.

RESPONSE:

The Custom Rate Framework reflects the output of a multi-year business and regulatory strategy process that evolved over a period of time in conjunction with the development of the 2025-2029 Investment Plan. This process was guided by three key considerations:

(1) The minimum funding requirements to address the asset and operational investment needs articulated in the evidence at Exhibit 2B and 4, which are reflected in the cost forecasts that underpin this application;
(2) The regulatory principles articulated in the Rate Framework evidence, which were informed by the OEB expectations and requirements as set out in the RRF and Rate Handbook; and
(3) Consideration of existing rate-setting approaches and mechanisms and how they may be deployed, innovated or evolved to achieve better alignment with the identified principles.

The result of this process was the proposed Custom Rate Framework which consists of multiple elements as outlined in the evidence at Exhibit 1B, Tab 2, Schedule 1. Other elements, mechanics and approaches that utility explored during this process were ultimately not relied upon, and are thus not relevant to the determination of the issues in this proceeding.

Please see response to 1B-Staff-3 which explains the difference between the proposed rate framework and a five-year cost of service. Please see the response to 1B-SEC-13 which shows how the incentives of the Custom Rate Framework balance risk between the utility and ratepayers.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-24

Reference: Exhibit 1B, Tab 2, Schedule 1 p. 2

Toronto Hydro has been operating using a Custom IR Framework for the past 10 years - 2015-2019 and 2020-2024. The RRFE/Rate Handbook states that Utilities are expected to demonstrate ongoing continuous improvement in their productivity and cost performance while delivering on system reliability and quality objectives. It also states that Utilities are expected to demonstrate value for money by presenting plans for delivering services that meet the needs of their customers while controlling their costs. The Handbook also states that Custom IR is not a multi-year cost of service; explicit financial incentives for continuous improvement and cost control targets must be included in the application. (Handbook to Utility Rate Applications, dated October 13, 2016). Toronto Hydro is rebasing and rates are increase by approximately 7.5% per year for residential consumers. Please explain how Custom IR has benefited Toronto Hydro's customers.

RESPONSE:

For clarity, Toronto Hydro's residential distribution bill impacts are increasing by an average of 7.0% over the 2025 to 2029 rate term, with total bill increases averaging 2.0%.

Since 2015, Custom IR has enabled Toronto Hydro to make the investments necessary to provide safe and reliable service to its customers, during a time of multi-year investment needs that exceed what can be funded through base rates – the precise business condition for which Custom IR was intended.[1] Over this period of time, the utility has made demonstrable gains in productivity and efficiency and continuous improvement in service quality performance outcomes for its customers.

[1] OEB Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach (October 18, 2012) at page 19.

These achievements and benefits are detailed in the Historical Performance and Productivity evidence filed at Exhibit 1B, Tab 3, Schedules 2 and 3, respectively and include but are not limited to:

- 19% improvement in customer first contact resolution since 2013;
- 60% decrease in Total Recordable Injury Frequency Rate (TRIF);
- Adding over 381,000 customer on e-bills since 2013 yielding cumulative savings of $4.4 million from avoided paper, printing, and postage costs;
- A 45% decrease in the number of feeders serving large customers that are experiencing a high number of interruptions per year;
- Reduced the average duration of power outages due to defective equipment by 26 percent over the 2013-2022 period;
- Improved billing accuracy from 96.6% in 2013 to 99.1% in 2022, exceeding the OEB's minimum requirement of 98%;
- Improved service levels with respect to customer connections timelines (i.e. New Residential/Small Business Services Connected on Time) from 95% in 2013 to 99% in 2022, exceeding the OEB minimum requirement of 90%;
- Direct customer benefits (i.e. givebacks) exceeding $200 million made possible by a multi-pronged facilities consolidation strategy that reduced the square footage per employee by approximately 40 percent;
- Productivity initiatives totaling $23 million in costs that the utility expects to avoid or reduce by the end of the current rate term, in addition to delivering extensive qualitative benefits that are described in detail in the evidence;
- Effective cost performance as evidenced by total cost custom benchmarking, unit cost benchmarking, IT cost benchmarking and compensation cost benchmarking;
- Stabilizing the rapid deterioration of system health metrics that the utility faced when it embarked on its multi-year ICM before the first Custom IR; and
- Keeping up with the growth and densification of Canada's largest and one of North America fastest growing cities, and enabling the development of transit, housing and major infrastructure projects across the city.

Toronto Hydro intends to sustain the productivity, performance achievements, and improvements made over the last two Custom IR period, and drive continuous improvement with respect to new/expanded performance objectives. To that end, and in direct response to the OEB's decision in EB-2018-0165, Toronto Hydro has brought forward an innovative performance incentive mechanism (PIM) proposal to improve the balance of risk between ratepayers and the utility in this application. The PIM includes explicit financial incentives for:[2]

a) **Continuous improvement** (e.g. reduce the duration of outages, enhance system security, make progress towards grid automation in the horseshoe, track and measure new elements of post-transactional customer satisfaction, achieve and maintain certification with continually improving international standards for key management systems),
b) **Maintaining service quality performance in accordance with customer preferences** (e.g. invest no more than is necessary to maintain the frequency of outages caused by defective equipment and maintain customer service performance)
c) **Public policy responsiveness** (e.g. connect DERs in an timely manner, expand the use of non-wires alternatives for system capacity, reduce gHg emissions); and
d) **Cost control targets** (e.g. achieve quantified efficiency benefits that will provide demonstrable value to customers in the next rate period).

[2] Exhibit 1B, Tab 3, Schedule 1

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-25

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 5

Please provide examples of rate frameworks that are similar to the one being proposed by Toronto Hydro.

RESPONSE:

As noted in the evidence, Toronto Hydro's Custom Rate Framework is an evolution of the Custom IR rate frameworks approved by the OEB in other recent applications.[1] The evidence filed by Scott Madden in Exhibit 1B, Tab 2, Schedule 1, Appendix B reviews a series of jurisdictions which have implemented framework components similar to those proposed by Toronto Hydro, such as recognition of expanded utility objectives, performance incentives, modified attrition relief mechanisms (such as I-X), alternative cost recovery mechanisms for large or volatile investments, and funding for demonstration projects.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-26

References: Exhibit 1B, Tab 2, Schedule 1, Page 5

QUESTION:

The evidence states that the proposed X-factor is higher than the OEB-approved X-factor under standard price Cap Incentive Regulation. How will customers benefit from the X-factor if Toronto Hydro earns back the .6% through the Performance Incentive measure?

RESPONSE:

The proactive component of the X factor is a voluntary contribution by Toronto Hydro reflecting an amount that it ordinarily would be able to recover in rates as a fair return, but which Toronto Hydro has put at risk with the opportunity to earn it back upon the achievement of certain results under the Plan. As shown in Exhibit 1B, Tab 3, Schedule 1 at page 58, achievement of the targets included in the proposed scorecard will result in minimum nominal benefits over the 2025 to 2029 term of between $90.3 million and $216.3 million, with lifetime nominal benefits of $892.5 million to $1.2 billion. The proposed PIM incentive which would be awarded as a result of target achievement is $65 million on a nominal basis. Benefits for customers will exceed costs in the event Toronto Hydro achieves targets and is awarded the full PIM incentive. For a further explanation and illustration of how the PIM balances utility risk/reward and customer costs/benefits, please see the response to 1B-SEC-13.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-27

References: Exhibit 1B, Tab 2, Schedule 1, Page. 7

QUESTION:

Over the 2025-2029 rate period Toronto Hydro's operations and capital investment needs are growing by approximately 37.5% due to a number of distinct and interrelated drivers. Please attribute a percentage to each of those drivers set out in the evidence. For example, how much of the increases are related to inflationary pressures? How much s related to the aging and deterioration of Toronto Hydro's asset base?

RESPONSE:

As noted, the drivers identified on page 7 of Exhibit 1B, Tab 2, Schedule 1 are "interrelated", and thus cannot be broken down as requested. At the reference noted, each driver is accompanied by a footnote directing the reader to the evidence where detailed information, including cost breakdowns as appropriate, about each driver can be found.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-28

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 9

QUESTION:

Toronto Hydro concludes from its Customer Engagement process that 84% of the customers surveyed supported the rate increase associated with the draft plan or one that does even more to advance outcomes. In any of its customer engagement has Toronto told its customers that included in rates is a return on equity that is currently more than 9%. If not, why is this not relevant?

RESPONSE:

The materials provided to customers during customer engagement were focused on customer outcomes, customer priorities, and bill impacts, in a manner that allowed for customers to meaningfully express their priorities and speak to their willingness to pay for such priorities. Given space limitations, it did not make sense to raise topics outside the scope of Toronto Hydro's planning process

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-29

Reference: Exhibit 1B, T2, S1, p. 9

QUESTION:

The evidence states that, "an energy transition is gradually unfolding across key sectors of the economy with residents, businesses and institutions adopting electrified technologies such as electric vehicle (EVs), heat pumps, solar panels and energy storage systems. Toronto Hydro must sustain, expand and modernize the grid to be ready and equipped to serve customers' growing demand for safe and reliable electricity during this transition." Please provide all assumptions Toronto Hydro has made regarding the adoption of EV, heat pumps, solar panels and energy storge systems in its service territory for the 2025-2029. Please specify how this impacts Toronto Hydro's capital and programs in each year and provide the corresponding impact on the revenue requirement in each year.

RESPONSE:

Toronto Hydro's Peak Demand Forecast outlined in Exhibit 2B, Section D4 at page 4 provides the assumptions for the EV forecast. The capital programs that are primarily affected by the System Peak Demand Forecast are (i) Stations Expansion at Exhibit 2B, Section E7.4, and Load Demand at Exhibit 2B, Section E5.3. It is not possible to isolate the specific impact of EVs on the proposed expenditure levels in these programs because the Peak Demand Forecast and underlying investment plan, represents an aggregate view of system need. EV Demand represents just one of a combination of drivers that influence investment levels in various geographic regions of the Toronto Hydro Grid.

Given uncertainty with respect to the uptake of heat pumps, Toronto Hydro did not model heat electrification as an individual driver in its Peak Demand Forecast for this rate period.

Please see the response to 1B-CCC-13 for (i) information about the adoption of DERs, including solar panels (which are captured under renewables) and energy storage systems, and (ii) a list of the affected capital and operations work programs.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-30

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 11

Preamble:

Toronto Hydro commissioned an industry leading consumer choice modelling Future Energy Scenarios study to assess the impacts of different energy transition scenarios on Toronto Hydro's distribution system. The Future Energy Scenarios conclude that system peak demand could grow significantly or more moderately depending on technology, policy and consumers choices that will be made in the future. Toronto Hydro's evidence is that it must ensure the grid is ready ahead of when demand increases (to avoid under-served customers) and also be reasonably cautious in building new capacity for the future. Please explain how this study directly impacted Toronto Hydro's capital and operating plans for the period 2025-2029

RESPONSE:

Toronto Hydro augmented its decision-making process with the results of a Future Energy Scenarios model to understand the impact of different policy, technology and consumer behavior drivers; and used the Future Energy Scenarios to stress-test whether the utility's capacity plan can accommodate energy transition needs (e.g., building heating electrification) in the early part of the next decade, if required. The Future Energy Scenarios reveal that the impact of building electrification in the next two decades could be significant from a system peak demand perspective, but that there are notable differences (driven by policy, technology and consumer-behaviour choices) as to when and how building electrification could unfold. Practically, this meant that Toronto Hydro decided to take a "wait and see approach" to investments in new capacity for accommodating wide-scale building electrification in the mid-2030s and beyond. For more information on Toronto Hydro's capacity planning and electrification process please refer to Exhibit 2B Section D4. For more information on the Future Energy Scenarios, please refer to Appendix A and B of the same schedule.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-31

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 11

The evidence refers to Enbridge Gas Inc's Pathways to Net Zero, National Grid's Future Grid Plan and Eversources' Electric Sector Modernization Plan. Please indicate to what extend these studies has impacted or informed Toronto Hydro's capital and operating plans for the period 2025-2029.

RESPONSE:

These studies did not impact Toronto Hydro's capital and operating plans for the period 2025-2029.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-32

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 24

Please explain why a 0 percent productivity factor continues to be appropriate? How does this provide a benefit to Toronto Hydro's ratepayers.

RESPONSE:

Toronto Hydro continues to rely on the OEB policy with respect to the productivity factor of 0%. The combined X-Factor, inclusive of the productivity factor, the empirical stretch/efficiency-factor and the PIM, applies a 0.75% stretch to the utility's revenues each year over the 2026-2029 period. As detailed in the response to interrogatory 1B-Staff-03(b), the combined X-factor provides customers a total rate reduction benefit of $81.5 million over the rate term, in addition to the benefits associated with achieving the PIM targets, as set out in Exhibit 1B, Tab 3, Schedule 1 at pages 57-58.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-33

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 24

To what extent has Toronto Hydro seen the use of a Revenue Growth Factor (or a similar mechanism) - which enables year over year rate increases to fund incremental revenue requirement to both capital and OM&A investments in other performance based rate plans. Please provide examples and context.

RESPONSE:

Please refer to the expert evidence at Exhibit 1B, Tab 2, Schedule 1, Appendix A at:

- Page 6: Jurisdictions, such as UK and New York, have recognized the need to ensure adequate cost recovery of capital and OM&A costs as part of their forecasted multi-year revenue requirements.
- Page 14: The RGF, which includes forecasted capital and OM&A expenditures is generally consistent with 1) the 'building blocks' approach used in jurisdictions such as the UK, Australia, Philippines, and Malaysia, and 2) the 'stair-step' approach utilized by New York utilities.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-34

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 25

Please explain how Toronto Hydro arrived at a 2% annual inflation factor adjustment for its Revenue Growth factor.

RESPONSE:

Please refer to interrogatory 1B-Staff-92(a).

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-35

Reference: Exhibit 1B, Tab 2, Schedule 1, Table 3, Page 25

Table 3 - 2026-2029 Revenue Growth Factor sets out the proposed RGF for each year. Did Toronto Hydro consider smoothing the revenue requirement adjustments over the five-year period? If not why not? Why is the adjustment so much larger in 2028? What would be the downside of having a more consistent adjustment each year?

RESPONSE:

The Revenue Requirement for 2028 is larger than the increases in other years because of PILs/taxes. More specifically, the increase is primarily attributed to the expiration of the accelerated CCA rules on December 31, 2027.[1]

Toronto Hydro considered smoothing the revenue requirement, but ultimately decided not to pursue this option because it was able to achieve the same outcome by adjusting the clearances of Group 2 rate riders.

Smoothing rates through rate riders is the preferred solution for two reasons: (1) it is a familiar approach that has been used in previous applications, and (2) it is less burdensome (i.e. more efficient) to implement from a regulatory accounting perspective because it doesn't require new accounts to be created to reconcile timing-related difference as a result of the advancement/deferral of revenue adjustments needed to enable smoothing.

Please provide the actual Toronto Average Blended Salary Increase for 2023 and the forecast level for 2024.

RESPONSE:

Please see response to interrogatory 1B-Staff-93.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-37

Reference: Exhibit 1B, Tab 2, Schedule 1 p.35

Preamble:

Toronto Hydro is proposing a Demand-Related Variance Account (DRVA) to record the demand driven revenue requirement impacts arising from variances in actual versus forecast capital and operational expenditures for certain demand-based programs and the revenue impacts arising from variances in forecast versus actual billing determinants over the rate period. The Council is interested in understanding the scope of the DRVA;

QUESTION (A):

a) For each year 2020-2024 please provide the forecast and actual expenditures for the following capital and operating programs: Customer Connections, Customer Operations, Stations Expansion, Load Demand, Non-Wires Solutions, Generation Protection Monitoring and Control and Externally-initiated Plant Relocations and Expansions. Also, please provide the forecast and actual revenue requirement that would have been dealt with through the DRVA Expenditure sub-account had one been in place for that period;

RESPONSE (A):

Please see below Table 1 for Actuals/Bridge Capital Expenditures and Table 2 for Actuals/Bridge Operating Expenditures. In responding to this interrogatory Toronto Hydro has only included OM&A segments that would have been dealt with through the DRVA expenditure sub-account had one been in place for that period.

Table 1: Actuals/Bridge Capital Expenditures that would have been subject to the DRVA sub-account (in $ millions)

Programs	Actuals				Bridge
	2020	2021	2022	2023	2024
Customer Connections	35.6	92.4	76.1	86.8	78.2
Stations Expansion	18.2	50.3	47.5	10.4	16.1
Load Demand	24.0	29.7	30.8	26.7	23.2
Non-Wires Solutions[1]	1.0	0.5	0.1	0.0	0.6
Generation Protection Monitoring & Control[1]	0.8	0.8	0.1	0.2	7.8
Externally Initiated Plant Relocations & Expansions	8.7	9.3	12.9	16.0	13.0

Table 2: Actuals/Bridge Operating Expenditures that would have been subject to the DRVA sub-account (in $ millions)

OM&A Segments[2]	Actuals				Bridge
	2020	2021	2022	2023	2024
Customer Connections, Exhibit 4, Tab 2, Schedule 8, Section 5	3.7	1.6	1.6	3.1	3.6
Key Accounts, Exhibit 4, Tab 2, Schedule 8, Section 6	-	0.5	0.8	0.8	1.2
Flexibility Services, Exhibit 2B, Section E7.2	0.4	0.2	0.2	0.8	0.8

Please see Table 3 for approved Capital Expenditures and Table 4 for approved Operating Expenditures that would have been dealt with through the DRVA expenditure sub-account had one been in place for that period.

Table 3: Approved Capital Expenditures that would have been subject to DRVA sub-account (in $ millions)

Programs	Approved				
	2020	2021	2022	2023	2024
Customer Connections	40.1	40.9	41.7	42.6	43.4

[1] 94% of the Renewable Enabling portions of these investments will be provincially funded and not included in the DRVA
[2] Only includes segments associated with the DRVA

Programs	Approved				
	2020	2021	2022	2023	2024
Stations Expansion	19.5	40.0	49.3	12.5	15.2
Load Demand	11.3	11.4	18.5	22.6	23.6
Non-Wires Solutions[3]	1.0	3.7	3.8	1.0	1.0
Generation Protection Monitoring & Control[3]	3.7	2.3	2.4	2.5	2.7
Externally Initiated Plant Relocations & Expansions	11.4	20.8	4.6	4.7	4.5

As noted in Toronto Hydro's response to interrogatory 4-SEC-89(a), the total OM&A cost approved by the OEB for 2020 was $266.7 million, which was lower than the 2020 test year OM&A funding requested by Toronto Hydro.[4] The OEB approved OM&A on an envelope basis and therefore, Toronto Hydro cannot provide a breakdown by the specific programs or segments such as Customer connections. However, in order to provide a directional view of the segments that would have been dealt through the DRVA expenditure sub-account had one been in place for that period, Toronto Hydro has used its 2020 test[5] costs for Customer Connections, Key Accounts and Flexibility Services and have escalated it by the OEB approved Custom Price Cap Index ("CPCI") formula[6] for 2021-2024 using OEB's prescribed rates.

Table 4: Approved* Operating Expenditures that would have been subject to the DRVA sub-account (in $ millions)

OM&A Segments	Approved*				
	2020	2021	2022	2023	2024
Customer Connections	3.2	3.3	3.3	3.4	3.6
Key Accounts	-	-	-	-	-
Flexibility Services	0.8	0.8	0.8	0.9	1.0

[3] 94% of the Renewable Enabling portions of these investments will be provincially funded and not included in the DRVA
[4] See also 1B-SEC-8 for a discussion of adjustments for Account 4380 with respect to the OEB-approved 2020 OM&A budget.
[5] EB-2018-0165, Exhibit 4A, Tab 2, Schedule 8
[6] EB-2018-0165, Ontario Energy Board, Decision and Order (December 19, 2019)

Please see Table 5 below for Approved and Actual/Bridge Revenue Requirement that would have been dealt with through the DRVA expenditure sub-account had one been in place for that period.

Table 5: Approved and Actual/Bridge Revenue Requirement that would have been subject to DRVA sub-account ($ Millions) /C

	2020	2021	2022	2023	2024	2020-2024
Approved Revenue Requirement	7.9	14.7	21.2	33.1	45.1	122.1
Actual/Bridge Revenue Requirement	7.1	17.4	51.4	69.4	68.1	213.4
Variance	**(0.8)**	**2.7**	**30.1**	**36.3**	**23.0**	**91.4**

QUESTION (B):

b) For each year 2025-2029 please provide the proposed revenue requirement for each of the programs listed in a). In effect, what is the proposed revenue requirement that will be the subject of the DRVA Expenditure Variance sub-account?

RESPONSE (B):

Please see below table 6 for proposed revenue requirement for each of the programs: /C

Table 6: 2025-2029 Revenue Requirement associated with DRVA Programs (in $ millions)[7] /C

	2025	2026	2027	2028	2029
Customer Connections	9.7	16.4	23.8	33.0	40.8
Stations Expansion	0.3	2.2	3.6	4.1	4.3
Load Demand	2.5	5.2	8.4	12.0	15.2
Non-Wires Solutions	0.2	0.9	1.1	1.6	1.9
Generation Protection Monitoring & Control	0.0	0.0	0.1	0.1	0.2
Externally Initiated Plant Relocations & Expansions	4.6	5.3	6.5	7.9	9.0
Customer Operations	4.7	4.8	5.2	5.4	5.7
Total Revenue Requirement	**22.0**	**34.8**	**48.5**	**64.1**	**77.1**

[7] Rounding variances may exist

QUESTION (C):

c) For the period 2020-2024 please provide the forecast and actual revenue that would have been dealt with through the DRVA Variance sub-account had one been in place for that period

RESPONSE (C):

Please refer to 1B-SEC-16 -Table 2.

QUESTION (D):

d) For each year 2025-2029 please provide the forecast revenue that will be the subject of the DRVA Revenue Variance sub-account.

RESPONSE (D):

Please refer to 1B-SEC-16-Table 1.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-38

Reference: Exhibit 1B, Tab 3, Schedule 1, Pages 2-6

Toronto Hydro's position is that the Performance Incentive Mechanism (PIM) provides ratepayers a significant $65 million upfront benefit and shifts risk to the utility for delivering key outcomes that matter to customers;

QUESTION (A):

a) Please provide examples of such an approach being adopted by other utilities;

RESPONSE (A):

Toronto Hydro's expert Scott Madden provides examples of performance incentives adopted in other jurisdictions, with all associated details and references, in Exhibit 1B, Tab 2, Schedule 1, Appendix B. Jurisdictions where such incentives have been implemented include UK, Hawaii, Rhode Island, and New York.[1]

QUESTION (B):

b) How did Toronto Hydro arrive at the .6%?

RESPONSE (B):

Please Toronto Hydro's response to 1B-VECC-3.

QUESTION (C):

c) Please explain how the $65 million was calculated.

RESPONSE (C):

Please see Toronto Hydro's response to 1B-Staff-3 (c).

QUESTION (D):

d) Please provide evidence to demonstrate that the targets established for each metric reflect, challenging, but achievable outcomes;

RESPONSE (D):

The requested evidence is provided Exhibit 1B, Tab 3, Schedule 1. In section 2 of that narrative, from pages 8-56, Toronto Hydro provides a detailed explanation of each metric including historical results (where available), the rationale for featuring the metric on the Custom Scorecard and for adopting the proposed target, and a summary of the key investments in the plan that enable the utility to achieve the targets.

QUESTION (E):

e) Toronto Hydro has proposed a process whereby the finalization of the targets takes place in a second phase of this proceeding that can be run in parallel with the Draft Rate order process. If agreement cannot be reached through the "settlement-like process" parties would have an opportunity to make submissions to the OEB. Would Toronto Hydro support a discovery stage as part of this process? If not, why not?

RESPONSE (E):

At this stage, Toronto Hydro is unable to assess if and to what extent a further discovery stage would provide value to the process. Toronto Hydro trusts that if a phase 2 is granted, the OEB will contemplate the procedural steps necessary based on the specifics known at that time, and the parties will have the opportunity to make submissions in that regard.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-39

Reference: Exhibit 1B, Tab 3, Schedule 3, Page. 15

QUESTION :

Toronto Hydro has set out 2020-2024 "Productivity Achievements". The evidences states that in total, over the current rate period the utility implemented over 30 distinct productivity initiatives which yield material benefits for ratepayers. These benefits include over $23 million in costs that the utility expects to avoid or reduce by the end of the rate term, resulting in a 2025 rebasing revenue requirement that is approximately $5.7 million lower. Please provide a table setting out each of these initiatives and the associated cost avoidance/benefits where these can be quantified. Please reconcile these amounts with the $23 million and the $5.7 million. Please include all assumptions.

RESPONSE:

Please see Toronto Hydro's response to 1B-AMPCO-07.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-40

Toronto Hydro has set out its Productivity Achievements for the period 2020-2024. Please provide a complete list of productivity initiatives planned for 2025-2029. Please set out the expected annual savings for each initiative.

RESPONSE:

Please see Toronto Hydro's response to interrogatory 1B-SEC-25.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-41

Reference: Exhibit 1B, Tab 4, Schedule 1, Page 6

In 2022 Toronto Hydro launched the Etobicoke Demand Response Pilot in Partnership with Power Advisory LLC and Toronto Metropolitan University Centre for Urban Energy. What was the overall cost of the pilot and how was it funded? Are there any costs associated with the pilot in 2025? If so, what are the costs?

RESPONSE:

Please see the evidence in Exhibit 2B, Section E7.2 at pages 12-13 for information about the Etobicoke Demand Response pilot. Please see the response to interrogatory 1B-CCC-42 for information about the cost of the pilot and how it was funded. There are no costs associated with this pilot beyond 2025.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-42

Reference: Exhibit 1B, Tab 4, Schedule 1, Pages 1-12

QUESTION:

Tonto Hydro has set out strategies and initiatives undertaken by Toronto Hydro during the 2020-2024 period. These include:

- Innovation @TH
- System Observability: Network Condition Monitoring and Control (NCMC)
- System Controllability: Reclosers Pilot
- Etobicoke Demand Response Pilot
- Battery Energy Storage Systems
- Future Energy Scenarios Modelling Tool
- Electric vehicles (EV) Demand Response
- Process Automation
- Customer Experience and Service Tools
- Workforce Development and Upskilling

For each of these strategies/initiatives/pilots please provide the following:

a) The cost of each and how it was funded (through rates, other sources of funding etc.)

b) An indication as to whether the strategy, initiative/pilot costs were forecast and if so, what the forecast costs were

c) An indication as to whether the strategies/initiatives/pilots will continue and if so, the expected annual cost

d) The cost reductions associated with these strategies/initiatives/pilots and whether those cost savings have been embedded in the rate plan forecasts.

RESPONSE:

Appendix A to this response includes a table with a breakdown of the initiatives by rate period. With respect to question (d), quantified efficiency benefits (i.e. cost reductions or avoidances) are provided below for the initiatives where it is possible to quantify this information. Toronto Hydro confirms that material cost reductions are embedded in the forecasts, where appropriate.

- **Etobicoke Demand Response Pilot**
  - **2020-2024:** Please see Exhibit 2B, Section E7.2.1.4 and Toronto Hydro's response to interrogatory 2B-SEC-73.
  - **2025-2029**: Please see Exhibit 1B, Tab 3, Schedule 1 at pages 51 to 52 and the response to 1B-Staff-49 for a quantification of benefits associated with Toronto Hydro's target to procure 30MW on non-wires system capacity through its Flexibility Services program as described in Exhibit 2B, Section E7.2.
- **System Observability: Network Condition Monitoring and Control ("NCMC"**)
  - **2020-2024:** Please see the evidence in Exhibit 2B Section E7.3.3 for details on benefits and cost savings seen to date as part of the NCMC program.
  - **2025-2029**: Please see the evidence in Exhibit 2B Section E7.3.3 for details on benefits and cost savings forecasted as part of the NCMC program. As a result of the implementation of NCMC, Toronto Hydro expects to reduce the number of planned vault inspections required for each network vault per year, reducing maintenance costs in that program by approximately $300 per vault starting in 2027. At the end of the NCMC program (i.e. once all vaults are commissioned), this will result in approximately $275,000 in maintenance costs avoided each year. These costs savings are reflected in the Preventative and Predictive Underground Line Maintenance program outlined in Exhibit 4, Tab 2, Schedule 2.
- **System Controllability: Reclosers Pilot**
  - **2020-2024:** The goal of the reclosers pilot was to confirm intended coordination and reliability benefits that Toronto Hydro could achieve with the piloted recloser

technologies. As the primary driver is reliability improvements, there are no specific cost reduction planned as part of the reclosers pilot.

- **2025-2029**: Although Toronto Hydro expects to continue pilots for specific recloser technologies, reclosers that have completed the pilot phase are included in the System Enhancements program.[1] As with the pilots, the reclosers planned as part of this program are driven by reliability and are intended to support Toronto Hydro's improvement target for outage duration.[2] Please refer to Toronto Hydro's response to 2B-Staff-246(a) for an estimation of economic benefits associated with the reduction of "customer minutes out" in the 2025-2029 rate period under the proposed Contingency Enhancement Program.

- **Process Automation**
  - **2020-2024** : Please see Exhibit 1B, Tab 3, Schedule 3 for evidence relating to productivity initiatives undertaken in the current rate period, many of which are tied to process automation. Please refer to Toronto Hydro's response to interrogatory 1B-AMPCO-7 for the quantified benefits per initiative.
  - **2025-2029:** Please refer to the evidence Exhibit 1B, Tab 3, Schedule 1, subsection 2.4.1 "Efficiency Achievements" at pages 41-44. As noted in the response to interrogatory 1B-SEC-25, Toronto Hydro intends to continue to focus on process automation (i.e. digitization, robotics and predictive analytics) to drive continuous improvement in productivity and to meet the proposed Efficiency Achievements target in the next rate period.
- **Customer Experience:**
  - **2020-2024**: Please refer to the evidence Exhibit 4, Tab 2, Schedule 14, subsection 4.2 "Cost Control and Productivity Measures" at pages 11-14, which discusses numerous achievements that improved customer experience and convenience through enhancements to online and self-service tools, while generating significant process

[1] Exhibit 2B, Section E7.1.
[2] Exhibit 1B, Tab 3, Schedule 1, at p. 8-15.

efficiencies and cost avoidance through the automation of manual processes and streamlining operational tasks.

- **2025-2029**: Please refer to evidence on the Customer Relationship Management segment of the Customer Care program in Exhibit 4, Tab 2, Schedule 14 at pages 34-46 (especially pages 39-41) and the Key Accounts segment of the Customer Operations program in Exhibit 4, Tab 2, Schedule 8 at pages 22-27. Through the adoption of modern technology and continuous engagement with its diverse customer base, including the unique needs of key accounts (e.g. hospitals, public service providers, and large users) Toronto Hydro intends to continue delivering strong customer service and drive continuous improvement in meeting customers' evolving expectations.

Initiative	2020-2024 Costs	Funding Source	Continuation	2025-2029 Costs
Innovation @ TH	Approximately $750,000	Self-Funded	Yes. Please see Exhibit 1B, Tab 2, Schedule 2	$16M[1]
System Observability: Network Condition Monitoring and Control (NCMC)	$56.8M	Rates	Yes. please see Exhibit 2B, Section 7.3	$6M
System Controllability: Reclosers	$19.9M	Rates	Yes. Please see Exhibit 2B, Section E7.1	$132M
Etobicoke Demand Response Pilot	$4M	Rates ($2M) + IESO Grid Innovation Fund ($2M)	Yes. Please see Exhibit 2B, Section E7.2	$5.7M
Future Energy Scenarios Modelling Tool	$1.026M[2]	Rates	Yes. Please see Exhibit 2B, Section D5.	$72,000
Workforce Development & Upskilling	Not possible to quantify as these costs are embedded in program budgets.	Rates	Yes. Please see the OM&A and Workforce evidence in Exhibit 4, Tabs 1, 2 and 4.	Not possible to quantify as these costs are embedded in program budgets.

[1] Toronto Hydro is proposing to allocate the equivalent of 0.3% of its total revenue requirement to the Innovation Fund, which is approximately $16 million based on the pre-filed revenue requirement. For more information on the Innovation Fund proposal, please refer to Exhibit 1B, Tab 4, Schedule 2.
[2] Please refer to Toronto Hydro's response to interrogatory 2B-Staff-156 part (c).

Initiative	2020-2024 Costs	Funding Source	Continuation	2025-2029 Costs
EV Demand Response	$287,000	Rates	Yes. Please see Exhibit 1B, Tab 4, Schedule 2, Appendix A.	n/a[3]
Process Automation	$32M	Rates	Yes. Please see Exhibit 2B, Section 8.4 and Exhibit 4, Tab 2, Schedule 17.	$50M[4]
Customer Experience	$28.5M	Rates		$25M[5]

[3] Pilot projects as part of the Innovation Fund will be scoped-out (i.e. designed and budgeted) once the OEB has approved the proposal. For more information on the Innovation Fund proposal, please refer to Exhibit 1B, Schedule 4, Tab 2.
[4] This is a high level estimate and may change since Toronto Hydro will assess and evaluate each individual project through its Enterprise Technology Portfolio (ETP) Framework as described in the IT Investment Strategy at Exhibit 2B, Section D8.5.3, pp. 18-21
[5] *Ibid.*

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-43

Reference: Exhibit 1B, Tab 4, Schedule 1, Pages 13-20

Preamble: Toronto Hydro has stated that Innovation has shaped its Application and the 2025-2029 investment plan that underpins it. The Council would like have a better understanding of the costs included in the Application that are related to "innovation" over and above the "Innovation Fund". Toronto Hydro refers to several innovation initiatives:

- Grid Modernization Strategy
- Local Demand Response
- Renewable Enabling Investments
- Enterprise Technology Portfolio
- Regulatory Innovation

For each of these initiatives provide the following:

QUESTION (A):

a) The annual cost of these initiatives for each year of the plan

RESPONSE (A):

Please see the summary table below for a list of the programs that map to each of the referenced initiatives with evidentiary references and a breakdown of the related annual costs.

For the Grid Modernization Strategy, this is an overarching framework that encompasses many programs and initiatives throughout the application as set out in Exhibit 2B, Section D5. As described in interrogatory 1B-CCC-44, the overall cost of this strategy is estimated to be in the range of $550-$600 million over the 2025-2029 period, representing an average annual spend of

$110-$120 million. This amount includes some of the expenditures listed in other parts of the following table.

Toronto Hydro notes that the costs reproduced below are the costs related to the program/segment overall, which in some cases include costs beyond the scope of "innovation" where it isn't possible to disaggregate innovation-specific costs from other cost drivers in the program.

Table 1: Innovation-Related Programs 2025-2029

Initiative	Relevant Programs	Annual Costs ($ Millions)				
		2025	2026	2027	2028	2029
Grid Modernization Strategy [1]	**See Exhibit 2B, Section D5** Relevant Programs include: • **System Enhancements** (2B, E7.1) • **Metering (AMI2.0)** (2B, E5.4) • **Asset & Program Management – System Planning** (4, T2, S9) • **Control Center** (4, T2, S7) • **Network Condition Monitoring and Control** (2B, E7.3)	110.0 - 120.0	110.0 - 120.0	110.0 - 120.0	110.0 - 120.0	110.0 - 120.0
Enterprise Technology Portfolio	**IT Software Enhancements** (2B, E8.4)	38.6	40.6	41.0	33.3	34.8
	IT OM&A (Cloud) (2B-Staff-263)	5	5.5	6	6.5	7
Renewable Enabling Investments[2]	**Network Condition Monitoring and Control** (2B, E7.3)	4.2	0.2	0.4	0.6	0.6
	Energy Storage (2B, E7.2)	3.6	3.6	7.5	3.8	4.0
	Station Expansion – Sheppard TS (2B, E7.4)	-	0.5	4.5	5.0	5.0
Local Demand Response	**Non-Wires Solution** (2B, E7.2)	0.2	0.9	1.1	1.6	1.9
	Asset and Program Management – Local Demand Response (4, T2, S9)					
Regulatory Innovation	**Innovation Fund** (1B, T5, S2)	2.9	3.1	3.2	3.5	3.6

[1] Average annual costs. All IT Software related investments that support Grid Modernization are included within the Enterprise Technology Portfolio.
[2] Please see Exhibit 2A, Tab 5, Schedule 1

QUESTION (B):

b) The annual benefit expected and information on the extent to which the benefits are factored into the revenue requirement for each year.

RESPONSE (B):

The table below provide a concordance to the evidence where benefits associated with the initiatives are presented. Specific projects under these initiatives and related programs will be scoped through annual planning processes as part of the execution of the 2025-2029 Investment Plan and implementation of the OEB's decision in this rate application.

Table 2: Innovation-Related Program Benefits

Initiatives	Programs	Benefits
Enterprise Technology Portfolio	**IT Software** (Exhibit 2B, E8.4)	Toronto Hydro intends to leverage technology to achieve various performance targets and benefits as outlined in the 2025-2029 Custom Scorecard at Exhibit 1B, Tab 3, Schedule 1.
	IT OM&A (Cloud) (2B-Staff-263)	
Grid Modernization Strategy	**System Enhancements** (Exhibit 2B, Section E7.1)	Please see Exhibit 2B, Section D5, page 17 for the estimated lifetime operational cost savings from the deployment of SCADA switches.
		Please see the response to 2B-Staff-246 for quantified reliability benefits. Toronto Hydro also integrated the reliability benefits associated with new SCADA switches and mid-line reclosers as part of its Reliability Projection ("RP") Methodology. A detailed description of this methodology is available in 2B-SEC-42 a) and a forecast of reliability performance for 2025-2029 is available in 2B-SEC 42 c). In addition, Toronto Hydro estimated the benefits of the implementation of FLISR across the Horseshoe region based on preliminary network simulations. Please see the quantification of anticipated improvements in 2B-Staff-162 a).
Local Demand Response	**Non-Wires Solutions**	Please see the Non-Wires Solutions metric and target in Exhibit 1B, Tab 3, Schedule 1 at page 66.

QUESTION (C):

c) An indication as to whether or not external funding was sought and/or obtained either through the OEB, IESO or NRCan

RESPONSE (C):

Please see Toronto Hydro's response to 1B-Staff-10 for list of the types of initiatives/projects that Toronto Hydro has previously sought external funding for. Toronto Hydro notes that opportunities for external funding for the next rate period must be determined on the basis of specific projects, which will be scoped through annual planning processes as part of the execution of the 2025-2029 Investment Plan and implementation of the OEB's decision in this rate application.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-44

Reference: Exhibit 1B, Tab 4, Schedule 1, Page 12

Toronto Hydro is undertaking a Grid Modernization strategy to make investments it deems necessary to ready the grid for decarbonization and energy transformation while enhancing the value that the system provides to customers through improved reliability, resilience and efficiency outcomes:

QUESTION (A):

a) What is the overall cost of this strategy and the annual costs for each year of the rate plan term?

RESPONSE (A):

The overall cost associated with the programs and initiatives that map to the Grid Modernization Strategy is estimated to be in the range of $550-$600 million over the 2025-2029 period. This includes the investments and capability building initiatives described throughout Section D5. Note that while modernization is an element of many of the investment programs discussed under the Grid Modernization Strategy, it is not the sole purpose of the programs. The same costs are responsive to other drivers, for example, failure risk and compliance (e.g., renewal of smart meters under AMI 2.0) and capacity (e.g., flexibility services).

QUESTION (B):

b) Are the ADMS, OMS and FLISR systems considered part of the Grid Modernization strategy and the overall business case?

RESPONSE (B):

Yes. All three initiatives are enabled by the broader ADMS project as described in Exhibit 2B, E8.4, Appendix A.

QUESTION (C):

c) Please explain, in detail, the extent to which Toronto Hydro collaborated with other utilities in terms of developing its Grid Modernization strategy. For example, both PUC Distribution Inc. and Elexicon Energy Inc. have undertaken similar projects. Has Toronto Hydro consulted with either PUC Distribution Inc. or Elexicon regarding their projects. If not, why not?

RESPONSE (C):

Toronto Hydro did not consult with the specified utilities in the development of the 2025-2029 Grid Modernization Strategy. However, as discussed in Exhibit 2B, Section D5.1.1, the strategy is informed by Toronto Hydro's extensive first-hand knowledge of the sector and the successes and leading examples of peer utilities in various progressive jurisdictions. Toronto Hydro regularly engages with industry peers on strategic and operational subjects, including through direct, informal engagement, as well as through engagements facilitated by consultants, industry groups and associations.

The Grid Modernization Strategy is also based on Toronto Hydro's extensive knowledge of the unique challenges and opportunities for its own system and operations. As further outlined in D5.1.1, Toronto Hydro has developed a grid modernization strategy which addresses emerging challenges and opportunities in a manner that leans first and foremost into the deployment of proven technologies (e.g., reclosers, switches, smart meters, analytics). From a materiality perspective, most of these investments are a continuation or renewal of programs that Toronto Hydro has been rolling-out at a gradual pace over the last two decades (e.g., remote-operable switches; smart meters), while others (e.g., achieving "self-healing" grid operations) represent the

culmination of transformational efforts that have been a part of the utility's long-term modernization roadmap for many years.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-45

Reference: Exhibit 1B, Tab 4, Schedule 1, Pages 15-16

Please provide the overall cost of the nine energy storage systems being put into place to enable the connection of forecasted renewable growth on nine high priority feeders. What is the definition of a "high priority feeder"? Are these being put in place primarily to enable the connection of renewable DER facilities? If so, how are they funded (through rates generally or by the owners of DER facilities)?

RESPONSE:

As described in Exhibit 2B, Section 7.2.2, over the 2025-2029 period, Toronto Hydro plans to invest $22.5 million to deploy nine Energy Storage Systems (ESS) with an aggregated capacity of 10.2MW on nine distribution feeders. These ESS installations are intended for renewable enablement, correcting destabilized grid parameters than can result from high amounts of generation on one feeder.[1] ESS can act as a load to prevent output curtailment from the renewable assets while ensuring a stable grid through controlling the minimum load to generation ratio (MLGR). "High-priority feeders" are feeders that exceed optimal MLGRs, as defined in IEEE Standard P1547.2/D6.5 and National Renewable Energy Laboratory's High Penetration PV Integration Handbook for Distribution Engineers (NREL Handbook).

Toronto Hydro confirms that its ESS program targets the enablement of REG connections and does not contemplate additional use cases to support the distribution system. As such, the utility is seeking treatment of these costs as eligible investments for provincial rate recovery under section

[1] Seguin, R., Woyak, J., Costyk, D., Hambrick, J., & Mather, B. (2016). (tech.). High-Penetration PV Integration Handbook for Distribution Engineers (pp. 4–26). Oak Ridge, Tennessee: Office of Scientific and Technical Information.

79.1 of the *Ontario Energy Board Act, 1998.*[2] For further details, please refer to Exhibit 2A, Tab 5, Schedule 1 (updated January 29, 2024).

[2] Cost Recovery re Section 79.1 of the Act, O. Reg. 330/09, at s. 1(2).

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-46

Reference: Exhibit 1B, Tab 4, Schedule 2

Toronto Hydro is proposing an Innovation Fund to support the design and execution of innovation pilot projects over the 2025-2029 rate period. The pilot projects undertaken through the Innovation Fund would be focussed on testing new technologies, advanced capabilities and alternative strategies that enable electrification grid readiness and are responsive to the OEB's expectations with respect to facilitation DER integration, as expressed in the Framework for Energy Innovation. The fund amounts to approximately $16 million over the 2025-2029 rate period:

QUESTION (A):

a) Please explain, in detail, the extent to which Toronto Hydro intends to collaborate with other utilities regarding its innovation Fund pilots;

RESPONSE (A):

As indicated in the description of the Governance Framework for the Innovation Fund at page 10 of Exhibit 1B, Tab 4, Schedule 2 , Toronto Hydro would engage with external stakeholders to inform the pilot project selection process, including other utilities as relevant. In these engagements, Toronto Hydro would canvass ideas and solutions that are being considered in the sector to help gain a better understanding of pilot projects that may be technically feasible and advisable. This feedback would be used as input into the pilot selection process, the output of which will identify the selected projects and key details about the projects, including the rationale for selecting them. Furthermore, and as noted on page 16 of the referenced evidence, in order to contribute to broader knowledge sharing with the electricity sector, Toronto Hydro intends to share its pilot project learnings with the OEB Innovation Sandbox team, so it can then be shared with industry stakeholders that include other Ontario utilities.

QUESTION (B):

b) With respect to the pilots that may prove to be less fruitful than others will ratepayers be responsible for the costs of those pilots? If so, why?

RESPONSE (B):

Toronto Hydro is requesting funding for the Innovation Fund which is purposefully not conditional on the ultimate degree of success for individual pilot projects. Inherent in the pursuit of innovative solutions, which Toronto Hydro is doing consistent with provincial and OEB policy objectives, is the risk that some efforts will be more or less successful than others, but also the understanding that there is value in the learning that comes from the efforts regardless of the outcome. Furthermore, if funding were to be conditional on the outcome of efforts to innovate, this could have a chilling effect on the pursuit of innovative solutions and is likely to encourage spending on projects that are mature, or where the beneficial outcomes are more proven or certain. These are the very aspects that the proposed Innovation Fund is designed to overcome.

QUESTION (C):

c) What specific type of projects will be prioritized?

RESPONSE (C):

The prioritization of pilot projects takes place at two stages of the Governance Framework, namely: (i) the application of defined characteristics to determine specific areas for innovation (at the conceptual level), and (ii) the pilot selection phase (at the scoping level).

As described in the referenced evidence at pages 6-8, Toronto Hydro has identified certain characteristics for the pilot projects that will be supported by the Innovation Fund. Those characteristics include that the projects will explore distribution capabilities associated with adapting to fundamental change in the energy sector, as identified in or related to certain expectations of the OEB set out in the FEI report, and the projects will have the potential to deploy solutions that are innovative because they use new technology or existing technology in new ways, they involve

innovative business practices and relationships, or they involve enhancing distribution services in ways that benefit customers.

In parallel, through its Grid Modernization Strategy, Toronto Hydro identified certain high-potential areas of innovation that present tangible opportunities to begin designing and executing projects rather than undertaking a "blank page" ideation phase. Toronto Hydro assessed these areas of innovation for the characteristics mentioned above and concluded that they are aligned with these characteristics (Exhibit 2B, Schedule D5).

The pilot project concepts identified for the 2025-2029 rate period, which would involve testing new distribution capabilities by deploying pilot projects that have the potential to be scaled up into standard capital or operational work programs, are: (a) Flexible Connections, (b) Electric Vehicle Commercial Fleet Charging, (c) EV Demand Response, and (d) Advanced Microgrids. Further details about how each of the pilot project concepts meets the defined characteristics are set out in Appendix A of the referenced evidence.

Individual projects will be selected and scoped out during the Pilot Selection and Design Phases of the Governance Framework (Section 4.1). In these Phases, the Innovation Fund team will prioritize projects that have potential business value, execution feasibility, opportunity for scalability, and opportunity to leverage external funding. The Pilot Selection phase will also be informed by external stakeholder engagement, as further described in Exhibit 1B, Tab 4, Schedule 2.

QUESTION (D):

d) Does Toronto Hydro expect there to be a prudence review of the costs and benefits of the pilots it plans to undertake? If not, why not?

RESPONSE (D):

No. As explained in the rationale for the Innovation Fund at pages 2-6 of the referenced evidence, the Innovation Fund has been designed to overcome certain challenges that act as barriers to

innovation for regulated distributors. These challenges include having to demonstrate, in rate applications, the prudency of innovation-driven pilot projects on the basis of costs and benefits which are not always certain at the outset, and which projects are early stage, exploratory and/or developmental in nature. To overcome this obstacle, Toronto Hydro is requesting approval of the Innovation Fund proposal effectively on the basis of the rigorous internal Governance Framework that will be used to ensure the associated funds are prudently deployed. Additionally, the proposal includes a variance account to track Toronto Hydro's expenditures, which will return any unspent funding back to ratepayers. See Proposed Rate Treatment (Section 5) of the referenced evidence, and Exhibit 9, Tab 1, Schedule 1 for more information on the proposed Innovation Fund Variance Account (IFVA).

QUESTION (E):

e) What type of reporting will Toronto Hydro undertake regarding the pilots that will be funded through its Innovation Fund?

RESPONSE (E):

At pages 8-16 of the referenced evidence, the Governance Framework for the proposed Innovation Fund refers to three types of reports that will be produced, for different purposes, including the pilot selection report, milestone reports, and the pilot evaluation and learnings report. The pilot selection report will identify the selection of projects and key details about the projects, including the rationale for selecting them. The milestone reports will be produced throughout the lifecycle of each project and are intended for internal management purposes to monitor progress and expenditures. Lastly, the pilot evaluation and learnings report is intended to capture the learnings, reflecting on the achievement of desired outcomes, including learning objectives, that are set at the outset of each pilot project during the design phase of the Governance Framework. Crucially, this report will assess and determine the future of each pilot project as described in Section 4.2 (Pilot Execution & Evaluation Phases) of Exhibit 1B, Tab 4, Schedule 2. The pilot evaluation and learning report will be shared with the OEB's Innovation Sandbox, and the key takeaway from this report could then be shared with industry stakeholders.

QUESTION (F):

f) Please provide copies of all of the research Toronto Hydro undertook to inform the level of funding requested;

RESPONSE (F):

Please see Toronto Hydro's response to interrogatory 1B-DRC-06 part d).

QUESTION (G):

g) Please explain how the $16 million will be recovered over the rate plan term.

RESPONSE (G):

As stated in the Innovation Fund evidence at pages 16-17, Toronto Hydro proposes to recover the funds through an Innovation Fund rate rider. For more details on the rate rider, please refer to Toronto Hydro's response to interrogatory 9-Staff-342 part a).

In addition, Toronto Hydro proposes to establish a new variance account, the Innovation Fund Variance Account, to record variances between amounts collected by the rate rider and amounts actually deployed for and used in carrying out pilot projects.

More information on the Innovation Fund Variance Account can be found in Exhibit 9, Tab 1, Schedule 1, and on the Innovation Fund rate rider in Exhibit 9, Tab 3, Schedule 1.

QUESTION (H):

h) Does $16 million represent a cap? Is it comprised of both capital and OM&A costs?

RESPONSE (H):

The $16 million does not represent a cap. As explained in the Innovation Fund evidence, the proposed Innovation Fund reflects a level of investment identified based on comparative jurisdictional research. This amount represents approximately 0.3% of the 2025-2029 revenue requirement outlined in Exhibit 6, and reflects the low end of the range of utility investment in

comparable innovation and research and development activities, with average utility spending at 0.5% to 1% of revenue. As part of the Innovation Fund proposal, Toronto Hydro proposed a *symmetrical* variance account to track actual revenue requirement (whether capital or OM&A related) against the forecasted amount that will be recovered through the Innovation Fund rate rider. Toronto Hydro intends to clear the balance in the variance account in its next rebasing application.

QUESTION (I):

i) When does Toronto Hydro expect to have its work plan for designing and implementing the selected pilot(s) completed?

RESPONSE (I):

As stated in the evidence at page 11, the completion of the work plan is marked by approval of the steering committee. Before this can happen, the pilot project owners need to compile pilot project scopes (including outcomes and milestones), budgets, and work plans for managing the process. These activities occur in the second phase of the internal Governance Framework – the design phase. It is Toronto Hydro's intention to begin undertaking the activities described in the Governance Framework, beginning with the pilot selection phase, after the OEB renders its Decision and Rate Order for the 2025-2029 Custom Rate Application. Once the pilot selection phase has been completed, Toronto Hydro will proceed with the pilot design phase. Given that pilot projects may require multiple years of testing, Toronto Hydro will endeavour to complete the design phase within the first 18 months of the rate period.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-47

Reference: Exhibit 1B, Tab 4, Schedule 2, Appendix B - NRCan letter

QUESTION:

Did Toronto Hydro seek funding from NRCan for its Innovation Fund? If not, why not? Does it expect to do so in the future? If not, why not?

RESPONSE:

As stated in the Innovation Fund evidence, Toronto Hydro intends to apply for NRCan funding to support Innovation Fund pilot projects if and when they are eligible under NRCan program rules. In January 2024, Toronto Hydro submitted an Expression of Interest to NRCan's Smart Grid Demonstration program. The EOI included submissions on two projects to be considered for funding through NRCan's Smart Grid Demonstration program. One of the projects submitted is included in the Innovation Fund. The NRCan program could provide funding for other potential pilots projects under the EV Commercial Fleet Charging or EV Demand Response areas of innovation. For a complete list of external funding that Toronto Hydro has applied for in the last few years, please see Toronto Hydro's response to interrogatory 1B-Staff-10. The referenced NRCan letter is the result of Toronto Hydro's engagement with NRCan in connection with the Innovation Fund proposal. In response, NRCan shared with Toronto Hydro the referenced letter.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-48

Reference: Exhibit 1B, Tab 5, Schedule 1, Page 4

With respect to customer engagement Toronto Hydro undertook a two-phased approach to inform its rate Application. First, prior to embarking on the business and investment planning process, it obtained a "genuine" understanding of its customers' needs and priorities and used this feedback to set strategic direction for the investment priorities of it plan. Second, after the 2025-2029 draft plan was prepared Toronto Hydro went back to its customers to obtain feedback on the draft plan. The utility considered this feedback in refining and finalizing its plan.

QUESTION (A):

a) If customers' top priorities are price and reliability, what has Toronto Hydro done to address the pricing issue in any significant way?

RESPONSE (A):

As noted in the evidence in Exhibit 2B, Section E2.1 finding balance between price and progress towards outcomes that customer expect was a key focus throughout Toronto Hydro's integrated planning process. To achieve this balance, Toronto Hydro constrained its initial capital plan by approximately $480 million from the beginning to the end of the process. Similarly, the OM&A plan detailed in Exhibit 4 was also constrained by approximately $40 million through the course of the planning process. This was primarily achieved through the iterative review of the workforce plan as described in the response to interrogatory 4-CCC-58(d). Finally, price was also a consideration in the Performance Incentive Mechanism (PIM) described in Exhibit 1B, Tab 3, Schedule 1, which provides customers an upfront rate reduction benefit of approximately $65 million over the rate term by shifting financial risk to the utility for delivering performance outcomes that customers value.

QUESTION (B):

b) Toronto Hydro states that "…on average 84% of customers surveyed supported the draft plan and the associated rate impacts." Were customers given the 7.5% annual distribution rate impact numbers? If not, why not? Does imply that they support annual increases in the revenue requirement as proposed?

RESPONSE (B):

Please see the response to interrogatory 1B-Staff-39(b). Toronto Hydro would like to clarify that the proposed average annual distribution rate impact is 7%.

QUESTION (C):

c) What specific changes did Toronto make to its investment plan in Phase 2. How did Toronto Hydro decide on a $70 million reduction to its overall plan?

RESPONSE (C):

As noted in the timeline provided in the response to interrogatory 2B-SEC-32, the last step in Toronto Hydro' integrated business planning process is the refinement and finalization of the plan based on the results of the Phase 2 engagement. The evidence in Exhibit 2B, Section E2 at pages 9-11 describes the changes that Toronto Hydro made to the plan in more detail. Please also refer to Toronto Hydro's response to interrogatory 2B-SEC-54 for a breakdown by program of the changes which were made to the draft capital plan in the last step of the process.

QUESTION (D):

d) What is the revenue requirement impact for each year and the rate impact each year for residential customers of reducing the overall capital plan by $70 million?

RESPONSE (D):

Please see Table 1 and Table 2 below for revenue requirement reduction and residential rate impact respectively for each year as a result of reducing the overall capital plan by $70 million.

Table 1: Revenue Requirement Change – CE Phase 2 Refinements to the Final Plan (in $ millions)

	2025	2026	2027	2028	2029	2025-2029
Revenue Requirement	(0.3)	(0.7)	(1.3)	(2.0)	(3.0)	(7.3)

Table 2: % Residential Customer Rate Impacts associated with CE Phase 2 Refinements to the Final Plan

	2025	2026	2027	2028	2029	2025-2029
Residential Rate Impact %	0.0%	(0.1%)	(0.1%)	0.0%	(0.1%)	(0.1%)

QUESTION (E):

e) Please define "social permission";

RESPONSE (E) – PREPARED BY INNOVATIVE:

"Social permission", as it relates to this application, is defined in Toronto Hydro's Customer Engagement Executive Summary, which is filed at Exhibit 1B, Tab 5, Schedule 1, App A at page 1. That definition is provided below:

Social permission is the percentage of customers who responded to Toronto Hydro's draft plan by indicating either: (1) they think Toronto Hydro should accelerate spending beyond the level in the draft plan to deliver better system outcomes, (2) they support the proposed rate increase that is reflected in the draft plan, or (3) they feel that the proposed rate increase in the draft plan is necessary, even though they don't like the proposed increase.

QUESTION (F):

Did Innovative discuss the Performance Incentive Mechanism as part of the customer engagement process? Were customers told Toronto Hydro would have an opportunity to "earn back" the $65 million?

RESPONSE (F):

No. The 2025-2029 Custom Scorecard and associated Performance Incentive Mechanism (PIM) was developed after Phase 2 Customer Engagement. Toronto Hydro had to finalize its plan, including making adjustments based on the results of Phase 2, in order to confirm the $65 million incentive and the scorecard measures and targets.

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-49

Reference: Exhibit 1B, Tab 5, Schedule 1, Page 13

Preamble:

Toronto Hydro undertook application-specific customer engagement through Innovative Research. In addition, Toronto Hydro states that ongoing customer and stakeholder engagement activities occur in the normal course of business as part of Toronto Hydro's robust and sophisticated customer research and response model.

QUESTION (A):

a) What is expected to be the overall cost of the Innovative Research work specific to this Application? Please provide a detailed breakdown;

RESPONSE (A):

Please see table 1 below:

Table 1: Innovative Project Phase Costs

Phase	**Costs (before HST)**
Phase 1	$284,250
Phase 2*	$476,411
Total	$760,661

*As of the end of 2023.

QUESTION (B):

b) What is the annual cost of ongoing customer engagement activities included in the rate plan revenue requirements?

RESPONSE (B):

Please see the summary table below for a list of the programs that map to the on-going customer engagement initiatives referred to Exhibit 1B, Tab 5, Schedule 1 and a breakdown of the related annual costs. Toronto Hydro notes that the costs in this table are related to the program/segment overall, which include costs beyond the scope of "on-going customer engagement" because it is not possible to disaggregate customer engagement costs from other drivers in the program.

Table 2: On-going Customer Engagement

Program /Segment	Description of Activities	Annual Costs ($ Millions)				
		2025	2026	2027	2028	2029
Customer Operations – Key Accounts Segment (Exhibit 4, Tab 2, Schedule 8 at Page 22)	Proactive and responsive engagement activities with Key Account customers. Please refer to for more information.	1.5	1.5	1.7	1.8	1.9
Customer Operations – Customer Connections Segment (Exhibit 4, Tab 2, Schedule 8 at Page 16)	Communications with customers relating to connection and upgrade requests, from intake through the completion process, and general inquiries.	3.2	3.3	3.5	3.6	3.8
Customer Care - Customer Relationship Management Segment (Exhibit 4, Tab 2, Schedule 14 at Page 34)	Communications across various channels to provide customers information in relation to service offerings and the utility's operations.	14.7	15.7	16.1	16.9	17.5
Customer Care - Collections Segment (LEAP) (Exhibit 4, Tab 2, Schedule 14 at page 26).	Application of financial assistance programs such as the Low-Income Energy Assistance Program ("LEAP") and Ontario Energy Support Program ("OESP").	10.2	10.9	11.0	11.3	11.6

Program /Segment	Description of Activities	Annual Costs ($ Millions)				
		2025	2026	2027	2028	2029
Public, Legal and Regulatory Affairs – Communications and Public Affairs Segment (Exhibit 4, Tab 2, Schedule 18 at page 28)	Includes channels that facilitate two way communication with customers such as costs for surveys, focus groups, and the Customer Advisory Panel. This also includes town halls and other communications with customers regarding planned capital work.	6.6	6.9	7.1	7.3	7.6
Asset and Program Management – System Planning Segment (Exhibit 4, Tab 2, Schedule 9 at Page 12)	The utility uses the City of Toronto's development pipeline to engage large customers and developers with upcoming projects to understand their needs, determine their load requirements and timelines, provide technical guidance, explore innovation opportunities, and provide support in understanding the connection process. For more information, about development planning please see coordinate planning Exhibit 2B, Section B.	8.4	9.1	9.5	10.0	10.3
	Toronto Hydro participates in the Regional Planning process which includes community and stakeholder engagement, including webinars, led by the IESO.					

RESPONSES TO CONSUMERS COUNCIL OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCC-50

Reference: Exhibit 1B, Tab 5, Schedule 3, Page 1

Please file Toronto Hydro's responses to matters raised in letters of comment filed with the OEB during the course of the application.

RESPONSE:

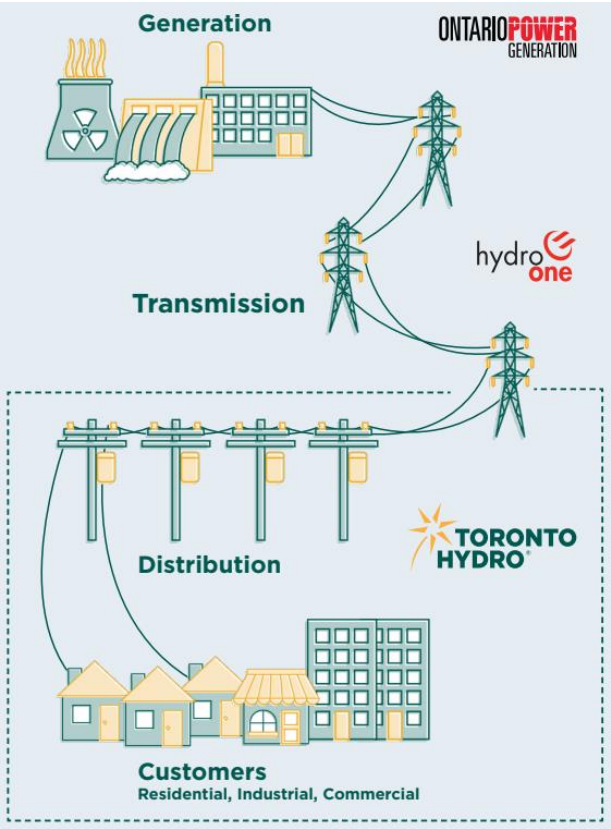
Please see Appendix A

Re: Toronto Hydro 2025–2029 Rate Application Letters of Comment

Dear Valued Customer,

Thank you for your letter of comment regarding Toronto Hydro's 2025–2029 rate application and investment plan. Customer letters are an important part of the rate application process and we appreciate you taking the time to provide your feedback.

The Ontario Energy Board (OEB) received 22 letters of comment in total. Many of the letters focused on similar themes, including that:



- Customers need clarity about what portion of their electricity bill goes to Toronto Hydro
- Customers believe the required electricity infrastructure already exists, so additional investment isn't required
- Customers are struggling with the cost of living and can't afford additional rate increases
- Customers want Toronto Hydro to explore other solutions rather than increasing costs

This letter represents Toronto Hydro's response to the comments raised and is divided into the following sections:

1. Electricity 101: Toronto Hydro's Role in the Electricity System
2. Toronto Hydro Bill Breakdown
3. Toronto Hydro's Investment Needs
4. Toronto Hydro's Operating Environment
5. Customer Engagement and Business Planning
6. Timing and Pace of Investment
7. Supporting Electrification
8. Affordability and Cost-of-Living Challenges
9. Our Productivity and Performance
10. Additional Resources

1. Electricity 101: – Toronto Hydro's Role in the Electricity System

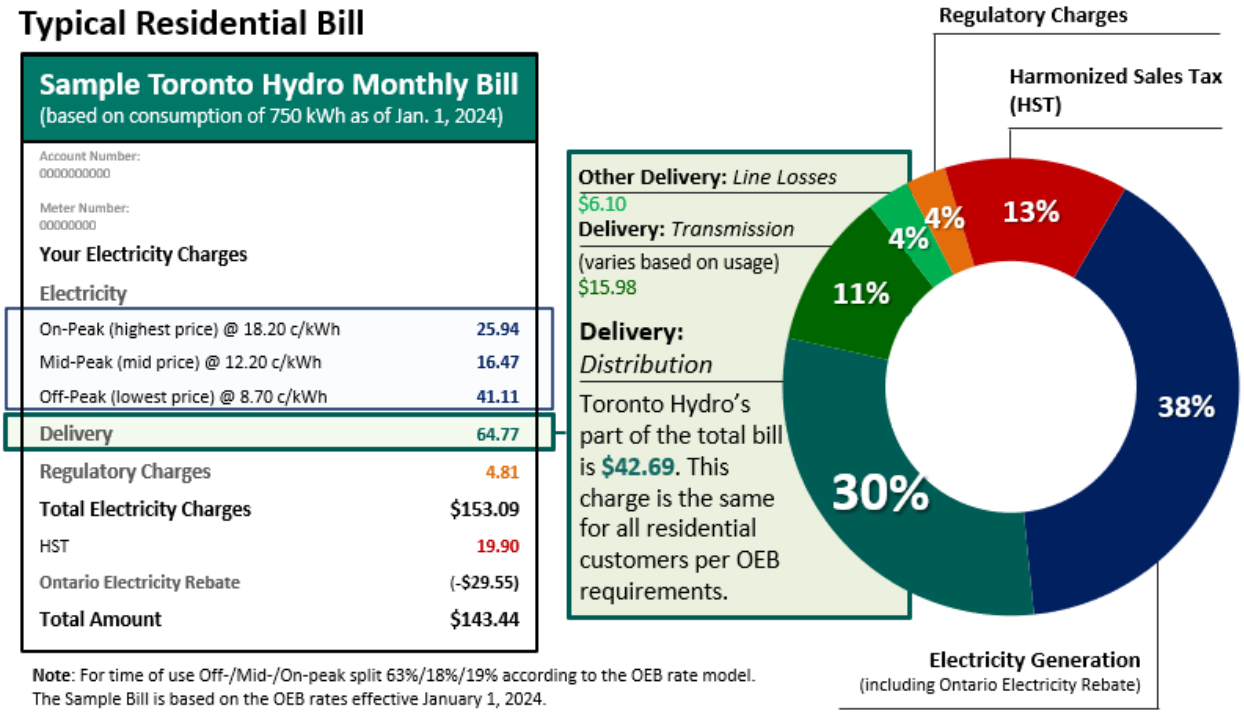
Ontario's electricity system is made up of three parts: **generation**, **transmission** and **distribution**:

Generation: Generation is the process of creating electricity from sources such as nuclear power, hydroelectric, natural gas wind and solar. Ontario Power Generation, a government-owned company, generates almost half of Ontario's electricity. The other half comes from other generators contracted by the grid operator.

Transmission: Once electricity is generated, it must be sent to urban and rural areas across the province. This happens by way of high-voltage transmission lines that serve as highways for electricity. Ontario has approximately 30,000 kilometers of transmission lines, mostly owned and operated by Hydro One.

Distribution: Toronto Hydro is responsible for the last step of the journey: distributing electricity locally to customers. Toronto Hydro does not generate or transmit electricity — we own and operate the local electricity system made up of approximately 183,620 poles, 61,300 distribution transformers, 17,060 primary switches, 15,393 kilometers of overhead wires and 13,765 kilometers of underground cables.

2. Toronto Hydro Bill Breakdown



Toronto Hydro recognizes that there is some confusion among customers about how their electricity bill is distributed among the different parties involved in the electricity system, including what portion goes to Toronto Hydro and how Toronto Hydro spends the money we receive.

While the electricity bill you receive comes from Toronto Hydro, we actually collect payment for the entire electricity system. **Only about 30% of your electricity bill goes to Toronto Hydro** to pay for the local distribution grid. For example, if the typical monthly residential bill is $143.44**,** the **Delivery Charge** would be **$64.77** and would include:

- Toronto Hydro's Distribution: $42.69
- Hydro One's Transmission: $15.98
- Other Delivery including Line Losses (which is electricity lost during transmission): $6.10

The **remaining 70% of the bill** goes to generation companies, transmission companies, the federal and provincial governments, and regulatory agencies. Included in this amount is the 40% of your total bill that covers electricity generation costs. This is the part of your bill that changes based on your consumption. In other words, if you take steps to conserve energy, these actions will only impact 38% of your bill. For the typical residential customer, this amount is approximately $53.97.

The diagram below provides a breakdown of a typical residential bill:

3. Toronto Hydro's Investment Needs

The Delivery Charges found on your bill help fund Toronto Hydro's distribution system. For 2025 to 2029, we developed an investment plan to get the grid ready to serve the city's evolving electricity needs, including increased development from population and economic growth, as well as increased electrification and digitization. Our plan will help ensure that our grid and operations will remain safe, reliable and environmentally responsible.

Specifically, Toronto Hydro's 2025–2029 investment priorities include:

- **Sustainment and Stewardship:** These are investments to renew aging, deteriorating and obsolete distribution equipment to maintain the foundations of a safe and reliable grid.
- **Modernization**: These are investments to develop advanced technological and operational capabilities that will make the system better and more efficient over time
- **Growth and City Electrification**: These are necessary investments to connect customers (including distributed energy resources) and build the capacity to serve a growing and electrified local economy
- **General Plant**: These are investments in our vehicles, work centres and information technology infrastructure to keep the business running and reduce our greenhouse gas emissions

4. Toronto Hydro's Operating Environment

In developing the investment priorities that formed the basis of our 2025–2029 plan, we aimed to address certain needs and challenges of delivering safe, reliable and clean electricity, including:

- **Powering a mature and growing urban city**: We serve Canada's largest and North America's second fastest growing city (by population). We also operate in a dense urban environment, which makes it more complicated and more expensive for us to plan and build infrastructure. As Toronto continues to grow, we need to prepare the grid to power new condo towers, residential communities and businesses.
- **Fixing and replacing equipment in poor condition:** A large percentage of our grid was installed in the 1950s and 60s, and approximately a quarter of the utility's grid equipment continues to operate past useful life. We need to continue monitoring the condition of our grid and replace equipment most at risk to keep it safe and reliable for customers.
- **Keeping up with how customers use electricity:** Customers are increasingly adopting electrified technologies like electric vehicles and heat pumps for their day-to-day energy needs, and using new technologies like solar panels and battery storage to manage their energy usage. We need to upgrade our equipment and modernize our grid to keep up with these changes.
- **Responding to extreme weather and cybersecurity threats:** Extreme weather events such as extreme heat, high winds, flooding and ice storms are becoming more common due to climate change. In addition, cybercrime is on the rise across Canada. We need to invest in making our grid and operations more resilient against these emerging threats.

5. Customer Engagement and Business Planning

In preparing our plan, we recognized that we needed to balance addressing the operating challenges with price and other outcomes that customers value. Toronto Hydro has a robust planning process, which ensures that customer feedback informs our multi-year investment priorities.

During our planning process, we heard from over 37,000 customers across two phases of customer engagement:

- **Phase 1:** In 2022, we started preparing our plan by asking customers about their needs and preferences for electricity distribution services. Based on the Phase 1 Engagement and system conditions, we developed an initial plan that targeted certain short and long term goals.
- **Phase 2:** In March 2023, we went back to our customers with this draft plan — via a comprehensive online survey — to get feedback and to ask customers how the plan could better meet their needs and preferences.

With unprecedented levels of participation (more than 33,000 customers completed the survey), **84% of respondents supported our proposed plan** or one that does even more to improve services.

6. Timing and Pace of Investment

We understand that there are concerns about affordability, and questions regarding whether our proposed investments can be delayed until economic conditions improve.

Toronto Hydro's investment planning and rate application process operates on a five-year cycle. This means we only go to the OEB approximately every five years with an investment plan to ask for updated rates.

As described in this letter, there are certain investments which are necessary to renew aging equipment and prepare for increased growth in the city. These investments cannot happen quickly — particularly in a densely populated and congested city like Toronto. Building new powerlines and stations takes years of planning and construction. There are also equipment and resource constraints that limit how quickly we can build a bigger grid. That's why we need to start investing now to get the grid ready for future growth.

If we were to put off these investments, this could lead to lower reliability, lower service levels for customers looking to connect to the grid, and reduced efficiency. In addition, if we wait to make these proactive investments, we will likely have to spend even more to catch up on work that needs to be done, instead of spending more gradually. That's why we need to start investing in least-regrets investments now so as not to risk the safety, security, reliability and resiliency of the grid.

In the long term, increasing the utilization of the electricity system (through increasing the number of total users as well as the amount of electricity used by individual users) could help to bring down costs for individual customers.

7. Supporting Electrification

We understand that there are concerns that increased electricity rates will disincentivize customers from switching to electric vehicles (EVs) and heating. The rates we're proposing are necessary for making the investments needed to ensure the grid is ready when increased electricity demand materializes.

In addition, as customers increasingly turn to electricity for more of their day-to-day energy needs, it's expected that they will spend less of their income on energy over the long term as increased electricity costs are more than offset by savings from reducing or eliminating their use of fossil fuels, such as gasoline and natural gas.

Finally, there are a number of financial incentives available for EVs and electric heating, such as the Government of Canada's Incentives for Zero-Emission Vehicles Program[1] and the City of Toronto's Home Energy Loan Program.[2]

8. Affordability and Cost-of-Living Challenges

While our proposed rate increases are necessary for ensuring system safety and reliability and addressing the investment needs and challenges described in this letter, we recognize that there are some customers for whom rate increases will be particularly challenging.

[1] https://tc.canada.ca/en/road-transportation/innovative-technologies/zero-emission-vehicles/incentives-zero-emission-vehicles/program-overview

[2] https://www.toronto.ca/services-payments/water-environment/environmental-grants-incentives/home-energy-loan-program-help/help-terms-and-conditions/

A number of financial assistance programs are available to eligible customers, with support ranging from helping customers reduce their electricity usage to on-bill credits that help offset monthly charges. The following programs are available to eligible customers:

- The City of Toronto's **Emergency Energy Fund (EEF)** assists customers with energy-related emergencies to reconnect, prevent disconnection or assist in payment of energy arrears
- The OEB's **Ontario Electricity Support Program (OESP)** provides an on-bill credit each month to qualifying households
- The Independent Electricity System Operator's **Energy Affordability Program** offers support to income-eligible electricity consumers by helping them to better manage their monthly electricity costs and to increase their home comfort
- The OEB's **Low-income Energy Assistance Program (LEAP)** provides a one-time emergency grant to help customers pay their electricity bill

To learn more about these assistance programs, visit **torontohydro.com/help**.

Additionally, as part of our commitment to improving how these programs work, Toronto Hydro is requesting enhancements to the LEAP program for the 2025-2029 rate period. Through these various enhancements, we're aiming to increase the average annual number of customers assisted to approximately 1,900 per year (or more than 9,000 over the entire five-year period).

We're also committed to working with the OEB, governments and other stakeholders to find additional targeted solutions that will help customers who need it most.

9. Our Productivity and Performance

Toronto Hydro always strives to provide value to our customers. Like many companies, Toronto Hydro faces rising costs in purchasing equipment for the grid and completing construction work in the city. Despite this, we're always looking for ways to minimize costs and rate increases by finding productivity and efficiencies in our plans and work. For example, as part of reducing our facilities footprint in the city, we consolidated from seven operating centres down to four. As part of this consolidation, the utility sold properties, and are returning proceeds of close to $200 million to customers by the end of the decade resulting in an annual credit of approximately $132 on the average residential customer's bill from 2016 to 2029.

During our business planning process, we asked external experts to assess our performance, including benchmarking with respect to our productivity, reliability, and cost efficiency. The results of those studies, which were publicly filed as part of our application, demonstrate that our performance on these measures is similar or better than our peer utilities.[3]

This also applies to employee compensation. Toronto Hydro balances cost-effectiveness with the need to attract and retain the talent required to provide service in an increasingly complex and dynamic operating environment. Toronto Hydro has external consultants who benchmark our total compensation, and we've been found to be within a market-competitive range in the energy market.

[3] For more information on Productivity initiatives, please see Exhibit 1B, Tab 3, Schedule 3.

In addition, our 2025–2029 plan is focused on delivering results that matter to customers like you. To help ensure that we achieve these outcomes, we'll be holding ourselves financially accountable through a framework that tracks and reports our performance on 12 distinct measures. This performance framework provides customers with an upfront rate reduction benefit of $65 million that we will only earn back if we achieve certain objectives.

RESPONSES TO COALITION OF CONCERNED MANUFACTURERS AND BUSINESSES OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCMBC-2

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 25, Table 3: 2026-2029 Revenue Growth Factor

QUESTION:

What is the main reason for the large increase in the Revenue Growth Factor from 2.62% in 2027 to 7.43% in 2028?

RESPONSE:

The primary reason for the increase in the Revenue Growth Factor from 2.62% to 7.43% is an increase in PILs. Specifically, PILS are increasing over this period primarily due to a lower Capital Cost Allowance (CCA) compared to 2027 as the accelerated CCA rules are ending as at December 31st, 2027.

RESPONSES TO COALITION OF CONCERNED MANUFACTURERS AND BUSINESSES OF CANADA INTERROGATORIES

INTERROGATORY 1B-CCMBC-3

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 26

Preamble:

"Substituting the labour component of the inflation factor with a Toronto-specific index is responsive to the consideration that labour is a key cost driver within the utility's plan, and a Toronto-specific labour index could be more suitable to account EB-2023-0195 Toronto Hydro Rates Application - CCMBC Interrogatories for the localized inflationary cost pressures that the utility faces in the 2025-2029 rate period."

QUESTION (A):

a) Please confirm that Toronto Hydro proposes that ratepayers bear the risk of inflation.

RESPONSE (A):

Toronto Hydro's proposed approach to inflation is consistent with standard incentive regulation under Price Cap IR, which adjust rates annually by an OEB approved inflation-factor. Rates include the impacts of each year's Inflation Factor adjustment, while the utility is responsible for managing variances between actual inflation and the rate adjustments resulting from the Inflation Factor. Toronto Hydro is also responsible for managing the impacts, and bearing the risk of revenue reductions imposed by the X-Factor during the 2025 to 2029 period.

QUESTION (B) – (D):

b) Does the Toronto-specific labour index only cover the City of Toronto, or does it cover a larger area?

c) What percentage of Toronto Hydro employees are residents of the City of Toronto?

d) Do the businesses and manufacturers operating in Toronto face the same inflationary cost pressures as Toronto Hydro?

RESPONSE (B-D):

Please see Toronto Hydro's response to 1B-Staff-93.

RESPONSES TO DISTRIBUTED RESOURCE COALITION INTERROGATORIES

INTERROGATORY 1B-DRC-1

References: Exhibit 1B, Tab 5, Schedule 1, Appendix A

Exhibit 2B, Section E8.4

Preamble:

THESL engaged Innovative Research Group Inc. ("IRG") to assist in meeting THESL's customer engagement commitments and develop a comprehensive customer engagement study. The work was carried out in two phases. The first phase assessed customers' needs and preferences in relation to THESL's programs and services for the 2025-2029 rate period. During the second phase, customers provided detailed feedback on the $5.9 billion draft plan and the associated price impacts.

QUESTION (A):

Please provide a copy of all written instructions provided by THESL to IRG in relation to IRG's customer engagement mandate for the Application and the report provided in Exhibit 1B, Tab 1, Schedule 1, Appendix A.

RESPONSE (A):

Please see 1B-SEC-11 at Appendix A for the retainer that established IRG's mandate pursuant to which the customer engagement was performed.

QUESTION (B):

Please provide a copy of all written instructions provided by THESL to IRG in relation to customer engagement with respect to consumer choice in integrating technologies like distributed energy resources ("DERs"), electric vehicles ("EVs"), solar power, and battery storage.

RESPONSE (B):

Toronto Hydro did not provide written instructions to IRG beyond the retainer outlined in the utility's response to 1B-SEC-11.

QUESTION (C):

Please describe all measures undertaken by THESL and IRG to invite and ensure the participation of EV stakeholders and other DER customers (including EV drivers, owners of DERs, EV associations, and DER industry associations) in customer engagement activities.

RESPONSE (C) – PREPARED BY TORONTO HYDRO:

Toronto Hydro undertook a two-phased approach to customer engagement through which it gathered feedback from nearly 37,000 customers – the utility's largest and most comprehensive customer engagement to date. For its Phase 2 engagement specifically, customers with an email address on file received an email invitation. Toronto Hydro also informed residential and small business customers about an open access version of the survey through bill inserts, social and traditional media as well as Toronto Hydro's website. This approach resulted in a broad engagement with the opportunity for all customers, including EV stakeholders and DER customers, to participate and provide valuable input into Toronto Hydro's planning process. The success of these efforts in ensuring that EV stakeholders and DER customers were engaged is clear in the response to the question at Exhibit 1B, Tab 5, Schedule 1, Appendix A at pages 286/365, where when customers were asked if they ever considered shifting from one energy source to another (with examples given such as switching to a heat pump or an electric vehicle) 20% of residential customers and 28% of small business customers said they had either done it or were actively taking steps in this direction.

QUESTION (D):

Please provide any and all notes from IRG's customer engagement relating to EVs and DERs that are supplementary to the reports provided in Exhibit 1B, Tab 1, Schedule 1, Appendix A.

RESPONSE (D) – PREAPRED BY INNOVATIVE:

There are no additional notes from IRG's customer engagement relating to EVs and DERs that are supplementary to the reports provided in Exhibit 1B, Tab 5, Schedule 1, Appendix A.

QUESTION (E and F):

Please discuss how the outcomes and priorities of customers have changed compared to historical equivalents and discuss any trend lines in customer priorities related to the adoption and integration of technologies like DERs, EVs, solar power, and battery storage.

Please discuss how the outcomes and priorities of customers have changed compared to historical equivalents and discuss any trend lines in customer priorities related to the energy transition and THESL's net zero commitments. As part of your answer please discuss any work done by THESL or IRG on the substantive knowledge of customers and what they understand their understanding of the energy transition.

RESPONSE (E AND F):

RESPONSE – PREPARED BY INNOVATIVE:

The focus of this engagement was to understand Toronto Hydro customers' current preferences. There was no time series analysis of change in customers' views on outcomes and priorities conducted for this application.

The surveys conducted for this engagement do not presume any knowledge about the energy transition. Each question provides enough background information for customers to provide meaningful responses. The questions were tested with customers to ensure they felt there was enough information. There is a diagnostic question at the end of the survey to double check whether customers felt there was too little, too much or the right amount of information. Most customers indicated the survey had the right amount of information.

The Phase 1 survey did include two awareness questions. The first asked about customer familiarity with the primary sources of GHG emissions, and the second asked customers about their familiarity with the role of an expanded and modernized grid to implement the City of Toronto's Net Zero Strategy. The results show a wide range of knowledge about primary sources of GHG emissions, confirming other publicly released research on energy transition knowledge by INNOVATIVE. For example, on Exhibit 1B, Tab 5, Schedule 1, Appendix A at page 113 of the Phase One Residential Report, 55% of residential customers report being at least somewhat familiar with the primary sources of GHG emissions.

RESPONSE – PREPARED BY TORONTO HYDRO:

In the last five years, Toronto Hydro has observed many Key Account customers move from planning and finalizing their Environmental Social and Governance (ESG) goals to adoption of decarbonized projects. Many of these projects are either in the design/construction phase or already energized. This transition has been led by the Municipal, Academic, Schools and Social Services, and Hospitals (MASH) sector and Toronto Hydro anticipates that this will continue through the 2024-2029 period. For example, identifiable EV specific projects over the 2022-2024 period include over 400 on and off-street EV charging stations in garage lots, surface level lots and pole-mounted stations across the City of Toronto. This rate of electrification within the City of Toronto is expected to grow and increase throughout the 2024-2029 period together with ongoing new building construction electrification requirements for commercial, residential and mixed-use developments.[1]

The utility also generally anticipates growth in Renewable Distributed Energy Resources. Specifically, the utility currently projects that the total number of renewable DER connections[2] will

[1] Exhibit 2B, Section E5.1.4.1 at Page 22
[2] Renewable: consists of DER based on renewable technologies, such as solar photovoltaic, wind turbine and bio-gas generators;

grow from about 2280 connections in 2023 to nearly 4,500 by the end of 2029 – an increase of roughly 67 percent.[3]

[3] Exhibit 2B, Section E2.1.3.2 at Page 15

RESPONSES TO DISTRIBUTED RESOURCE COALITION INTERROGATORIES

INTERROGATORY 1B-DRC-2

References: Exhibit 1B, Tab 1, Schedule 1, pp.58-59

Exhibit 2B, Section E3

Preamble:

THESL notes that "[c]ustomers are showing a continued interest in participating in the electricity system as both consumers and producers of power." THESL further notes that "[e]quipment that has a high number of DER connections is more likely to experience unstable conditions that pose significant reliability and safety risks to the system and its users."

QUESTION (A):

Please elaborate on what THESL means by customers are interested in participating as both consumers and producers and that reliability and safety risks associated with equipment that has a high number of DER connections.

RESPONSE (A):

Some customers in Toronto Hydro's service territory choose to install Distributed Energy Resources (DERs), enabling them to produce electricity for their own consumption. As noted in Exhibit 2B Section E5.1.3.2, as of the end of 2022, Toronto Hydro connected 2,185 Renewable DERs, 28 Energy Storage and 116 Non-Renewable DER connections from customers and developers under a variety of technologies and applications with a total connected capacity of 304.94 MW. As noted in Exhibit 2B Section E7.2.2, an increase in generation projects can lead to a fundamental change in the power flow conditions at the distribution system and how they need to be managed. This has challenged the conventional radial nature of the grid to accommodate bi-directional power flow. Large scale deployment of renewable energy generation is known to cause issues in distribution system planning and operations such as unintentional islanding and overvoltage on feeders.

QUESTION (B):

Please provide details as to the areas in THESL's service territory experience the highest reliability and safety risks associated with DER connections (such as neighbourhood, number of DERs connected, overview of risks and reliability issues, customer concerns, etc.). If THESL is unable to provide further details, please explain why not and whether such information may be obtained in this proceeding or subsequent proceedings.

RESPONSE (B):

Please see Table 1 in Exhibit 2B, Section E3.3 for the areas that pose the highest risk for DER connections, due to the lack of fault level capacity on the bus associated with these stations. Further intake of DERs could put the stations and feeders in these areas at risk of exceeding the allowable fault limits, which could be detrimental to the equipment's rating. The safety and reliability risks associated with DER connection are detailed in the evidence at Exhibit 2B Section E3.

QUESTION (C):

What, if any, are factors that THESL believes will influence customer choice as the "key driver of DER demand", in addition to the economic and policy considerations listed, both for the period 2024-2029 and beyond.

RESPONSE (C):

Toronto Hydro believes that customers' choices regarding Renewable DER, Non-renewable DER and Energy Storage Facilities are shaped by a combination of technological, social, environmental, and policy factors. Below is a list of some of factors that can influence customer choice as the key driver of DER demand in the future.

- **Technological Advancements**: Advances in technology can make DERs more attractive and cost-effective for consumers. This includes technology that integrates DER into smart homes and buildings, allowing for better control, automation, and optimization of energy usage.
- **Energy Independence, Security and Resilience**: Consumers may choose DERs to gain greater control over their energy costs and to mitigate concerns about energy security and resilience.

This is particularly true to larger rotation-based generation facilities that could support their load or parts of it.

- **Environmental & Social Factor**: A growing awareness of climate change, along with peer influence and community norms in that respect can drive more customers to choose DERs to reduce their carbon footprints.
- **Government Incentives & New Business Models**: In addition to broader policy considerations, specific incentives, subsidies, and regulations can impact the attractiveness of DER for customers. The emergence of new business models, such as community-based energy projects, can provide customers with new options and incentives for adopting DER.

QUESTIONS (D) AND (E):

d) What are the consequences if DER growth rates exceed THESL's forecasts and more closely approximate the highest projection scenarios from the FES Report? Please include in your response a discussion on what challenges will this present in terms of THESL's ability to meet the higher demand and any consequences it may have on THESL's ability to meet demand past 2030 if demand continues to accelerate more quickly than anticipated.

e) What additional investments beyond those set out in E3.3.1 would THESL propose to accommodate the highest projections from the Future Energy Scenarios Report?

RESPONSE (D) AND (E):

It is important to note that highest level of DER uptake in FES is aligned with the Net Zero 2040 projections in TransformTO and is significantly more aggressive than any other scenario. It is based on the theoretical potential of solar generation in Toronto and hence represents an upper bound where 100% of suitable buildings install solar PV. For more information, please see Section 4.4 of Exhibit 2B Section D4 Appendix B.

Should the DER growth rate more closely resemble the highest projection scenario in the FES report, consequences would include more constrained feeders on the distribution network (due to

short-circuit capacity), issues with existing protection systems, as well as voltage regulation issues due to large amounts of DERs. As discussed in Exhibit 2B, Section E3, Toronto Hydro already faces DER hosting capacity limitations in a small percentage of areas on its system. In any scenario that involves DER growth, the number of restrictions can be expected to grow over time. Furthermore, the more rapid the uptake is of DERs, the sooner these limitations will be encountered and the more widespread they will become.

One benefit of a scenario-based model such as FES is that the utility can track developments as they occur and determine which scenario is more closely being followed, and plan the necessary investments accordingly to ensure that the utility is able to meet demand.

As summarized in Exhibit 2B, Section E3, Toronto Hydro has put forward a plan to address existing and anticipated DER hosting capacity restrictions in alignment with its DER forecast for 2025-2029. With respect to the longer-term, as discussed in detail in Section D5.2.2, an important stream of the utility's Grid Modernization Strategy is the Grid Readiness portfolio (and related innovation projects), which includes targeted investments to explore and demonstrate solutions and capabilities that could become part of Toronto Hydro's toolkit for cost-effectively facilitating and integrating a much higher penetration of DERs beyond 2030. If the rate of DER uptake significantly outpaces that reflected in Toronto Hydro's DER forecast, it will likely be necessary to increase the scope of investment in the solutions summarized and Section E3. A higher rate may also encourage a more accelerated pace of modernization and innovation investment to advance Grid Readiness capabilities.

Toronto Hydro is proposing the use of a Demand Variance Account to account for a scenario where significantly more than planned electrification drivers materialize.

RESPONSES TO DISTRIBUTED RESOURCE COALITION INTERROGATORIES

INTERROGATORY 1B-DRC-3

References: Exhibit 1B, Tab 1, Schedule 1, p.50

Exhibit 2B, Section 5.5

Preamble:

THESL notes that its "investment plan makes the minimum investments necessary (the "least regrets investments" to maintain key outcomes in the near-term while also making paced and deliberate progress in readying the grid and utility operations of the future, regardless of the path the energy transition takes."

QUESTION (A):

a) Please discuss the time horizon considered by THESL in its investment plan to support its "least regrets investments" approach and explain what is meant by "near-term" and "readying the grid and utility operations of the future".

RESPONSE (A):

In the context of making "least regrets" investment decisions, the "near-term" refers to Toronto Hydro's 2025-2029 Distribution System Plan period (and the utility's decision to largely prioritize modernization investments that will have immediate benefits to customers in this period), while "readying the grid and utility operations for the future" means making investments in the 2025-2029 period that will build toward certain more advanced capabilities that will be required in the next decade and beyond as the pace of change related to the energy transition is expected to accelerate.

For more information about the least regrets planning approach, please refer to Exhibit 2B, Section D4 starting on page 9. Please also refer to the response to interrogatory 1B-PP-05-part (a) for more context on "readying the grid and utility operations of the future".

QUESTIONS (B):

b) Please discuss the disadvantages and downside risks to THESL's distribution system, customers, investments in DERs, infrastructure, and/or workforce of underinvesting in electric vehicle infrastructure and DER connection and adoption infrastructure if a higher electrification scenario materializes compared to the one relied upon in the Application and THESL's investment plan. Please also discuss the implications of underinvestment over the rebasing period (2025-2029), mid-term (2030-2040), and long-term (2040 onwards).

RESPONSE (B):

Toronto Hydro's "least regrets" investment plan for 2025-2029 is designed to prepare the grid and operations for the level of growth anticipated in the utility's 10-year Peak Demand Forecast and its DER forecast. The utility is also proposing a Demand-Related Variance Account ("DRVA") to protect ratepayers, the utility and its shareholder, from structural unknowns in forecasted costs and revenues related to demand growth in a time of unprecedented change and transformation in the economy and energy system. Please see Exhibit 1B, Tab 2, Schedule 1 starting on page 35 for detailed evidence with respect to the need and scope of the proposed DRVA.

Hypothetically, if a much higher electrification scenario occurs and Toronto Hydro fails to make the necessary investments in a timely manner, this would have negative impacts on the various topics listed in DRC's question. Some of the key impacts are summarized below by time period.

<u>Rebasing Period (2025-2029)</u>

1. **Distribution System:** Underinvestment in infrastructure to support EVs, DERs and various other drivers of demand could lead to increased strain on the system. This could result in more frequent outages, reduced reliability, and lower service quality. Toronto Hydro could face higher operational costs and emergency repairs due to the inadequacy of the current infrastructure to handle peak loads.
2. **Customers:** Lack of access to adequate EV charging capacity could slow down the adoption of electric vehicles.

3. **Investments in DERs:** Underinvestment could hinder the integration of DERs, affecting local energy generation and storage solutions. This could result in lost opportunities for customers to reduce energy costs and emissions, and for the broader grid to benefit from more distributed energy production.
4. **Workforce:** Insufficient investment could result in a workforce that is ill-prepared for the evolving energy landscape, lacking skills in new technologies and customer service demands associated with EVs and DERs, as well as missed opportunities to build and apply efficiency-enhancing digital solutions including data analytics.

Mid-Term (2030-2040)

1. **Distribution System**: Continued underinvestment could lead to chronic underperformance of the grid, with aging infrastructure unable to cope with the growing electrification needs. This may necessitate costly, large-scale emergency upgrades to prevent system failures.
2. **Customers**: As electrification demands increase, customers could face significant power quality issues, such as voltage fluctuations and reliability problems. This could lead to public dissatisfaction and loss of trust in Toronto Hydro.
3. **Investments in DERs**: A lack of robust DER-supporting infrastructure could result in missed opportunities for reducing peak loads and improving grid resiliency, leading to higher operational costs and electricity rates. Toronto Hydro would find itself turning away large volumes of prospective DER projects.
4. **Infrastructure**: Persistent underinvestment could make the grid increasingly vulnerable to extreme weather events and cyberattacks, jeopardizing security and reliability at the same time that customer expectations for service reliability would be increasing.
5. **Workforce**: A workforce not scaled or trained to meet the demands of a rapidly evolving energy sector could lead to inefficiencies and increased costs, further impacting Toronto Hydro's ability to meet customer needs and regulatory requirements.

Long-Term (2040 Onwards)

1. **Distribution System:** The long-term consequences of underinvestment could include a severely degraded and unreliable grid, unable to support the electrification needs of the city, resulting in economic and social impacts.
2. **Customers:** Long-term underinvestment could lead to significant disparities in service quality, with some customers having access to reliable and modern energy services while others do not.
3. **Investments in DERs**: Failure to invest adequately could result in a significant lag in the adoption of clean energy technologies, impacting environmental goals and leading to higher greenhouse gas emissions.
4. **Infrastructure:** The gap between the infrastructure needs and the actual state could widen, making it increasingly difficult and expensive to catch up with necessary upgrades and innovations.
5. **Workforce:** A long-term lack of investment in workforce development could result in a significant skills gap, undermining Toronto Hydro's ability to innovate in the evolving energy market.

QUESTION (C):

c) Similarly, please discuss any disadvantages where a lower electrification scenario materializes.

RESPONSE (C):

In the case where a significantly lower electrification scenario materializes, accompanied by overinvestment along various time horizons as highlighted above, the central disadvantage would be the risk of underutilized or stranded assets and technological obsolescence leading to increased electricity rates for customers. These risks, as well as the risks discussed in response to parts (b) and (c) of this question emphasize the importance of flexibility, accurate demand forecasting, and adaptive planning in Toronto Hydro's investment strategies to mitigate financial risks and system

performance risks, ensure customer satisfaction, and align with broader environmental and policy objectives.

RESPONSES TO DISTRIBUTED RESOURCE COALITION INTERROGATORIES

INTERROGATORY 1B-DRC-4

Reference: Exhibit 1B, Tab 1, Schedule 1, pp. 12-13

Preamble:

THESL is seeking to grow its workforce by approximately 25 percent "to have the required resourcing capacity and capabilities to sustain foundations of a safe and reliable grid and meet the imperatives of an urban city and customers who are increasingly relying on electricity to expand, digitize and decarbonize their footprint."

QUESTION (A):

a) Please identify in the record THESL provides details of how technological advancement will require training their workforce over the course of years to ensure THESL is able to sustain a safe and reliable grid as the energy transition accelerates.

RESPONSE (A):

Please see Exhibit 4, Tab 4, Schedule 3, Pages 8-13.

QUESTION (B):

b) Please confirm and comment on whether the anticipated widespread adoption of DERs and EVs over the next five years and beyond will require investments in THESL's workforce and please discuss what will be involved in training the workforce for your proposed approach (timeframes, new approaches, etc.)

RESPONSE (B):

Please see part a) above and Exhibit 4, Tab 4, Schedule 3, pages 22-25.

QUESTION (C):

c) Please comment on what training, programs, and investments will be needed if a more ambitious energy transition and DER adoption scenario occurs over the next five years and beyond. In your response, please comment on what training and upgrading of workforce skills will be needed to ensure that THESL's workforce is able to meet the challenges of an accelerated energy transition in this and the next decade and how does this compare to THESL's current approach and the approach proposed in the Application.

RESPONSE (C):

Please see response to part b above.

RESPONSES TO DISTRIBUTED RESOURCE COALITION INTERROGATORIES

INTERROGATORY 1B-DRC-5

References: Exhibit 1B, Tab 2 – 4

Exhibit 2B, Section E7.2

Preamble:

THESL notes that the Investment Plan optimizes near-term system capacity through, among others, the targeted use of non-wires solutions including grid-side technologies such as renewable enabling energy storage systems. THESL notes that for the proposed Non-Wires Solutions Program will focus on developing a scalable, demand-driven, energy storage system ("ESS") strategy that is responsive to distribution system needs and supports THESL's pathway to renewable integration and electrification.

QUESTION (A) :

Please indicate whether EV batteries are expressly and/or implicitly, included in THESL's definition of ESS and, if so, how?

RESPONSE (A):

Toronto Hydro's ESS strategy focuses on Toronto Hydro owned and operated, front-of-the-meter assets. As such, customer owned EV batteries are not part of this particular strategy. However, as a non-wires solution, EV batteries could play a role in the future. Please see the response to part (b).

QUESTION (B) :

Please explain how THESL proposes to optimize efficiencies from the many EV batteries and charging infrastructure in its systems?

RESPONSE (B):

The non-wires solutions (NWS) considered for the 2025-2029 rate period have been outlined in detail in Exhibit 2B Section E7.2. Toronto Hydro's use of NWS is targeted and focuses on credible capital deferral opportunities, and thus, the application of these solutions is limited to instances where such deferral opportunities can be identified and measured.

The use case identified at this time is limited to bus-level load transfer deferral or avoidance. This can be achieved through the procurement of dispatchable demand response from aggregators or customers. Toronto Hydro is agnostic to the technology (type of DER) or approach (load curtailment) utilized by aggregators or customers to deliver this demand response capacity. Participants are compensated based on measured and verified performance, utilizing the methodology outlined in IESO's Market Manual 12 – Issue 16.

When Toronto Hydro runs its LDR procurements, aggregators are invited to offer capacity. If the volume of electric vehicles (EVs) with bi-directional chargers reaches levels where the capacity could be aggregated to provide meaningful capacity, aggregators will be welcome to bid this capacity into the LDR process. If the cost of such capacity is competitive, Toronto Hydro will work with these aggregators to leverage the devices mentioned.

QUESTION (C) :

Please itemize all of the benefits that an EV ESS may have and provide THESL's rationale for not pursuing any specific EV ESS projects at this time given the stated benefits.

RESPONSE (C):

Toronto Hydro is open to procuring services from EV ESS if and when such devices can be aggregated to provided meaningful capacity to the grid. Toronto Hydro runs open DR procurements and invites interested aggregators to provide capacity from such devices if and when it is available.

RESPONSES TO DISTRIBUTED RESOURCE COALITION INTERROGATORIES

INTERROGATORY 1B-DRC-06

Reference: Exhibit 1B, Tab 4, Schedule 1

Exhibit 1B, Tab 4, Schedule 2

Preamble:

THESL indicates that its innovation activities include integrating DERs, preparing for electrification by augmenting the capacity planning process with new scenarios-based modelling, launching an internal sandbox initiative, conducting an EV "smart charging" pilot with both Plug 'n' Drive and Elocity. THESL is also proposing to establish a $16 million Innovation Fund to support the design and execution of innovative pilot projects over the 2025-2029 rate period.

QUESTION (A):

a) Please comment on whether the Innovation Fund will be dedicated solely to DER-related projects and whether there will be opportunities for further stakeholder participation regarding the allocation of funding for projects under the Innovation Fund.

RESPONSE (A):

The Innovation Fund will not be dedicated solely to DER-related projects. Rather, it will be dedicated to pilot projects that are aligned with the OEB's expectations for electricity distributors as set out in the FEI report and the Filing Requirements, including but not limited to developing capabilities to prepare for the impact of DERs on distribution systems. For more information on the types of projects that the Innovation Fund will focus on please see the Areas of Innovation (Section 3) and Pilot Selection and Design Phases (Section 4.1) of the Innovation Fund evidence found in Exhibit 1B, Tab 4, Schedule 2. Please also refer to Toronto Hydro's response to interrogatory 1B-CCC-46.

Decisions with respect to selection of projects and resulting allocation of funding under the Innovation Fund will be overseen by the Innovation Fund steering committee. As noted in the Pilot

Selection and Design Phases (Section 4.1) of the referenced evidence, stakeholder participation will inform the Pilot Selection phase by canvassing ideas and solutions to help Toronto Hydro gain a better understanding of what is feasible, what has potential business value, and what presents opportunities for scalability to leverage external funding.

QUESTION (B):

b) How does the proposed allocation of $16 million the Innovation Fund compare with total dollar amount funding in comparable jurisdictions?

RESPONSE (B):

Please refer to Toronto Hydro's response to interrogatory 1B-DRC-06 part (d).

QUESTION (C):

c) What types of projects will be eligible for funding under the Innovation Fund and what types of projects will be unable to access funding as a result of allocating only 0.3% of revenue as opposed to up to 1%?

RESPONSE (C):

Toronto Hydro would like to clarify that funding for the proposed Innovation Fund is not an allocation of revenue. Rather, Toronto Hydro has determined the amount of funding requested for this proposal, based on the top-down assumption of 0.3% of revenue requirement. This amount reflects the low end of the range identified in the utility's research as noted above and will be recovered through a rate rider as explained in the response to interrogatory 9-Staff-342.

The types of pilot projects to be supported by the proposed Innovation Fund will be determined based on the parameters set out in the evidence, as applied through the Governance Framework. For information on how Toronto Hydro will select and prioritize projects, see response to 1B-CCC-46 and Sections 3 (Areas of Innovation) and 4.2 (Pilot Selection and Design Phases) of the Innovation Fund proposal found in Exhibit 1B, Tab 4, Schedule 2.

QUESTION (D):

d) Please provide any and all analysis, reports, studies, presentations, data or other documentation with respect to developing the proposal for the Innovation Fund, including all THESL's research regarding utility investments across comparable innovation initiatives and research and development activities (i.e., the range from 0.3 to 1 percent of revenues).

RESPONSE (D):

Please see the detailed evidence in Exhibit 1B, Tab 4, Schedule 2. Attached as an appendix to this response, Toronto Hydro has provided a table summarizing the research conducted with respect to the Innovation Fund. Internal documentation relating to the development of the proposal is not relevant because it reflects considerations that are draft in nature, and which provide no further probative value to assessing the merits of the Innovation Fund proposal detailed in the evidence.

QUESTION (E):

e) Please discuss the findings of THESL's research regarding comparable innovation investments including which jurisdictions were considered, the types of projects that received funding, and any lessons learned from these projects and broader innovation funding and investments.

RESPONSE (E):

Toronto Hydro summarized the findings of its jurisdictional research in pages 5-6 (Rationale for the Innovation Fund) of Exhibit 2B, Tab 4, Schedule 2. Additionally, please see response to part (d) above for a description of Toronto Hydro's analysis.

QUESTION (F):

f) When selecting projects to fund through the Innovation Fund, will THESL look at what pilots and program successfully implemented by comparable utilities and then propose pilots that potential partners could assist with as part of THESL's services? If not, why not.

RESPONSE (F):

Please see Toronto Hydro's response to interrogatory 1B-CCC-46 part (a).

QUESTION (G):

g) Please discuss and elaborate on why pilots specific to THESL are necessary or helpful as opposed to considering the outcomes of innovation projects by comparable utilities (Ontario or otherwise) then applying the outcomes and learnings to THESL's services.

RESPONSE (G):

As stated in the Innovation Fund evidence, adopting solutions implemented by other utilities is not a "cut-and-paste" exercise as it requires further in-depth exploration and testing. Each distributor and each distribution system have different operating characteristics, and this is particularly true for Toronto Hydro and its urban distribution system which serves a diverse customer base and reflects the amalgamation of six different municipal utilities. In the Pilot Selection and Design Phases (Section 4.2), Toronto Hydro intends to engage external stakeholders to inform pilot selection. Included in the list of external stakeholders are other Ontario distributors, who will be canvassed on their experience and knowledge.

QUESTION (H):

h) Why were these specific attributes for DERs selected?

RESPONSE (H):

As stated in the referenced evidence, the need for the Innovation Fund proposal is driven by multiple imperatives, including meeting the OEB's expectations for electricity distributors to be prepared for the impacts of DERs on the distribution system. Other imperatives that more broadly underpin the need for the Innovation Fund include developing capabilities to adapt to the changing energy landscape, such as the energy transition and electrification of key economic sectors utilizing space heating and transportation.

QUESTION (I):

i) Please identify the senior utility leaders who will oversee the Innovation Fund and the selection of projects and discuss how interested stakeholders will be able to assist with generating creative and innovative projects and whether funding will be available to ensure adequate stakeholder participation?

RESPONSE (I):

The Innovation Fund evidence indicates the four-phase process outlined in the Governance Framework will be overseen by a steering committee of senior utility leaders and managed by pilot project 'owners' whose business responsibilities correspond to the Area of Responsibility of the pilot project that has been designated by the steering committee. The senior leaders and project owners will be determined upon approval of the Innovation Fund proposal and other material requests outlined in this rate application.

The evidence further outlines that the steering committee will have a supervisory role over the management of the pilot project team, as it will be responsible for making key decisions such as approving project scopes and budgets. The project owners will be responsible for managing the day-to-day activities of designing, executing, and reporting on the pilot projects.

Since stakeholder participation is embedded into the pilot selection phase, it is part of the Innovation Fund and will be allocated resources to support undertaking stakeholder engagement activities. The format and other specifics of stakeholder engagement will be determined upon approval of the Innovation Fund proposal. For details on the role of stakeholder participation in the Governance Framework, please see Toronto Hydro's response to interrogatory 1B-CCC-46 part (a).

QUESTION (J):

j) Please discuss and provide further examples of what the ideas and projects put forward through the Sandbox and what information and data are being shared with THESL employees overseeing the operation and implementation of the Sandbox. Please also

discuss how the outcomes of the Sandbox are being communicated and shared with relevant and interested stakeholders. If information is not readily available or shared with stakeholder, please explain why not and what mechanisms exist (or should exist) to share such information in a timely and meaningful way.

RESPONSE (J):

Examples of ideas that have been submitted are detailed in Exhibit 1B, Tab 4, Schedule 1 at pages 2 and 3. The outcomes of projects are shared through internal communications channels, including but not limited to: employee roadshows, employee intranet, electronic notice boards and through other employee engagement avenues. For more information about how Toronto Hydro is leveraging its experience and learnings with the sector in terms of developing DER integration capabilities for peak management purposes, please also see Toronto Hydro's response to 1B-Staff-40(b).

Jurisdiction	Innovation Investments	Level of Funding
NV-RME (Norwegian Energy Regulatory Authority)	Targets projects that test out new, innovative solutions connected to flexibility, aggregation, and new tariffs to improve pricing signals.[i]	0.3% of asset base[ii]
Ofgem	Eligibility requirements include: (1) facilitate energy system transition and/or benefit consumers in vulnerable situations; (2) potential to deliver a net benefit to customers; (3) Involve research, development or demonstration (e.g. new technology, new methodology, novel arrangement or operational practice); (4) develop new learning; (5) must be innovative (e.g. unproven business case entailing a degree of risk); (6) not lead to unnecessary duplication.[iii]	0.5%-1% of base revenues - Network Innovation Allowance[iv]
New York Public Services Commission (NYPC)	Reforming Energy Vision (REV) projects that explore reshaping utility business practices to encourage new roles and business models for electric utilities, including:[v] • DER integration and consumer behaviours and expectations around distributed generation and other new types of technologies such as energy efficiency and demand response; • Advance the concept of the utility as a distribution platform company, which through incentives and price signals encourages technological innovation; • Leveraging collaboration and experts to understand specific technology challenges and identify potential solutions to address them.	0.5% of total revenue requirement or $10 million annually - Reforming Energy Vision (REV) Demonstrations[vi]
Australia Energy Regulator	Researching, developing or implementing demand management capability or capacity. Eligible projects must be innovative, meaning: new or original concepts, including new or original ways of building or developing capability and capacity to undertake, facilitate or utilize demand management; or	0.75-1% of Annual Revenue Requirement (ARR) under Demand Management Innovation Allowance Mechanism[viii]

Jurisdiction	Innovation Investments	Level of Funding
	technology not previously implemented; or focused on customers in a market that has not been exposed to the technology[vii]	
California Public Utilities Commission	EPIC-4 funding streams include: accelerate advancements in renewable generation technologies; create a more nimble grid to maintain reliability for 100% clean energy; increase value of DER; improve customer value of energy efficiency and electrification technologies, etc.[ix]	$13.61 USD per customer annually – EPIC (Electric Program Investment Charge)[x]
Minnesota Public Utilities Commission	Remove barriers to entry for renewable energy technologies, including economic barriers from competing against conventional energy sources, targeting areas of energy productions, research and development projects, and educational research initiatives[xi]	$9.12 USD per customer annually – Renewable Development Fund (RDF)[xii]
Massachusetts Department of Public Utilities	Utilities to propose projects focused on testing, piloting, and deploying RD&D projects that modernize the grid and employ new technologies including for optimizing system performances through grid visibility, command and control, and self-healing, optimize system demand, and interconnection and integrate DERs as part of Grid Modernization Plan.[xiii]	Eversource: $14.26 USD per customer annually[xiv]
Enbridge Energy Transition Technology Fund (Proposed in EB-2022-0220)	Advance research, development, and commercialization of low-carbon technologies that reduce GHG emissions, including RNG and low-carbon fuels; emissions reduction through end-use (including hydrogen); Carbon Capture Utilization & Sequestering (CCUS)[xv]	$5 million CAD annually / $25 million total over 5 years; approx. 0.4% of revenue requirements proposed for test year (2024)[xvi]
Hydro-Quebec	n/a	Spends 1% of total revenues on R&D[xvii]
Ontario Power Generation	n/a	Spends 0.7% of total revenues on R&D[xviii]

RESPONSES TO ENVIRONMENTAL DEFENCE INTERROGATORIES

INTERROGATORY 1B-ED-1

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 10

QUESTION (A):

a) Enbridge's Pathways to Net Zero forecasts a tripling of demand whereas Toronto Hydro and the IESO forecast demand doubling. Please explain why Enbridge comes up with a significantly different figure and discuss which one Toronto Hydro believes is correct.

RESPONSE (A):

Toronto Hydro's Future Energy Scenarios ("FES") should not be confused with a forecast. The outputs of FES are based on contrasting future scenario worlds (essentially "what if" scenarios), implemented via technology uptake and consumer behaviour models, and applied geospatially to Toronto Hydro's unique service territory, customer base, and distribution network. These scenario worlds were chosen with the intention of demonstrating a reasonable range of potential outcomes over the long-term, at the network level of Toronto Hydro's distribution system (as opposed to the Ontario bulk system in the IESO's study, for example).

In general, it is important to bear in mind that these studies are approaching different subjects (e.g., peak demand ranges in FES vs. costed GHG reduction pathways in Enbridge's study), at different levels of granularity (e.g., Toronto vs. provincial), using distinct modelling approaches, assumptions and data sources. For these reasons, a simple comparison between Toronto Hydro's Future Energy Scenarios and the referenced Enbridge and IESO studies is not feasible. The analysis in the Future Scenarios provides a reasonable outlook into the future possible system demands the utility faces in a range of credible energy transition scenarios.

RESPONSES TO ENVIRONMENTAL DEFENCE INTERROGATORIES

INTERROGATORY 1-ED-02

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 34

QUESTION (A):

a) Toronto Hydro states that its proposed Innovation Fund "is the low end of a range found in research of comparable ratepayer-funded initiatives aimed at facilitating innovation by utilities and regulatory bodies in other jurisdictions, as well as general data on utility spending for research and development activities." Please provide this analysis.

RESPONSE (A):

Please see Toronto Hydro's response to interrogatory 1B-DRC-06 part d).

QUESTION (B):

b) If Toronto Hydro were to set its Innovation Fund budget at the mid-range of comparable initiatives, what would the budget be?

RESPONSE (B):

If Toronto Hydro was to fund its Innovation Fund through a rate rider based on the mid-range of what it found in its research, Toronto Hydro would calculate an amount equal to 0.5% of its Revenue Requirement instead of 0.3%, which would result in approximately $27 million of funding for the Innovation Fund.

QUESTION (C):

c) What additional activities would Toronto Hydro undertake with a mid-range Innovation Fund budget?

RESPONSE (C):

The activities described in the four phases of the Governance Framework present a methodology, which is flexible with respect to budget, since it provides a roadmap for implementation rather than setting the scope of work. In contrast, the areas of innovation that can be addressed and the pilot projects that can be undertaken in connection with areas of innovation are affected by budget. Since Toronto Hydro has proposed the Innovation Fund to be at the low end of the range of funding found in its research, it has not considered what additional activities it might be able to undertake with a mid-range budget. However, the effect of a larger budget would likely be that Toronto Hydro could propose more areas of innovation and/or more pilot projects or larger scale pilot projects within the planned areas of innovation.

QUESTION (D):

d) How will the Innovation Fund rate rider be charged to residential customers - variable or fixed?

RESPONSE (D):

The Innovation Fund Rate Rider will be charged to residential customers as a fixed charge, consistent with the Distribution Revenue rate design for these classes. For a breakdown of how the Innovation Fund Rate Rider will be collected over the rate period, see Exhibit 9, Tab 3, Schedule 1 (Rate Rider Table).

QUESTION (E):

e) Is Toronto Hydro open to other Ontario utilities participating in its Innovation Fund pilots and benefiting from the results?

RESPONSE (E):

Please see Toronto Hydro's response to interrogatory 1B-CCC-46 part a).

RESPONSES TO ENVIRONMENTAL DEFENCE INTERROGATORIES

INTERROGATORY 1B-ED-3

Reference: Exhibit 1B, Tab 3, Schedule 1, Page 38

QUESTION (A):

a) Please provide a table listing each building owned by Toronto Hydro, how they are heated, their approximate annual gas consumption, the age of any fossil fuel heating equipment, the approximate life left in any fossil fuel heating equipment, the annual fossil fuel costs (all inclusive, including commodity, delivery, and fixed charges), and the annual incremental electricity costs that would arise were the fossil fuel equipment with an appropriate electric heat pump.

RESPONSE (A):

All of Toronto Hydro's station buildings rely on electric heating and therefore, the following information relates to the utility's four work centres only, which rely on a mix of fuel sources, including fossil fuel. Please refer to the appendix to this response, which lists the fossil fuel heating equipment currently in service in the utility's 4 work centres, remaining useful lives of the assets, annual fuel costs, and gas consumption.

Toronto Hydro is unable to reliably estimate incremental electricity costs from replacing fossil fuel equipment with electric heat pumps since asset replacements may not be always like for like. For example, capacity limitations might require replacing one fossil fuel unit with multiple electric heat pumps or the addition of supplemental heating sources such as electric baseboard heaters. Moreover, heating system efficiencies vary across assets and work centres, adding to the difficulty of estimating incremental electricity costs.

QUESTION (B):

b) If any of its fossil fuel heating equipment reaches the end of its life within the rate term, will Toronto Hydro replace it with electric or fossil fuel equipment?

RESPONSE (B):

Yes, Toronto Hydro plans to replace poor condition end of life fossil fuel heating equipment in its buildings with electric or hybrid equipment, in accordance with prudent asset management practices under the utility's Facilities Asset Management Strategy[1] and with a view to successfully executing the Net Zero 2040 Strategy.[2]

As shown in the response to part (a), the majority of fossil fuel heating equipment coming at end of life in the 2025-2029 rate period are located at the 500 Commissioners work centre, where the utility expects to focus most of its investments.

[1] Exhibit 2B, Section D6.
[2] Exhibit 2B, Section D7.

RESPONSES TO ENVIRONMENTAL DEFENCE INTERROGATORIES

INTERROGATORY 1B-ED-4

Reference: Exhibit 1B, Tab 3, Schedule 1, Page 47

QUESTION (A):

For historic and planned LDR, please indicate (i) the percent which also provides demand response for provincial capacity purposes, (ii) the percent that involves gas-fired generation, (iii) the percent that involves storage, (iv) the percent that involves the purchase of DR from a pre-existing DER.

RESPONSE (A):

(i) Historically and currently, the capacity that has been utilized by Toronto Hydro for its LDR program has not been, and is not, simultaneously committed to the IESO's Capacity Auction. The LDR program only simulates providing demand response for provincial capacity purposes for the purposes of the Grid Innovation Fund pilot project as described in Section E7.2.1.4. of the Non-Wires Solutions program found at Exhibit 2B, Section E7.2.

(ii) Between 2018-2020, 87% of the demand response capacity committed to Toronto Hydro's LDR program involved the use of gas-fired generation. From 2020-2024, 0% of the demand response capacity committed to Toronto Hydro's LDR program relies on gas-fired generation.

(iii) Toronto Hydro has not yet received any DR capacity from storage resources, despite the fact that storage resources are eligible for participation.

(iv) All of the DERs that have been involved in provided DR capacity to Toronto Hydro existed prior to the launch of the procurements.

RESPONSES TO ENVIRONMENTAL DEFENCE INTERROGATORIES

INTERROGATORY 1B-ED-5

Reference: Exhibit 1B, Tab 3, Schedule 1, Page 50

QUESTION (A):

Please quantify the benefits of the proposed NWAs to electricity customers as a whole on a best-efforts basis.

RESPONSE (A):

The rate-payer benefits associated with the NWS program is outlined in detail in Exhibit 1B, Tab 3, Schedule 1 at pages 49-55.

QUESTION (B):

Please provide the underlying calculation spreadsheets for the benefits-cost analysis of the proposed LDR Flexible System Capacity, including any DCF spreadsheets. Please include the lifetime savings.

RESPONSE (B):

Please see the response to interrogatory 1B-Staff-49.

RESPONSES TO ENVIRONMENTAL DEFENCE INTERROGATORIES

INTERROGATORY 1B-ED-6

Reference: Exhibit 1B, Tab 4, Schedule 1, Page 15

QUESTION (A):

a) How many and what percent of Toronto Hydro customers are unable to connect a DER to the system due to capacity constraints?

RESPONSE (A):

Currently, there are five station buses unable to host DERs. This represents approximately 5 percent of Toronto Hydro's system. Please refer to Table 1 of Exhibit 2B, Section E3.3.

QUESTION (B):

b) Please estimate how many and what percent of Toronto Hydro customers will still be unable to connect a DER to the system due to capacity constraints by 2029 after additional investments by Toronto Hydro?

RESPONSE (B)

Toronto Hydro's proposed investments in Generation Protection, Monitoring and Control (GPMC) (Exhibit 2B, Section E5.5) and Stations Expansion (Section E7.4) target all system restrictions preventing the connection of DERs to the system. In addition, system capacity investments through the Load Demand (Exhibit 2B, Section E5.3) and Non-Wires Solutions (Section E7.2) programs are intended to alleviate expected system constraints to connecting DERs by 2029, such as improving minimum generation to load ratio (MLGR).

QUESTION (C):

c) Please provide a table showing the Toronto Hydro feeders, whether they are constrained, how many customers are attached to each, whether the constraint is short-circuit or thermal, and whether the constraint will be eliminated or lessened within the rate term.

RESPONSE (C):

Please see Table 1 in Exhibit 2B, Section E3.3.

QUESTION (D):

d) The application states: "Toronto Hydro plans to deploy nine energy storage systems, with an aggregate capacity of 10.2 MW, to enable the connection of forecasted renewable growth on nine high-priority feeders." Approximately how many customers will be impacted by this investment? Please list the relevant feeders, the nature of the restriction, and how many customers will be able install DERs due to the lifting of the restriction.

RESPONSE (D):

Please refer to Exhibit 2B Section E7.2 Table 20 for the nine planned ESS projects at respective priority feeders with an aggregate capacity of 10.2MW, intended to enable an aggregate renewable generation capacity of 6.12MW. The planned investments do not directly correlate to an impacted number of customers, which will depend on the size of the DERs as they materialize. Toronto Hydro's proposed investments will relieve minimum load to generation ratio (MLGR) restrictions.

QUESTION (E):

e) Does Toronto Hydro provide flexible hosting capacity? If not, when will it do so?

RESPONSE (E):

At this time, Toronto Hydro does not provided flexible connections. However, this is a capability that the utility has put forward as a pilot project concept that could be supported by its proposed Innovation Fund (see Exhibit 1B, Tab 4, Schedule 2, Appendix A, pages 2-3 for more details). Toronto Hydro also notes that flexible hosting capacity arrangements have been proposed as part

of the OEB's Distributed Energy Resources (DER) Connections Review. On January 29, 2024, the OEB introduced a proposal for a new section 6.2.4.1A of the Distribution System Code, which will outline how distributors can establish specific system or operating conditions and/or contractual terms that will require the output or operation of the proposed embedded generation facility to be varied.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-1

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 2.3.2 Complex Operating Conditions, Table 1: Ontario Cities Population Density

Preamble:

The population density of Etobicoke, North York, and Scarborough is similar to the population density of Mississauga, Brampton, Vaughan, Richmond Hill, Markham, Pickering, Whitby, and Oshawa.

QUESTION (A):

a) Please expand Table 1 to show the population densities of Etobicoke, North York, Scarborough, Mississauga, Brampton, Vaughan, Richmond Hill, Markham, Pickering, Whitby and Oshawa and file it.

RESPONSE (A):

Cities	Population (People)	Land Mass (km^2)	Population Density (People/km^2)
Toronto[1]	2,794,356	631.1	4,428
Ottawa	1,017,449	2788.2	365
Mississauga	717,961	292.74	2,453
Brampton	656,480	265.89	2,469
Hamilton	569,353	1118.31	509
Richmond Hill	202,022	100.79	2,004
Vaughan	323,103	272.44	1,186
Markham	338,503	210.93	1,605
Pickering	99,186	231.10	429

[1] Toronto Hydro notes that the municipality of City of Toronto already includes the boroughs of Etobicoke, North York, and Scarborough.

Cities	Population (People)	Land Mass (km^2)	Population Density (People/km^2)
Whitby	138,501	146.69	944
Oshawa	175,383	145.72	1,204

QUESTION (B) :

b) Please confirm that there are large areas of agricultural land within city limits of Hamilton and Oshawa.

RESPONSE (B):

Toronto Hydro is familiar with the characteristics of its service territory and the boundaries of the City of Toronto, but does not have similar detailed data regarding the municipal boundaries and service territories applicable to all other utilities.

QUESTION (C) :

c) What is the population density of Mississauga if the land occupied by Pearson Airport is excluded.

RESPONSE (C):

Please see part b) above.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-2

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 2.3.2 Complex Operating Conditions and Table 2

Preamble:

"The density of Toronto Hydro's service territory is unique even within an international context due to the ever-increasing number of high-rise buildings."

QUESTION (A):

a) Please provide Toronto Hydro's definition of a high-rise building.

RESPONSE (A):

Please see footnote 28: "High-rise building is a multi-floor building of at least 12 stories or 35m in height. As per data from SkyscraperPage, Global Cities & Buildings Database https://skyscraperpage.com/cities/#notes".

QUESTION (B):

b) Table 2 indicates that there are 2,598 high rise buildings in Toronto. How many of those buildings use natural gas for space and water heating? How many of those buildings have a natural gas or diesel emergency power generator?

RESPONSE (B):

Toronto Hydro does not track this type of data.

QUESTION (C):

c) Please list the cost impacts that construction of high-rise buildings imposes on Toronto Hydro.

RESPONSE (C):

High-rise buildings are not tracked distinctly from other types of connection projects. Customer connections costs are evaluated in accordance with DSC Section 3 Connection and Expansions, and evaluated based on the new customer's connection and expansion asset requirements. If new facilities must be constructed to the main distribution system in order to connect the Customer, those facilities (expansion) are evaluated via the prescribed economic evaluation in DSC Appendix B. The economic evaluation determines the amount of capital contribution that will be required by the Customer for the expansion work. The customer is responsible for the connection asset costs (connection from the main distribution system to the customer's demarcation point) less the basic connection allowance.

QUESTION (D):

d) Does Toronto Hydro believe that existing ratepayers should subsidize developers of high-rise buildings? Please explain your answer.

RESPONSE (D):

Toronto Hydro is licensed by the Ontario Energy Board ("OEB") to supply electricity to Customers as described in the Electricity Distribution License issued to Toronto Hydro on October 17, 2003 by the OEB. Additionally, there are requirements imposed on Toronto Hydro by the various codes referred to in the Distribution License and by the *Electricity Act, 1998* and the *Ontario Energy Board Act, 1998*, including the Distribution System Code. As a licensed distributor of electricity, Toronto Hydro is obligated to connect customers to its distribution system and must adhere to the laws, regulations, and codes to effect customer connections. This includes cost allocation and treatment of service connections in a manner compliant with the laws, regulations and codes.

QUESTION (E):

e) Are developers of high-rise buildings required to pay contributions in aid of construction to offset the costs they impose on Toronto Hydro? If the answer is yes, please explain how these contributions are assessed and the total amount collected by Toronto Hydro in the most recent

year for which a total amount is available. If the answer is no, please explain why not.

RESPONSE (E):

Please refer to Toronto Hydro's response to parts c) and d) above.

With regards to the total amount of contributions collected by Toronto Hydro, by year, please refer to Exhibit 2B, Section E5.1, Table 9, pages 18-19.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-3

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 2.3.2 Complex Operating Conditions

Preamble:

"In addition to high-rise buildings, this growth is also driving the development of sustainable new housing communities through the redevelopment of areas such as Downsview, the Golden Mile and the Port Lands, some of which are planned as net zero communities and to meet the highest performance measures of the Toronto Green Standard."

QUESTION (A):

a) Please provide Toronto Hydro's definition of "sustainable new housing communities."

RESPONSE (A):

Sustainable new housing communities in this context refers to new developments that have been approved by the City of Toronto Planning that conform to current and future versions of the Toronto Green Standard (TGS).

QUESTION (B):

b) Please file the Toronto Green Standard and identify the "highest performance measures."

RESPONSE (B):

The Toronto Green Standard (TGS) is owned and managed by the City of Toronto. More information may be found on the City of Toronto website - https://www.toronto.ca/city-government/planning-development/official-plan-guidelines/toronto-green-standard/. Performance targets are established based on type of development, this framework can be found on the above website.

QUESTION (C):

c) Does Toronto Hydro audit claims of measurement of highest performance under the Toronto Green Standard?

RESPONSE (C):

The Toronto Green Standard is audited and enforced by the City of Toronto. More information may be found on the City of Toronto website - https://www.toronto.ca/city-government/planning-development/official-plan-guidelines/toronto-green-standard/.

QUESTION (D):

d) Do sustainable new housing communities impose additional costs on Toronto Hydro than do existing communities?

RESPONSE (D):

Sustainable new housing communities do not incur additional costs nor are they treated differently from other customers. The supply of electricity or related services by Toronto Hydro to any customer are subject to the same assessment and requirements outlined in Toronto Hydro's Conditions of Service, which comply with the requirements of the Distribution System Code.

QUESTION (E):

e) Does Toronto Hydro believe that ratepayers in existing communities should subsidize ratepayers in new sustainable communities? Please explain your answer.

RESPONSE (E):

There is no cross subsidy, please refer to response d) above. As a licensed distributor of electricity, Toronto Hydro is obligated to connect customers to its distribution system and must adhere to the laws, regulations, and codes to effect customer connections. This includes cost allocation and treatment of service connections in a manner compliant with the laws, regulations and codes.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-4

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 2.3.4 Extreme Weather

Preamble:

"Extreme weather amplifies the challenge of distributing electricity to a mature, dense and rapidly growing urban city. Heat, high winds, heavy rainfall, freezing rain and heavy snowfall can cause major system damage and result in prolonged power outages. As evidenced by recent events (outlined in Table 3 below), extreme weather has become a regular operating condition that the utility must consider and manage in its day-to-day operations and long-term planning activities. With the frequency and intensity of adverse weather increasing due to climate change, Toronto Hydro's grid and operations must become more resilient to this challenge."

QUESTION:

Please provide Toronto Hydro's definitions of "extreme weather," "averse weather," "climate change" and "prolonged power outage."

RESPONSE:

Toronto Hydro defines "extreme weather" and "adverse weather" as rain, ice storms, snow, winds, extreme temperatures (heat and cold), freezing rain, frost, or other extreme weather conditions that are likely to affect grid operations.

The utility uses the Intergovernmental Panel for Climate Change's ("IPCC") definition of climate change as "a change in the state of the climate that can be identified (e.g., by using statistical tests) by changes in the mean and/ or the variability of its properties and that persists for an extended period, typically decades or longer."[1]

[1] https://www.ipcc.ch/site/assets/uploads/sites/4/2022/11/SRCCL_Annex-I-Glossary.pdf

Prolonged power outage refers to an interruption in electric service that lasts longer than typical outages at the distribution level and can extend from several hours to days or even weeks.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-5

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 2.3.1 Technology Advancements

Preamble:

"Integrating DERs into the grid provides customers more tools to actively manage their energy needs and enables the grid to be supplied by locally-generated renewable electricity resources. To advance these outcomes, Toronto Hydro must address the significant challenge of accommodating electrons that flow bidirectionally within a grid that was not built for this type of supply and demand. Equipment that has a high number of DER connections is more likely to experience unstable conditions that pose significant reliability and safety risks to the system and its users. Toronto Hydro monitors all DER connections closely for these factors to ensure that the grid remains safe and reliable for customers, and is building advanced grid capabilities to mitigate against these risks and enable DER adoption by customers in the future."

QUESTION (A):

a) Please confirm that customers who own DER's impose additional costs on Toronto Hydro.

RESPONSE (A):

Confirmed. There are additional costs associated with enabling DER connections. Some of these costs are eligible investments for provincial rate protection pursuant to *Ontario Regulation 330/09*, as outlined in Exhibit 2A, Tab 5, Schedule 1.

QUESTION (B):

b) Does Toronto Hydro require new customers who are installing DER's to pay a contribution to offset the costs they impose on Toronto Hydro?

RESPONSE (B):

Yes. Toronto Hydro complies with the requirements of the Distribution System Code to determine the capital contributions that must be paid by DER customers connecting to the grid.

QUESTION (C):

c) Does Toronto Hydro believe that customers who do not own DERs should subsidize customers who own DERs? Please explain your answer.

RESPONSE (C):

It is not within Toronto Hydro's purview to comment on the cost allocation rules in the Distribution System Code, or the OEB's policy objectives with respect to DER integration. Toronto Hydro notes that investments in Grid Modernization to develop advanced grid capabilities that can support and enable DER adoption by customers in the future, also provide value to load customers in terms of reliability, resiliency and efficiency benefits. Please see Exhibit 2B, Section D5 for more information.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-6

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 2.3.2 Workforce Challenges

Preamble:

"Over this period, as Toronto Hydro's replenished a large wave of retirements, it also right-sized its workforce through continuous improvements in productivity, including harmonizing key jobs to create a more agile compliment of staff, and automating manual processes to increase employee output levels"

QUESTION (A):

a) Please provide Toronto Hydro's definition of "right-sized."

RESPONSE (A):

Please refer to 1B-CCC-14 (b)

QUESTION (B):

b) Does the quoted paragraph indicate that Toronto Hydro has increased or decreased the total number of its employees? Please explain your answer.

RESPONSE (B):

Please refer to 1B-CCC-14 (b)

QUESTION (C):

c) On the average, is the compensation of a newly hired young and inexperienced employee higher or lower than of an old and experienced employee who is retiring? Please explain your answer.

RESPONSE (C):

Please refer to 4-CCMBC-18.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-7

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 3.3 Plan Validation and Finalization, Table 4: Summary of 2025-2029 Proposed Distribution Rate Change

QUESTION (A):

a) Are the amounts shown in Table 4 up to date? If the answer is no, please file the table with the current amounts.

RESPONSE (A):

Toronto Hydro confirm the amounts in Table 4 are up to date.

QUESTION (B):

b) Please expand Table 4 to show percentage rate increases (not bill impacts as shown in Exhibit 1B, Tab 1, Schedule 3, Page 1, Table 1 or Page 3, Table 3 which mask rate increases with other factors) for each year and the average. If such a table is elsewhere in the filing, please provide the reference.

RESPONSE (B):

Please refer to Exhibit 8, Tab 1, Schedule 1, Page 14-16, Table 5.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-8

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 4.2 Growth and City Electrification, Table 6: City Growth and Electrification Capital Programs

QUESTION (A):

a) Is Toronto Hydro charging developers for the costs of relocations to accommodate new high-rise developments? Please discuss.

RESPONSE (A):

If a customer requests that a Toronto Hydro owned asset be relocated, Toronto Hydro applies Distribution System Code Section 3.1.10 – "Where a customer requests the relocation of a distributor-owned asset, the distributor shall recover from that customer the cost of relocating that asset, except to the extent recovery is limited under law."

QUESTION (B):

b) Is Toronto Hydro sharing the costs of relocations for road widening, LRT construction, waterfront reconstruction construction with the City of Toronto, Metrolinx, Waterfront Toronto, and other agencies? Please discuss.

RESPONSE (B):

Please refer to Exhibit 2B, Section E5.2, pages 5-8 for details of cost apportionment between Toronto Hydro and third parties requesting relocation of utility assets to accommodate the maintenance and improvement of public infrastructure.

QUESTION (C):

c) Is Toronto Hydro following the OEB's Distribution System Code in determining the need for contributions for new loads? Please discuss.

RESPONSE (C):

Yes, please refer to Toronto Hydro's response to interrogatory 1B-EP-2 parts (c) and (d).

QUESTION (D):

d) Are the amounts shown in Table 6 net of contributions or are the gross amounts?

RESPONSE (D):

Toronto Hydro confirms that the amounts shown in Table 6 are net of contributions. Please refer to Exhibit 2B, Section E5.1.4.1, Table 9 for the gross, contribution and net Customer Connections expenditures and Exhibit 2B, Section E5.2.4, Table 4 for Externally Initiated Plant Relocations & Expansions expenditures.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-9

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 4.3 Grid Modernization

Preamble:

"The system provides a holistic view of the grid and encompasses advanced applications such as Outage Management System (OMS), Fault Location Isolation and Service Restoration (FLISR), Volt/Var Optimization, which allow swift detection and response to outages and grid disturbances, and enable reliable and efficient management of DERs by optimizing voltage levels and reactive power flows throughout the distribution system."

QUESTION (A):

What percentage of expenditures on OMC, FLISR, and Volt/Var Optimization are required to enable reliable and efficient management of DERs and what percentage of expenditures are required for other reasons? Please explain your answer.

RESPONSE (A):

Toronto Hydro's investments in Outage Management System (OMS), Fault Location Isolation and Service Restoration (FLISR), and Volt/Var Optimization applications are intended to reduce the frequency and duration of outages, improve grid resiliency, enhance the efficiency of outage response, and optimize the distribution system. As such, they are independent of the uptake of DERs or the need to enable DER management.

QUESTION (B):

Are customers who own DER's required to pay a contribution to offset the expenditures that are required to serve them? If the answer is yes, please provide the total amount that is expected to be collected in 2025 from customers who own or rent DER's. If the answer is no, please explain why not.

RESPONSE (B):

No. Customers are only required to pay a capital contribution for project expenses and operational costs to facilitate the DER connection. Toronto Hydro recovers the cost of this connection in accordance with the Distribution System Code.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-10

Reference: Exhibit 1B, Tab 1, Schedule 3, Page 5, Table 5: Customer and Load Growth Changes for 2018-2029

QUESTION (A):

a) Please confirm that Toronto Hydro's evidence as presented in Table 5 shows that electrification will result in a reduction in load. Please explain your answer.

RESPONSE (A):

Toronto Hydro does not confirm that the evidence in Table 5 proves electrification will lead to a decrease in load. Please see response to interrogatory 1B-PP-18.

QUESTION (B):

b) Please confirm that Toronto Hydro is proposing to spend more and more money to deliver less and less electricity. Please explain your answer.

RESPONSE (B):

Toronto Hydro does not confirm this statement. Exhibits 2B and 4 contain detailed evidence of the needed and prudent investments for Toronto Hydro to sustain the distribution system, modernize the grid, connect new customers and DERs, and invest in its workforce in order to provide safe and reliable service in an increasingly complex environment. Further, Toronto Hydro's multi-variate regression analysis forecasting customer and load growth, which explicitly includes historical and forecast CDM assumptions, shows modest growth in system-wide consumption and demand. This customer and load forecast is a separate exercise from Toronto Hydro's peak demand forecast for system planning purposes. That peak demand forecast informs "the planning of capital work programs mainly at the distribution station level (e.g., feeder level) to meet capacity need. The

peak demand forecast considers localized growth and density intensification from new high-rise developments, EVs, and other large connections that are driving the need for investments."[1]

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-11

Reference: Exhibit 1B, Tab 1, Schedule 3, Page 10, Table 10: Proposed Capital Structure and Cost of Capital Parameters

QUESTIONS (A) AND (B):

a) Is Toronto Hydro proposing to use the same 40% deemed equity thickness as the other 57 distributors regulated by the OEB? Please explain your answer.

b) Is Toronto Hydro proposing to use the same 9.36% deemed return on common equity as the other 57 distributors regulated by the OEB? Please explain your answer.

RESPONSE (A) AND (B):

Please see the response to interrogatory 5-Staff-315. Toronto Hydro intends to update the deemed return on equity rate at the time of the DRO based on the Cost of Capital parameters which will be issued by the OEB in the fall of this year.

QUESTION (C):

Does the recent OEB decision in the EB-2023-0143 Getting Ontario Connected Variance account that allowed.

RESPONSE (C):

Toronto Hydro cannot respond because this question is incomplete.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-12

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 2

Preamble:

"The current custom rate framework, which was established in the 2015-2019 Rate Application (EB-2014-0116), provided stability and flexibility as Toronto Hydro grappled with the significant challenge of renewing a rapidly deteriorating distribution system. The 2025-2029 Custom Rate Framework detailed in this schedule is structurally consistent with the rate framework approved by the OEB in past applications, with purposeful evolutions to achieve the objectives summarized below.

Provide multi-year funding certainty and flexibility for Toronto Hydro to:

(i) continue to sustain a reliable grid and safe and effective operations; and

(ii) address current and emerging (externally-driven) needs and challenges that the utility faces in delivering its services and preparing the grid for the energy transition."

QUESTION (A):

a) Please explain why the current rate framework should be changed if it provided "stability and flexibility." Does Toronto Hydro no longer need stability and flexibility?

RESPONSE (A):

As noted in the referenced evidence, Toronto Hydro maintained various components of its prior Custom IR rate framework which facilitate the continuation of stability and flexibility. For a detailed explanation of the rationale for evolving the current rate framework please refer to section 2 of the referenced evidence starting on page 12. With respect to funding implications specifically, Table 2 of the evidence outlines the ROE implications of continuing with the current rate framework.

QUESTION (B):

b) Does Toronto Hydro still have a "rapidly deteriorating distribution system"? If the answer is yes, why has Toronto Hydro management failed to stop the deterioration since the current custom rate framework was established?

RESPONSE (B):

Please refer to Exhibit 2B, Section E2.2.1, which provides an overview of the current condition and reliability performance of Toronto Hydro's distribution asset populations. While the current state of different asset classes varies, in the broadest terms, Toronto Hydro's significant capital investments since 2015 have resulted in stable or improving asset condition and age demographics, and improvements in reliability. Toronto Hydro's 2025-2029 System Renewal plan is built from the bottom up to ensure the utility will continue to make the minimum investment necessary to maintain current levels of asset risk and recent historical reliability performance.

QUESTION (C):

c) Please explain what is meant by the term "structurally consistent" and how it differs from the meaning of the word "consistent"?

RESPONSE (C):

"Structural consistency" generally refers to the uniformity, coherence, or stability of a system, or framework concerning its underlying structure. In the noted reference, "structural" refers to foundational components of the 2025-2029 custom rate framework. Please refer to pages 5 and 6 of the Rate Framework evidence (Exhibit 1B, Tab 2, Schedule 1) for a summary the components of the proposed rate framework, a comparison to the 2020-2024 custom rate framework and an explanation of how the proposed rate framework aligns with the RRF and OEB Rate Handbook.

QUESTION (D):

d) Does the 2025-2029 Custom Rate Framework meet the OEB Filing Requirements for Electricity Distribution Rate Applications, Chapter 3, Incentive Rate Setting Applications? If

the answer is no, please explain why not.

RESPONSE (D):

The premise of this question not consistent with the Chapter 3 Filing Requirements which state at page 1: "*These filing requirements set out the OEB's expectations for electricity distributors' annual rate adjustment applications in between cost of service (CoS) applications under Price Cap IR, or the Annual IR Index, also known as IRM applications.*"

QUESTION (E):

e) Does "multi-year funding certainty" provide more funding certainty than Price Cap IR used by most Ontario Distributors? If the answer is yes, why should Toronto Hydro have more funding certainty than other distributors? If the answer is no, please explain why not?

RESPONSE (E):

Relative to the funding that is available to Toronto Hydro specifically under Price Cap IR, the proposal in this application provides adequate funding certainty. Please refer to 1B-Staff-12 for a breakdown of the revenue differences between Price Cap IR and the proposed custom index. Please refer to the response to 1B-Staff-15 for the implications of Price Cap IR on utility financial performance (ROE).

Toronto Hydro is unable to comment on the funding adequacy of Price Cap IR for other utilities. Such a determination needs to be made on the specific facts and circumstances of each utility in question.

QUESTION (F):

f) Does the proposed 2025-2029 Custom Rate Framework increase or decrease the earnings risk of Toronto Hydro compared to its current rate framework? Please explain your answer.

RESPONSE (F):

The structure of the proposed 2025-2029 Custom Rate Framework places more risk on the utility than the structure of the 2020-2024 Custom Rate Framework. This is because, considering Toronto

Hydro's total cost benchmarking results relied on in this Application, the X-factor applicable under the 2020-2024 Custom Framework would have been approximately 0.45 % (i.e. 0.15% empirical stretch plus a 0.3% incremental stretch factor applied to capital), which is less than the 0.75% combined X-factor proposed in the 2025-2029 Custom Framework. Furthermore, the net difference between the two stretch factors (i.e. 0.3%) represents an amount that the utility would have been able to recover in rates under the 2020-2024 Custom Framework. However, under the 2025-2029 Custom Framework, Toronto Hydro has placed that amount at risk (as an upfront discount for ratepayers for the 2025-2029 rate period) pending the achievement of target performance objectives as outlined in the Custom Scorecard and accompanying PIM evidence in Exhibit 1B, Tab 3, Schedule 1.

QUESTION (G):

g) Does the proposed 2025-2029 Custom Rate Framework allow Toronto Hydro to have a higher or a lower earnings risk than Ontario distributors who use the Price Cap IR rate setting method? Please explain your answer.

RESPONSE (G):

For the reasons noted in part (f), all other things equally considered, Toronto Hydro assumes a greater level of earnings risk.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-14

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 12

Preamble:

"As illustrated in Figure 1 below, the continuation of a custom-rate setting approach is necessary for Toronto Hydro as funding derived from the OEB's standard Price Cap and IRM framework is insufficient to fund the plan's imperatives of system stewardship, growth and electrification, and modernization."

QUESTION (A):

a) Does Toronto Hydro believe that OEB's standard Price Cap IRM framework is inadequate to fund "imperatives of system stewardship, growth and electrification, and modernization" of electricity distributors and should be changed? Please explain your answer.

RESPONSE (A):

Within the context of Toronto Hydro's investment needs, Price Cap IR is inadequate to fund "imperatives of system stewardship, growth and electrification, and modernization." Please see the response to 1B-Staff-3(b) as it relates to funding under Price Cap IR.

The RFF provides a Custom IR approach for utilities that are in Toronto Hydro's circumstance, for whom Price Cap IR is insufficient. Toronto Hydro declines to comment on whether Price Cap IR should be changed, as the question is not relevant to this Custom IR proceeding.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-15

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 13

Preamble:

"Under a standard IRM scenario, Toronto Hydro's 2025-2029 capital investment plan would be underfunded by approximately 35 percent or $1.5 billion. Adoption of a plan constrained by this funding envelope would force the utility into a sustainment plan that would be almost entirely reactive in nature, resulting in roughly an 8 percent deterioration in system reliability by the end of the rate period, along with increases in safety and environmental risks and reactive replacement costs due to increasing numbers of asset failures."

QUESTIONS (A):

a) Please file the calculation that shows the derivation of the "8 percent deterioration in system reliability".

RESPONSE (A):

The 8 percent deterioration in system reliability was calculated as the percentage difference between 2018-2022 SAIDI (Excluding Loss of Supply, Major Events, and Scheduled Outages) of 48.16 and the projected 5-year rolling average at the end of the rate period under the IRM scenario of 51.91 minutes (see Figure 1 in Exhibit 1B, Tab 3, Schedule 1). For more details on Toronto Hydro's reliability projection models, please refer to interrogatory 2B-SEC-42.

QUESTION (B):

b) Would the "8 percent deterioration in system reliability" be experienced throughout the Toronto Hydro service area? If the answer is no, please provide the percentage of deterioration in each area.

RESPONSE (B):

Toronto Hydro's reliability projection methodology is not currently designed to forecast reliability for sub-divisions of the system. The eight percent deterioration is a system-wide average.

QUESTION (C):

c) Is Toronto Hydro claiming that only unconstrained spending can prevent a deterioration in system reliability?

RESPONSE (C):

No. Toronto Hydro's 2025-2029 Investment Plan establishes the necessary level of funding to manage System Reliability over the next rate period. It is not unconstrained. Key investments in expanding, modernizing, and sustaining the foundations of the grid will be critical for System Reliability, supporting the utility's objective of improving Outage Duration and maintaining Outage Frequency measures (see Exhibit 1B, Tab 3, Schedule 1, Pg. 8 to 21).

QUESTION (D):

d) If $1.5 billion spending is required to prevent any deterioration in system reliability, what would be the percentage of deterioration if only $1.0 billion was spent?

RESPONSE (D):

Toronto Hydro has not assessed this specific scenario, as doing so would require a complete re-evaluation of the 2025-2029 Investment Plan, program by program. However, based on similar 'envelope funding' scenarios requested by Intervenors, Toronto Hydro has produced additional reliability scenario projections (Outage Duration and Outage Frequency) over the 2025-2029 period for comparison purposes. Please refer to Toronto Hydro's response to interrogatory 1B-SEC-21.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-16

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 21

Preamble:

"Toronto Hydro proposes a shift in its rate-setting approach from price-cap to a revenue-cap model. Rather than escalate rates themselves each year, and use a simplistic g-factor to account for expected billing determinant growth, Toronto Hydro proposes to escalate revenue requirement each year, and design rates for each revenue requirement on the basis of forecasted customer and load growth over the rate term."

QUESTION (A):

a) Please confirm that under a price-cap model, a utility bears the load forecast risk while under a revenue-cap model a utility does not bear the load forecast risk. Please explain your answer.

RESPONSE (A):

Under a Price Cap model and the Revenue Requirement Cap applied for by other utilities regulated by the OEB, both the utility and ratepayers bear any risk or reward associated with variances in billing determinants. To the degree billing determinants exceed forecast, customers bear this risk and the utility experiences reward. Should billing determinants fall short of forecast, the utility bears the risk and customers experience reward.

However, under a true revenue cap model as proposed by Toronto Hydro, actual revenues collected are trued-up against forecast revenue requirement, as determined via annual CRCI escalations inclusive of the RGF values approved in the rebasing year. The true-up is completed on the basis of weather-normalized billing determinant variances.

QUESTION (B):

b) Please confirm that the proposed revenue cap model lowers the business risk of Toronto Hydro compared to the Ontario distributors that use the standard OEB price-cap model. Please explain your answer.

RESPONSE (B):

No. For information about the business risks that Toronto Hydro faces, please see the response to interrogatory 5-Staff-315.

The use of a revenue cap model inclusive of a true-up mechanism addresses uncertainty associated with billing determinants growth for *both* ratepayers and the utility. Conversely, this approach also neutralizes the opportunity for either party to benefit from billing determinant variances. The inclusion of this mechanism is an important component of Toronto Hydro's rate framework "…*to protect ratepayers, the utility and its shareholder, from structural unknowns in forecasted costs and revenues related to demand growth in a time of unprecedented change and transformation in the economy and energy system*."[1]

[1] Exhibit 1B, Tab 2, Schedule 1, p.4

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-17

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 23

Preamble:

"The C-factor is an attrition relief mechanism that implements additional rate escalations 1 each year, beyond those provided for through base rates escalated at inflation less productivity, to account for the utility's growing capital-related revenue requirement as a result of implementing the multi-year capital investment plan known as the DSP."

QUESTION:

The term "attrition relief mechanism" is not commonly used by the OEB. The noun attrition means a decrease in number size or strength. What is decreasing at Toronto Hydro that would require a relief mechanism?

RESPONSE:

As described in the reference above, attrition relief refers to a mechanism (such as the C-Factor or the Revenue Growth Factor) which mitigates the attrition of funding in rates relative to the utility's prudent and necessary costs (i.e. revenue requirement).

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-18

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 29

Preamble:

"In addition to the efficiency-factor, Toronto Hydro's rate framework proposes a proactive 0.6 percent performance incentive factor that further reduces revenues by approximately $65 million over the rate term, providing customers an additional upfront rate reduction."

QUESTION (A):

a) Why would a reduction in revenues provide customers a rate reduction in a revenue-cap plan or does Toronto Hydro actually mean a reduction in revenue requirement?

RESPONSE (A):

Through the Custom Revenue Cap Index, the X-factor reduces the revenue (and thus rates) that the utility is able to collect through rates over the 2026 to 2029 period. Toronto Hydro's revenue requirement remains unaffected by this input, as it reflects Toronto Hydro's costs to fund the 2025-2029 Investment Plan featured in Exhibits 2B and 4. Please see the response to 1B-Staff-3 for more information about the revenue reduction/deficiency imposed by the rate framework.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-19

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 32

Preamble:

"To implement the PIM, Toronto Hydro proposes a new deferral account - the Performance Incentive Mechanism Deferral Account (PIM-DA) - to record the PIM earnings. This account would be brought forward for review and disposition in the utility's next rebasing application, based on known (or forecasted) performance results for the 2025-2029 rate period."

QUESTION:

Will the entries in the PIM-DA be audited by an independent external auditor? If the answer is no, please explain why not.

RESPONSE:

As with all other DVAs, entries in the PIM-DA would be reviewed by an external auditor to obtain reasonable assurance that the financial statements are free from material misstatement.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-20

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 34

Preamble:

"In alignment with the OEB's statutory objective to facilitate innovation in the electricity sector, Toronto Hydro proposes to establish an Innovation Fund to support the design and execution of innovative pilot projects over the 2025-2029 rate period."

QUESTION (A):

a) Please provide Toronto Hydro's definition of "innovative pilot projects."

RESPONSE (A):

A pilot project is an exploratory project designed to test the feasibility, viability, and effectiveness of a particular concept, strategy, technology, or process before full-scale implementation. The goal of a pilot project is to gather data, identify potential challenges, and assess the practicality of the proposed solution or idea. As stated on page 7 of the referenced evidence, Toronto Hydro employs the same definition of innovation as the OEB does in section 2.1.7 of the Filing Requirements. Thus, "innovative pilot projects" refers to exploratory projects that have the potential to deploy innovative solutions in line with the considerations and parameters described in the Innovation Fund evidence, particularly in section 3 (Areas of Innovation).

QUESTION (B):

b) Please confirm that ratepayers will bear the risk that innovative pilot projects might deliver no benefits to ratepayers.

RESPONSE (B):

Please see Toronto Hydro's response to interrogatory 1B-CCC-46 part (b).

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-21

Reference: Exhibit 1B, Tab 2, Schedule 1, Pages 35 to 37

Preamble:

"Subject to OEB approval, Account 1508 - Demand-Related Variance Account (DRVA) would record: (i) the demand-driven revenue requirement impacts arising from variances in actual versus forecast capital and operational expenditures for certain demand-based programs (the Expenditure Variance Sub-Account); and (ii) the 1 revenue impacts arising from variances in forecast versus actual billing determinants over the rate period (the Revenue Variances Sub-Account)."

QUESTION (A):

a) Does the proposed Demand Related Variance account increase or decrease the business risk of Toronto Hydro? Please explain your answer.

RESPONSE (A):

As noted in the DRVA evidence filed at Exhibit 1B, Tab 2, Schedule 1 starting on page 35, this rate application is being filed during a time of unprecedented change and transformation, as customers, communities and governments at all levels are actively embarking on an energy transition to mitigate the existential and economic impacts of climate change. Decarbonization is expected to create new roles for electricity, including as an energy source for transportation and building heating systems. While there is certainty that fundamental change is ahead, there are degrees of uncertainty about how that change will unfold (e.g., the pace and adoption of electrified technologies such as EVs and heat pumps; the role of low-emission gas; and the scale of local vs. bulk electricity supply).

The DRVA mitigates the impact of heightened uncertainty and associated forecasting risk associated with forecasting customer demand during this period of unprecedented change and transition. In doing so, the DRVA negates the prospect of either ratepayers or the utility losing or benefiting from

structural unknowns (i.e. changes in policy, technology and consumer behaviour related to the energy transition) that may lead to material demand-related variances in costs or revenues in the next rate term.

As noted in the response to interrogatory 5-EP-34(c), a variance account does not lower utility risk because the recovery of any amounts tracked in a variance account is subject to regulatory prudence review upon disposition of the account.

QUESTION (B) :

b) Is Toronto Hydro assuming that all capital project variances including variances caused by poor project management would be recorded in the DRVA?

RESPONSE (B):

Toronto Hydro respectfully notes that the premise of this question is unfounded by evidence. Over the last two custom incentive rate period, the utility has demonstrated prudent delivery of its capital work program within reasonable margins of variance on total in-service additions (see 9-Staff-339). As noted above, and as is the case with any DVA that tracks variances from forecasted costs, the disposition of DRVA balances would be subject to a prudence review in the 2030 rebasing application.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-22

Reference: Exhibit 1B, Tab 2, Schedule 1, Pages 46, Demand-Related Revenue Variance Subaccount

QUESTION:

Does the proposed Demand-Related Revenue Variance account increase or decrease the business risk of Toronto Hydro? Please explain your answer.

RESPONSE:

Please see response to 1B-EP-21(a) with respect to the impact of the DRVA on business risk.

With respect to the DRVA – Revenue Variance Sub-Account, Toronto Hydro notes in the evidence at Exhibit 1B, Tab 2, Schedule 1 page 46: "*With this subaccount, Toronto Hydro's CRCI becomes a true revenue cap model (subject to weather-driven variances) … with the revenue variance sub-account operating similar to a decoupling true-up mechanism.*"

Please see the response to 1B-Staff-37(a) for a further explanation of how the Revenue Variance subaccount operates as a decoupling mechanism. Please see the response to 1B-EP-16 for a discussion of the difference in risk between a price cap and a revenue cap.

RESPONSES TO ENERGY PROBE RESEARCH FOUNDATION INTERROGATORIES

INTERROGATORY 1B-EP-23

Reference: Exhibit 1B, Tab 2, Appendix A and Appendix B, Scott Madden Report

QUESTION (A):

a) The report refers to a few US states. Should the OEB assume that regulatory commissions in the remaining US states have not approved any incentive rate plans that are similar to the plan that Toronto Hydro is proposing. Please explain your answer.

RESPONSE (A) - PREPARED BY SCOTTMADDEN:

No. The OEB should not assume US regulatory commissions not mentioned in the report have not approved rate plans that are similar to the plan that Toronto Hydro is proposing because the report was not intended to be a jurisdiction-by-jurisdiction scan of rate plans. Nor was the report intended to examine changes in ratemaking frameworks and practices over time.

Rather, the report identified ratemaking frameworks and practices of electric utilities that support a clean energy transition, similar to Toronto Hydro. The report focused in large part on electric utilities in jurisdictions leading clean energy transitions, such as Hawaii, New York, and the United Kingdom.

QUESTION (B):

b) Please confirm that regulatory regimes in the United Kingdom, Australia, Philippines, and Malaysia are quite different from the North American cost of service/ rate of return on rate base form of regulation. Please explain your answer.

RESPONSE (B) - PREPARED BY SCOTTMADDEN:

Australia, Philippines, Malaysia and the UK utilize a building blocks method to setting rates. The building blocks method is based on a cost of service (e.g., operating expenses, return on investment, depreciation, and taxes).

QUESTION (C):

c) Please confirm that the Revenue Growth Factor proposed by Toronto Hydro is actually a revenue requirement growth factor.

RESPONSE (C):

Toronto Hydro does not confirm the statement. While the mathematical basis for the Revenue Growth Factor (RGF) is the difference in forecasted revenue requirement from year to year during the rate term, the RGF is subject to the revenue reductions imposed by the X-Factor through the custom index. As noted and shown in the response to 1B-Staff-03(c), through the application of the X-factor, the custom index yields a revenue deficiency of approximately $81.5 million over the rate term, relative to the revenue requirement for the Investment Plan.

The custom index (inclusive of the RGF) does not fund the entirety of the revenue requirement (i.e. costs) that the utility requires to deliver the 2025-2029 Investment Plan; therefore, it is not accurate to characterize the RGF as a revenue requirement growth factor.

QUESTION (D):

d) Please explain how Toronto Hydro's proposed custom IR differs from a multi-year cost of service rate plan.

RESPONSE (D):

Please see response to 1B-Staff-03.

QUESTION (E):

e) Based on Scott Madden's research, is Toronto Hydro's proposed custom IR plan simple or complex?

RESPONSE (E) - PREPARED BY SCOTTMADDEN:

ScottMadden did not evaluate Toronto Hydro's proposed custom IR plan for its relative complexity or simplicity. ScottMadden evaluated Toronto Hydro's proposed custom IR plan for its consistency with other electric utility ratemaking frameworks and practices that support a clean energy transition.

QUESTION (F):

f) Based on Scott Madden's research does Toronto Hydro's proposed custom IR plan provide more or less incentive for productivity improvements than OEB's standard price-cap plan that is used by most Ontario distributors?

RESPONSE (F) - PREPARED BY SCOTTMADDEN:

ScottMadden did not evaluate Toronto Hydro's proposed customer IR plan for its relative incentive for productivity improvements as compared to OEB's standard price-cap plan. ScottMadden evaluated Toronto Hydro's proposed custom IR plan for its consistency with other electric utility ratemaking frameworks and practices that support a clean energy transition.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-5

Preamble:

Toronto Hydro indicates that the Energy Transition is already underway and that it needs to get ready for this electrified future now by preparing its grid and operations.

QUESTION (A):

a) What has THESL already done to ready its grid and operations and what is still outstanding?

RESPONSE (A):

Toronto Hydro has been readying its grid and operations through a number of investment programs over the past years. A few examples of what has been done and what needs to be done are provided below. For full details, please refer to Exhibit 2B, Sections D4 and D5.

The utility has been steadily modernizing its Horseshoe distribution system for many years through both its System Renewal efforts and complimentary System Service programs including the Contingency Enhancement segment (Section E7.1). A primary focus of these efforts has been the deployment of SCADA-operated switches which allow control room operators to remotely transfer load and isolate feeder sections under fault conditions or on a planned basis. These existing switches, combined with the switches and reclosers to be installed through 2025 to 2029, will form the physical basis for Toronto Hydro's self-healing grid in 2030 and beyond. Specifically, Toronto Hydro is aiming to have 90 percent of feeders in the Horseshoe system ready for automation by 2030. This will be accomplished in part through the Contingency Enhancement segment, which will install SCADA- controlled switches and reclosers on at least 34 feeders to bring them to the minimum optimal number of switching points per feeder of 2.5, which is required to enable an effective self-healing automation scheme.

Over the last decade, Toronto Hydro has strived to be a leader in Ontario when it comes to exploring and implementing technologies and solutions for facilitating, leveraging, monitoring and forecasting distributed generation ("DG") and distributed energy resources ("DERs") more broadly. Toronto Hydro has been a leader in the procurement of demand response services from customers. The utility's Local Demand Response program ("LDR") was the first utility-driven NWS program in Ontario and has been deployed successfully since the 2015-2019 rate period. In the 2020-2024 period, the utility has been pursuing similar DR services in the areas of Manby TS and Horner TS, and, through the OEB Grid Innovation Fund and Innovation Sandbox program, is working with the IESO, Power Advisory, and Toronto Metropolitan University's Centre for Urban Energy to implement a Benefit Stacking Pilot, which explores the procurement and deployment of DR resources to address overlapping distribution and transmission system level needs. In 2025-2029, Toronto Hydro is planning to expand its Local Demand Response program into a more diverse Flexibility Services program and procure up to 30 MW of demand response capacity at target six stations (Finch TS, Manby TS, and Leslie TS, Cecil TS, Strachan TS, and Copeland TS)." For more details on Toronto Hydro's Non-Wires Solutions programs, refer to Section E7.2.

Further, Toronto Hydro undertook enhanced capacity and connections capability assessments to monitor capacity related risks within its system. The enhancements include the preparation of the System Peak Demand Forecast with additional inputs for electric vehicles ("EVs"), data centers and Municipal Energy Plans, assessment of spare feeder positions, identification of system constraints that impact generation connections, and identification of unique drivers for demand growth. Toronto Hydro also augmented its decision-making process with the results of long-term scenario modelling tool known as Future Energy Scenarios.

QUESTION (B):

b) Does THESL have a long-term roadmap (or equivalent) for Grid modernization out to 2040 or beyond. If yes, please provide a copy.

RESPONSE (B):

Please refer to Toronto Hydro's response to interrogatory 2B-SEC-48.

QUESTION (C):

c) THESL outlines that the Energy Transition will continue to progress over the next few decades. This timeframe exceeds the 2025-2029 rate period. Please provide the analysis and documents THESL has available that show the temporal requirements to make the required grid and operational changes of the next few decades and what portion of these are required to be done over the 2025-2029 period (vs. in future rate periods).

RESPONSE (C):

The specific capabilities that Toronto Hydro will require over the longer duration of the energy transition are highly dependent on when, where and how the transition itself unfolds. In this context of uncertainty, the utility's complimentary growth and modernization strategies stem from a "least regret" planning approach, focusing on investments that will provide the utility with the capacity and flexibility to cost-effectively navigate whatever scenario unfolds in 2030 and beyond, while delivering immediate benefits to customers from those same investments in 2025-2029. For more information, please refer to Exhibit 2B, Sections D4 and D5.

QUESTION (D):

d) Please indicate which Energy Transition demands THESL grid and operations are currently not able to deliver on (e.g. EV charging, embedded generation/storage, etc.) and indicate how THESL identified that its system was not able to meet those needs (e.g. customer complaints, rejecting DER requests, third-party analysis and reports, etc.).

RESPONSE (D):

As noted in response to part (c), the capacity and operational capabilities that Toronto Hydro will require in order to avoid becoming a barrier to a cost-effective energy transition are highly dependent on when, where and how the transition itself unfolds. Toronto Hydro expects that as

the energy transition accelerates, especially in 2030 and beyond, the pressures of electrification and DER proliferation will require greater system capacity and more operational and analytical sophistication. The 2025-2029 investment plan takes appropriate steps toward this future state, without overcommitting to technologies and solutions that may not be necessary or may become obsolete in the long-run (i.e., least regrets investments). Without the investments outlined in Sections D4 and D5 of Exhibit 2B, Toronto Hydro believes it will ultimately find itself reacting in an unsophisticated and inefficient manner to the eventual demands of the energy transition, resulting in potentially higher costs, worse reliability, more significant delays and barriers to connection, and limited ability to leverage DERs at scale as a grid solution.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-6

QUESTION (A)—(B) :

a) Has THESL assessed what portion of the demand increases over the coming decades could be mitigated by CDM (including enhanced efficiency and design for new buildings)? If no, please explain why not. If yes, please provide a copy of the analysis, reports, presentation and other related materials.

b) Please provide details on incremental CDM programs, activities and forecasted results (demand and energy reduction). THESL intends to undertake during the rate term (2025 - 2029). Please indicate which are to be led by THESL and which are supporting others programs (e.g. IESO, OEB, City, etc.).

RESPONSE (A) AND (B):

Toronto Hydro relies on the IESO's assessment of CDM potential and CDM forecasts, which is in-progress in the current cycle of IRRP. The non-wires solutions considered for the 2025-2029 rate period have been outlined in detail in Exhibit 2B Section E7.2. Please refer to Toronto Hydro's responses to 1B-Staff-88 and 1B-Staff-89 for more information about the utility's non-wires strategy, investments and proposed incentives.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-7

Reference: Exhibit 1B, Tab 1, Schedule 1, Section 2.2

"However, market evolution and public policy are changing this trajectory, driving customers to adopt advanced electrified technologies - such as electric vehicles (EVs), solar panels, home energy storage, heat pumps and electric water boilers - which are increasing customer demand and expectations for outcomes." [Investment Plan Section 2.2]

QUESTION (A) AND (B):

a) Please explain why the following require increasing system demand capacity, rather than enabling system peak demand to be decreased.
   - electric vehicles (EVs) with bi-directional charger
   - solar panels and/or related on-site battery storage
   - home energy storage
   - heat pumps (particularly in mitigating AC load)

b) Please explain what THESL would need in place to leverage DERs (including those above) to reduce system peak demand and related traditional poles-and-wires investments.

RESPONSE (A) AND (B):

Toronto Hydro's System Peak Demand Forecast is a gross forecast which means that behind-the meter-energy distributed energy resources (DER) are not considered as negative energy load or energy generation to reduce peak. In order for these resources to be able to be relied upon to reduce the peak demand forecast they would have to be reliability aggregated and dispatched through demand response as non-wires solutions. Toronto Hydro has considered non-wires solution for the 2025-2029 rate period as outlined in Exhibit 2B Section E7.2. Please refer to

Toronto Hydro's responses to 1B-Staff-88 and 1B-Staff-89 for more information about the utility's non-wires strategy, investments and proposed incentives.

QUESTION (C):

c) Please provide the scorecard metrics and results related to DER (including CDM) that THESL is committing to over the 2025-2029 rate period.

RESPONSE (C):

Please see Exhibit 1B, Tab 3, Schedule 1 at sections 2.2.1 (New Services Connected on Time), 2.2.2 (Customer Satisfaction) and 2.4.3 (System Capacity Non-Wires).

QUESTION (D):

d) Please indicate how THESL has included decentralization of electricity supply (including storage) and distribution into its planning for the future and what those changes mean compared to the historical centralized generation and distribution of electricity.

RESPONSE (D):

As described in Exhibit 2B, Section E7.2, Toronto Hydro has been actively pursuing and deploying non-wires solutions since 2018 (at Cecil TS) and continues to build on this experience with the Etobicoke program. Toronto Hydro is also pursuing a target to procure 30 MW of NWSs in 2025-2029 – triple the target of past rate periods. The history of this work, as well as the future plans are outlined in detail in the referenced evidence. Please also refer to interrogatory responses 1B-Staff-88 and 1B-Staff-89 for more information about the utility's non-wires strategy, investments and proposed incentives.

Regarding the longer-term, as Toronto Hydro's Future Energy Scenarios demonstrate (Exhibit 2B, Section D4, Appendix A and B), it is yet to be determined how quickly and to what extent the electricity system within the City of Toronto will decentralize. Rates of adoption of distributed energy resources are highly dependent on policy, economic conditions, technology advancements,

physical constraints, and consumer behaviour. The Grid Modernization Strategy (Section D5), and the *Grid Readiness* portfolio in particular, speaks to the "least regrets" capability-building investments Toronto Hydro is making in the 2025-2029 period to prepare itself for increases in electrification and decentralization over the longer-term.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-8

QUESTIONS (A) – (C) :

a) Please explain what role (if any) THESL has to proactively plan the Energy Transition and to inform, incent and enable customers (and related enabling stakeholders) to execute in line with that plan as opposed to THESL reacting to the Energy Transition drivers and demands.

b) Please explain what actions and outcomes THESL has undertaken already plus will undertake over the 2025-2029 rate term to proactively define Energy Transition pathways in its service territory and lead customers/stakeholders to adopt those pathways via communications, programs, incentives, etc.

c) Please explain what initiatives and activities THESL intends to undertake to provide net zero or low carbon energy solutions as required to support the Energy Transition, while acknowledging that the proposed IESO grid mix estimate is indicating higher carbon emissions for electricity generation.

RESPONSE (A) – (C):

Toronto Hydro believes that its role is to ensure that the distribution grid and utility operations are ready and equipped to safely, reliably and efficiently support the realization of an energy transition via electrification in alignment with customer needs, requirements and public policy objectives. Fulfilling this role is an important consideration that underlies the 2025-2029 Investment Plan and related requests for approval which are set out in this application. To that end, the application includes numerous investments, initiatives and proposals (which are summarized in the table below) that inform, incent and enable the utility, customers and stakeholders to pursue energy transition goals via electrification. In addition to these specific areas of investment, Toronto Hydro notes that maintaining the foundation of a safe and reliable grid, effective processes, systems and operations, and a highly-skilled, engaged and productive workforce are also critical objectives for success in enabling an orderly energy transition.

1 **Table 1 – Initiatives Enabling Energy Transition via Electrification**

Initiative	Enabling Energy Transition via Electrification
Grid Modernization Strategy	Toronto Hydro is accelerating strategic investments in specific field and information technologies to improve the grid's ability to integrate customer loads and resources, and serve the increasingly complex demands on the utility's system assets and operations. Toronto Hydro's central concern is to not act as a barrier to the adoption of electrification technologies (e.g. EV and heat pumps) by being able to connect customers on time and continue to maintain system reliability of an increasingly dynamic distribution system by equipping the grid with the necessary tools and processes to do so. For a complete list of Grid Modernization investments, please see Exhibit 2B, Section D5.
Future Energy Scenarios Modelling	Toronto Hydro engaged UK consultant Element Energy to develop a bottom-up modelling tool (FES) to understand the range of possible changes to future peak demand based on the interplay of different policy, technology and consumer behaviour assumptions. This tool provides a range of peak demand scenarios that could materialize depending on how different drivers unfold but does not attach probability to the scenarios. This tool helps Toronto Hydro understand the different possible capacity requirements of its system to help inform capacity planning by ensuring that investments are designed to prepare for a multitude of energy transition scenarios. This means that system planning can be done on a "least regrets" basis where sufficient grid capacity is planned to support growth of electrification technologies without over-building, while having the flexibility to respond to changing grid needs in the face increasing uncertainty. For more information on Future Energy Scenarios, please refer to Exhibit 2B, Section D4.
Hosting Capacity Map	Over the 2025 to 2029 period, Toronto Hydro intends to develop and implement a Hosting Capacity Analysis with a customer-facing interface such as a map. This is intended to provide customers with visibility into where there is available capacity to support new or upgraded connections on the distribution system. In addition to streamlining the connection and upgrade process for customers adopting electrification technologies, this tool will provide Toronto Hydro with information to enable more granular system analysis and improve capacity planning to

	ensure the system can support customers' electrification needs. More information on the Hosting Capacity Analysis is provided in the Grid Modernization Strategy referenced above.
Renewable Enabling Investments	Toronto Hydro is making necessary investments (i.e. Renewable Enabling Investments) to ensure that the distribution system can support renewable energy connections, which are forecast to grow over the rate period. The REI are meant to address three different constraints that act as barriers to renewable connections – short circuit capacity, anti-islanding, and system thermal limits and load transfer capability. For more information, please see Exhibit 2B, Section E3 and Exhibit 2A, Tab 5, Schedule 1.
Local Demand Response	Toronto Hydro plans to expand its Local Demand Response program to procure 30 MW of flexible non-wires system capacity from customer and/or third-party owned DERs. For more information on the LDR program, please refer to the Non-Wires Solutions evidence at Exhibit 2B, Section E7.2 and please see Toronto Hydro's response to 1B-Staff-88.
AMI 2.0	Toronto Hydro was among the first utilities in Ontario to implement smart meters (AMI 1.0), having deployed them between 2006-2008. By 2025, approximately 70% of Toronto Hydro's residential and small commercial meters will have surpassed their expected useful life. As a result, the utility plans to replace approximately 680,000 meters, with next generation AMI 2.0 meters between 2023-2028. These meters, once paired with IT infrastructure, will act as a network of sensors improving observability and insight into system operation, energy consumption patterns, and grid performance. By having improved asset and outage management capabilities and possessing more granular visibility and monitoring capability over the secondary network will enable Toronto Hydro to better manage the needs of the energy transition in terms of connections and grid operations.
System Capacity Investments	Toronto Hydro has identified the electrification of transit, electric vehicles, hyperscale data centers, and Municipal Energy Plans as key drivers within the System Peak Demand forecast. This forecast informs demand-related capacity investments made through the Station Expansion, Load Demand and Non-Wires Solutions programs. For more

	information on Capacity Planning and Electrification, please refer to Exhibit 2B, Section D4.
System Standardization	Legacy 4kV stations and feeder equipment present challenges to connecting large loads and accommodating DERs. These assets must be converted to contemporary standards not only to improve safety, reliability outcomes but also importantly to keep pace with growing and changing customer demand due to electrification.
Innovation Fund	Toronto Hydro proposed an approximately $16 million Innovation Fund to support the design and execution of pilot projects that test new distribution capabilities, which includes capabilities that are needed to adapt to the changing energy landscape (e.g. supporting customers' electrification objectives). For the 2025-2029 rate period, the Innovation Fund proposal includes four pilot project concepts. Specifically, the Flexible Connections and EV Demand Response/Commercial Fleet Charging pilot project concepts are intended to support the connection and management of DERs. Flexible Connections will explore operational arrangement for connecting DERs in constrained areas that would otherwise require capital investments. EV-focused pilots will explore the role of the utility in managing EV charging to optimize grid operations. For more information on the Innovation Fund proposal, please refer to Exhibit 2B, Tab 4, Schedule 2.
System Planning	Please see Toronto Hydro's response to interrogatory 4-Staff-309 for a detailed discussion about how System Planning functions support and enable energy transition objectives.
Control Center	Since 2019, Toronto Hydro has been developing an Energy Centre (also known as DERMS) and gaining experience with managing DERs on the distribution system. This initiative is driven by a recognition that DER growth necessitates a shift in the way that distribution systems are operated. Rather than being geared primarily towards energy delivery, distributors must also consider the importance of energy management as it relates to safety and reliability. This requires more active management of short circuit levels, system voltages, and advanced protection schemes. Toronto Hydro has been exploring emerging functions such as

	scheduling, dispatching, aggregation, and settlement. For example, the DERMS platform is currently used to directly operate Toronto Hydro-owned battery energy storage systems and to monitor and manage grid-level impacts of customer DERs. As Toronto Hydro improves its capabilities to actively manage DERs on its system, it will be able to support an increased customer demand for DER connections. For more information see Exhibit 4, Tab 2, Schedule 7.
Customer Operations	Toronto Hydro is making investments in key areas of its customer operations. The customer connection teams are being expanded to support the increasing volume and complexity of both low and high voltage connections. These investments in headcount are being undertaken to support the increased growth and electrification in the City of Toronto. Additionally, the Key Account team is expanding to provide direct and tailored service to critical load customers, many of which are embedded into the economic and social fabric of the city. Many of these customers consider Toronto Hydro a trusted advisor in their efforts to achieve ESG targets through actions such as adopting BTM energy solutions and other peak and demand management measures. Toronto Hydro is investing in ensuring it has sufficient capacity and expertise to support its customers through the energy transition. For more information see Exhibit 4, Tab 2, Schedule 8.
Customer Care	Toronto Hydro is investing in its customer care teams to ensure sufficient capacity and knowledge to provide timely, effective, and efficient customer services. This includes being able to respond to and adequately address evolving customer needs and preferences affected by broad societal developments and industry trends such as new public policies, electrification, and increased adoption of EVs and DERs. Toronto Hydro is preparing for numerous changes in customer expectations, including demands for greater information on and control over electricity usage and expenditures, greater choice to purchase renewable power or self-generate for sale back to the grid, and ESG goals in energy use. In turn, Toronto Hydro is undertaking initiatives such as automation in customer self-service, upskilling in workforce, and acquiring additional specialized resources. For more information see Exhibit 4, Tab 2, Schedule 14.

Public Legal & Regulatory Affairs (PLRA)	Through this program Toronto Hydro ensures that there is sufficient organizational capacity to provide expert legal, regulatory, communications, policy and government relations, and public affairs services to respond to the changes in the energy sector driven by public policy, technological advancement and customer driven evolutions. This includes legal and regulatory support for offers to connect, arrangements with developers and operating agreements, as well as new policy changes. As well as communications with customers who have questions about electrification and new technologies. The PLRA program has been closely tied to and significantly driven by the nature – including volume and complexity – of the capital program. Given the focus of the capital plan on growth and electrification in the city, the PLRA program must reflect a workforce with a multidisciplinary skillset. For more information see Exhibit 4, Tab 2, Schedule 18

Through non-rate regulated business activities, which do not form part of this application, Toronto Hydro is also playing a proactive role in supporting the realization of the City's Net Zero Strategy by facilitating and stimulating the growth of emerging local cleantech markets. For more information, please see the latest Climate Action Plan status report.[1]

[1]Toronto Hydro, *Climate Action Plan 2023 Status Report*

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-9

References: Exhibit 1B, Tab 1, Schedule 1, Section 2.3.1

Preamble: Approximately a quarter of the utility's grid equipment continues to operate past useful life. [Investment Plan Section 2.3.1]

QUESTION (A):

a) Please provide how THESL defines "useful life".

RESPONSE (A):

In the context of this reference, Toronto Hydro refers to the useful life as the mean service life of the asset. Please see Toronto Hydro's response to interrogatory 2B-Staff-131, part (a) for the basis of the useful lives used.

QUESTION (B):

b) Please provide a summary by major category of the equipment that THESL has defined as 'beyond its useful life' and include for each category what percentage and value the portion is that THESL indicates is 'beyond its useful life'.

RESPONSE (B):

Please see the requested breakdown by category of Assets Past Useful Life in Table 1 below.

Table 1: Asset Count for Assets Past Useful Life

System	Non-Linear Assets (Units)	Percentage of Non-Linear Assets	Linear Assets (km)	Percentage of Linear Assets
Overhead	46,928	9.9%	1,301	29.7%
Underground	20,454	4.3%	3,082	70.3%
Network	846	0.2%	Not Applicable	Not Applicable

System	Non-Linear Assets (Units)	Percentage of Non-Linear Assets	Linear Assets (km)	Percentage of Linear Assets
Stations	1,219	0.3%	Not Applicable	Not Applicable
Civil	10,698	2.3%	Not Applicable	Not Applicable
Meters	393,024	83.1%	Not Applicable	Not Applicable
Total	**473,169**		**4,383**	

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-10

Reference: Table 1: Ontario Cities Population Density [Investment Plan] THESL indicates that the population density in Toronto is higher than the comparator municipalities listed.

QUESTION (A-B) :

a) Please explain how increased density would enable more capital and O&M efficiency compared to more disperse municipalities and related systems. If THESL does not believe this is correct, please explain why.

b) Has THESL done analysis of the Capital and/or O&M cost per customer correlated to population density (per km) compared to other utilities. If not, why not. If yes, please provide a copy of the analysis, reports, presentations or other materials pertaining to this analysis and its conclusions.

RESPONSE (A-B):

Toronto Hydro does not believe increased density to the degrees seen in the City of Toronto enables more capital and O&M efficiency relative to less dense, non-urban service areas. Please see the response to 2B-Staff-121, the pre-filed evidence in Exhibit 1B, Tab 3, Schedule 3 at pages 2 through 9, and the expert empirical evidence in Exhibit 1B, Tab 3, Schedule 3, Appendix A, which explicitly includes a congested urban variable to account for the impacts of highly dense urban environments on capital and operating costs.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-11

Reference: **"In this process, Toronto Hydro employed the principle of least regrets investment. Through the use of a new tool - the Future Energy Scenarios model - the utility modelled the grid impacts of a range of possible future peak demand scenarios based on the interaction between different policy, technology and consumer behaviour assumptions."**

QUESTION (A):

a) Please provide the definition of "least regret" as defined by THESL and the methodology/criteria/weighting used to determine which options result in a higher or lower regret. If the process uses THESL human decisions rather than an imperial approach, please explain.

RESPONSE (A):

The Investment Plan makes the minimum investments necessary (the "least regrets" investments) to maintain key outcomes in the near term while also making paced and deliberate progress in readying the grid and utility operations for the future, irrespective of the path the energy transition takes. The term "least regrets" refers to a strategic planning approach anchored in the decision-making theory of anticipating and minimizing regretful choices/outcomes when faced with uncertainty. This enables the utility to meet emerging challenges without having to wait for future variables with high levels of uncertainty to stabilize.

For example, Exhibit 2B Section D4.2 (Capacity Planning and the Energy Transition) identifies "least regret" investments by including additional drivers, augmenting its decision-making process with the results of a Future Energy Scenarios model, and using the Future Energy Scenarios to stress-test the utility's capacity plan. This meant Toronto Hydro acted with a higher degree of caution in terms of building new capacity to prepare the distribution grid for wide-scale building electrification in

the next two decades, as the policy and consumer behaviour drivers of this type of demand remain uncertain, and technology advancement could offer more cost-effective solutions in the future. Practically, this meant that Toronto Hydro decided to take a "wait and see approach" to investments in new capacity for accommodating wide-scale building electrification in the mid-2030s and beyond.

QUESTION (B):

b) Please provide the guide, user manual or equivalent for the Future Energy Model. If such documents do not exist, please explain how the model and its intended use is documented.

RESPONSE (B):

Future Energy Scenarios user training is provided as Appendix A to this response. Please refer to Exhibit 2B, Section D4, Appendix B for additional information on the FES model, including all assumptions, methods, and outputs.

QUESTION (C):

c) Is the Future Energy Model a Monte Carlo simulator or an NPV model? If neither, please explain.

RESPONSE (C):

The FES model is neither a Monte Carlo simulator nor an NPV model. See Section 2 and 3 of Exhibit 2B, Section D4, Appendix B for a description of the FES model.

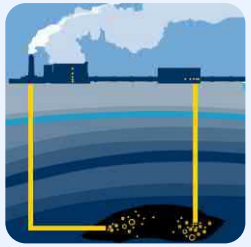
QUESTION (D):

d) Please confirm how the inputs to the Future Energy Model are determined, e.g. THESL employee judgement, external data source, etc.

RESPONSE (D):

Please refer to Section 4 of Exhibit 2B, Section D4, Appendix B.

QUESTION (E):



e) Where does THESL get the cost estimates for each scenario in the Future Energy Model.

RESPONSE (E):

The Future Energy Scenario model does not associate costs with any of the scenarios.

FES Model Documentation

User Training Session

Toronto Hydro

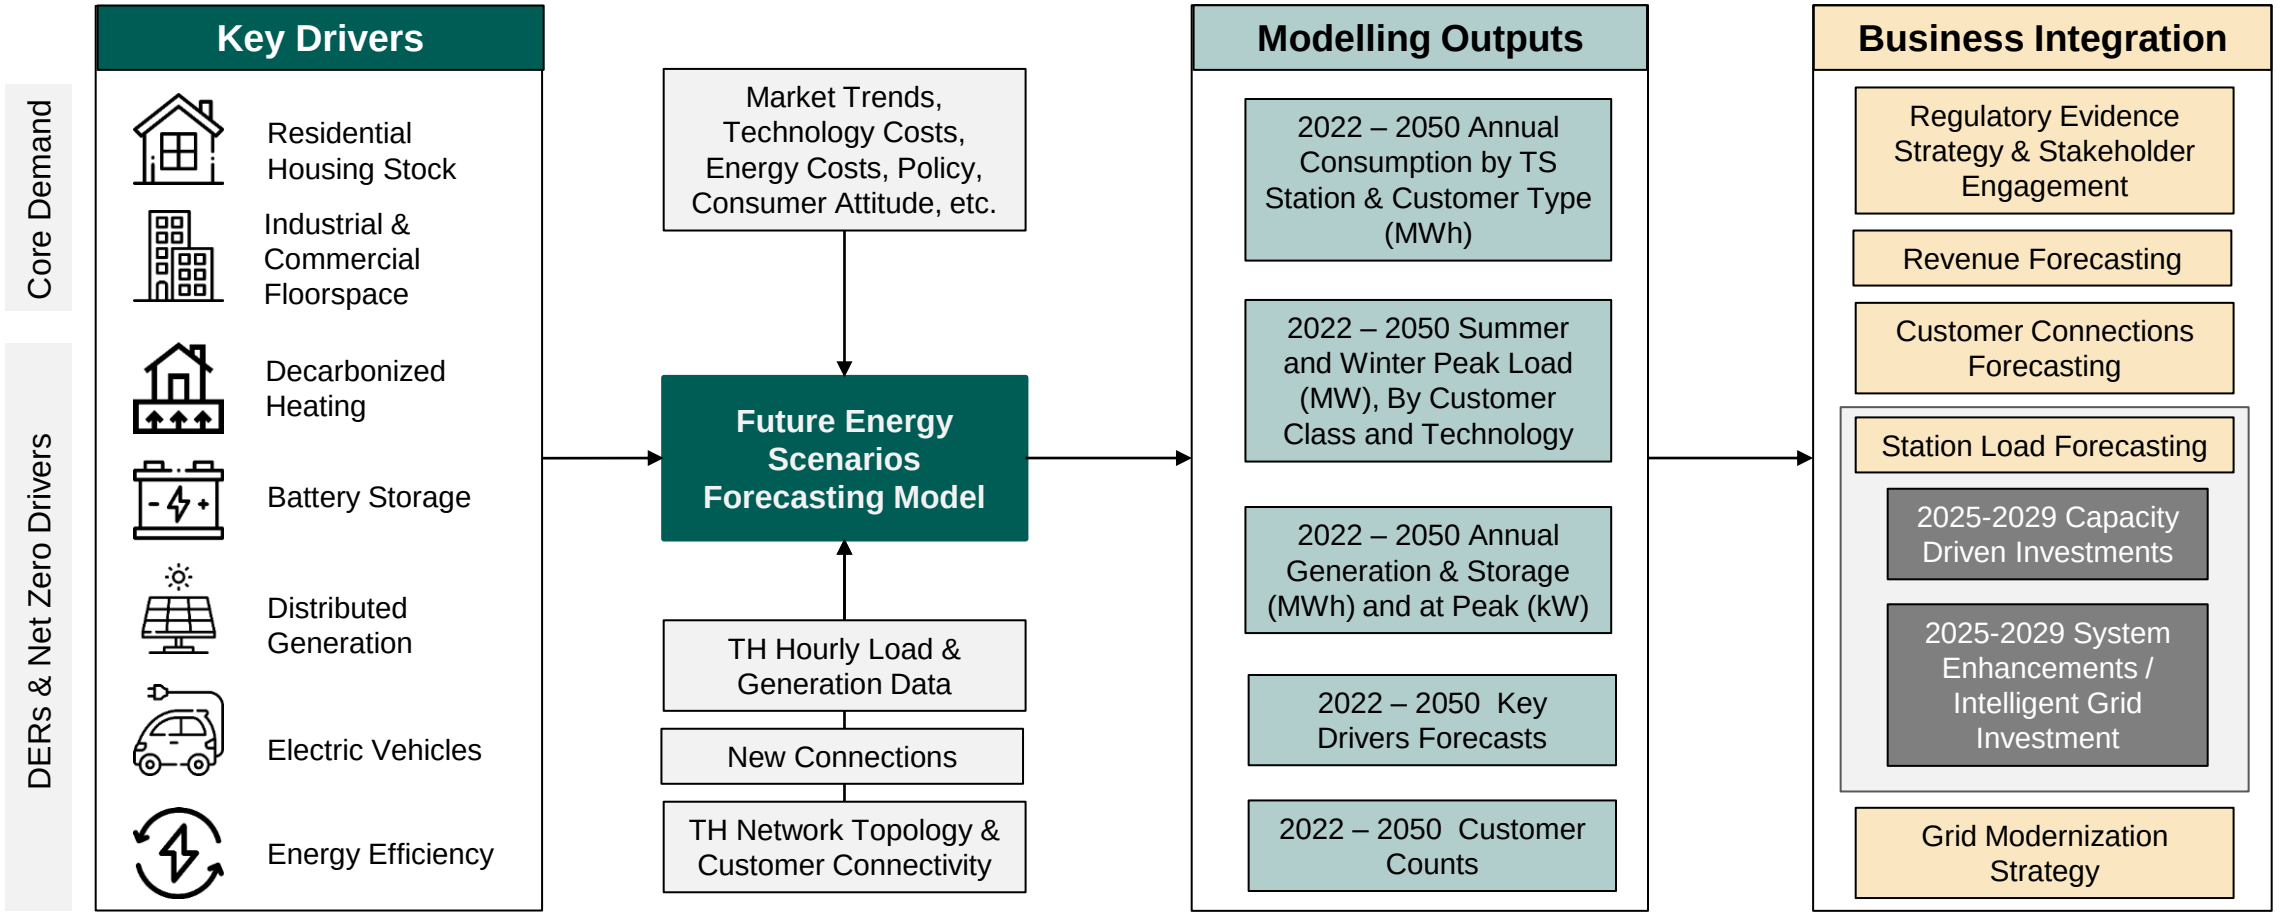
29 June 2023

elementenergy
an ERM Group company

Madhushan Perera
Ivan Antonov
Ian Walker

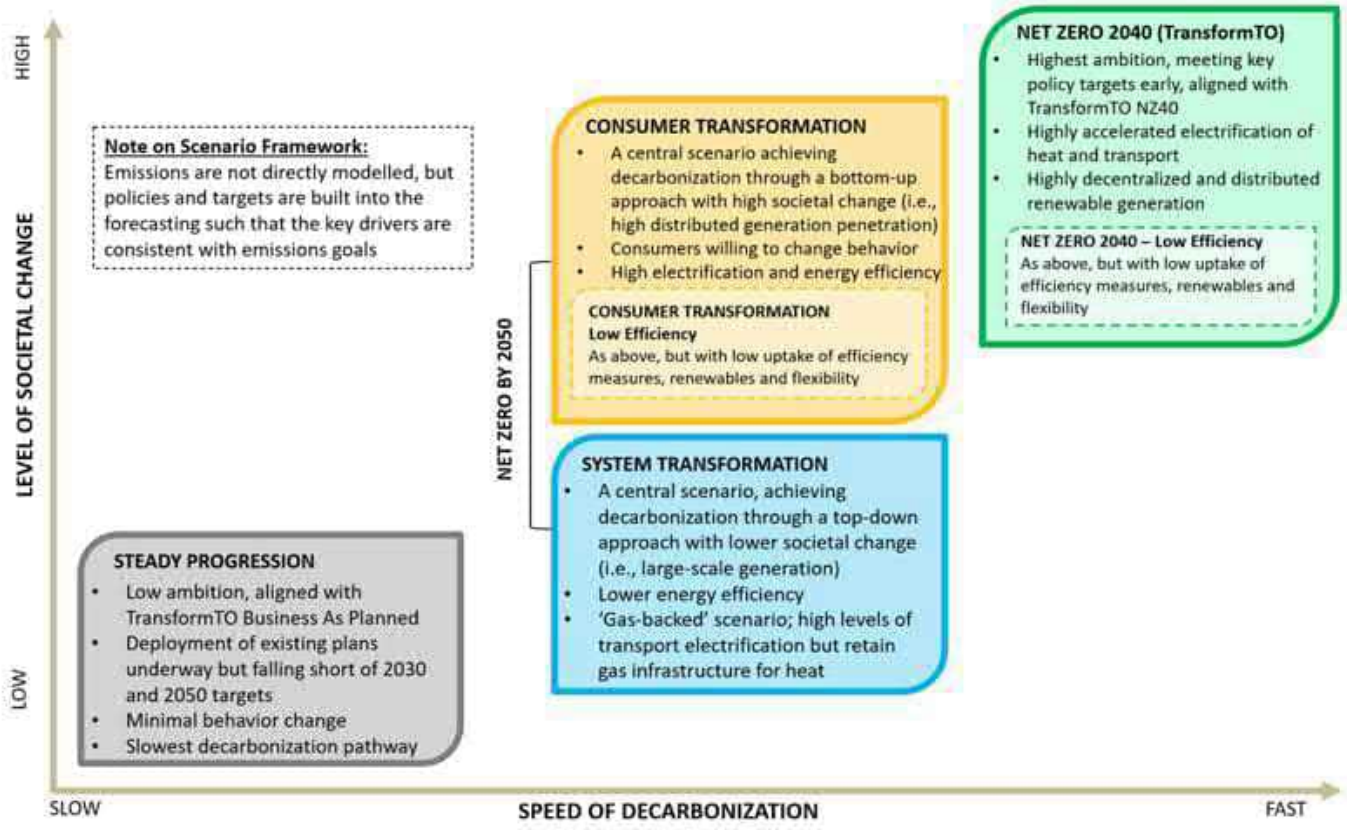
Context

- Ontario's energy system is set to become increasingly **decarbonized**, **decentralized**, and **digitized.** Toronto Hydro must ensure the distribution system enables decarbonization but remains reliable & resilient, and that rates remain affordable. **Long-term, scenarios-based geospatial forecasts** will play an increasingly significant role as different areas within Toronto decarbonize at different rates, allowing us to plan efficiently and **strategically deploy targeted solutions.**



TARGETTED BENEFITS OF THE FUTURE ENERGY SENARIOS

- Efficient Growth-related Investment Plans
- Aligned and Strategic Decision Making
- Single TH Vision on the Future Energy System
- Support Utility of the Future Planning
- Enhance Customer Engagement



Project Scope

- The key difference vs. other public studies is that FES forecasts plausible pathways to Net Zero 2050 based on **bottom-up consumer choice modelling,** informed by current and future industry and policy developments, **not based on top down change required to achieve GHG reductions**.

Scenario Worlds Mapping

- The FES outlines **four different future 'worlds'** (and **two sensitivities**) with different assumptions around degree of decarbonization and societal change and how that translates to the uptake of low carbon technologies.
- To build these worlds, individual scenarios (i.e. low/medium/high) have been created to describe the evolution of drivers of demand/generation (incl. building stock, electrification of transport, decarbonized heating, etc.).

Parameter	Steady Progression	System Transformation	Consumer Transformation		Net Zero 2040	
			Standard	Low	Standard	Low
Net zero by 2050?	No	Yes	Yes		Yes (by 2040)	
Core Demand						
Electrical efficiency	Low	Medium	High	Low	High	Low
Building stock growth	Single Projection					
Low-Carbon Transport						
Cars and light trucks	Low	Medium	Medium		High	
Medium/heavy trucks and Buses	Low	Medium	Medium		High	
Rail	Single Projection					
Smart charging / V2G	Low	Medium	High	Low	High	Low
Decarbonized Heating						
Heat pumps	Low	Medium plus hybrid HPs	High		Early High	
Thermal Efficiency	Low	Medium	High	Low	Very High	Low
Gas heating in 2050	High	Medium due to hybrid HPs	Zero		Zero	
Gas grid availability	Remains at current availability	Reduced utilization	Decommissioned by 2050		Decommissioned by 2040	
Gas grid composition	Mainly natural gas, with potential for biogas, SNG, or other renewable natural gas	Shift to biogas, SNG, or other renewable natural gas	Mainly natural gas, with potential for biogas, SNG, or other renewable natural gas until 2050		Mainly natural gas, with potential for biogas, SNG, or other renewable natural gas until 2040	
Distributed Generation						
Solar PV	Low	Medium	High	Low	Very High	Low
Onshore wind	Low	Medium	High	Low	High	Low
Biogas	Low	Medium	High	Low	High	Low
Other non-renewable generation	High	Medium	Medium	High	Low	High
Battery Storage						
Domestic battery storage	Low	Medium	High	Low	Very High	Low
I&C behind-the-meter battery storage	Low	Medium	High	Low	High	Low

Note: each driver is modelled separately on a Low / Medium / High basis and then mapped onto the scenario worlds that represent a single coherent view of a potential future world.

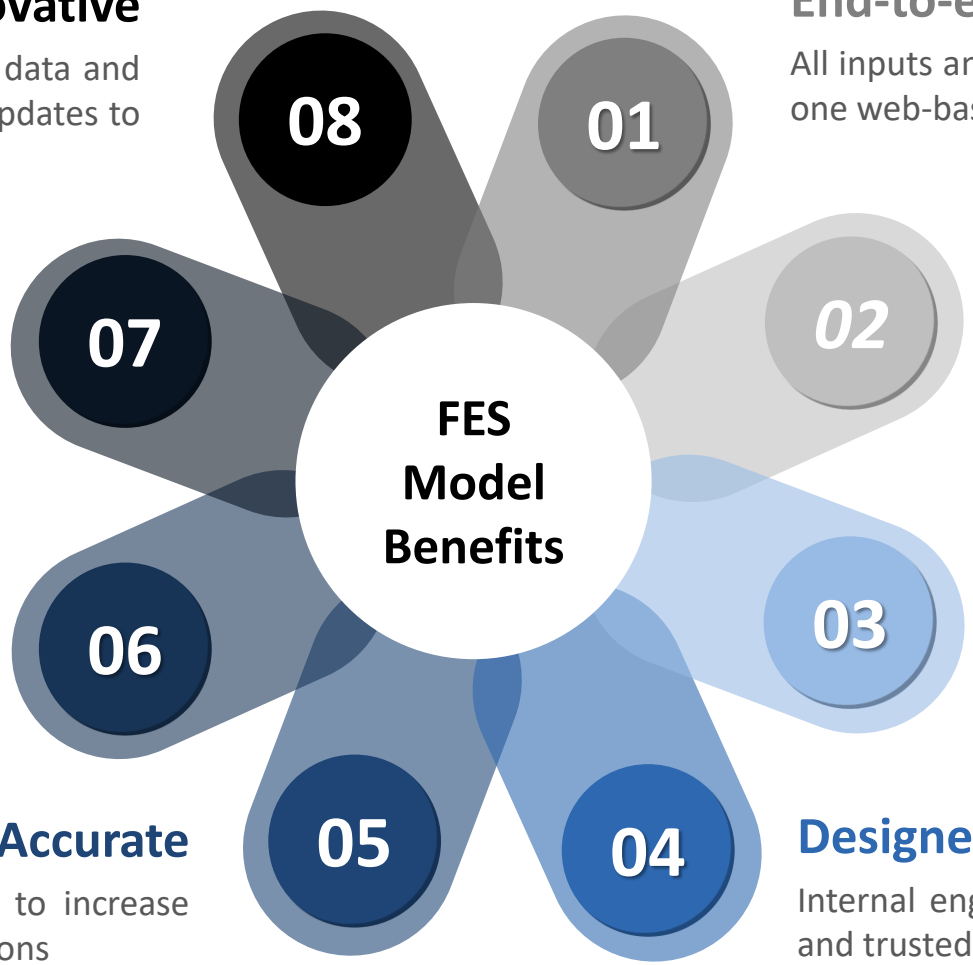
Review of functionality

Business problem statement – Future Energy Scenarios Model

- This project has been undertaken in response to the ***increasing complexity*** of distribution system load forecasting in Ontario and globally, due to factors such as decarbonization, decentralization, digitization, changing customer behaviours and evolving economic and policy conditions.
- New demands emerging from the ***electrification of heat and transport***, growing levels of ***distributed generation*** including variable renewable generation, and new sources of ***load flexibility*** (including energy storage) mean that local electricity distribution companies, such as Toronto Hydro, are facing increasing levels of ***uncertainty***.
- In this context, Toronto Hydro is looking to develop a more detailed understanding of how these various drivers will change and interact over time in order to plan investment in an efficient and timely manner and ***act as a key enabling organisation for the transition to a net zero energy system***. In particular this will feed into Toronto Hydro's ***grid modernization plan*** to enable increasing uptake of low carbon technologies in an efficient manner while maintaining system ***reliability*** and ***resilience***.
- As a result Element Energy are working with Toronto Hydro to generate the ***Future Energy Scenarios*** which provides scenario-based forecasts out to 2050 for peak load (MW), generation (MW), and energy consumption (MWh), generated from Element Energy's network load forecasting ***Future Energy Scenarios model*** and ***suite of bottom-up consumer-choice models*** for predicting uptake of low carbon technologies.

Future Energy Scenarios (FES) Model Overview

The FES Model is being delivered by Element Energy onto Toronto Hydro's on-premises systems.



Core platform functionality is being hosted on TH internal servers.

Legend

- FES model input data
- Phase 1: Segment forecasts
- **Phase 2: FES model**
- Separate tool
- Outputs

FES Model Benefits

End-to-end system

All inputs and outputs accessed through one web-based user interface

Python-based

Enables quick run time

Modular

To allow competition, driving innovation & low cost

Designed for users by users

Internal engagement to develop robust and trusted outputs.

Accurate

High data granularity aims to increase accuracy of load on substations

Scenario based

Enables uncertainty of forecasts to be understood, and risk based planning of interventions

Validated & tested

To gain trust in model and direct continuous improvement

Flexible & innovative

Allows for periodic updates of data and additional innovative feature updates to increase capabilities

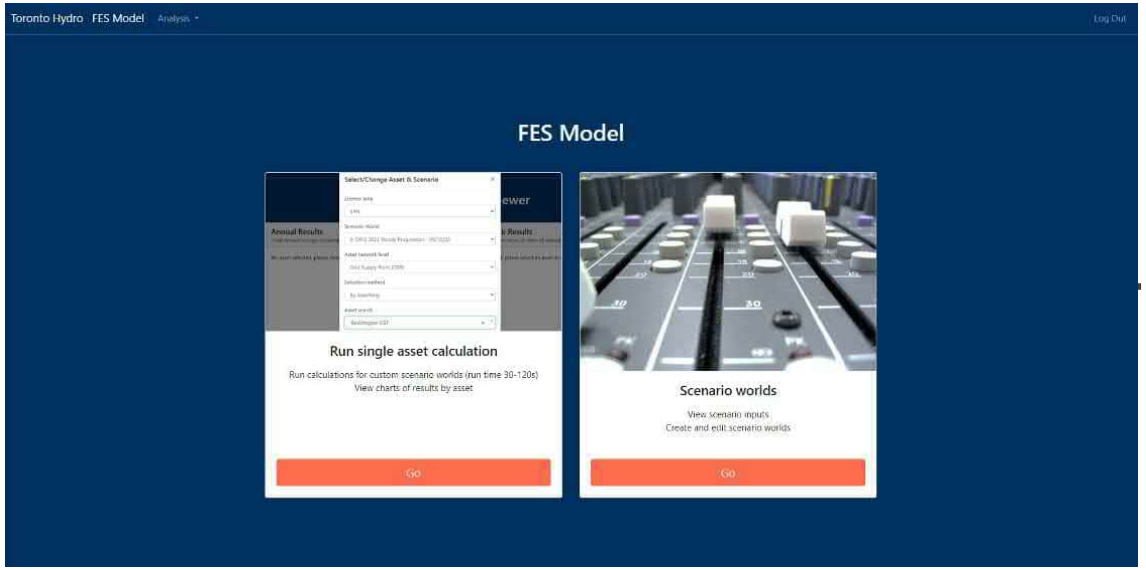
- Single Asset Analysis

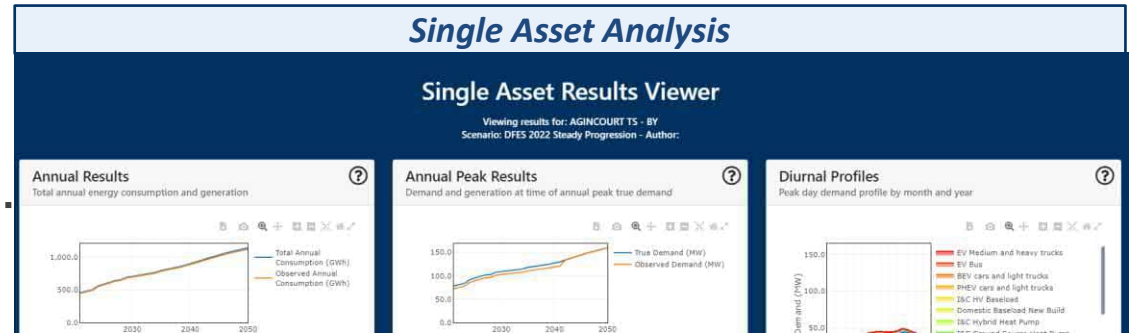
Review of functionality

Accessing the FES Model



- You will be able to access the Toronto Hydro FES Model through the url: redacted
- You will be able to automatically sign-in to the system via your existing Toronto Hydro Microsoft credentials – i.e. if you are already signed into Microsoft (e.g. a different Microsoft app), you should not need to re-enter your password.
- You will then be redirected to the home page *(see right image).*

Access via the provided URL using your TH Microsoft credentials



By the end of this training session, FES Model users should understand how to configure scenarios and run single asset calculations.

As part of the FES Model Go-Live, users will be able to access and utilise the online platform to configure scenarios (Scenario worlds) and run load forecasts for a single assets (Single Asset Analysis).

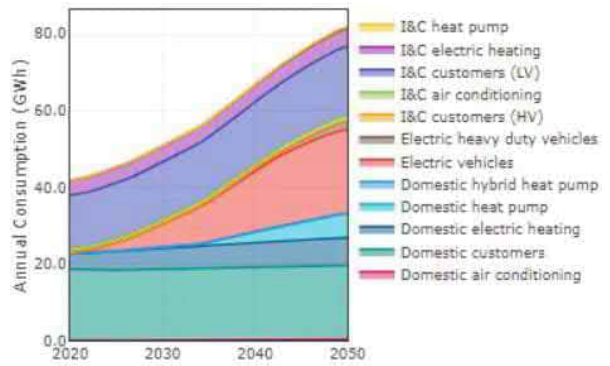
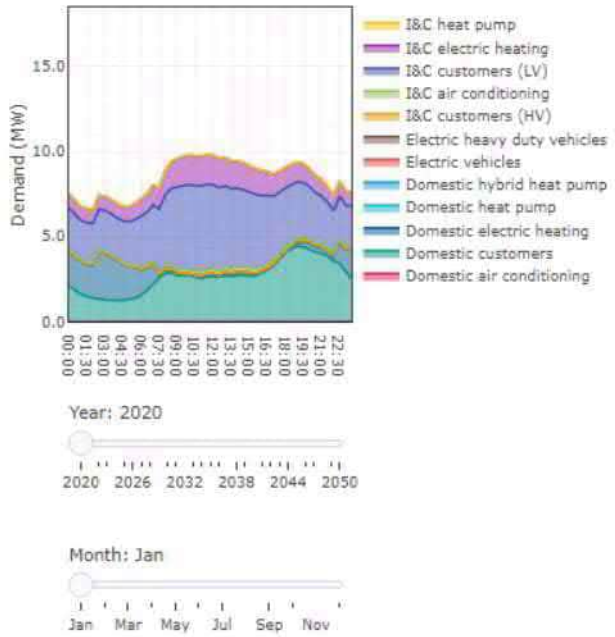
The model includes demand forecasting with scenario configuration and single asset model runs at the network level or TSBP level.

Configure and save new scenarios

Run demand forecasts with new scenarios



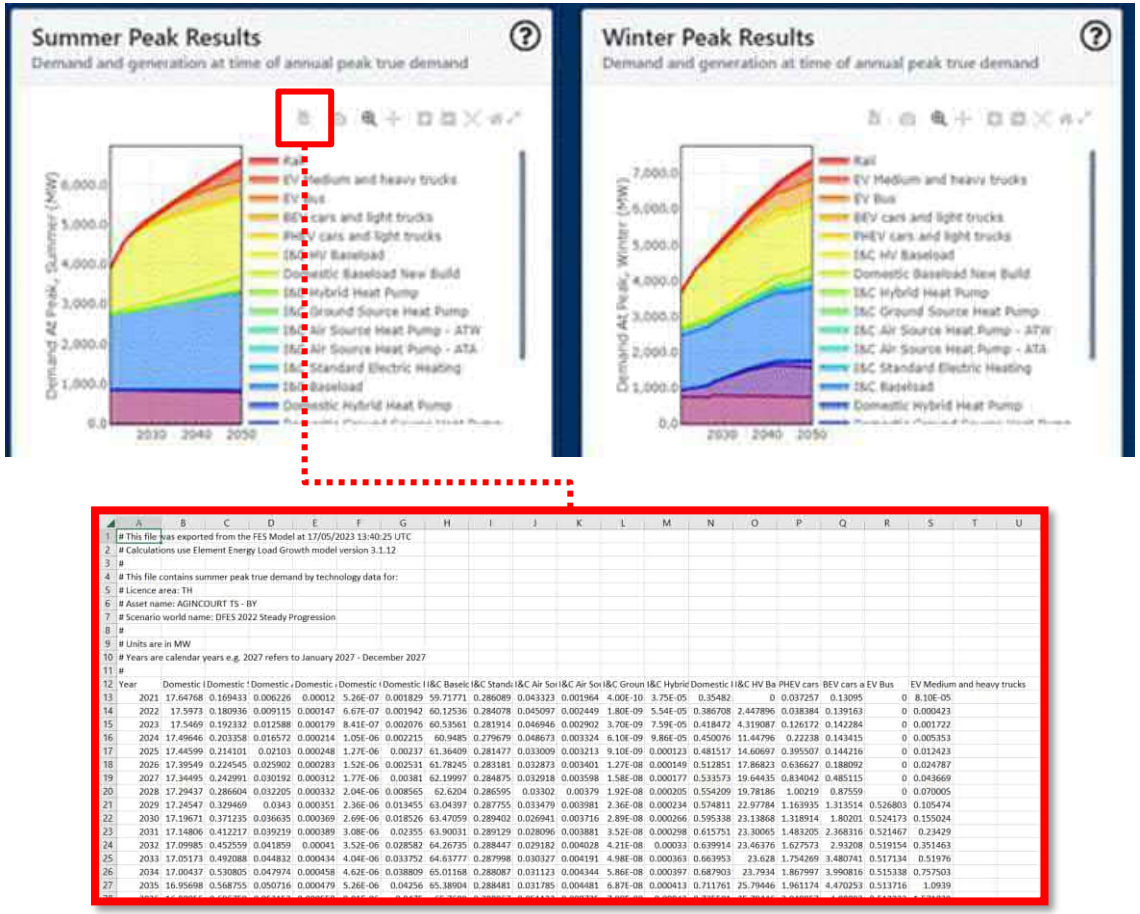
Can run for a chosen scenario and single asset (network or TSBP) by selecting from the list or searching.



The model includes demand forecasting with scenario configuration and single asset model runs at the network level or TSBP level.

View single substation results in interactive graphs

Annual consumption and annual peak true demand forecast



Peak day diurnal profiles

Download results to CSV files

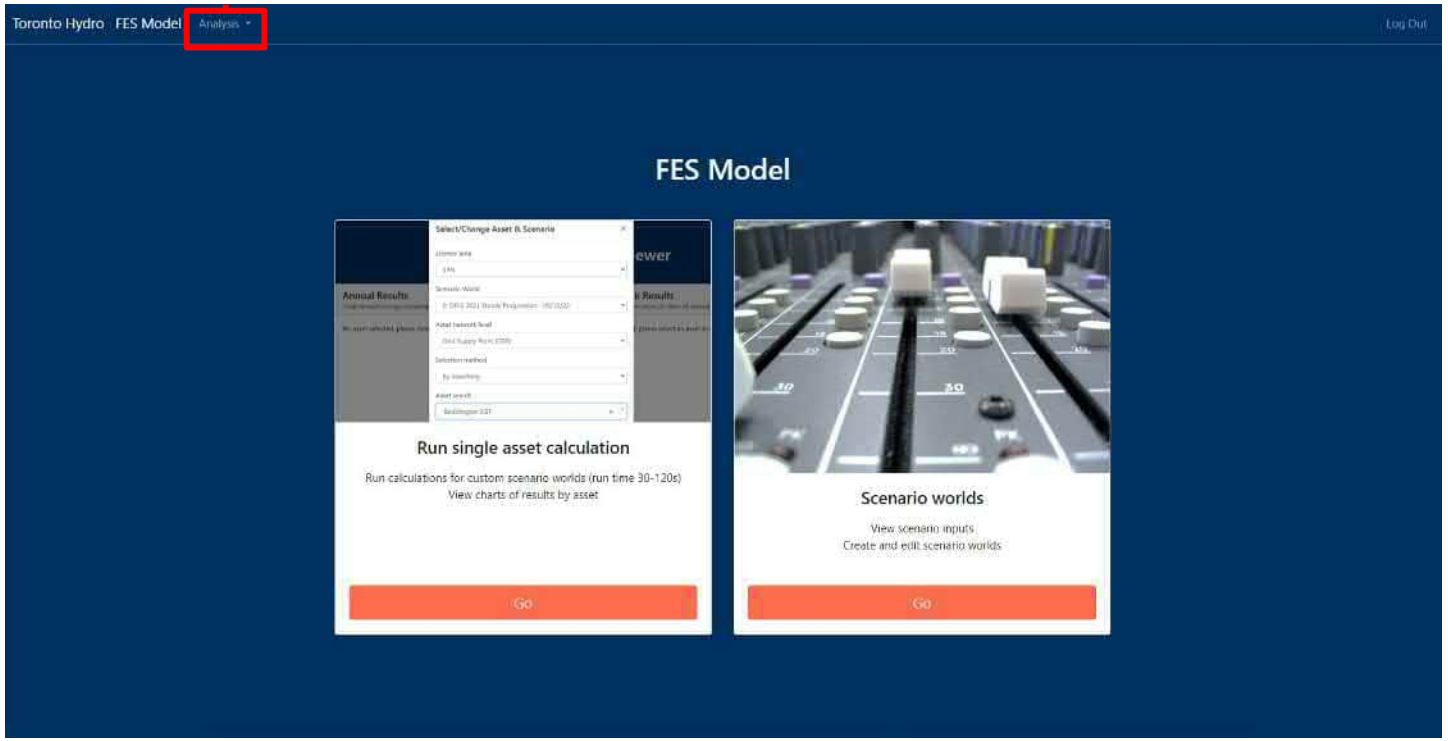
Can download results to CSV files for single asset model runs.

Overview

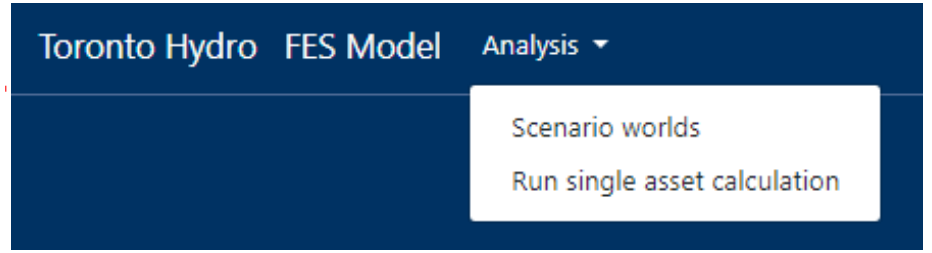
FES Model Overview

Accessing the FES Model

Model Functionality



Online Platform



- **Landing Page**
- Scenario worlds
- Single Asset Analysis

Review of functionality

Online Platform – Landing page

The main FES model landing page has two primary options (Run single asset calculation, Scenario worlds). Additionally, users may navigate the landing platform through the use of the “Analysis” tab at the top left of the page.

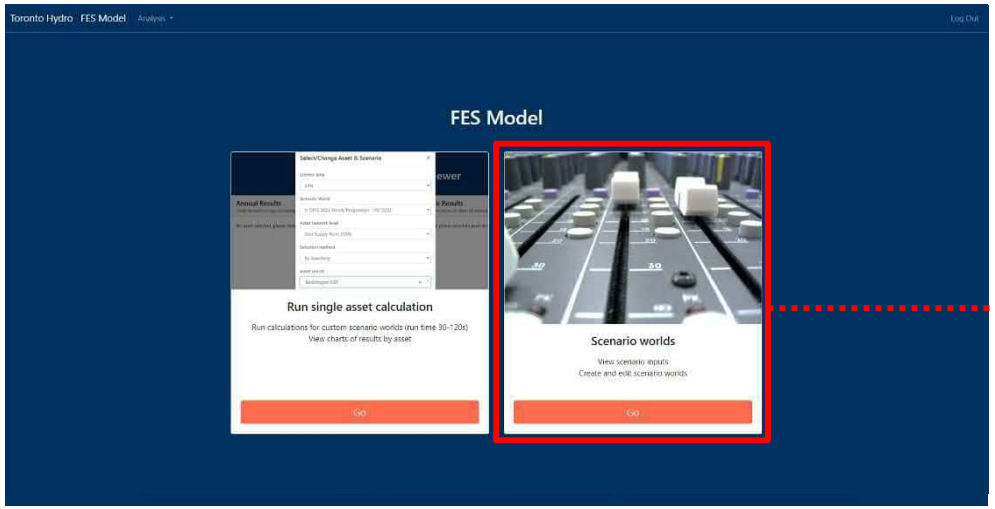
Under the “Analysis” tab, users may select the same two load forecasting options.

Overview

FES Model Overview

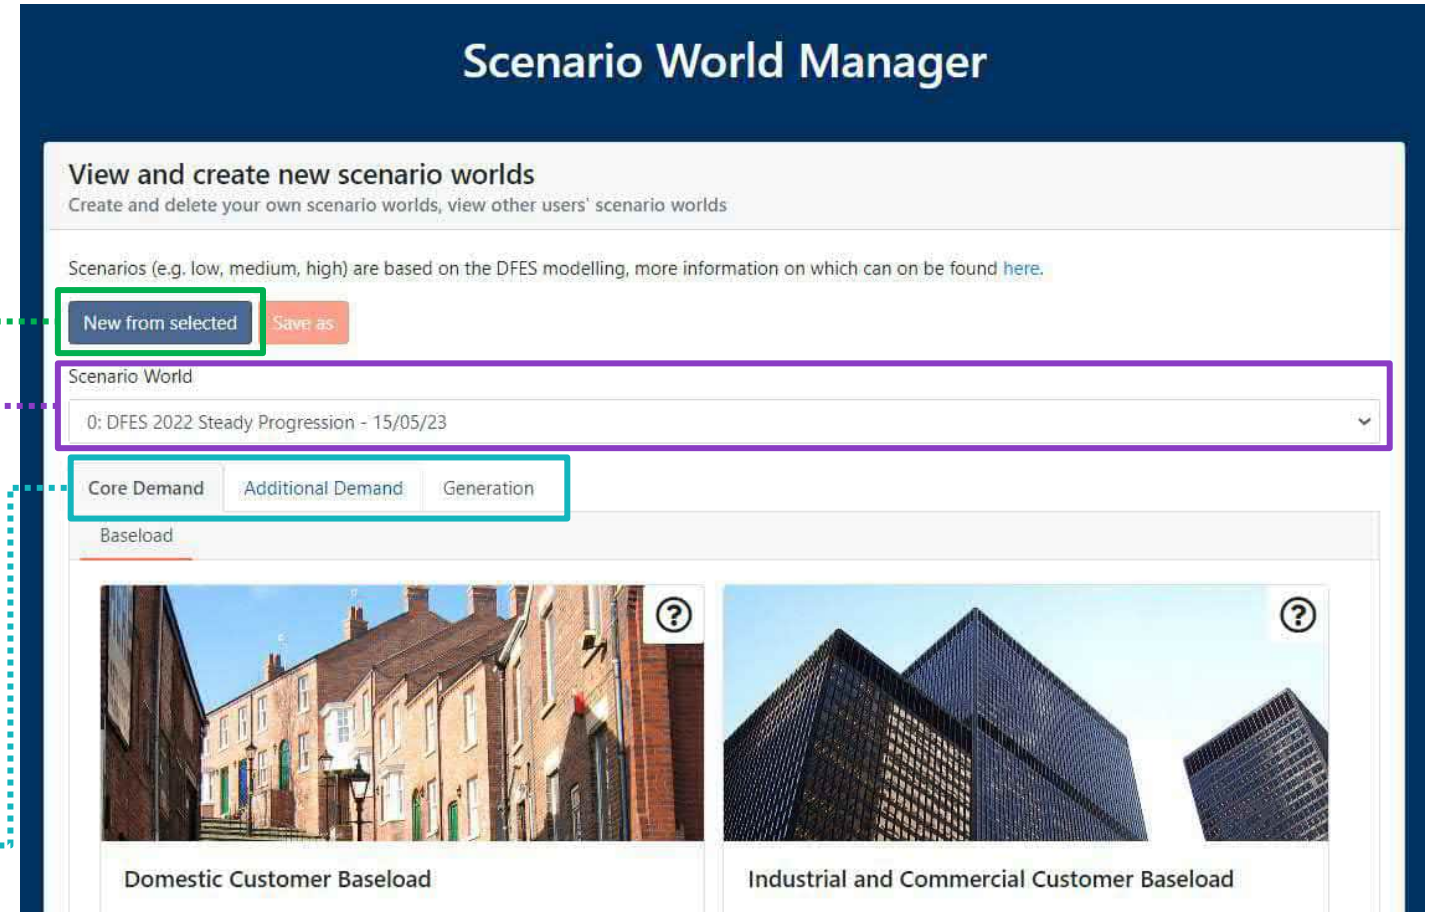
Accessing the FES Model

Model Functionality



Online Platform

- Landing Page
- **Scenario worlds**
- Single Asset Analysis

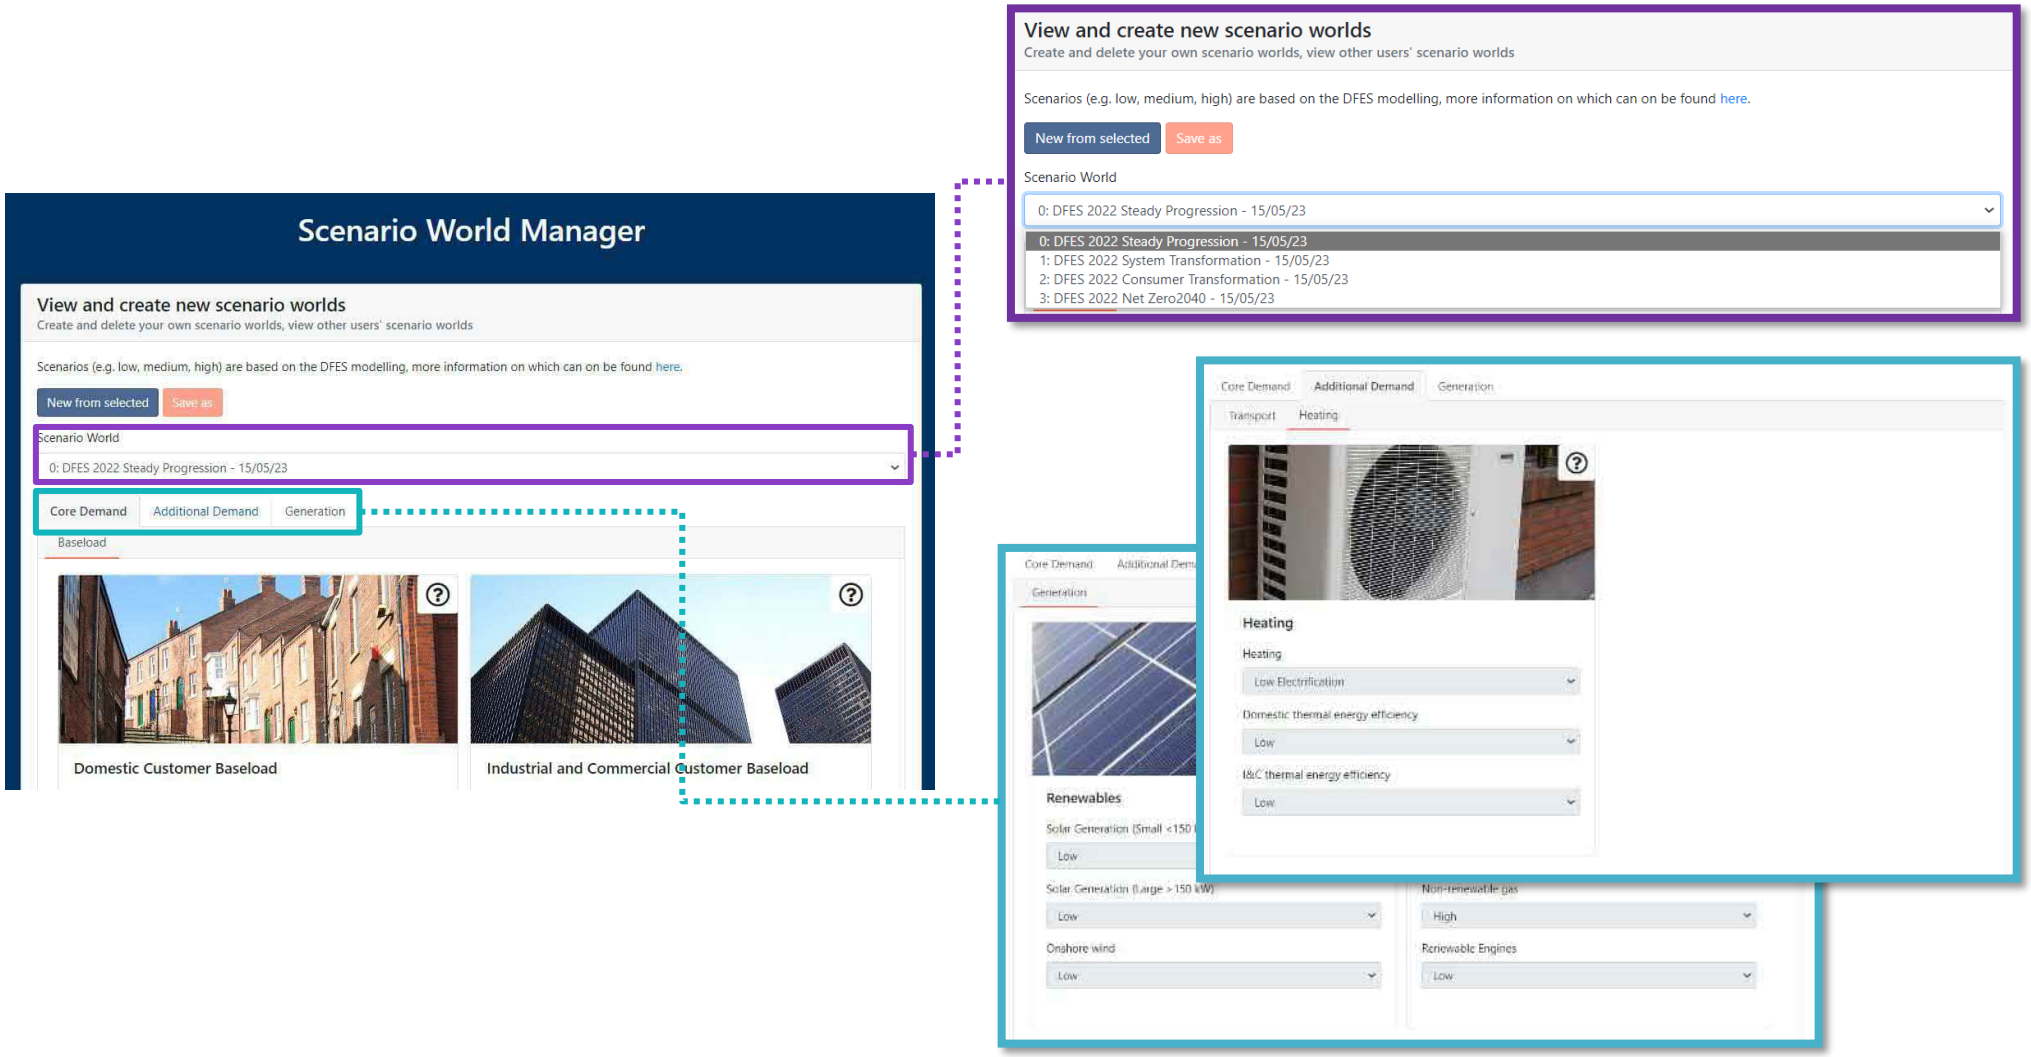


Review of functionality

Online Platform – Scenario worlds

From the main landing page, select the Scenario worlds option (or via the “Analysis” tab).

The Scenario worlds page allows users to view scenarios (e.g. the four DFES scenarios) and create new custom scenarios by varying core demand (e.g. domestic load) or low carbon technologies (e.g. electric vehicles).



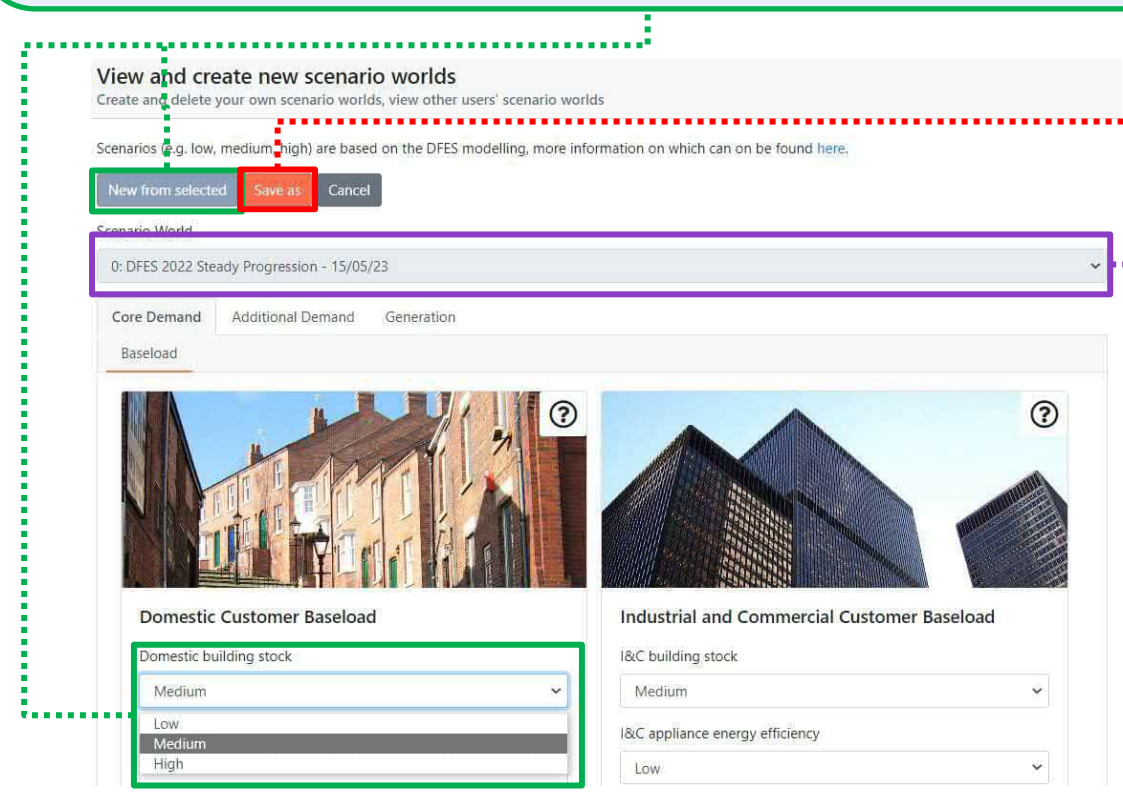
Users use an previously saved scenario as a base for a new custom scenario.

Saved scenarios can selected in this drop-down.

Assumptions for core and additional demands can be controlled via these three tabs.

Online Platform – Scenario worlds

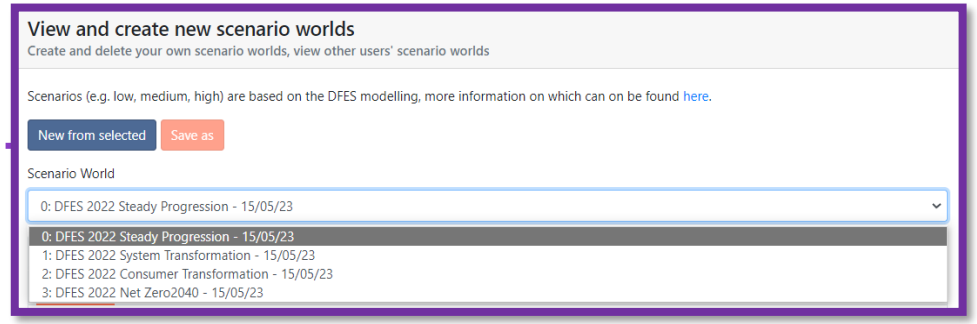
Saved global scenarios can be viewed in the drop down.



For the selected scenario, users can view the input driver-level assumptions (e.g. medium domestic building stock growth, high EV uptake) across core and additional demands.

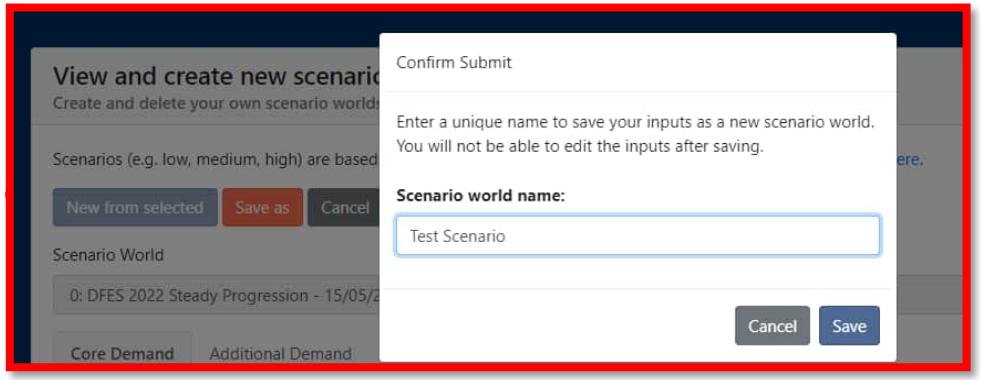
Online Platform – Scenario worlds

2



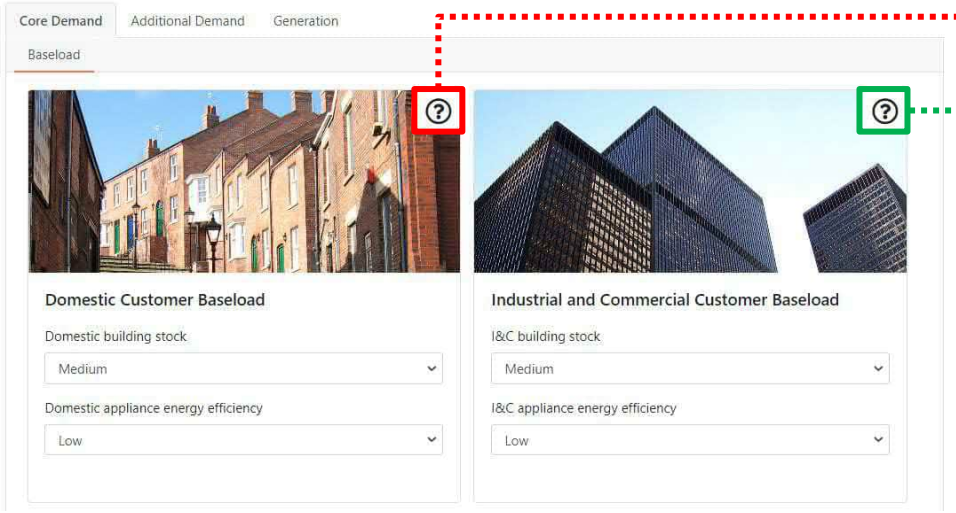
(i) To begin the setup of a new scenario, click “New from selected”. Select an existing scenario to view the scenario’s input assumptions across the core and additional demand tabs.

(ii) To modify the input assumptions, go through each of the drop-down menus and select from the available options (e.g. Low, Medium, High).



1

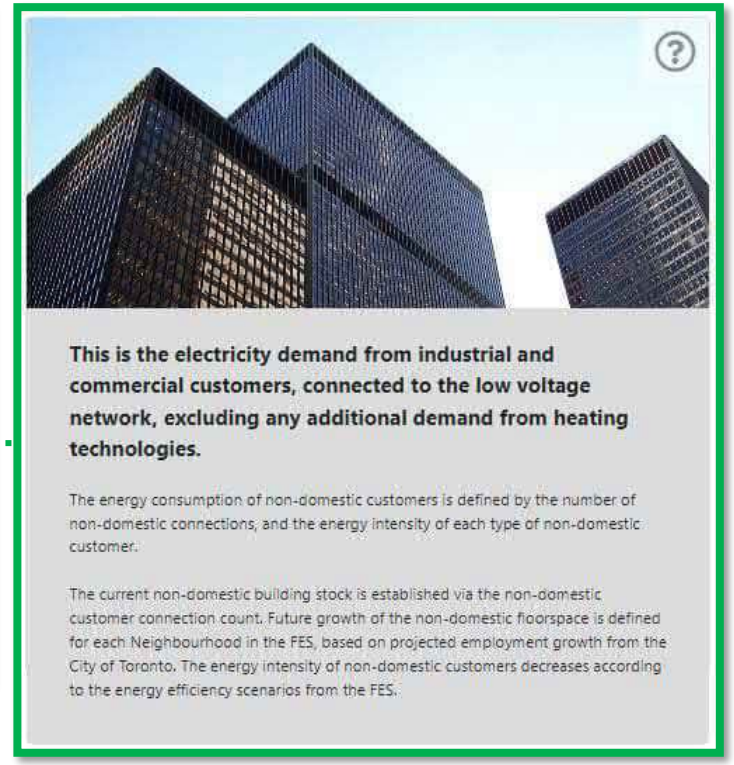
To create a new scenario, select the “---” to start fresh or a saved scenario to start from its settings.



3

To save a scenario, click “Save as” and name the global scenario in the window that pops up. Then click “Save” on the pop-up to confirm.

Online Platform – ? symbol – to learn more



Throughout the FES model, the ? symbol is placed where there is an opportunity to learn more information about something. Users can simply hover their mouse over the symbol and explanatory text will come up.

For example, hovering over the "Domestic Customer Baseload" brings up the below text.

For example, hovering over the "Industrial and Commercial Customer Baseload" brings up the below text.

Overview

FES Model Overview

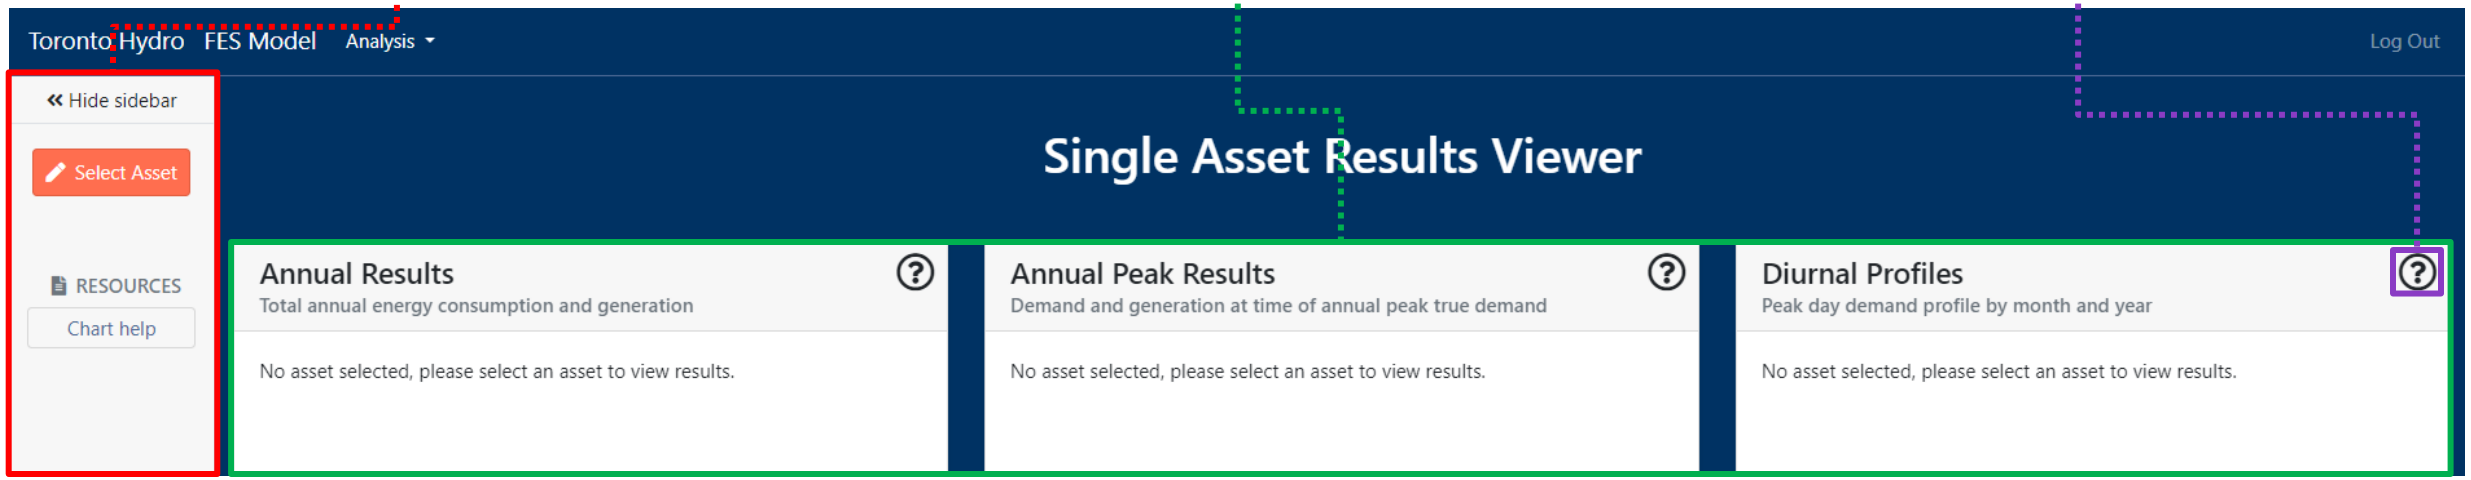
Accessing the FES Model

Model Functionality

Online Platform

- Landing Page
- Scenario worlds
- **Single Asset Analysis**

Review of functionality



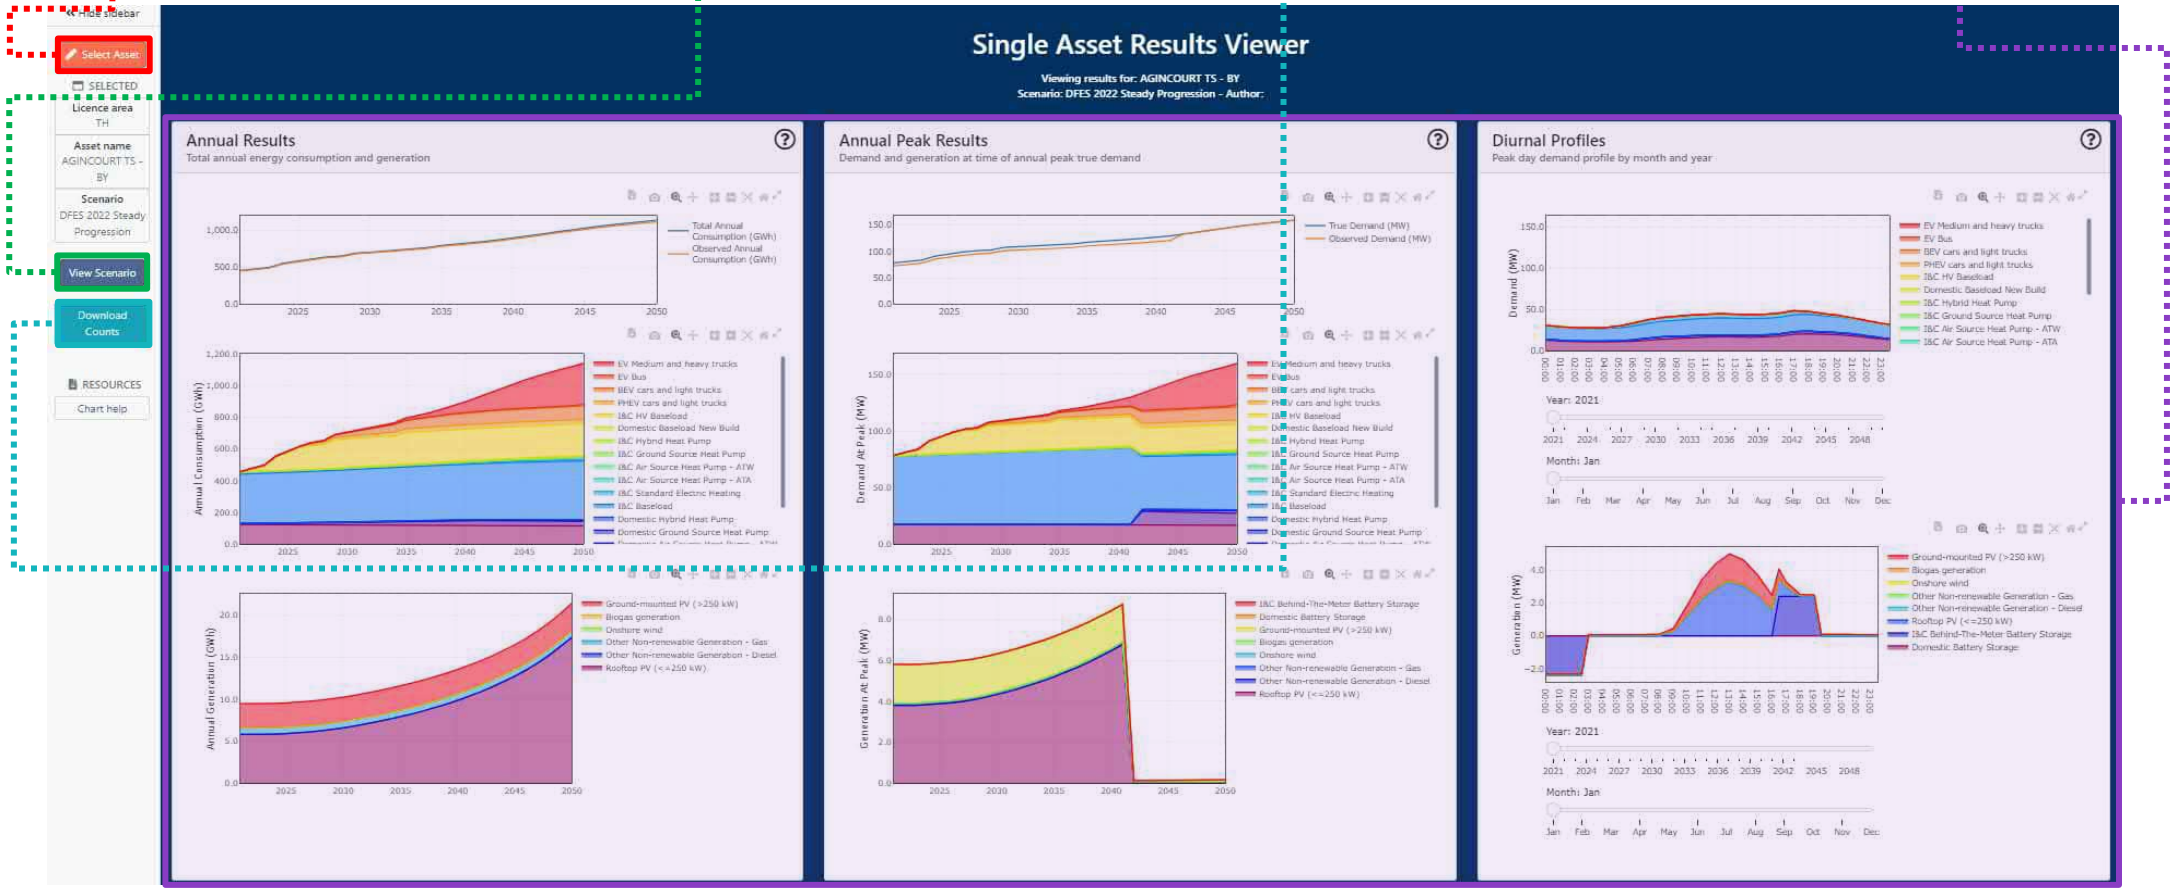
Online Platform – Single asset analysis

Via single asset analysis, users can run the FES model to get a load forecast for a specific asset for a given (custom) scenario. This asset can be a TSBP or the whole network. Results are broken down by technology and can be easily downloaded to CSV files.

The sidebar allows users select an asset (via search or selection) and scenario as well as view supporting information (e.g. chart explanation, category definitions).

The results viewer displays interactive plots including the annual consumption forecast, peak forecast, and demand profiles, all broken down by technology.

Like other pages, the ⓘ symbol is placed where there is an opportunity to learn more information about something. Users can simply hover their mouse over the symbol and explanatory text will come up.



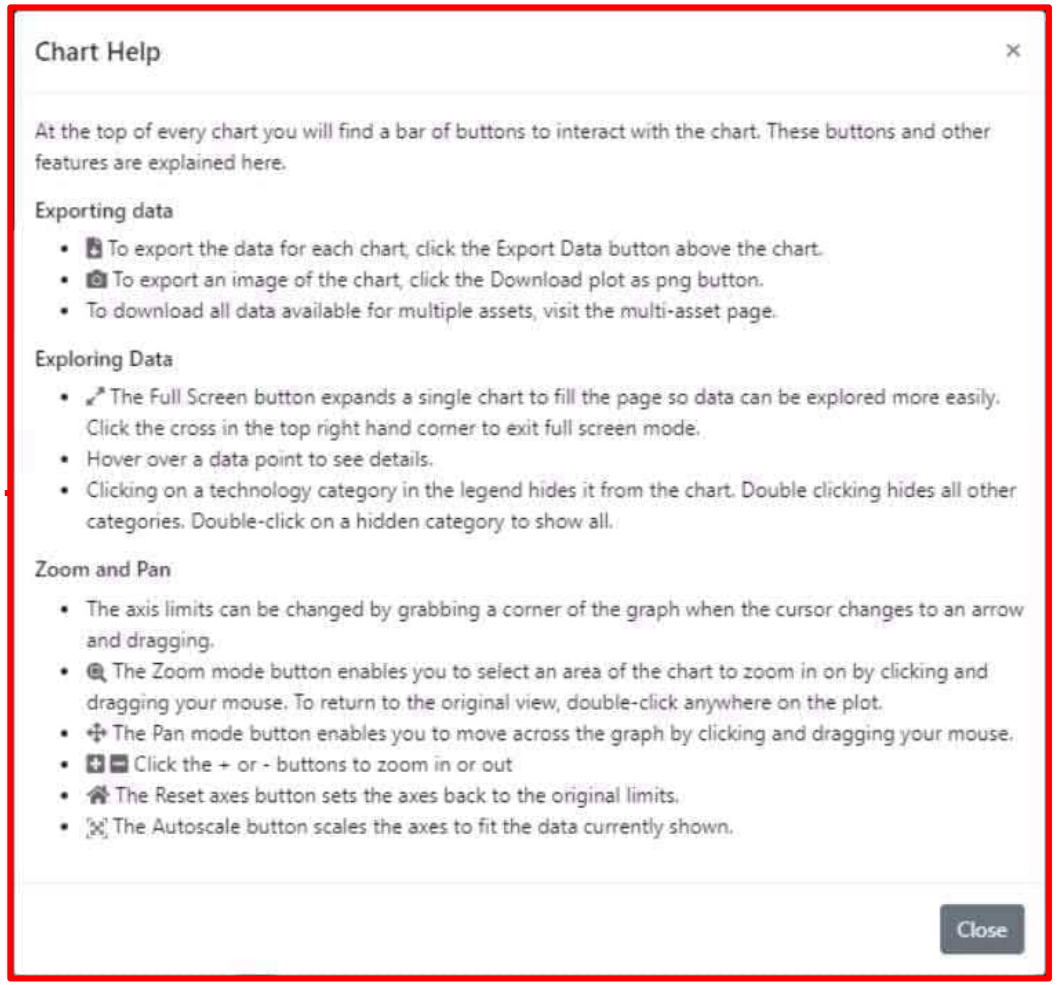
Online Platform – PLE Viewer

Select a substation and scenario to view

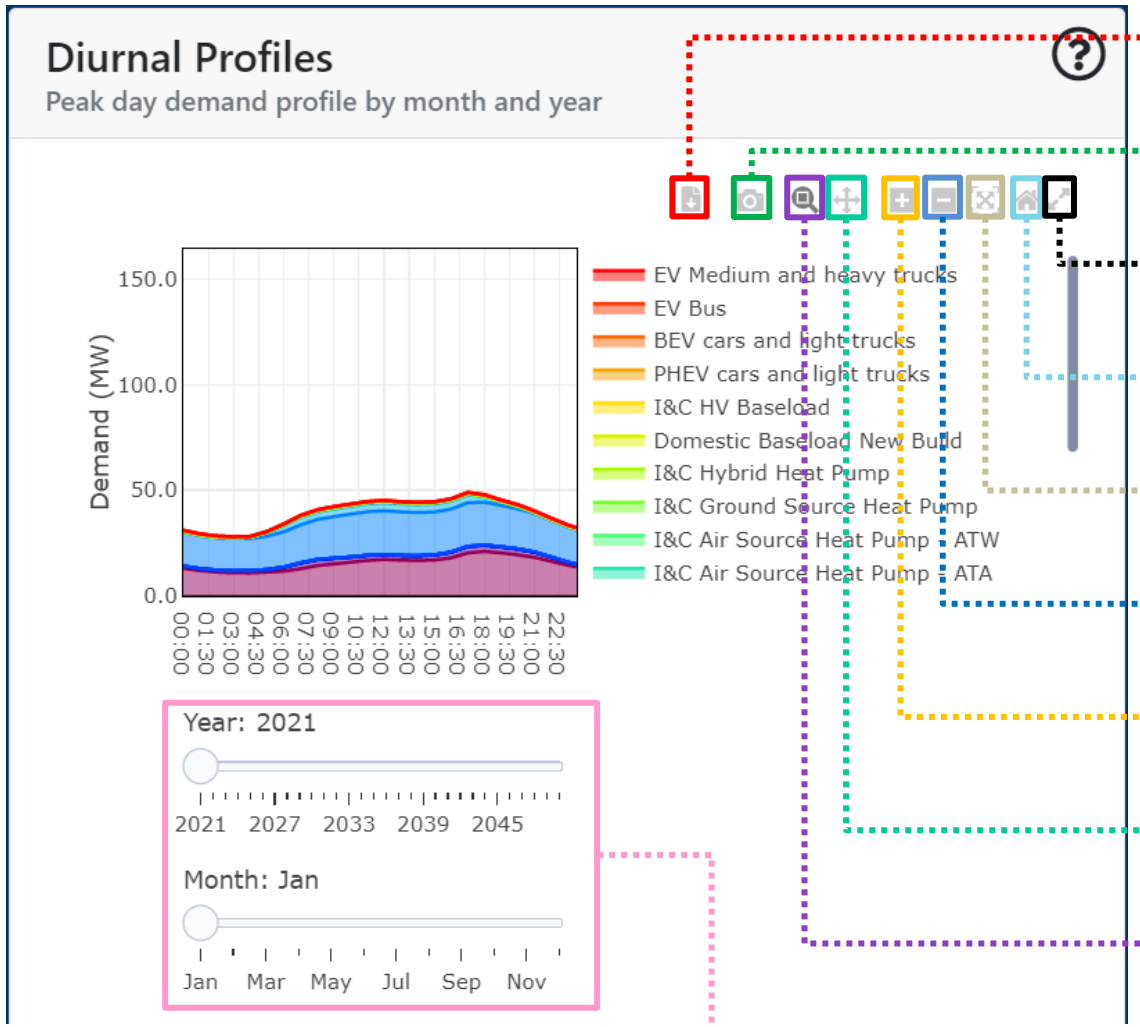
View scenario assumptions

Download connection counts by technology

Plots of annual consumption, peak demand, and peak day demand profiles; additional seasonal peak graphs are also available.



Online Platform – Resources



Users can use the sidebar resources as a source of reference when interpreting results.

The “Chart help” describes how to export data, explore the results data in the viewer once produced, and how to manipulate the page via zooming or panning.

Online Platform – Graph options

"Export data" – download data to CSV

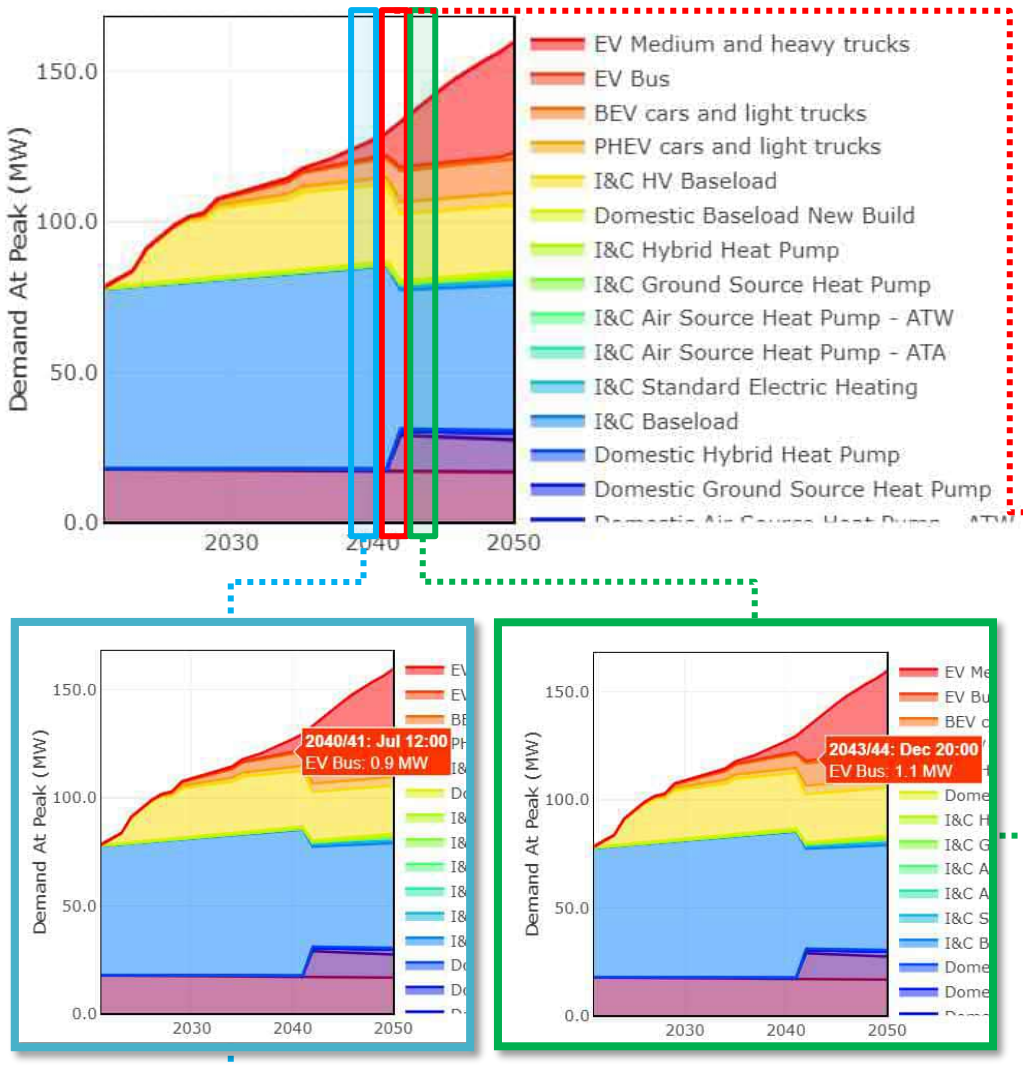
"Download plot as png image" – save graph image

"Full screen" – extend the graph to the full screen

"Reset axes" – set axes back to original scale

"Autoscale" – scale axes based on data in graph

"Zoom out" – increase axes scale to show larger range



"Zoom in" – decrease axes scale to show smaller range

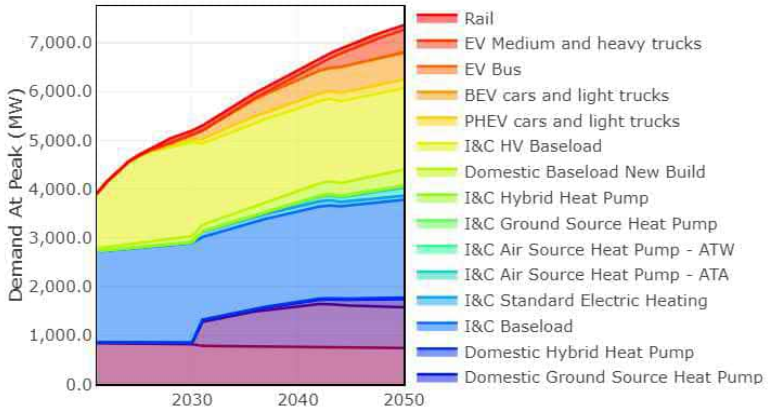
"Pan" – change mouse tool to scroll through graph

"Zoom" – change mouse tool to highlight to zoom

"Year" and "Month" sliders – slide to show data at different times

Online Platform – Time of peak changes

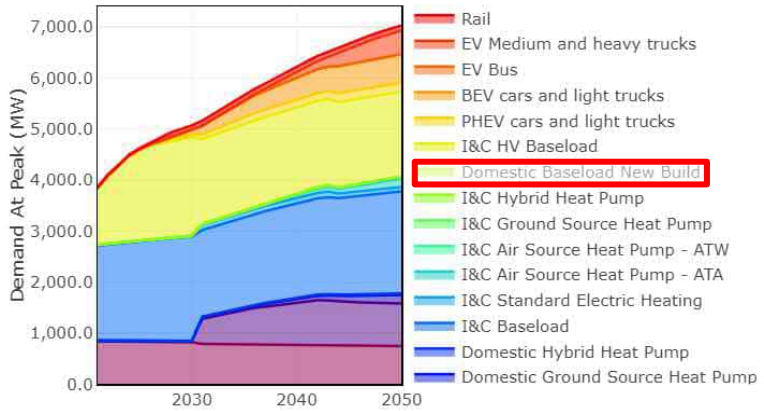
Users may sometimes see a step-change in certain loads within the annual peak results. These step-changes are due to change in the time of day and/or month of peak demand, and differing contributions of each load type at those different times.



Users can see the step-change in certain load types here.

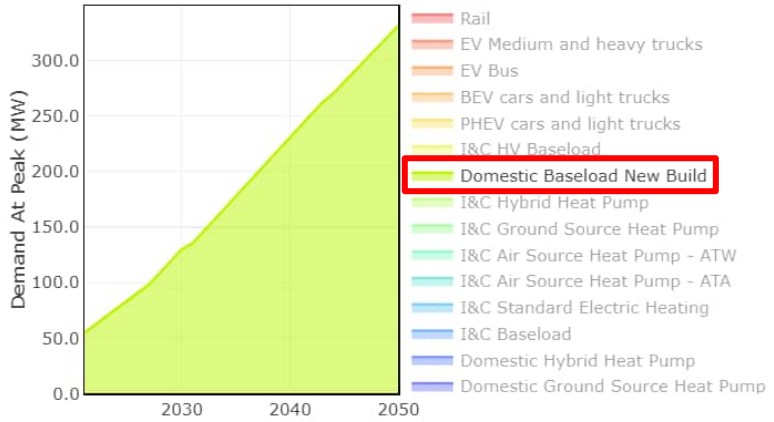
As an example, hovering over the EV Bus segment, to the **right** of the step-down shows that the peak is in **December at 20:00**.

In contrast, hovering over the EV Bus segment, to the **left** of the step-down, shows that the peak is in **July at 12:00**.



Online Platform – Graphical single- & double-click functions

Standard graphical output

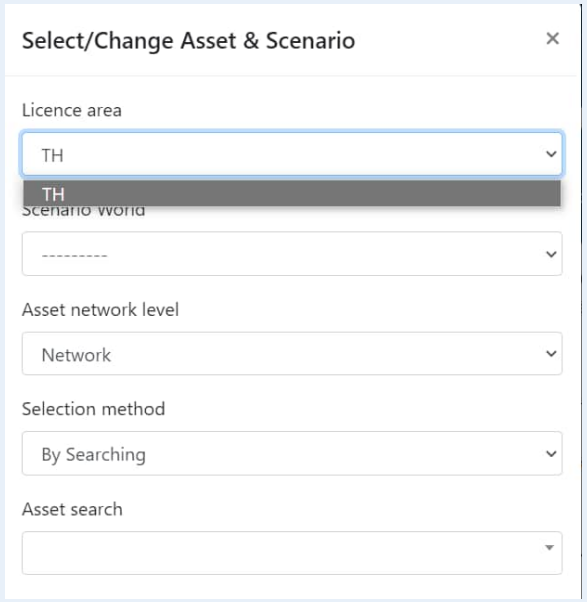


The standard graphical output displays interactive plots broken down by technology.

After a single-click on "Domestic Baseload New Build"

A single-click on one of the technologies displayed in the legend removes that technology from the plot.

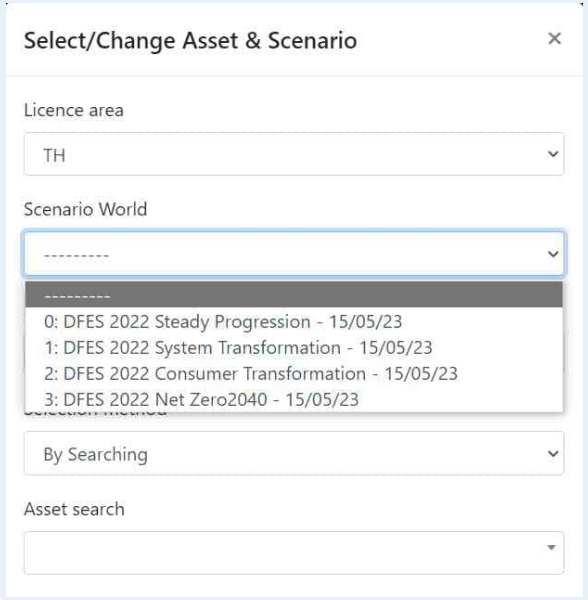
After a double-click on "Domestic Baseload New Build"



A double-click on one of the technologies displayed in the legend removes all other technologies, focusing on the chosen technology.

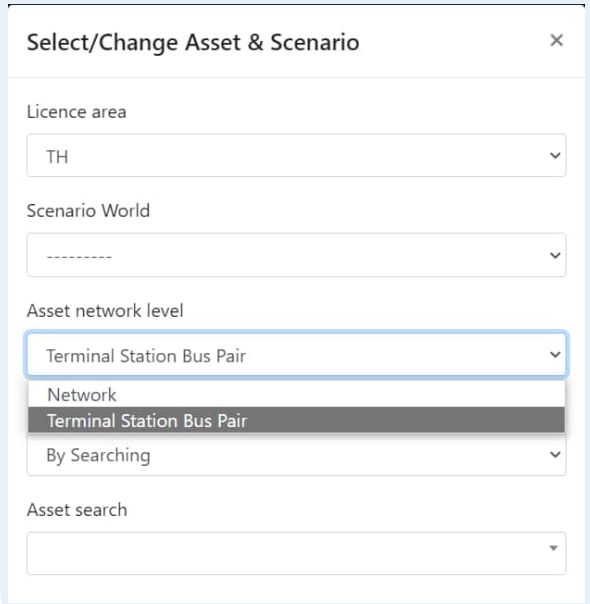
Online Platform – Asset Selection

Users can select/change the asset to view in the Single Asset Analysis by going through a list of dropdowns to narrow down to the desired asset for a selected scenario.



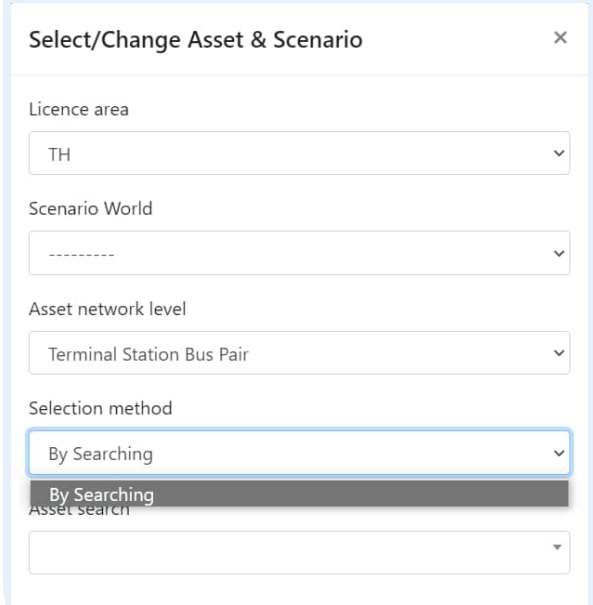
1

Select the licence area (Only TH in this case).



2

Select the scenario world (e.g. one of the DFES scenarios).



3

Select the asset network level.

4

Select the asset selection method (In this case only by searching).

Overview

FES Model Overview

Accessing the FES Model

Model Functionality

Online Platform

- Landing Page
- Scenario worlds
- Single Asset Analysis

Review of functionality

By now, FES model users should understand how to configure scenarios and run single asset calculations.

Functionality	Details
Scenario configuration	– Ability to load FES model parameters and modify them to create new custom scenarios. – Ability to view user-saved scenarios.
Single asset calculation	– Ability to run the load model for a specific asset for a given (custom) scenario. This asset can be a TS Bus Pair or the TH network. – Ability to display and manipulate interactive plots, including annual consumption forecast, peak forecast, and profiles forecast, with some broken down by technology. – Ability to download a CSV with technology counts/capacities via button.

General Information and System Availability

General Information

- TH users can access the FES model platform on **Google Chrome** or **Microsoft Explorer**.
- TH users can access the FES model via sign-in using their existing Toronto Hydro Microsoft credentials.

System Availability

- The FES model will operate continuously rather than on a start up/shut down schedule.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-12

Reference: "the majority of Key Account customers surveyed have goals to reduce their net GHG emissions to zero, and expect Toronto Hydro to support them in meeting their climate objectives by ensuring that the system has capacity for growth and by providing them advisory services to support their decarbonization-through-electrification journey" [Investment Plan Section 3.1] Please provide any references that support this observation (e.g. THESL key account interactions, survey questions, etc.).

RESPONSE – PREPARED BY IRG:

Customers were asked "Does your organization have a carbon reduction program in place? Page 31 of Exhibit 1B, Tab 5, Schedule 1, Appendix A, - Customer Engagement Report, Appendix.06 – Key Accounts shows that a majority (64%) of Toronto Hydro's key account customers had "net zero" targets or carbon reduction initiatives in place at the time of the Phase I Needs and Preferences Survey consisting of:

- 38% reporting carbon reduction targets currently in place, and
- 26% reporting "net zero" targets.

Additionally, page 28 of Appendix.01 – Qualitative Research documents that many key account participants interviewed in Phase I "shared their hopes that Toronto Hydro would increase their support in helping them transition to lower or non-emitting carbon energy sources, building out more distributed energy resources (including battery storage), and enabling grid modernization, such as microgrids technologies".

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-13

Reference: Table 4 Summary Of 2025-2029 Proposed Distribution Rate Change.

QUESTION:

Please confirm that the amounts in each column of the table are incremental, i.e. incremental to previous amount changes and not a cumulative amount.

RESPONSE:

Toronto Hydro confirms the amounts in each column of the table are incremental.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-14

Reference(s): Ontario has announced plans to build 1.5 million additional homes.

PollutionProbe_IR_AppendixA_CanmetReport (Table 1, Page 10)

QUESTION (A):

a) What portion of the 1.5 million homes Ontario announced are expected to be in the THESL service territory?

RESPONSE (A):

Toronto Hydro is unable to provide a response as it cannot speculate the portion of homes to be within its service territory.

QUESTION (B) AND (C):

b) Does THESL encourage new buildings to be self-sufficient (i.e. not connect to the grid), Net Zero or net exporters to the grid? If yes, please provide the information/incentives that THESL uses to encourage this. If not, please explain why not given that it would reduce future system demand.

c) Best available information for Toronto from the Canmet ENERGY Report noted above indicate that new energy efficient home design required 78% less energy (2.6kW compared to older homes at 11.6kW). Please outline what THESL is doing to ensure that new homes align with energy efficient design and technologies.

RESPONSE (B) AND (C):

Through non-rate regulated business activities, which do not form part of this application, Toronto Hydro is playing a proactive role in supporting the realization of the City's Net Zero Strategy by

facilitating and stimulating the growth of emerging local cleantech markets. For more information, please see the latest Climate Action Plan status report.[1]

QUESTION (D):

d) Please provide an estimate of the additional demand that would occur on the THESL system if traditional design and technologies are used for new homes and buildings instead of best practice energy efficiency design and technologies.

RESPONSE (D):

Toronto Hydro is unable to undertake the detailed hypothetical analysis that is required to answer this question within the discovery timelines in this proceeding. Furthermore, Toronto Hydro notes that this analysis is not relevant and does not provide probative value to deciding the issues in this proceeding.

[1] https://www.torontohydro.com/documents/20143/193303016/climate-action-plan-2023-status-report.pdf

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-15

Reference: Investment Plan Section 4.4

"Toronto Hydro is committed to reducing its direct GHG emissions (referred to as Scope 1 emissions) in order to mitigate the impacts of climate change and reach "net zero" by 2040"

QUESTION (A):

a) Has THESL committed to a Net Zero target? If no, please provide a copy of the actual commitment and related plan. If yes, please provide a copy of the commitment and related plan.

RESPONSE (A):

Yes, Toronto Hydro has committed to achieving Net Zero by 2040. Please refer to the Net Zero 2040 Strategy in Exhibit 2B, Section D7 and information on the Emissions Reduction measure proposed for the utility's 2025-2029 custom scorecard in Exhibit 1B, Tab 3, Schedule 1.

QUESTION (B):

b) Please explain why THESL is only counting Scope 1 emissions, particularly when Scope 2 emissions are also directly related to THESL operations.

RESPONSE (B):

Toronto Hydro's Net Zero 2040 Strategy only counts Scope 1 emissions because the variability of Scope 2 emissions is influenced by factors outside of Toronto Hydro's control, such as the greenhouse gas ("GHG") emissions associated with electricity generation. For example, although Toronto Hydro reduced the amount of electricity lost from its system during distribution in 2023, net Scope 2 emissions nonetheless increased as more emissions were released during the generation of electricity in Ontario than the previous year.

Nevertheless, Toronto Hydro quantifies, reports on, and actively implements mitigation measures to reduce the portion of Scope 2 emissions the utility can influence. For example, Toronto Hydro is reducing the Scope 2 emissions associated with distribution losses by making the system more efficient through the replacement of legacy outlets and construction standards, including 4 kV distribution assets. Toronto Hydro has also implemented energy efficiency measures such as LED lighting and building automation upgrades in its work centres to minimize Scope 2 emissions associated with electricity consumption.

QUESTION (C):

c) Does THESL use lifecycle carbon (GHG) emission to analyses any of its decisions or operations? If yes, please specify.

RESPONSE (C):

Please refer to subpart (d).

QUESTION (D):

d) Please explain what specific criteria are included in the THESL procurement policies, processes and templates to consider supplier Net Zero commitment and product carbon intensity.

RESPONSE (D):

As part of competitive bidding, Toronto Hydro requires suppliers to provide information related to the efficient use of resources and energy throughout the life cycle of the goods being procured, as well as any energy, water, or fuel-saving features. Additionally, Toronto Hydro assesses new products prior to use with a view to the product's impact on the environment, identification of environmentally preferable alternatives, and end-of-life treatment. The environmental impacts to be compared across the product/service lifecycle include:

i. Waste to landfill
ii. Greenhouse gas emissions

iii. Natural resource use (i.e. if product is made of recycled materials or sustainably harvested resources)

iv. Hazardous waste generation

v. Energy use

vi. Water consumption

vii. Biodiversity (i.e. does the product/service have a negative impact on plants and animals).

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-16

Reference: Figure 6: FTE per GWh of Load Served [Investment Plan]

QUESTION:

Please provide a version of Figure 6 that also includes 2023 through 2029 forecasted data. Please also provide the input data (via Excel or other format used)

RESPONSE:

Please see below an analysis of Toronto Hydro FTE per GWh from 2015 through 2029. The data inputs relied on for FTE can be found in Toronto Hydro's Appendix 2-K, while weather normalized GWh inputs can be found on page 1 of Exhibit 3, Tab 1, Schedule 1. Toronto Hydro cannot provide a version of Figure 6 which goes beyond 2022 because this figure relies on historical RRR data for the peer group. Toronto Hydro does not have a forecast of FTE or GWh for the members of the utility peer group.

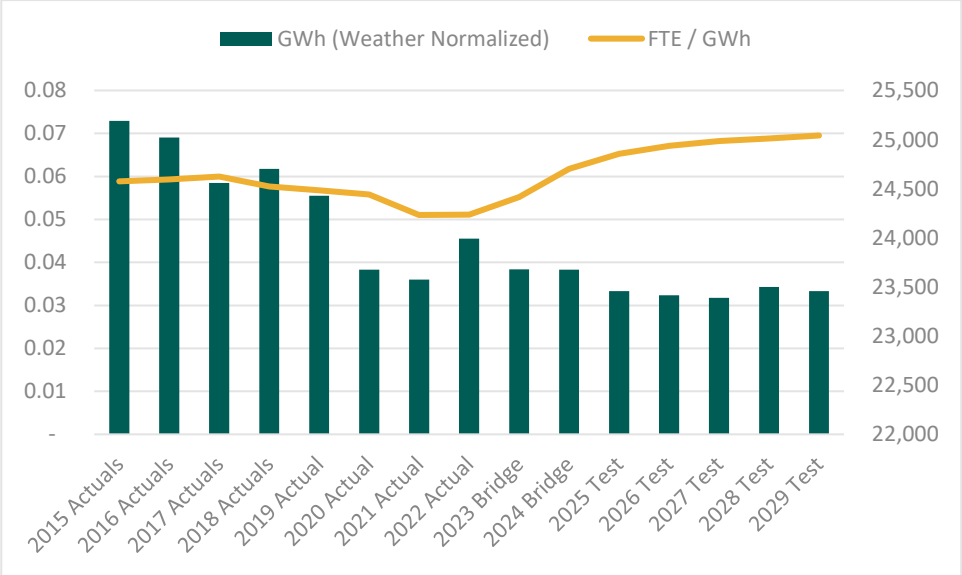

Figure 1: FTE per GWh 2015 to 2029

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-17

QUESTION:

Please explain how the proposed Advanced Distribution Management System is different than the Toronto Hydro Asset and Program Management function which are already supported and budgeted separately. Also, please provide a comparative list of the function, tasks and outcome related to each identifying which are the same or different.

RESPONSE:

The Advanced Distribution Management System ("ADMS") is a software solution that integrates and consolidates functionalities from several systems, such as Toronto Hydro's Outage Management System ("OMS") and Distribution Management System ("DMS"), which handle a wide array of mission-critical outage management and system management functions; Supervisory Control and Data Acquisition ("SCADA"), which enables real-time distribution system monitoring and control; and the Distributed Energy Resources ("DER") Management System or DERMS, which monitors and controls DERs. The primary role of ADMS is to provide power system controllers a platform to efficiently operate the distribution system and to provide the utility with a comprehensive and unified view of the state of the distribution system at any given time by acting as a central hub which pulls data from, and interacts with, this constellation of software and systems. Additional details regarding Toronto Hydro's plans for a ADMS platform are provided in Exhibit 2B, Section D5.2.1.2, and Section E8.4.

In contrast, Asset and Program Management are organizational functions that are primarily focused on strategic sustainment and development of Toronto Hydro's electricity distribution system, and oversight of work program delivery. Additional details regarding Toronto Hydro's Asset Management system are provided in Exhibit 2B, Section D1 and the OM&A expenditures to deliver on this function are discussed in Exhibit 4, Tab 2, Schedule 9.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-18

Reference: Exhibit 1B, Tab 1, Schedule 3, Page 5, Table 5

THESL has indicated that it expects significant growth due to decarbonization, the Energy Transition and related changes. However, Table 5 indicates decreasing load out to 2029. Please reconcile.

RESPONSE:

As outlined in Executive Summary, Exhibit 1, Tab 1, Schedule 1, Toronto Hydro stated that the application is being filed during a time of unprecedented change and transformation, as customers, communities and governments at all levels are actively embarking on an energy transition to mitigate the existential and economic impacts of climate change. This, by definition, requires the utility to invest ahead of load materializing.

Since 2006, Toronto Hydro has experienced a significant decrease in total consumption, including due to conservation activities – both program-driven and naturally occurring. In the early stages of the energy transition, electricity consumption is forecasted to continue to decline, then plateau, and then rise.

To protect both ratepayers and the utility from structural unknowns in forecasted costs and revenues related to demand growth in a time of unprecedented change in the economy and energy system, Toronto Hydro proposes to reconcile the demand-related program and revenue variances as part of the DRVA. As the question and Toronto Hydro both anticipate, the energy transition is more likely to lead to greater revenues, and through the DRVA, those incremental revenues will be tracked and cleared to the benefit of customers.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-19

Reference: **ScottMadden management consultant report, page 6. The report indicates that the UK and New York have created separate cost recovery mechanisms for utilities to fund innovation.**

QUESTION (A):

a) Please provide a copy of the exemplar mechanism summary/documentation links, reports or other information for the UK and New York examples referenced.

RESPONSE (A) - PREPARED BY SCOTTMADDEN:

Please refer to the links below for the UK.

1. RIIO-2 Framework Decision:

https://www.ofgem.gov.uk/sites/default/files/docs/2018/07/riio2_july_decision_document_final_300718.pdf

2. RIIO-ED2 Final Determinations :

https://www.ofgem.gov.uk/publications/riio-ed2-final-determinations

Please refer to the link below for New York.

https://documents.dps.ny.gov/public/Common/ViewDoc.aspx?DocRefId=%7BF3E72300-3F69-442A-A86D-02EB3C3E2890%7D

QUESTION (B):

b) Please provide a table comparing the main similarities and differences between the proposed THESL Innovation Fund and those of the comparator utilities mentioned in the report.

RESPONSE (B) - PREPARED BY SCOTTMADDEN:

Please refer to the table below.

Innovation Fund	Objectives	Characteristics	Cost Recovery Mechanism
THESL Innovation Fund	Facilitate innovation in the electricity sector	Innovative pilot projects over the 2025-2029 rate period that test new technologies, advanced capabilities and alternative strategies that enable electrification grid readiness and are responsive to the OEB's expectations with respect to facilitating DER integration, as expressed in the Framework for Energy Innovation (FEI) report.	Rate Rider
UK RIIO	Deliver a sustainable energy sector. Deliver value for money over the long-term for existing and future customers	**Strategic Innovation Fund**: Ambitious and Innovative projects that help shape the future of the energy networks and accelerate the transition to net zero, at lowest cost to consumers **Network Innovation Allowance**: Innovative projects that facilitate energy system transition and/or benefit customers in vulnerable situations	Included in allowed revenues in RIIO ED-2 price control period
New York REV	Test new business models and partnerships with third parties. Harness the utility platform, expertise, and brand to reduce clean energy costs and barriers while potentially providing new utility value streams	Demonstration Projects that include partnerships between utilities and third-party service providers; deploying advanced distribution systems and explore opportunities to work with various types of customers.	Rate Rider
Nova Scotia	Allow for testing to provide valuable data and learnings, or aid in the development of business cases, prior to full-scale deployment	Projects that provide customer value in some or all of the following areas: 1) Reduce upward pressure on revenue requirement; 2) Provide reliability and grid stability; 3) Support environmental and other government policy compliance; 4) Improve customer experience	Rate Rider
California EPIC	Fund public investments in research to create and advance new energy solutions, foster regional innovation, and bring ideas from the lab to the marketplace	Projects that support one or more of the following goals: 1) Transportation electrification; 2) Distributed energy resource integration; 3) Building decarbonization; 4) Achievement of 100% net-zero carbon emissions and coordination of the role of natural gas; 5) Climate Adaptation	Rate Rider

Toronto Hydro's proposed Innovation Fund is similar to the electric utilities referenced in the report, including the objectives, characteristics, and cost recovery mechanisms.

QUESTION (C):

c) Please confirm that there are no Ontario or Canadian utilities examples that the consultant has identified for comparison. If there are, please provide details.

RESPONSE (C) - PREPARED BY SCOTTMADDEN:

The report includes Nova Scotia. Please refer to Exhibit 1B, Tab 2, Schedule 1, Appendix B, p. 41.

QUESTION (D):

d) Have the example jurisdictions/utilities noted above been used for any of the other benchmarking reports THESL filed in this application? If yes, please indicate which ones.

RESPONSE (D) - PREPARED BY SCOTTMADDEN:

ScottMadden did not review the other benchmarking reports THESL filed in this application.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-20

Reference: Exhibit 1B, Tab 3, Schedule 1, Page 7, Table 1: 2025 - 2029 Performance 1 Incentive Scorecard Measures

QUESTIONS (A) – (B):

a) Please provide a copy of Table 1 noted above and include extra columns to indicate:

- Is the metric existing or new.
- If it is an existing metric, please provide the previous target and actual.
- If it is a new metric, please indicate the average actual based on the current term (2020-2024) data.
- The total $ payout per item if THESL hits the target
- The total net benefit ($) per item if the target is achieved (i.e. the total net benefit before the THESL payout)

b) Please confirm if the proposed payout per metric is 'all or nothing' based on hitting the target or some sort of sliding scale.

RESPONSE (A) – (B):

Please see the responses to 1B-Staff-46, 1B-Staff-52 and 1B-Staff-54.

QUESTION (C):

Will THESL commit to a third-party audit of results prior to any scorecard payout? If not, why not?

RESPONSE (C):

Toronto Hydro does not believe that a third-party audit of results is necessary because (1) the utility has mature processes for reporting performance as part of RRR and the EDS and (2) OEB Staff and

interested parties will be able to test the results through the discovery process in the utility's next rebasing application.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-21

Reference: Exhibit 1B, Tab 3, Schedule 1

Preamble:

For the benefits that can be quantified however, the Investment Plan and Custom Scorecard that underpin the PIM, yields nominal customers benefits that range from approximately $90 million and $216 million over the 2025 to 2029 period, and lifetime benefits in the range of $890 million to over $1.23 billion, as detailed in section 3 below.

QUESTION:

Please provide the breakdown of values and math used to calculate the customer benefit ranges of:

- $90 million
- $216 million
- $890 million to $1.23 billion

RESPONSE:

Please see Table 21 at page 57 of Exhibit 1B, Tab 3, Schedule 1.

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-22

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix C

QUESTION (A):

a) Please provide a copy of the following graphs with the specific utilities labelled for each bar on the x-axis (i.e. only Toronto Hydro is noted and not the specific utilities being compared in the graphs)

i. Figure II-1: Customer Density

ii. Figure II-2: IBEW Average Annual Wage

RESPONSE (A) PROVIDED BY UMS GROUP:

Acknowledging that this information was not used as normalizers in the quantitative benchmark, the following charts are provided (See Figure 1 and 2 below). In consideration of our commitment to anonymity to the study participants (as a condition of participation), we must adhere to the alphabetical designations used throughout the study.

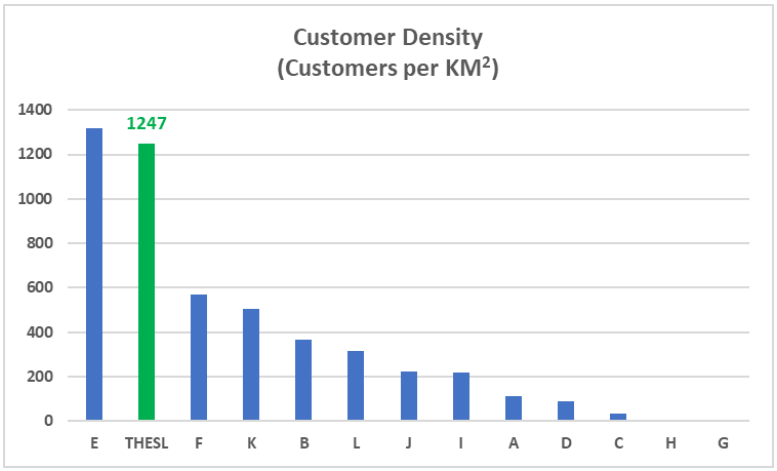

Figure II-1: Customer Density

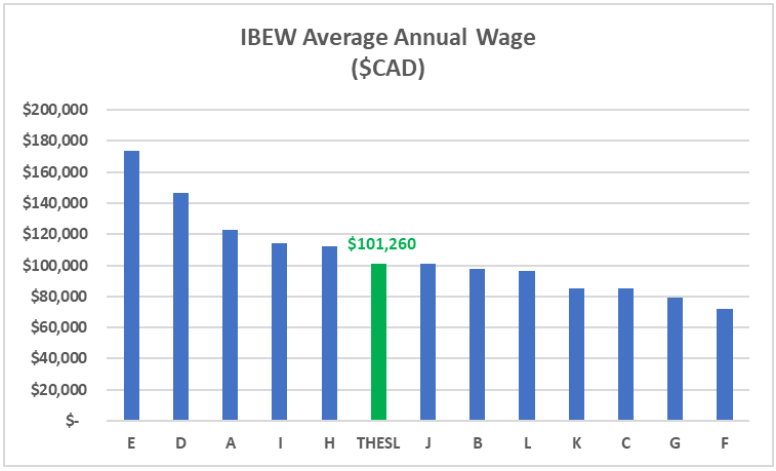

Figure II-2: IBEW Average Annual Wage

QUESTION (B):

b) Please explain how the Peer Group Panel was selected and what characteristics (e.g. population size, rate base, capital envelope, number of assets, etc.) the Peer Group shares with Toronto Hydro.

RESPONSE (B) PROVIDED BY UMS GROUP:

As stated in the Section III – Project Approach (Peer Group Panel) of the referenced UMS Group Benchmarking Study, UMS Group sought to provide comparisons that would be relevant to THESL's operating environment:

- Focusing first on other Province of Ontario electric distribution systems / organizations, we narrowed our consideration to those serving more than 75,000 customers, thus providing nine candidates for further review. UMS Group then compared these utilities relative to 10 data sets presented in the Ontario Energy Board ("OEB") data provided as part of the Activity and Program-based Benchmarking Initiative. (Refer to Appendix B, Figure B-3, and prefacing discussion for a listing of the 10 data sets and a summarization of the analysis). In so doing, we identified Alectra Utilities, Hydro Ottawa, Elexicon Energy, and London Hydro as possible comparators. All four were invited to participate, with Elexicon Energy and London Hydro providing input.

- In parallel, UMS Group reached out to the utilities that had participated in the previous application (EB-2018-0165) and was successful in enlisting the participation of eight (the remaining balance of nine cited varying more pressing priorities amidst constrained resources as their reason for declining participation). Two additional utilities that had been invited but declined last time accepted this time around: Avista Utilities and a Canadian utility that requested anonymity as a precondition to participation. As stated in the Executive Summary of the referenced benchmarking study, these utilities were deemed as valid comparators based on demographics (customer density, vegetation, and weather / climate), and factors that add complexity to field execution (e.g., technical, legislative, regulatory, and bargaining unit constraints / mandates).

To substantiate the appropriateness of the resulting Peer Group Panel, Table III-1 in Section III – Project Approach of the referenced benchmarking study shows that THESL aligns with most members of the Peer Group across four of five external factors that our experience deems most impactful to worker productivity.

QUESTION (C):

c) UMS indicates that Hydro One was excluded because it is not a representative peer for Toronto Hydro. Please confirm and explain why London Hydro is a more appropriate peer than Hydro One for Toronto Hydro.

RESPONSE (C) PROVIDED BY UMS GROUP:

With respect to electric distribution, Hydro One is viewed as predominantly rural, not subject to issues of utility, building, and population congestion, nor the same types of ordinances that can affect productivity. However, we wanted to include other Ontario Utilities, so solicited participation from others deemed as better comparators, notably Alectra, Elexicon, London Hydro, and Hydro Ottawa. Neither Alectra nor Hydro Ottawa were able to support the effort, citing resource constraints due to other overriding priorities.

QUESTION (D):

d) Please explain why Ontario peer utilities (most comparable to Toronto Hydro like Alectra) were not included in the study.

RESPONSE (D) PROVIDED BY UMS GROUP:

Please see the response to part c above. Other Ontario Utilities were solicited, but two (including Alectra) opted out, citing resource constraints due to other overriding priorities.

QUESTION (E):

e) Please explain why UMS included one Anonymous peer in the study analysis rather than excluding that utility, given that there would be no ability to ensure an Anonymous utility is an appropriate benchmark.

RESPONSE (E) PROVIDED BY UMS GROUP:

Though one step further than the norm in maintaining confidentiality (utilities typically accept the notion of an alphabetic designation as sufficient), we did not view the Anonymous Utility as an invalid data point for the task at hand. In fact, it corresponded quite well to the criteria described above and provided us with another Canadian Utility.

QUESTION (F):

f) Please confirm how the study finding would be impacted if the Anonymous utility peer is excluded.

RESPONSE (F) BY UMS GROUP:

While we consider it appropriate to include the anonymous utility, we have assessed the impact of excluding it, as requested. As changes are noted within each Asset Category and Maintenance Program, the general theme underlying Table II-1 in Section II – Executive Summary of the referenced benchmarking study remains intact with the following highlighted (underlined in italic) adjustments:

Generally, THESL is positioned within each of the categories and programs between approximately *2.3% above (previously 1.9% above)*, the Median (barely third quartile) to negative 12.2% below the Median (well-embedded in the second quartile) when combining both benchmarking perspectives.

Table II-1: Benchmark Comparisons ($CAD)

Applying Conversion and Accounting Adjustments Only (Less Anonymous Utility)

			Median	Percent from Median
Asset Categories				
Wood Pole	Each	$8,317	8,134	2.3%
UG Cable (XLPE)	Per Meter	$131	128	2.0%
Pole Top Transformer	Each	$18,691	18,691	0.0%
Pad mount / UG Transformer	Each	$37.373	36,643	2.0%
Network Transformer / Protector	Each	$127,649	129,169	-1.2%
Breaker	Each	$37,983	40,722	-6.7%
Cable Chambers / Manholes	Each	$136,409	135,579	0.6%
Maintenance Programs				
Vegetation Management	Per Line KM	$2,175	2,175	0.0%
Pole Test and Treat	Each	$17	18	-2.0%
Overhead Line Patrol	Per Line KM	$23	26	-12.2%
Substation Maintenance	MVA	$1,712	1,681	1.9%
Building Vault Inspection	Each	$258	268	-3.9%

RESPONSES TO POLLUTION PROBE INTERROGATORIES

INTERROGATORY 1B-PP-23

Reference: Exhibit 1B, Tab 3, Schedule 3, Appendix C, Table D-1

QUESTION (A):

a) Does the list of utilities in Table D-1 represent the full list of current utility data sets UMS has available? If not, please provide the full list.

RESPONSE (A) PROVIDED BY UMS GROUP:

UMS Group does not maintain datasets for unit costs, and those from previous studies are outdated and not reflective of the new market realities resulting from inflation, supply chain challenges, and COVID-related restrictions (only recently being lifted across the industry). Therefore, in embarking on "one-off" studies like that performed for THESL, UMS Group leverages (1) existing relationships (formed over the past 34 years since its inception) to recruit a Peer Group Panel, and (2) the tested and industry accepted comparative modeling and supporting methodologies.

QUESTION (A):

b) Please explain why ATCO Electric was not included as a Peer utility.

RESPONSE (B) PROVIDED BY UMS GROUP:

We contacted ATCO Electric to no avail. We understand that resource constraints amidst other more urgent priorities precluded their participation.

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-01

Reference: Exhibit 1B

Please update the following to include 2023 actuals:

a. Ex.2A-1, p.2, Table 1 and 2

RESPONSE:

a) Please see Table 1 for updated 2023 actuals and 2024 forecast. Toronto Hydro intends to file an update to 2025-2029 forecasts for Table 2 prior to the Technical Conference.

Table 1: 2020-2024 Rate Base Summary ($ Millions)

	OEB Approved	Actuals				Bridge
	2020	2020	2021	2022	2023[1]	2024
Opening PP&E NBV	4,229.4	4,233.2	4,419.2	4,628.1	4,893.9	5,227.4
In-Service Additions[2]	527.4	447.9	485.2	554.4	594.7	619.8

[1] Includes a preliminary estimate of Working Capital Allowance. The finalized amount will be filed for the 2023 reporting year on April 30, 2023 per RRR Filing Guide
[2] Includes disposal of properties

Depreciation	(265.4)	(262.0)	(276.2)	(288.7)	(261.2)	(277.8)
Closing PP&E NBV	4,491.3	4,419.2	4,628.1	4,893.9	5,227.4	5,569.4
Monthly Avg PP&E NBV	**4,298.6**	**4,284.3**	**4,457.7**	**4,686.3**	**4,960.0**	**5,327.0**
Working Capital Allowance	216.2	249.8	217.2	220.7	216.8	230.3
Rate Base	**4,514.8**	**4,534.1**	**4,674.9**	**4,907.0**	**5,176.8**	**5,557.3**

b) Please see Toronto Hydro's response to interrogatory 2A-Staff-104, Appendix A, for updates for 2023 actuals and updated 2024 forecast in Appendix 2-AA.

c) Please see Toronto Hydro's response to interrogatory 2A-Staff-104, Appendix B, for updates for 2023 actuals and updated 2024 forecast to Appendix 2-AB.

d) Please see Appendix A to this response for updates to Exhibit 2A, Tab 1, Schedule 1, Appendix A for 2023 actuals and 2024 forecast update

e) Please see Appendix B to this response for updates to Appendix 2-BA for 2023 actuals and updated 2024 forecast.

f) Please see Appendix C to this response for updates to Appendix 2-H for 2023 actuals.

g) The request entails complex modelling to update the load forecast to include 2023 as a historical actual year and the regression equations to forecast 2024 to 2029. Toronto Hydro is unable to undertake the detailed modelling required to update the OEB model within the interrogatory timelines. However, as noted in the letter filed with its Evidence Update on January 29th, Toronto Hydro intends to update this model to reflect 2023 actuals and the updated 2025-2029 forecast on April 2nd prior to the Technical Conference.

h) Please refer to Toronto Hydro's response to interrogatory 4-SEC-89, subpart (c).

THESL Fleet Benchmarking

April 2023

METSCO
MAKING IT POSSIBLE

AGENDA

- Executive Summary
- Ontario Peer Fleet Benchmark
- North America Benchmark

DRAFT

Summary

Need: THESL relies on its vehicle fleet to perform electricity distribution activities safely and efficiently. The Fleet & Facilities team justifies the prudency of the program, with the aim of ensuring reliable vehicle operation and managing assets at the lowest overall lifecycle costs.

Analysis: METSCO performed an industry research scan to help THESL determine how its indicators compared to other electric utilities across North America as well as determine if there are any additional metrics it should be tracking.

Output: The output of the analysis was structured within four categories: utility service metrics, fleet maintenance/utilization metrics, fleet expenditure metrics and additional supporting metrics. METSCO's conducted research was unable to conclusively determine whether THESL's fleet program is suitable for its intended purpose. However, the research suggests that THESL's fleet size may be insufficient to efficiently serve its entire circuit line compared to other similar companies.

Next Steps: THESL's fleet management team can consider the analysis and output of the benchmark into its upcoming CIR narrative in order to justify the prudency of its overall fleet program.

DRAFT

Project Approach

- In collaboration with THESL, utility characteristics were identified for THESL to inform selection of peer utilities.

- The count of peer utilities and grouping was established at the beginning of the project. Peer utilities were separated into two regions:
  - **Ontario region**: Hydro Ottawa, Hydro One, Alectra, and Elexicon.
  - **North America region** (excluding Ontario): Three anonymized utilities (two from Canada and one from the United States).

- METSCO categorized its analysis to the following KPI categories:
  - **Utility Service Metrics:** such as number of customers, number of fleet vehicles, customer growth projections and general service characteristics such as size of service territory, customer density, vehicle density, and length of underground cables.
  - **Fleet Maintenance / Utilization Metrics:** such as maintenance and repair timelines, average lifecycle per vehicle type, optimal lifecycle per vehicle type, and average kilometers driven per vehicle type.
  - **Fleet Expenditure Metrics:** such as annual fleet OM&A expenditure, OM&A per vehicle, annual CAPEX, CAPEX per vehicle, and forecast comparisons.
  - **Additional Support Metrics:** additional support metrics identified through the research that did not fit with the above categories. These KPIs are utilized by other peers that THESL may consider as part of its Fleet Management program.

DRAFT

Benchmark Limitations

- There were challenges encountered while attempting to find fleet management programs to compare with THESL's fleet:
  - Limited standardization of disclosed metrics across utilities. This was more evident across North American peers versus Ontario peers.
    - The evidence presented in the last DSPs of HONI and Hydro Ottawa indicates that there are variable fleet benchmarks, and the metrics favor their own performance.
  - Ontario DSPs are filed at different time periods so fleet programs are captured at different time snapshots
  - Utility methodologies are not standardized or publicly available.
  - Little information available with respect to fleet metrics across North American utilities, which limited selection of peers to those who had statistics available.
  - Limited information available in terms of annual OM&A expenditures.
  - Large range of benchmark statistics a result of limited analytical capacity outside the utilities selected.

- The benchmark limits additional factors in the analysis, though they can be inferred through the presented information:
  - Climate/weather impacts on vehicles.
  - Road conditions and the associated impacts on vehicle wear and tear.

METSCO
MAKING IT POSSIBLE

Utility Service Metrics

DRAFT

Taking into consideration THESL's fleet size, customer count, service area and underground line:

- THESL's fleet serves the most customers per vehicle compared to peers.
  - This may indicate THESL's fleet size is undersized for the customer count.
- THESL's fleet has the highest vehicle density among its peers.
  - It is possible that the fleet size of THESL is larger than necessary for the area covered by the fleet program.
- THESL's fleet serves the highest underground cable (and total circuit length) per vehicle compared to the average of peers.
  - This may indicate THESL's fleet size is undersized for servicing it's system.

Grouping	Customers per Vehicle	Sq. KM per Vehicle	UG Cable (KM) per Vehicle	Total Circuit Length (KM) per vehicle
THESL	2,030.1	1.6	35.4	75.2
Ontario Peer Average (excluding HONI)	1,519.4	42.4	31.3	48.5
Ontario Peer Average (including HONI)	1,183.3	32.6	23.8	40.2
Select North American Peers	1,041.2	142.0	5.2	-

Note: values include all vehicle types

METSCO
MAKING IT POSSIBLE

Maintenance/Utilization Metrics

DRAFT

The following observations are made for THESL's maintenance metrics:

- Peers use a 'Medium Duty' class whereas THESL does not and is absent from the table.
- Peers outside Ontario disclose only year values versus kilometer.
- THESL's light and heavy vehicle class has a high year-low kilometer pairing whereas its peers exhibit the reciprocal.
    - No evidence was found to indicate which pairing is optimal for managing a fleet program or identifying if a fleet program is right-sized for its intended system.

Grouping	Light Duty		Heavy Duty	
	Yrs	KM	Yrs	KM
THESL	8.6	136,000	12.5	200,000
Ontario Peer Average (excluding HONI)	7.3	183,000	11.8	300,000
Ontario Peer Average (including HONI)	7.5	182,500	11.8	312,500
Select North American Peers	8.2	-	10.8	-

METSCO
MAKING IT POSSIBLE

Fleet Expenditure Metrics

DRAFT

Taking into consideration THESL's annual CAPEX program for its fleet:

- THESL has the highest CAPEX intensity among its peers, excluding HONI, and this CAPEX has the most significant impact on its customers.
- Compared to utilities outside of Ontario, THESL has a lower CAPEX impact on its customers. However, the annual CAPEX programs of these peers are almost three times higher than THESL's due to the larger customer and service area they serve.
  - It is uncertain whether THESL's fleet CAPEX is excessive or insufficient, but the presented averages suggest that THESL's program may be somewhat higher than that of its Ontario counterparts.

Grouping	Annual CAPEX	CAPEX per Customer (Forecast)	CAPEX per Vehicle (Forecast)
THESL	$8,900,000	$11.33	$22,998
Ontario Peer Average (excluding HONI)	$4,131,000	$7.93	$12,222
Ontario Peer Average (including HONI)	$9,658,000	$10.50	$9,963
Select North American Peers	$25,504,500	$19.25	$7,029

DRAFT

Additional Support Metrics

- METSCO's research revealed various fleet metrics and KPIs, but it is unclear whether all of them are reported or utilized to inform fleet management programs.
- METSCO has suggested a set of KPIs for THESL to consider incorporating, but it may not be feasible to compare THESL's performance against its peers using these KPIs.

	Cost	Safety	Environmental	Service
Peer Identified	- Annual OM&A	- Route Adherence (comparing routes driven with optimal routes) - Mean Km Between Defect - Preventative Maintenance Compliance	- Avg. Fuel Efficiency per Vehicle Type (L/ 100km) - Avg. Energy Efficiency (kWh/km)	- Duty Cycle – average daily mileage and maximum daily mileage of existing fleet - Total Charging Energy Requirement - Summer vs. Winter kWh/km - Vehicle Equivalency: Weighting factor based on expected labour hour requirements

DRAFT

Recommendations

Based on the aforementioned metrics, it is inconclusive with the available information that THESL's current fleet program is fit-for-purpose. The following has informed this opinion:

- However, the research suggests that THESL's fleet size may be insufficient to efficiently serve its entire circuit line compared to other similar companies.
- Although THESL has a high density of customers and customer count per vehicle, their service territory is relatively small and contiguous, which suggests that their vehicles may accumulate less mileage. This is supported by the fact that they have a lower number of square kilometers per fleet vehicle compared to other utilities.
- When compared to North American peer utilities, THESL's capital expenditure per fleet vehicle is relatively high, which is likely due to necessary fleet replacement, upgrading, and procurement from the varying traffic patterns THESL is exposed to versus its peers.

At the same time, our analysis suggests THESL can consider the following:

- Some peers have different lifecycles for their vehicles compared to THESL. THESL's optimal lifecycle configurations may need revision or re-examination through annual equivalent cost metrics considering their fleet replacement strategy.
- To improve their fleet asset lifecycles, it may be beneficial for THESL to reevaluate their fleet maintenance and replacement schedules, as they currently have longer timelines than most of their Ontario peers. Shortening these timelines could potentially have a positive impact.
- It may be beneficial for THESL to explore the feasibility of incorporating additional KPIs in order to enhance and optimize their fleet management program to better serve their unique operating area.

METSCO
MAKING IT POSSIBLE

Ontario Peer Fleet Benchmark

Ontario Utility Baseline Analysis

DRAFT

	# of Vehicles	# of Customers
THESL	387	785,667
Hydro Ottawa	277	353,315
Hydro One	8,227	1,439,974
Alectra	560	1,069,683
Elexicon	125	171,564

- Note: Hydro One stats cover both distribution and transmission.
- THESL's fleet count is 30% lower than the highest distribution-only utility - Alectra.
- THESL's customer count is third lowest of the Ontario peers.

Source: **2021 Electric Utility Yearbooks / DSP Submissions**
Ontario Energy Board. (2023). *Natural gas and electricity yearbooks* [Data]. https://www.oeb.ca/ontarios-energy-sector/performance-assessment/natural-gas-and-electricity-utility-yearbooks

Ontario Utility Service Analysis

	Service Area (Sq. KM)	Urban Service Area (%)	Customers per Sq. KM	Customers per Vehicle	Sq. KM per Vehicle
THESL	630	100%	1247.09	2030.1	1.63
Hydro Ottawa	1,116	40.7%	316.59	1275.5	4.03
Hydro One	961,154	0.1%	1.50	175	3.4
Alectra	1,923	42.8%	556.26	1,910.1	6.3
Elexicon	788	79.6%	217.72	1,372.5	116.8

- THESL has the highest density of customers (2.25 x higher than Alectra, almost 4x higher than HOL)
- THESL is only utility with a 100% urban service area – Elexicon is second with urban service area of 79.6%
  - One could argue that stop-and-go traffic occurs more frequently in urban areas than in rural areas.
  - The performance of a vehicle is more affected by stop-and-go traffic.
  - Higher maintenance costs can result from the impact of stop-and-go traffic on vehicles.
- THESL has the highest customers per vehicle - 71% more than the average of peers, 34% higher if Hydro One is excluded.
- THESL has lowest service area per vehicle (excluding Hydro One, outperforms peer average by 57%)

DRAFT

Source: **2021 Electric Utility Yearbooks**
Ontario Energy Board. (2023). *Natural gas and electricity yearbooks* [Data]. https://www.oeb.ca/ontarios-energy-sector/performance-assessment/natural-gas-and-electricity-utility-yearbooks

Ontario Utility Service Analysis

DRAFT

- THESL's underground cable circuit length is second highest (2.6x more on average than peers).
  - Second highest length of underground cable per vehicle
- A similar observation can be made with the total circuit length per vehicle – THESL is on the higher end of the spectrum which may indicate its fleet is undersized to meet the requirements of the system.

	UG Cable Circuit Length (KM)	Total Circuit Length (KM)	Underground Line (KM) per Vehicle	Total Circuit Length (KM) per Vehicle	Underground / Total Line (%)
THESL	13,681	29,087	35.4	75.2	47%
Hydro Ottawa	3,234	6,000	11.7	21.7	54%
Alectra	37,104	51,872	66.3	92.6	72%
Elexicon	1,970	3,919	15.8	31.4	50%
Hydro One	10,432	124,556	1.3	15.1	8%

Source: **2021 Electric Utility Yearbooks**
Ontario Energy Board. (2023). *Natural gas and electricity yearbooks* [Data]. https://www.oeb.ca/ontarios-energy-sector/performance-assessment/natural-gas-and-electricity-utility-yearbooks

Ontario Utility Service Analysis

DRAFT

- THESL had lowest average annual growth of all peer utilities
- Based on DSP forecasts, THESL's customer per vehicle ratio would increase to 2103 without the addition of extra vehicles
  - THESL vehicle count would need to rise to 400 (+13) to maintain current customer per vehicle ratio.

	Bridge Year	Yearly Average Growth (Actual)	Forecasted Customer per Vehicle (2024)
THESL	2018-2019	0.59%	2103
Hydro Ottawa	2020	1.46%	1278
Alectra	2019	0.93%	N/A
Elexicon	2021	1.14%	1371
Hydro One	2022	1.15%	173

Source: **2021 Electric Utility Yearbooks / DSP Submissions**

Ontario Fleet Maintenance Analysis

DRAFT

- THESL fleet incorporates 15 types of vehicles and trailers
  - 6 light vehicle types and 9 heavy vehicle types
  - Unlike other peer utilities, THESL does not identify any vehicles as "medium-class"
- Light vehicles are assessed at 8.6 years and 136,000km, on average.
- Heavy vehicles are assessed at 12.5 years and 200,000km, on average
  - Midpoint is used to determine average for vehicle categories with a range of values.
- Vehicles considered "medium" at other utilities include step vans, walk-through body trucks, dump trucks and flatbed trucks.

THESL Maintenance Characteristics (LCA/DSP)	Vehicle Class (DSP)	Life Cycle (Years)	Life Cycle (KM)
Car	Light	9	120,000
Cargo Minivan	Light	7	140,000
Passenger Minivan	Light	9	120,000
Full Size Van	Light	10	135,000
Pick-Up	Light	9	180,000
SUV	Light	8	120,000
Cube Van	Heavy	12-15	180,000
Single-Bucket Van Mount Aerial Device	Heavy	11	210,000
Cable Truck	Heavy	11-14	240,000
Crane Truck	Heavy	10-14	210,000 or 240,000
Dump Truck	Heavy	8-12	210,000
Line Truck	Heavy	13	195,000
Double Bucket Aerial Device	Heavy	14	210,000
Digger-Derrick	Heavy	13	195,000 or 210,000
Trailers	Heavy	20	N/A

Ontario Fleet Maintenance Analysis

DRAFT

Utility	Light-Duty	Medium-Duty	Heavy-Duty	Trailers	Other
THESL*	8.6 yr/ 136,000 km	Not Available	12.5 yr./ 200,000 km	20 yr.	Not Available
Hydro Ottawa	10 yr./ 150,000 km	12 yr./ 150,000 km	12-15 yr./ 200,000 km	Not Available	15 yr.
Hydro One**	8 yr./ 180,000 km	Not Available	11.5 yr./ 350,000 km	Not Available	Not Available
Alectra	7 yr./ 250,000 km	10 yr./ 250,000 km	12 yr./ 500,000 km	15 yr.	Not Available
Elexicon	5 yr./ 150,000 km	Not Available	10 yr./ 200,000 km	12 yr.	15 yr.

- THESL can be seen as maintaining their fleet more frequently/sooner than its Ontario peers.
- THESL's light and heavy vehicle class has a high year-low kilometer pairing whereas its peers exhibit the reciprocal.
  - This may be contributed by the various operating conditions the fleet is in (for example THESL is in a 100% urban-based that can experience more wear and tear on vehicles versus other peer service areas).
  - No evidence was found to indicate which pairing is optimal for managing a fleet program or identifying if a fleet program is right-sized for its intended system.
- Unlike other peer utilities, THESL does not identify any vehicles as "medium-duty". This can present an opportunity to THESL to introduce a new class to their fleet with supporting maintenance programs.

Ontario Additional Support Metrics

DRAFT

- THESL is at parity with other Ontario peers for most important fleet management KPIs
  - Age, Mileage, Fuel Efficiency, Utilization Rate, and Cost Metrics
- THESL has opportunity to incorporate more advanced metrics
  - Vehicle Equivalency as a measure of efficiency
    - Enables more powerful comparisons between disparate vehicle types and fleet compositions

	THESL	Hydro Ottawa	Hydro One	Alectra	Elexicon

Common KPIs	• Customer Ratio – Customers per Vehicle
	• Service Area Ratio – KM per Vehicle
	• Age
	• Mileage - Average KM travelled per year
	• Fuel Efficiency - Average Fuel Cost
			• Utilization Rate
			  • Availability
			  • Average Downtime
			• Repair and Maintenance Costs
			  • Per Vehicle Class
			  • Per KM
			  • Preventive Maintenance Costs / Reactive Maintenance Costs
			  • Idle Time
			  • Vehicle Condition: Graded A, B, C		

Unique KPIs	• At-Fault Accident Rate • GHG Intensity: (GHG in tonnes / KM travelled) • Cost Recovery: (Billable Hours / Actual Operating Expenses)	None discovered through research	• Vehicle Equivalency: Weighting factor based on expected labour hour requirements	None discovered through research	• # of Vehicle Trips

Source: THESL- **LCA Report** / THESL- **Fleeting Benchmarking** / OEB.ca – **Utility DSPs**

METSCO
MAKING IT POSSIBLE

North America Peer Fleet Benchmark

North American Utility Baseline Analysis

DRAFT

	# of Vehicles	# of Customers
THESL	387	785,667
Utility A (Man)	3,675	608,554
Utility B (BC)	3,600	5,000,000
Utility C (SMUD)	927	1,500,000

- THESL's fleet count is in the lowest of the North American peers studied (41% the fleet of Utility C, which is the closest comparator of the utilities shown).
- THESL's customer count is lowest of the NA peers studied (52% the population of Utility C.

North American Utility Service Analysis

	Service Area (Sq. KM)	Urban Service Area (%)	Customers per Sq. KM	Customers per Vehicle	Sq. KM per Vehicle
THESL	630	100%	1247.09	2030.1	1.63
Utility A	650,000	N/A	0.94	116.59	176.87
Utility B	888,000	N/A	5.63	1,388.89	246.67
Utility C	2,331	37.9%	643.50	1,618.12	2.51

- Utility C remains is the closest comparable utility to THESL.
- THESL is the only utility with 100% urban service area (while no statistics available for Utility A and Utility B, METSCO can confirm they service both rural and urban areas).
- From analysis, the following characteristics are attributable to THESL:
  - Smallest service area (approx. 27% the service area of Utility C).
  - Largest density of customers per square km of service area (approx. 194% higher than Utility C).
  - Largest density of customers per vehicle (approx. 20% higher than Utility C).
  - Lowest area per vehicle (approximately 65% of average area per vehicle of Utility C).
- In short, THESL is operating within a unique service area that cannot be fairly compared to other municipal-owned utilities and that have publicly available information.

DRAFT

North American Utility Service Analysis

DRAFT

- THESL's **underground cable circuit length** is highest (1.4x more on average than peers).
- THESL has, by far, the highest length of underground cable per vehicle (4x higher on average than peers)
- THESL has the second highest % of total underground cable

	UG Cable Circuit Length (KM)	Total Circuit Length (KM)	Underground Line (KM) per Vehicle	Total Circuit Length (KM) per Vehicle	Underground / Total Line (%)
THESL	13,681	29,087	35.4	75.2	47%
Utility A	10,000	82,000	2.7	22.3	12%
Utility B	9,040	55,000	2.5	15.3	16%
Utility C	9,521	15,800	10.3	17	60%

North American Municipal Utilities Utility Service Analysis

METSCO
MAKING IT POSSIBLE

Utility	Service Area km²	Total Customers	Customers per km²
Seattle City Light	340.1	447,578	1316.02
L.A. Department of Water and Power	1225.06	1,547,815	1263.46
THESL	630	785,667	1247.09
Glendale Water and Power	80.29	90,079	1121.92
Saskatoon Light and Power	69	60,875	638.25
Burlington Electric Department	33.67	21,490	638.25
Alameda Municipal Power	59.05	34,979	592.36
ENMAX Power (AB)	1089	510,000	468.32
Austin Energy	1131.82	520,727	460.08
Kissimmee Utility Authority	220.15	90,000	408.81
Long Island Power Authority	3185	1,100,000	345.37
Sacramento Municipal Utility District	2331	644,723	276.59
Cedar Falls Utilities	74.46	18,000	241.74
Nashville Electric Service	1812.99	430,000	237.18
CPS Energy	4060	907,526	223.53
Memphis Light, Gas and Water	2848.99	439,828	154.38
Brownsville Public Utilities Board	344.47	51,406	149.23
Salt River Project	7510.97	1,112,683	148.14
City Utilities of Springfield	826.8	117,075	141.60

- Analysis shows a range of service area sizes and total customers.
- THESL scores relatively high in terms of density of customers, when compared to the other North American municipally-owned utilities, analyzed.

DRAFT

North American Municipal Utilities Utility Service Analysis

Utility	Total Service Area (km²)	Total Customers	Customers per km²	Vehicle Fleet Size	Customers per vehicle
THESL	630	785,667	1247.09	387	2030.15
ENMAX Power (Alberta)	1089	510,000	468.32	348	1465.52
Sacramento Municipal Utility District	2331	644,723	276.59	927	695.49
Seattle City Light	340.1	447,578	1316.02	1000	447.58
Los Angeles Department of Water and Power	1225.06	1,547,815	1263.46	8000	193.48

- When analyzing for customer density per fleet vehicle, we narrowed our search to municipalities that had a comparable customer population and relatively comparable service area.
- In this case, while THESL has a similar customer density per sq. km to Seattle City Light and L.A. Department of Water and Power, but a much higher density of customers per vehicle.
- Overall, THESL has the highest density of customers per vehicle out of all NA utilities studied (inclusive of Utility A, Utility B, and Utility C).

DRAFT

North American Peers – Utility A Fleet Utilization

DRAFT

THESL

	Car	Bucket Truck	Crane Truck	Cube Van	Derrick Truck	Dump Truck	Line Truck	Pickup Truck	SUV	Van
# of Utilized Units	10	79	10	30	7	4	5	74	27	100
KMs travelled	3238.08	19,834.48	1,100.66	7,844.10	1,427.29	212.59	1,274.04	35,526.61	8,077.99	30,390.20
KMs/ vehicle	323.81	251.07	110.07	261.47	203.90	53.15	254.81	480.09	299.18	303.90

Utility A

*Utility A does not publicly provide the number of KMs traveled per vehicle, but they do provide a breakdown of fleet vehicle type and volume. It should also be noted that vehicle categories by volume are different than vehicle types by depreciation.

	Cars/ SUVs	Light Fleet	Aerial	Trailer	Digger	Line Truck	Off-Road	Forklift/ Manlifts
# of Utilized Units	106	1090	147	918	52	229	561	162

- Utility A's utilization results are inconsequential without access to statistics like kilometers travelled as the number of a certain type of vehicle is not indicative of how many kilometers it drives each year
- THESL utilizes their pick-up trucks the most (as they have the highest average kilometers travelled per vehicle)
- THESL is more granular in terms of vehicle categorization

North American Peers – Utility C Fleet Utilization

DRAFT

THESL

	Car	Bucket Truck	Crane Truck	Cube Van	Derrick Truck	Dump Truck	Line Truck	Pickup Truck	SUV	Van
# of Utilized Units	10	79	10	30	7	4	5	74	27	100
KMs travelled	3238.08	19,834.48	1,100.66	7,844.10	1,427.29	212.59	1,274.04	35,526.61	8,077.99	30,390.20
KMs/ vehicle	323.81	251.07	110.07	261.47	203.90	53.15	254.81	480.09	299.18	303.90

Utility C

	Light-Duty	Bucket Trucks	Pickup Trucks & Vans	Heavy-Duty	Service Trucks	Construction Equip.
# of Utilized Units	106	93	294	68	141	225
KMs travelled	65,522.11	133,186.2	327,065.60	43,949.98	153,381.90	1,328.58
KMs/ vehicle	618.13	1,432.11	1,112.47	646.32	1,087.81	5.90

- It should be noted that Utility C is a urban-based utility.
- Utility C's most utilized vehicle is its bucket truck (a medium-duty vehicle). THESL's most utilized vehicle is a pickup truck (a light-duty vehicle), while their bucket trucks are somewhere in the middle.
- Utility C uses approx. 3x the vehicle that THESL uses and has a service area that is 3.7x larger. Their average kms travelled per vehicle are also approx. 2.3 x higher than THESL. Utility C has fewer vehicle categories than THESL (6 compared to 10)

*No statistics were available for Utility B

North American Peers – Utility A Lifecycle Planning

DRAFT

THESL

*AEC = Annual Equivalent Cost

	Car	Cargo Van	Passenger Minivan	Full Size Van	Pickup	SUV	Cube Van	Single Bucket	Single Bucket VM	Cable Truck	Crave Truck	Dump Truck	Line Truck	Double Bucket	Digger Truck	Trailer	Avg.
Planned Life (yrs)	6	7	6	9	6	12	12	14	8	16	14/ 16	14	13	14	13-14	20	**11.59**
Optimal AEC* (yrs)	9	7	9	10	9	8	12-15	12-16	11	11-14	10-14	8-12	13	14	13	20	**11.56**

Utility A

	Passenger Vehicles	Light Trucks	Heavy Trucks	Construction Equipment	Large-Soft-Track-Equip.	Trailers	Misc. Vehicles	Average
Service Life (yrs)	10	11	17	20	25	30	10	**17.57**

- While there are no statistics available for Utility A's optimal lifecycle for fleet efforts, they have a higher average service life than THESL
- On average, THESL's light-duty vehicles have an average life of 9.2 years (compared to Utility A's 10 years), while THESL's heavy-duty vehicles have an average life of 13.95 years (compared to Utility A's 18.83 years)

*No statistics were available for Utility B

North American Peers – Utility C Lifecycle Planning

DRAFT

THESL

*AEC = Annual Equivalent Cost

	Car	Cargo Van	Passenger Minivan	Full Size Van	Pickup	SUV	Cube Van	Single Bucket	Single Bucket VM	Cable Truck	Crave Truck	Dump Truck	Line Truck	Double Bucket	Digger Truck	Trailer	Avg.
Planned Life (yrs)	6	7	6	9	6	12	12	14	8	16	14/ 16	14	13	14	13-14	20	**11.59**
Optimal AEC* (yrs)	9	7	9	10	9	8	12-15	12-16	11	11-14	10-14	8-12	13	14	13	20	**11.56**

Utility C

	Light-Duty	Bucket Trucks	Pickup Trucks & Vans	Heavy-Duty	Service Trucks	Construction Equip.	Average
Current Economic Lifecycle (yrs)	3-6	10-15	3-6	10-15	10-15	10-15	**9.83**
Future (Optimal) Economic Lifecycle (yrs)	3-6	12-18	3-6	12-15	12-18	12-18	**11.25**

- THESL scores well against Utility C in terms of the currently planned lifecycle of their vehicle fleet as well as optimal lifecycle (which, for the purposes of this study, we are comparing against Utility C's "Future Economic Lifecycle" projections) with higher actual and optimal lifecycles for each.
- THESL scores higher in every vehicle category (i.e. has a higher average lifespan).
- While Utility C uses the same categories for utilization and life-cycle planning, THESL has added more categories for their life-cycle planning than in utilization). Utility C also has far fewer categories (7 compared to 26).

*No statistics were available for Utility B

North American Fleet Maintenance Analysis

Utility	Light-Duty	Medium-Duty	Heavy-Duty	Trailers	Other
THESL	8.6 yr/ 136,000 km	Not Available	12.5 yr./ 200,000 km	20 yr.	Not Available
Utility A	10 yr./ 250,000 km	10 yr./ 250,000 km	10 yr./ 10,000 engine hours	30 yr.	As Necessary
Utility B	10 yr.	10 yr.	10 yr.	10 yr.	10 yr.
Utility C	3-6 yr.	10-15 yr.	10-15 yr.	Not Available	Not Available

- THESL's fleet maintenance and repair timelines are on par if not slightly ahead of the peers studied.
- Based on the information available, the following conclusions can be drawn with respect to THESL:
  - THESL lies in on the middle-to-high-end of the spectrum in terms of vehicle maintenance timelines
  - Light-Duty maintenance is performed more frequently than Utility B (by approx. 1.4 years), but much less frequently than Utility C (by approx. 4.1 years)
  - Trailer maintenance is performed more frequently than Utility A (by 10 years) and less frequently than Utility B (by 10 years)
  - There could be room for improvement in terms of heavy-duty maintenance, as both Utility A and B tend to maintain these vehicles more frequently (by approx. 2.5 years each)

DRAFT

North American Fleet Expenditure Analysis

Utility	Annual OM&A	OM&A/ Vehicle	Annual CAPEX	CAPEX/ Vehicle	Owned Vehicles
THESL	Not Available	Not Available	$8,900,000/ $11.33 per cust.	$22,997.42	100%
Utility A	$30,104,000/ $49.47 per cust.	$8,191.56	$19,609,000/ $32.22 per cust	$5,335.78	99%
Utility B	$45,300,000/ $9.06 per cust	$12,583.33	$31,400,000/ $6.28 per cust.	$8,722.22	Not available

- Despite not having OM&A statistics available for THESL, there is a broad range in terms of OM&A per customer (Utility A is nearly 5.5x more than THESL) and OM&A per vehicle (with utility has 65% the CAPEX per vehicle in relation to Utility B)
- THESL's annual CAPEX per customer lies in the middle (considerably lower than Utility A, but considerably higher than Utility B), while THESL's annual CAPEX per vehicle is by far the highest (more than double that of Utility B, and more than 4x that of Utility A)
- THESL owns 100% of their fleet, while Utility A leases around 1% of their fleet.
- While there were no statistics available in terms of Utility's B owned vehicle fleet, they did note that they outsource maintenance and repair of approximately 46% of their fleet vehicles, which represents all of their light-duty vehicles

*No statistics were available for Utility C

Electric Vehicle Management

Appendix: Ontario Electric Vehicle Management

DRAFT

	THESL	Hydro Ottawa	Hydro One	Alectra	Elexicon
Philosophy	• Prioritize replacement of ICE units with BEV that would maximize return on investment • Pause purchases of new ICE vehicles in short term • Conduct pilot projects to assess capabilities of different types of EVs	• Hydro Ottawa is committed to the acquisition of vehicles with hybrid technology where there is an operational and financial business case for doing so.	• Committed to transforming a portion of its fleet to plugin electric or hybrid vehicles by 2030, devoting 5% of its capital budget for EV purchases in 2021 and 50% by 2030 • 50% of sedans and SUVs to electric or hyrbrids by 2025	• Contributes to Alectra Utilities' environmental performance by reducing GHG emissions associated with fleet fuel consumption by utilizing hybrid and electric vehicles where possible	• Unavailable
Fleet	• 8 2018 Chevy Bolts • 5 2021 Chevy Bolts • 1 2010 Diesel/Electric Single Bucket Truck	• 2 Chevy Volts • 2 hybrid cars • 1 hybrid bucket truck • 17-20 devices with battery technology, • 14 flex-fuel vehicles • 10 aerial devices converted to biopure, biodegradable oil	Unavailable		

Source: THESL - **EV Phase-In Plan (2021)** / OEB.ca – **Utility DSPs**

Appendix: North American Electric Vehicle Management

DRAFT

While all three North American peers studied mention the need to electrify their fleet, all except for Utility C are in the very earliest stages of fleet electrification (awareness of the need to electrify, but lacking in an electrification strategy). THESL has begun to establish their Fleet Electrification Strategy, which puts them ahead of Utility A and Utility B.

North American peer EV philosophies are as follows:

Utility A
- Mentions 24 % of their emissions come from fleet vehicles
- They have plans to implement electrification of their fleet – no further details given in this regard

Utility B:
- Vehicle fleet contributes to 1.3% of utility's GHG emissions
- 93 % of Utility B's light-duty and sedan vehicles are either zero-emissions or hybrid electric
- 70% of GHGs emitted from fleet come from non-light-duty vehicles
- Utility has a GHG reduction program

Utility C:
- Utility C has a detailed fleet electrification plan; goal is to be 100% electrified by 2030, which puts them slightly ahead of THESL, who has a 100% electrification goal of mid to late 2030s)
- 13 % of Utility C's vehicle fleet was electrified as of 2020

THESL Fleet Benchmarking

Electric Vehicle Addendum – June 2023

Hydro Ottawa

Finding	Source
"[Hydro Ottawa]'s immediate focus will be on minimizing our own footprint to the lowest feasible level [and] moving as much of our vehicle fleet as possible to zero-emissions technology."	2021-2025 Strategic Direction
"Hydro Ottawa also continues to invest in green fleet vehicles and technology, where it is available for commercial fleets, and to replace vehicles, as per the established fleet replacement schedule with…hybrid or more energy efficient vehicles, where available	Updated 2021-2025 DSP Attachments
"There is currently low market availability of hybrid vehicles. However, Hydro Ottawa keeps up to date on possible hybrid options for lighter vehicles such as pick-up trucks."	
“To date, Hydro Ottawa has converted more than 40 per cent of its fleet to flex-fuel, battery and hybrid technology, and lowered energy use at 52 of its 91 substations through the installation of building automation systems to control lighting and heating.”	Cision News Article (Source is Hydro Ottawa) dated April 2023

Hydro One

Finding	Source
"Hydro One is proceeding with an electric fleet strategy to help reduce fuel and maintenance costs, as well as its environmental footprint... Hydro One will continue replacing current internal combustion engine vehicles with electric vehicles or plug-in hybrid electric vehicles equivalent to electrify its fleet.“ "Investment will be channeled to expand EVs in multiple categories. The methodology is to track productivity saving in fuel spend for full EV conversion and hybrid conversion.”	Undertaking JT-5.01 - Filed: 2022-01-05
"[Goal to] convert 50% of sedan and SUV fleet to EVs by 2025." "14% of fleet converted from 2018 baseline as of 2021."	Sustainability Report 2021
"Fleet Management Services has begun a gradual adoption of EVs, devoting 5% of its capital budget for EV purchases in 2021 and 50% by 2030.” “As a member of the Edison Electric Institute, HONI has committed to transforming a portion of its fleet to EV or hybrid vehicles by 2030.”	2021 GSP
“Hydro One is committed to achieving net-zero GHG emissions by 2050. We have established a target to achieve a 30% GHG reduction by 2030.” “We Plan to convert 50% of out fleet of sedans and SUVs to electric vehicles or hybrids by 2025 and 100% by 2030.”	Notice of 2023 Annual Meeting of Shareholders

Alectra

Finding	Source
"Fleet management is developing a long-term vehicle electrification strategy plan. The potential for cost and GHG savings is significant, and fleets that plan proactively for electrification can maximize benefits to all stakeholders.	2021 Sustainability Report
"Global supply chain issues, higher costs and inflation have slowed Alectra's efforts, causing a delay in the company's plans to electrify its fleet."	2022 ESG Report
"[Fleet Electrification] contributes to Alectra Utilities' environmental performance by reducing GHG emissions associated with fleet fuel consumption by utilizing hybrid and electric vehicles where possible	2020-2024 DSP

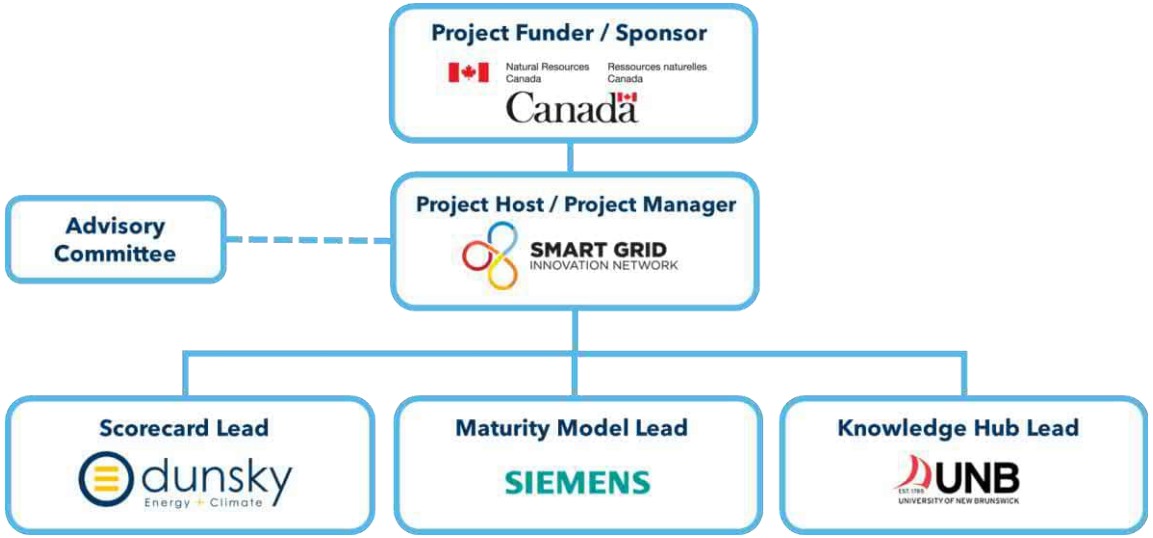
SMART GRID
INNOVATION NETWORK

Smart Energy Benchmarking



UTILITY SCORECARD RESULTS

June 2023

About the Project Team

The Smart Grid Innovation Network (SGIN) supports Canada's clean energy transition by advocating for the smart energy sector. SGIN promotes, identifies, and helps drive smart energy solutions in Canada. Our mission is to foster Canada's transition to a clean energy future.

The Smart Energy Benchmarking initiative project team includes SGIN, Dunsky Energy + Climate Advisors, Siemens Canada Ltd, & University of New Brunswick (UNB). The project is guided by an Advisory Committee that includes representatives from government, utilities, academia and subject matter experts.

About the Authors

Dunsky Energy + Climate Advisors supports leading governments, utilities, corporations and others across North America in their efforts to accelerate the clean energy transition, effectively and responsibly.

With deep expertise across the Buildings, Mobility, Industry and Energy sectors, we support our clients in two ways: through rigorous Analysis (of technical, economic and market opportunities) and by designing or assessing Strategies (plans, programs and policies) to achieve success.

Dunsky is proudly Canadian, with offices and staff in Montreal, Toronto, Vancouver, Ottawa and Halifax. Visit **www.dunsky.com** for more information.

Executive Summary

Introduction

A clean, electrified economy is central to achieving Canada's net zero emissions goals by 2050. The accelerated rate to decarbonize the last 20% of our electricity grid and expand electricity energy use places us in uncharted territory creating significant challenges, as well as new opportunities.

Electric utilities play a pivotal role in the clean energy transition across three broad categories:

1. **Clean Energy Supply.** Shifting away from fossil fuel-based generation to clean or non-emitting sources such as solar, wind, hydro, geothermal and nuclear. This requires clear targets, comprehensive strategies and bold leadership that is mission driven, willing to take risks and determined in their actions.
2. **Modern Grid.** Building a modern, dynamic and resilient grid to optimize the integration of clean energy sources, manage greater electrification and prepare for a changing climate while maintaining a reliable and stable electricity supply.
3. **Customers and Society.** Taking a customer-centric, equitable approach in all decisions related to products, services and experiences that will enable all customers to participate in, and benefit from the energy transition.

The Smart Energy Benchmarking Initiative aims to help Canadian electric utilities acquire the knowledge, skills and tools to incorporate renewable energy, modernize the grid, and support equity, diversity and inclusion activities.

The project is divided into three phases:

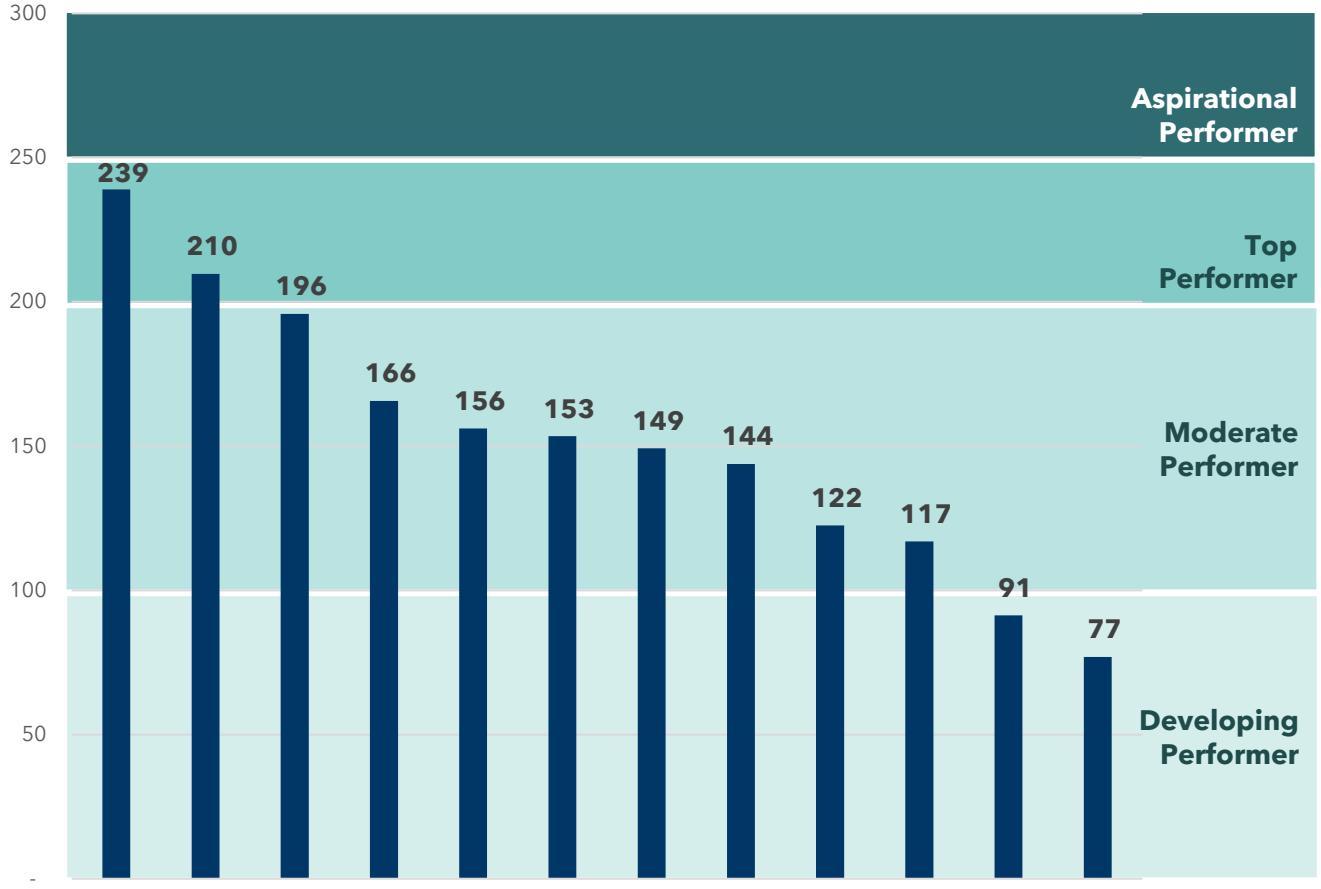
Smart Energy Scorecard | **Capability Model** | **Knowledge Hub**

The scorecard benchmarks 12 electric utilities' current state (baseline year 2021) in the clean energy transition – the starting line. The scorecard will help utilities understand their baseline, work to their strengths, identify solutions in areas that are still developing and set standards against which they can measure progress.

The project is non-judgmental focused on fostering utility collaboration, building capabilities, celebrating successes and finding solutions. Each utility and the environment in which they operate is unique. The goals are the same, and we can learn from one another, but the path each utility takes will be their own.

"Your present circumstances don't determine where you can go, they merely determine where you start."

- Nido Qubein



2021 Scorecard Results: The Baseline

Canadian electric utilities are at varying stages of preparedness for the energy transition.

While no utility achieved aspirational performance, three utilities are recognized as top performers and are showing leadership across all three categories (Clean Energy Supply, Modern Grid and Customers & Society).

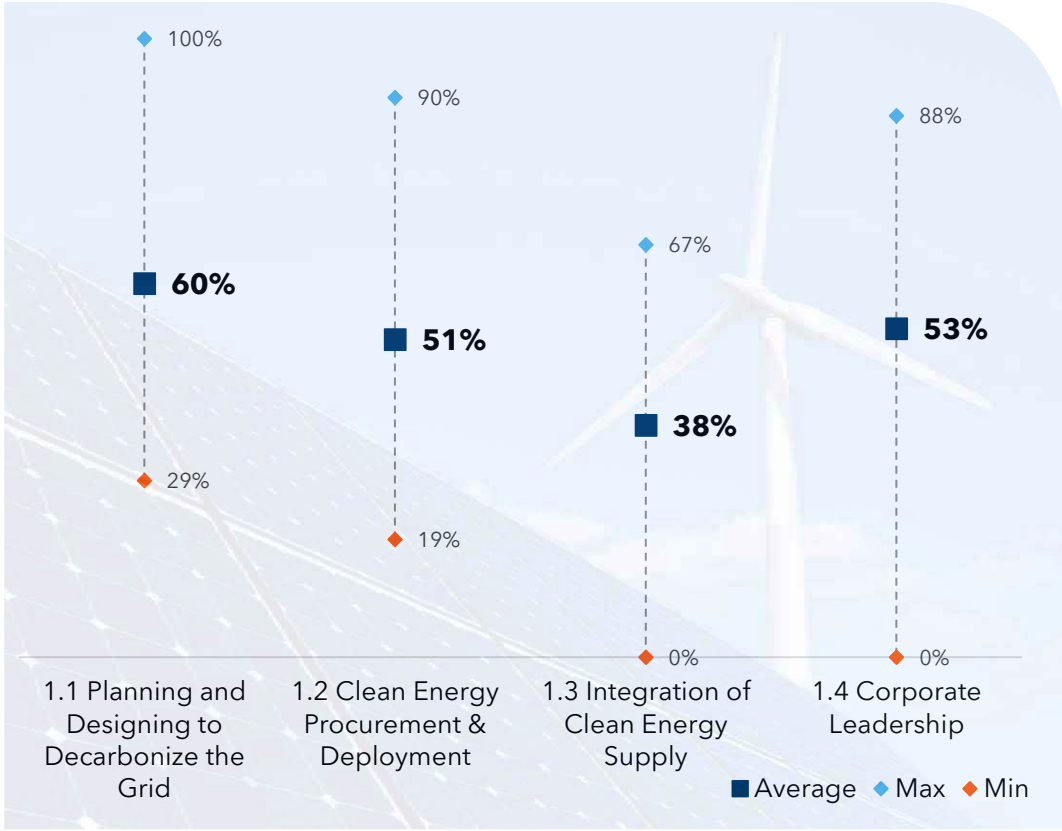
Most utilities fall within the middle of the band. In many cases, utilities' actions are constrained by the boundaries of their regulatory and/or policy environment.

While the overall score is important, understanding how utilities scored across indicators that contributed to the total score tells a more complete story.

Clean Energy Supply: Key Findings

1 Clean Energy Supply

1.1 Planning & Designing to Decarbonize the Grid	1.2 Clean Energy Procurement & Deployment	1.3 Integration of Clean Energy Supply	1.4 Corporate Leadership



Benchmarked utilities were at different stages of their decarbonization journeys, levels of commitment, degree of control over their supply and experience integrating clean resources at scale. While some benefited from existing non-emitting resources, others had only begun the transition. Without bold leadership and accountability, utilities may be challenged to meet their corporate and community goals.

1.1 Goals & Plans: While most of the country was covered by varying clean grid goals, few jurisdictions had comprehensive (costed, timed) plans to achieve these. Ontario, the largest Canadian province, stood out for not having a defined clean grid goal.

1.2 Clean procurement: Two thirds of utilities and jurisdictions actively procured renewable generation and removed barriers to deployment, with the remaining third taking a passive approach and in some cases adding more fossil-fuel based electricity generation.

1.3 Clean resource integration: Most utilities had limited experience with large-scale renewable projects (> 5MW), or with enabling/valuing ancillary services for distributed resources.

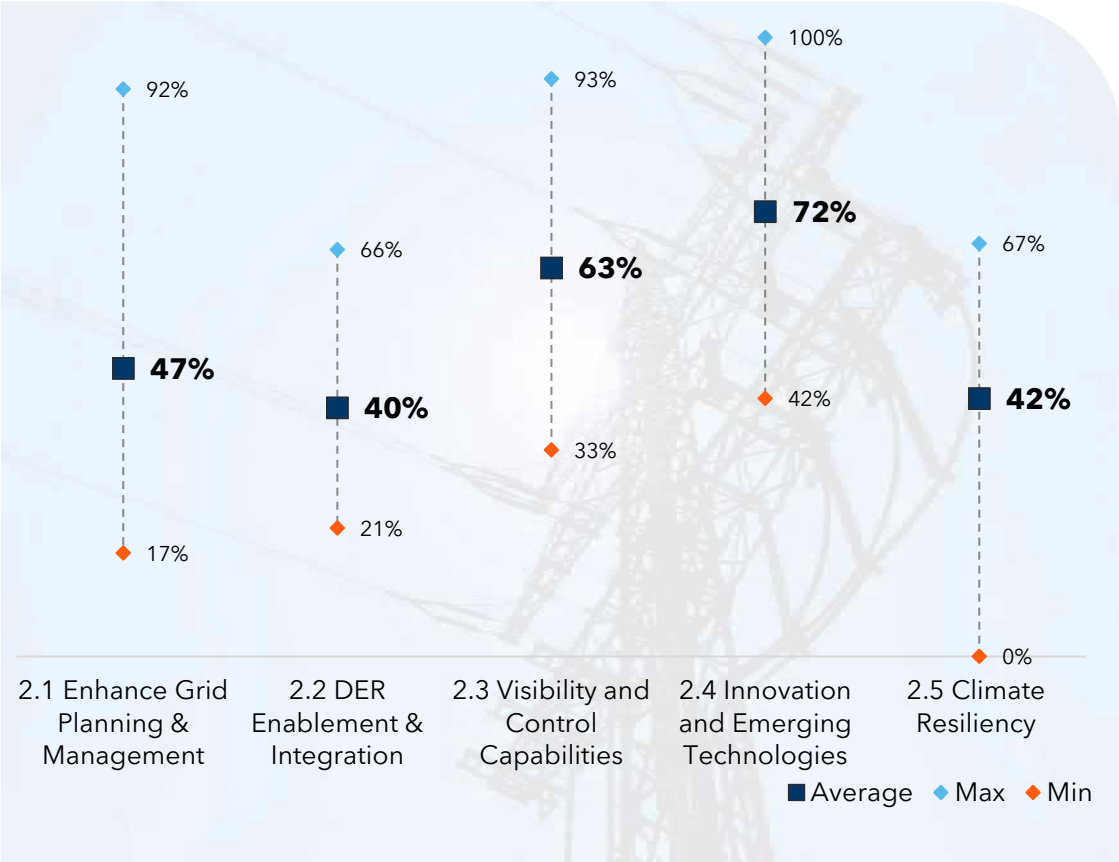
1.4 Corporate leadership: Most utilities had sustainability initiatives and commitments to decarbonize their operations, but the depth of those commitments and the quality of reporting varies. Few utilities tied executive compensation to the achievement of decarbonization targets.

Modern Grid: Key Findings

2 Modern Grid

2.1 Enhanced Grid Planning & Management	2.2 DER Enablement & Integration	2.3 Visibility & Control Capabilities	2.4 Innovation & Emerging Technologies	2.5 Climate Resiliency

Canadian electric utilities were in the process of upgrading their grids and grid capabilities. Most followed incremental pathways, with only a few pursuing transformational visions. Overall, there was a gap between roadmaps, pilots, and control system investments, and limited amount of Distributed Energy Resources (DER) enablement and integration.



2.1 Grid planning: Most utilities were actively working to modernize their load forecasting and DER management processes. Capabilities varied in terms of data availability, model sophistication (top-down vs. bottom-up) and specificity (system-level annual vs. localized hourly forecasts).

2.2 DER enablement & integration: Most utilities had a DER strategy or roadmap, but DER's potential remained underutilized in 2021 (e.g., for ancillary services, non-wires alternatives, demand response, etc.). This was principally due to regulatory or market-based constraints.

2.3 Visibility & control: By 2021 utilities had invested significantly in visibility and control capabilities, with Advanced Metering Infrastructure (AMI), Advanced Distribution Management Systems (ADMS) and Supervisory Control and Data Acquisition (SCADA) deployed in most cases. DER Management Systems (DERMS) deployment remained nascent but was growing.

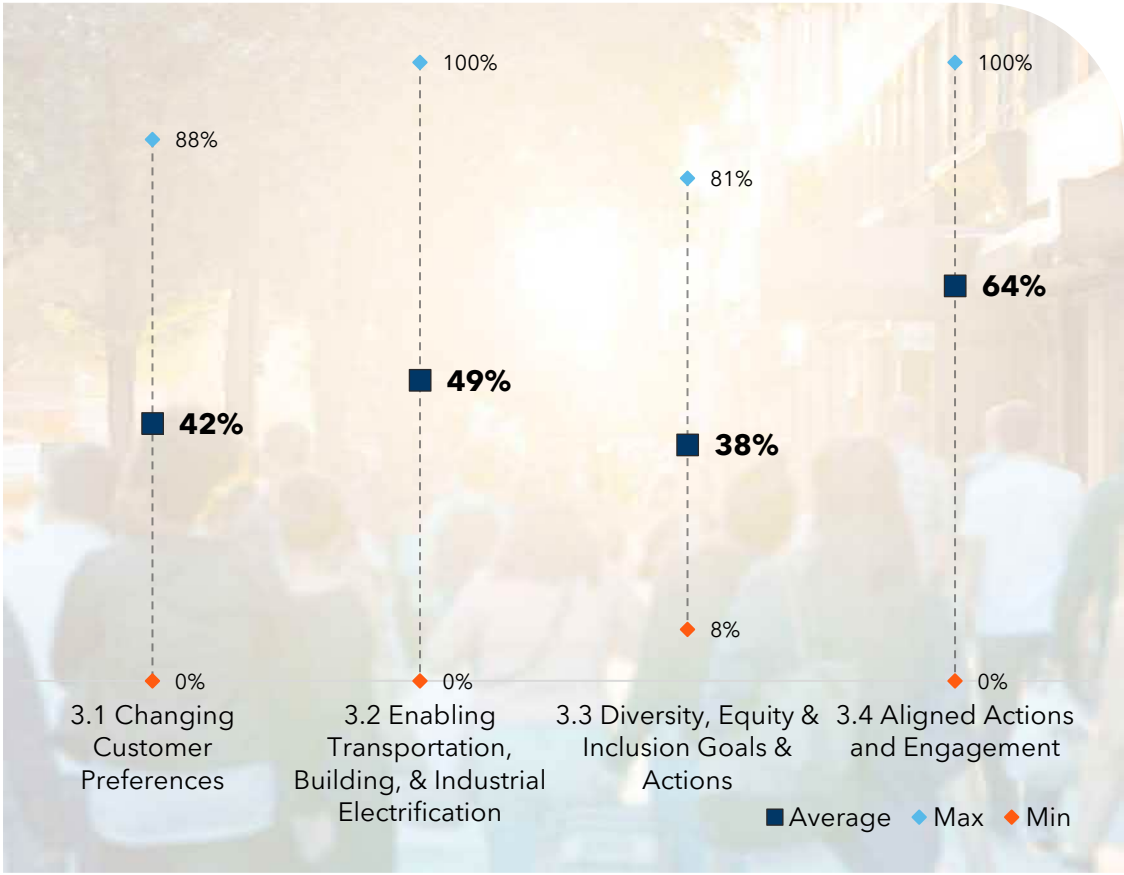
2.4 Innovation & technologies: Most utilities had innovation funds, resources, and pilot projects, often supported by government funding. Most were testing operational or technological upgrades, and a few utilities were planning for fundamental business model transformations.

2.5 Climate resiliency: Most utilities were upgrading their grid infrastructure and operations to face more adverse climate events, but few had systematically incorporated climate change scenario analysis into their planning processes.

Customers & Society: Key Findings

3 Customers & Society

3.1 Changing Customer Preferences	3.2 Enabling Transportation, Building and Industrial Electrification	3.3 Being Intentional about Diversity, Equity and Inclusion	3.4 Aligning Actions and Engagement



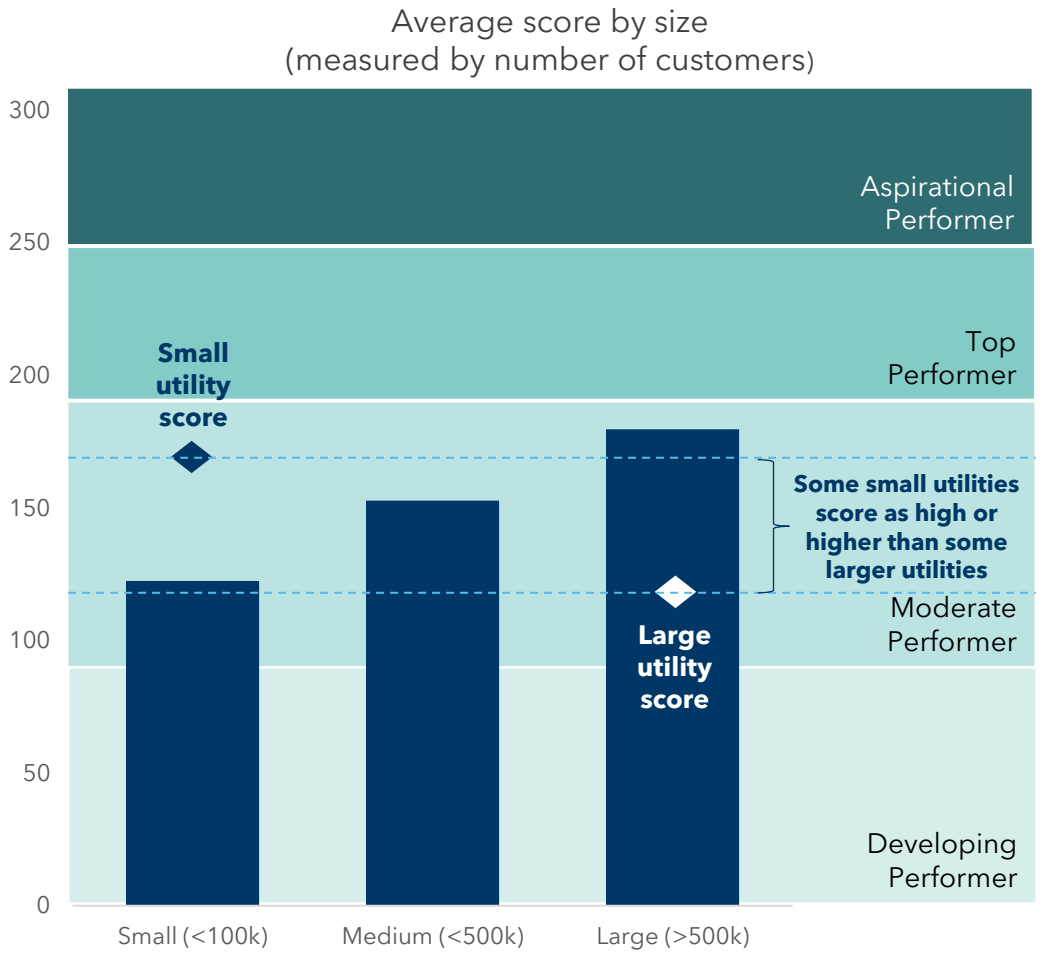
Utilities were increasingly engaging with multiple stakeholder groups to transform the electricity system. While few had developed comprehensive electrification strategies, many considered it for specific sectors. Utilities considered equity to varying degrees; vulnerable community groups will need to be prioritized to ensure an equitable transition.

3.1 Customer preferences: Most utilities offered services and solutions to encourage efficiency, decarbonization and/or electrification, such as incentives for DERs, Electric Vehicles (EVs), charging infrastructure, energy storage, efficient technologies, and, in some cases, rate-based solutions. Digital platforms to engage customers were common, although the level of sophistication varied.

3.2 Electrification: Few utilities had comprehensive electrification strategies, with most focused on a single sector (e.g., transportation) versus economy-wide solutions or perspectives.

3.3 Diversity & Equity: Many utilities had internal Diversity, Equity and Inclusion (DEI) strategies and/or initiatives for their organization and workforce. Community-oriented DEI strategies were less common, and principally addressed through income-eligible and First Nations programs. Benchmarked utilities were spending less than leading US-based jurisdictions on such programs.

3.4 Alignment & Engagement: Several utilities were completely or partially aligned with government climate goals, while some were constrained by a lack of such goals. Utilities were increasingly proactive in collaborating with governments, efficiency organizations, electricity systems operators and regulators to advocate for, and/or advance the energy transition.

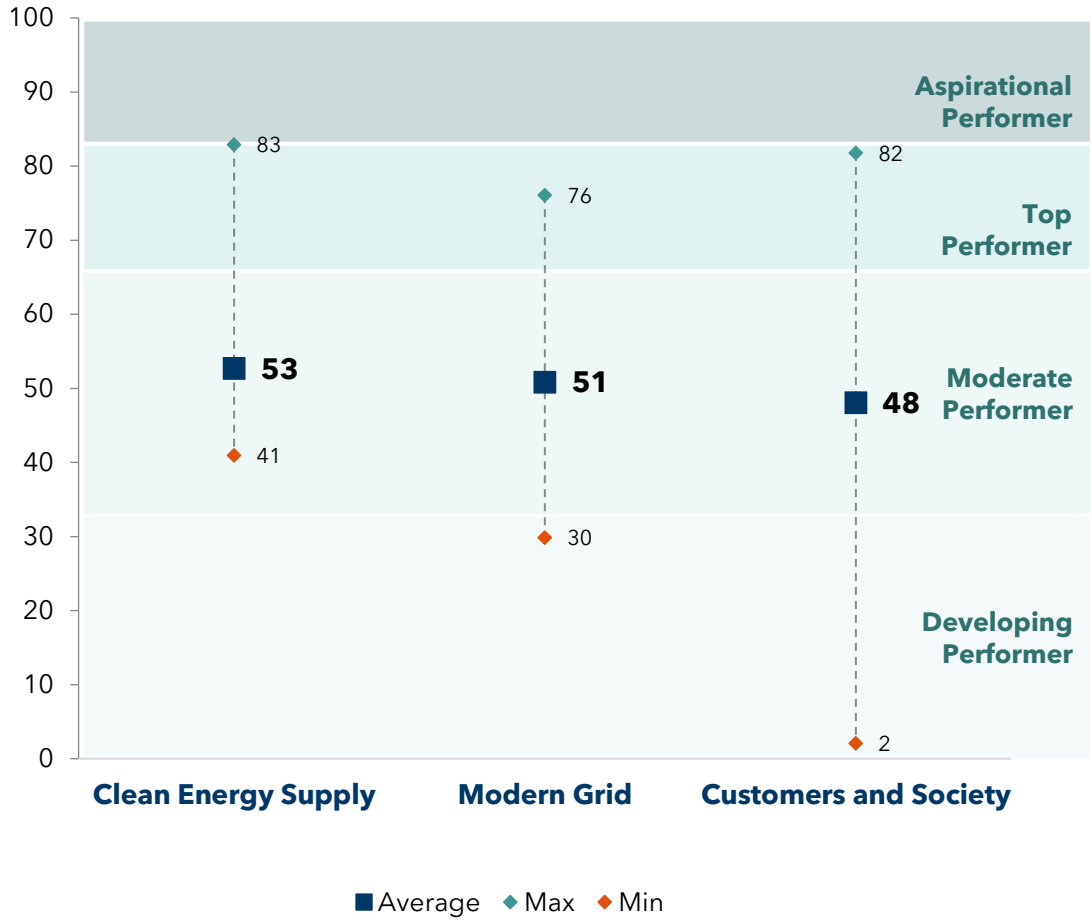


Scorecard Results by Utility Size

Utilities' average scores can be influenced by size, how clean the grid is, and ownership structure; however, these variables are not always indicators of success. Each utility is demonstrating leadership in various metrics and across the three main categories.

Size: Larger utilities tend to score more points, as they have more financial and non-financial resources to plan, execute, innovate and adopt best practices. However, some small utilities outperform their larger peers due to a combination of local innovation, jurisdictional opportunities and leveraging external funding sources. For example, one of the four small utilities achieves the fourth-best overall score.

Other factors that can influence scores are the **grid** and **ownership**. Those with already clean grids have a natural advantage in the "Clean Energy Supply" category. In turn, crown corporations and municipally owned utilities are organically aligned with government and community objectives in the "Customers & Society" category.



Note: given the limited number of participating utilities, no statistically significant conclusions can be drawn about correlations or causations between performance and any utility characteristics.

Scorecard Results Across Three Major Categories

On average, electric utilities performed **moderately** across the three dimensions crucial to a net zero pathway.

Average, low and high scores across the three major scorecard categories

Ten Key Insights from the Results

INSIGHT 1	**Canadian utilities have embarked on the energy transition journey**. They recognize the climate emergency and have established plans to reduce emissions. While utilities are at various stages in the transition, every benchmarked utility demonstrated leadership in certain areas.
INSIGHT 2	**More effort is needed.** The pace and scale required to meet our net zero goals by 2050 and avoid the worst climate change impacts, requires greater leadership and ambition, comprehensive decarbonization and electrification strategies, detailed inclusive roadmaps, and the tools and resources to act. The clock is ticking; without accelerated action, several actors will be challenged to achieve their targets.
INSIGHT 3	**Utilities are a diverse group, which must be considered when comparing scorecard results, opportunities and solutions.** Utilities vary in terms of size, structure, services, context, and control over their environment. We must recognize this diversity when interpreting the results and crafting policy and/or regulations that will affect utilities. Where possible, utilities and others can leverage diversity of thought and approaches to adapt innovative solutions to their unique context. Jurisdictions with less clean grids will require substantial and coordinated support to quickly live up to their own goals, and in some cases, even more ambitious federal targets.
INSIGHT 4	**Utilities are facing a massive transformation**. An already complex electricity system is under greater pressure to continue to deliver safe, affordable and reliable electricity along with being clean, resilient and equitable. If not managed carefully, this transformation could leave some groups – including some utilities and their communities – behind.
INSIGHT 5	**Utilities can't do it alone and current government commitments and regulatory structures have constrained some utilities**. Government and regulators must give utilities concrete climate targets, direction and support to guide their net-zero pathways. Utilities need latitude to implement needed action and support to make significant investments to balance DER integration, facilitate greater electrification and resiliency, and enable customers to contribute to, and benefit from, the transition. In many cases, legislation and regulation needs to evolve to enable utilities and financial support is needed to complement utility investment.

Ten Key Insights from the Results

INSIGHT 6	**Utilities need a comprehensive strategy that covers all three dimensions of this transition**. All the scanned utilities are making progress and demonstrating leadership in certain areas, but more work is needed to effectively address and coordinate actions across all elements of the clean energy transition.
INSIGHT 7	**Distribution-oriented utilities have historically not been the main drivers of grid innovation but will become increasingly important as gateways for the integration of DERs into the grid**. As such, utilities will require considerable support (policy, regulatory, financial, technological) to increase deployment of, and leverage, DERs, including valuing DERs in ancillary services. Canada lags American and European jurisdictions in enabling and leveraging distributed grid flexibility.
INSIGHT 8	**Utilities are anchored in their communities and are thus valuable partners to relay information both ways**. It will be important for utilities to communicate messaging related to the energy transition to partners and customers and provide diverse services and solutions to help customers participate in, and contribute to, the transformation. Vice-versa, utilities can communicate customer needs, expectations and reactions to policy-makers to inform future policy.
INSIGHT 9	**More attention needs to be paid to equity implications of the transition**. Utilities are actively considering equity in the workplace to ensure that it is diverse and inclusive, but internal action has not yet translated to community-wide equity impacts and strategies (e.g., several utilities have set internal diversity targets and implemented actions, but most have yet to study community needs and establish comprehensive strategies to measure and mitigate the transition's impact on those most vulnerable).
INSIGHT 10	**Ultimately, the clean energy transition presents a significant opportunity for electric utilities and society**. Utilities' core service – deliver clean, safe, reliable and affordable electricity – is at the heart of the energy transition and set for significant growth. By becoming more sustainable, resilient, and efficient, electric utilities can contribute to communities' as well as to their own prosperity.

Considerations

"If you're walking down the right path and you're willing to keep walking, you will eventually make progress"
- Barack Obama

The clean energy transformation requires collaboration and cooperation across stakeholders. Each has a unique role to play in promoting the adoption of cleaner energy sources and transitioning towards a sustainable energy future. We outline key considerations for utilities, SGIN, and government, regulators and system operators.

Utilities	• Participating utilities can use their scorecard results to **inform internal discussion**, diagnosis, planning and prioritization, as well as to **engage external partners** whose support is needed for progress, including regulators, governments, and others. They can also draw on the **community of practice** created by this initiative to share insights, good practices and lessons learned. • Other utilities in Canada can **review this scorecard to situate themselves,** obtain guidance for their own transition and consider participating in future scorecards.
SGIN	• SGIN should **publicize the scorecard** to promote its takeaways and raise awareness of the smart utility concept. • Phase B of this initiative – the Maturity Model – will **support select participating utilities** to build on their scorecard results and improve their specific capabilities. • Phase C of this initiative – the Knowledge Hub – will make smart energy benchmarking trends, and good practices **available to a broader audience**, such as other utilities across Canada as well as policy makers, regulators, system operators, and service providers. • SGIN intends to **repeat the scorecard** to monitor progress from existing utilities and include additional utilities. Future scorecards should include indigenous and northern utilities, and may consider other relevant metrics (e.g., cybersecurity).
Government, Regulators, and System Operators	• **Governments** can use this scorecard to help inform energy- and climate-policies, regulations and goals. They must guide, support, and as needed aid utilities in undertaking necessary actions, as well as support research and public engagement. • **Regulators** ensure that utilities comply with government policies and regulations. They can use the scorecard to set regulatory frameworks and observe the impact on utilities' abilities to accelerate the energy transition. Regulatory innovations are needed to enable required investments, accelerate the adoption of new technologies, processes, tariffs and programs, and ensure that no one is left behind. • **System operators** can use this scorecard to pinpoint barriers to the integration of DERs and intermittent generation assets into the grid and wholesale markets. They play key roles in outlining clear standards and pathways for decarbonization, and in some cases, in implementing demand response and demand side management programs.

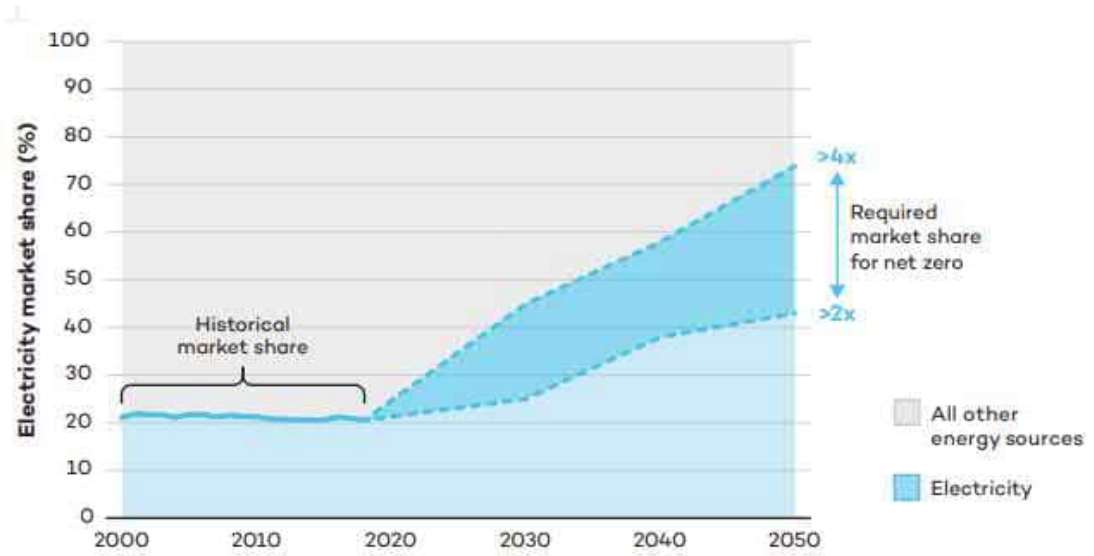
1. Introduction

Context

To avoid the worst climate change impacts and benefit from the economic opportunity climate action presents, Canada has set a target to achieve net-zero emissions by 2050. To ensure Canada delivers on its targets, this commitment was enshrined in legislation under the Canadian Net-Zero Emissions Accountability Act.[1]



Substituting fossil fuels with clean, non-emitting electricity and electrifying our economy is vital to achieving net-zero emissions in Canada. To lay the groundwork, Canada has committed to net-zero electricity by 2035 through the Clean Electricity Regulation.[2]

Canada is fortunate where over 80% of our electricity is currently non-emitting; however, electricity only accounts for approximately 20% of energy demand. To achieve net-zero by 2050, Canada must increase the supply of clean, non-emitting electricity and ensure more parts of the economy are connected to the electricity system. This will require that Canada produce 2-3 times as much clean power as it does today.[3]

Utilities are at the center of climate targets and action plans. They have a key role in meeting clean electricity commitments by generating, procuring and integrating electricity from clean and non-emitting sources, and enabling, supporting and delivering on initiatives that will optimize the grid and help all customers electrify, including those most vulnerable.

THE CLEAN ELECTRIFICATION CHALLENGE

To achieve net-zero by 2050, Canada must increase the supply of non-emitting electricity and ensure more parts of the economy are electrified. Growing building, transportation, and industry electrification could increase Canada's electricity share by up to four times within the next 30 years.

Project Overview

In 2022, Smart Grid Innovation Network (SGIN) launched the Smart Energy Benchmarking Initiative to help Canadian electric utilities prepare for the clean energy transition. The initiative is funded by Natural Resources Canada's (NRCan) Smart Renewables and Electrification Pathways (SREP) Capacity Building stream. SREP supports projects that can transform our electricity sector to the 2050 net-zero economy, and help organizations acquire the knowledge, skills, and tools to incorporate renewable energy, modernize the grid, and support equity, diversity, and inclusion activities.

WHAT IS A SMART ENERGY SYSTEM?

A smart energy system is one that supports decarbonization in an affordable, safe, sustainable, resilient, and equitable way. It includes the whole energy system (gas, thermal, and electricity grids) that integrates clean energy, through a smart, dynamic, and customer-centric approach.

The Smart Energy Benchmarking initiative focuses on the role of electric utilities within the broader smart energy system.

The Smart Energy Benchmarking initiative has six objectives:

1. Stimulate the development of clean energy and grid modernization projects.
2. Increase Canadian utilities' capacities to meet emerging customer needs, modernize their grids, prepare for greater electrification and renewables integration.
3. Celebrate utility leadership in the energy transition and nudge those getting started through healthy competition.
4. Develop a body of knowledge that serves as a resource for utilities and others across Canada as they work to decarbonize.
5. Create a healthy ecosystem for collaboration between stakeholders.
6. Be intentional about equity, diversity, and inclusion goals and impacts

Smart Energy Benchmarking: A Phased Approach

This report summarizes results of Phase A: Smart Energy Scorecard.

Phase A

Scorecard

Benchmark **12 electric utilities'** current smart energy development and identity performance relative to peers and best-in-class practices

June 2022 – April 2023

Phase B

Maturity Model

Work with **a subset of utilities** to build on their strengths and develop their capabilities to improve preparedness and performance

April 2023 – September 2023

Phase C

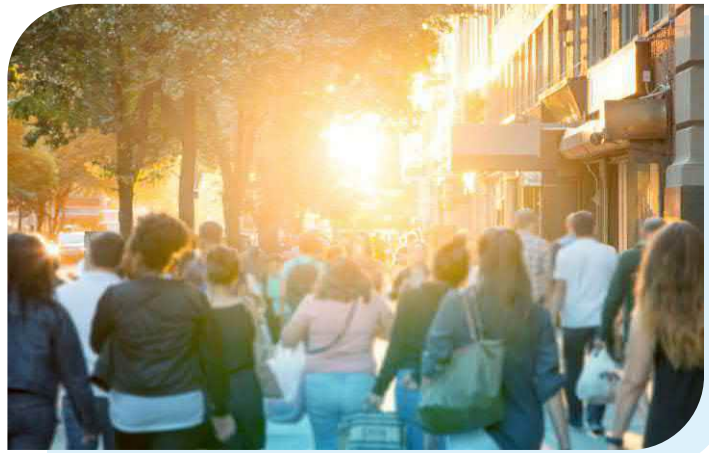
Knowledge Hub

Share findings, trends, and best practices to a **broader audience** to support industry capacity-building

September 2023 – December 2023

Phase A: Smart Energy Scorecard

Electric utilities are responsible for generating, transmitting and distributing electricity to end users. In the context of the clean energy transition, the scorecard assesses utilities across three main functions:



1 Clean Energy Supply

To reduce greenhouse gas emissions and meet renewable energy targets, electric utilities must shift away from fossil fuel-based generation to clean or non-emitting sources such as solar, wind, hydro, geothermal, and nuclear.

2 Modern Grid

The electricity grid is complex system of generating stations, transmission lines, substations, and distribution networks that deliver electricity to end users. The grid must be managed to ensure a reliable and stable supply of electricity, and to optimize the integration of more variable clean energy sources.

3 Customers & Society

Utilities can offer programs and services to encourage and enable customers to electrify their buildings, transportation and industries and adopt clean energy technologies. Utilities must also consider impacts to those most vulnerable so that all customers can benefit from the transition.

The Smart Energy Scorecard

The Smart Energy Scorecard assesses participating Canadian electric utilities' efforts and progress in the clean energy transition across 3 categories, 13 metrics and 140+ indicators (baseline year 2021).

Electric utilities play a critical role in enabling the transition to a clean energy future by ensuring a reliable and sustainable supply of electricity from renewable sources while also meeting the needs of end users. Utilities plans, actions and abilities were benchmarked across 140+ indicators that are deemed crucial to facilitate a clean energy system that continues to be safe, affordable, and reliable, as well as **clean, resilient, and equitable**.

The following four guiding principles influenced the final scorecard metrics:

1. Align with NRCan's SREP objectives and the net zero emissions goal
2. Measure performance against best-in-class practices within Canada and abroad
3. Be relevant, measurable, and flexible, and focus on what utilities can control & influence
4. Develop in collaboration with utilities and other relevant industry stakeholders

1 Clean Energy Supply

- 1.1 Planning & Designing to Decarbonize the Grid
- 1.2 Clean Energy Procurement & Deployment
- 1.3 Integration of Clean Energy Supply
- 1.4 Corporate Leadership

2 Modern Grid

- 2.1 Enhanced Grid Planning & Management
- 2.2 DER Enablement & Integration
- 2.3 Visibility & Control Capabilities
- 2.4 Innovation & Emerging Technologies
- 2.5 Climate Resiliency

3 Customers & Society

- 3.1 Changing Customer Preferences
- 3.2 Enabling Transport, Building & Industry Electrification
- 3.3 Being Intentional About Diversity, Equity & Inclusion
- 3.4 Aligning Actions & Engagement

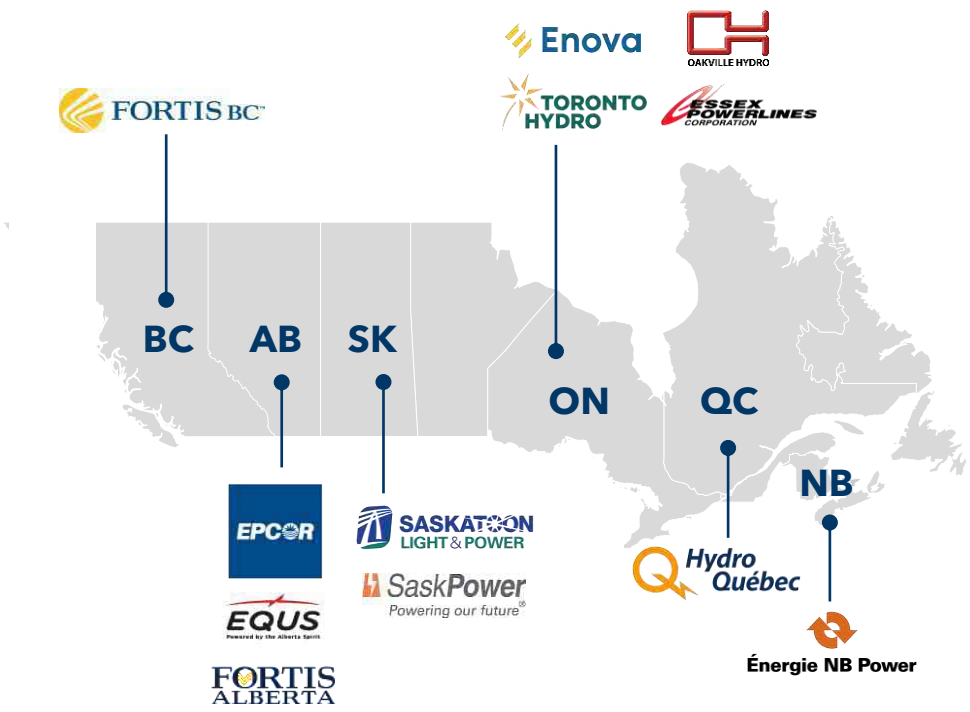
2. Approach

Project Approach and Timeline

Developing the smart energy scorecard was an iterative, collaborative approach that involved the project team, an advisory group and participating utilities.

Develop Preliminary Scorecard	Form & Engage Advisory Group	Recruit Utilities	Consult Utilities	Create Roadmap & Collect Data	Refine Data	Present Results
• Develop preliminary scorecard and metrics	• Form advisory group and gather input on project and approach	• Host information webinar • Invite electric utilities across Canada • 18 utilities enrolled	• Gather input to refine scorecard • Consult on data collection process • (2 utility workshops)	• Create utility roadmap • Collect scorecard inputs & supporting documents • 12 final utilities	• Address data questions • Refine scorecard inputs • Generate utility scores	• Present preliminary results • Create summary report & custom utility reports
Jul – Sep 2022	**Sep 2022**	**Oct 2022**	**Nov 2022 – Jan 2023**		**Feb – Mar 2023**	**April 2023**

Data for each indicator was provided by the utilities through a standardized data request form. Dunsky reviewed utility inputs for quality and consistency and assigned a score for each indicator against a pre-determined scoring grid. All 144 indicators are outlined in the appendix, along with scores and weights.



Overview of benchmarked utilities

The project team aimed to attract up to 20 utilities that represented the diversity across Canada in terms of utility size, type, ownership, and geography, clean vs not-so-clean grids and regulatory/policy environments. We summarize the targets set out at the beginning of the project and what was achieved. Additional comparisons are made on the following page.

Target	Achieved
Up to 20 electric utilities	• 18 utilities expressed interest • 12 electric utilities completed the scorecard
Focus on small, but include a range of utility sizes	• 4 small (<100K customers) • 4 medium (100K – 500K) • 4 large (>500K)
A range of utility types	• 4 vertically integrated utilites • 1 Transmission & Distribution (T&D) utility • 7 distribution-only utilities
A range of ownership structures, including indigenous owned	• 3 crown corporations • 6 municipally owned • 3 privately owned • 0 indigenous owned (one initially enrolled but could not complete the process due to resource constraints)
Geographic spread	• West (1 BC) • Prairie (3 AB, 2 SK) • Central (4 ON, 1 QC) • Atlantic (1 NB)

Overview of benchmarked utilities

Six provinces

Twelve utilities serving close to 7.5 million customers (presented West to East)

Utility	Type	Ownership	Nb. of customers	Provincial Electricity Market: Retail	Clean grid	¢/kWh[1]
Fortis BC	Generation, Transmission, Distribution	Private	< 100k	Regulated retail	>90% clean	11.4
FortisAlberta	Distribution	Private	≥ 100K to ≤ 500k	Competitive	<50% clean	19.9
EPCOR (EDTI)	Transmission, Distribution	Municipal	< 100k	Competitive	<50% clean	19.9
EQUS REA	Distribution	Coop	< 100k	Competitive	<50% clean	19.9
Sask. Light & P.	Distribution	Municipal	< 100k	Regulated retail	<50% clean	16.5
SaskPower	Generation, Transmission, Distribution	Crown corp.	≥ 100K to ≤ 500k	Regulated retail	<50% clean	16.5
Enova Power	Distribution	Municipal	< 100k	Hybrid	>90% clean	13.9
Essex Powerl.	Distribution	Municipal	< 100k	Hybrid	>90% clean	13.9
Oakville Hydro	Distribution	Municipal, Private	< 100k	Hybrid	>90% clean	13.9
Toronto Hydro	Distribution	Municipal	> 500k	Hybrid	>90% clean	13.9
Hydro-Québec	Generation, Transmission, Distribution	Crown corp.	≥ 100K to ≤ 500k	Regulated retail	>90% clean	7.6
NB Power	Generation, Transmission, Distribution	Crown corp.	≥ 100K to ≤ 500k	Regulated retail	>50% clean	13.9

Generation · Transmission · Distribution · Crown corp. · Municipal · Private · Coop

>90% clean · >50% clean · <50% clean · < 100k · ≥ 100K to ≤ 500k · > 500k

1 Electricity rates. Source for pricing data: Hydro-Québec, Comparison of Electricity Prices in Major North American Cities 2022 (2021 data for average residential prices in Vancouver, Edmonton, Regina, Toronto, Montréal, Moncton). Data is indicative only and may not represent the actual prices charged by the benchmarked utilities or others to consumers in their specific service areas in 2021.

This scorecard comes with several caveats

It is not a complete picture of Canadian utilities. While it covers 12 utilities from 6 jurisdictions of various sizes and ownership types, which collectively serve around 7.5 million customer accounts, it was not designed to be a representative sample.

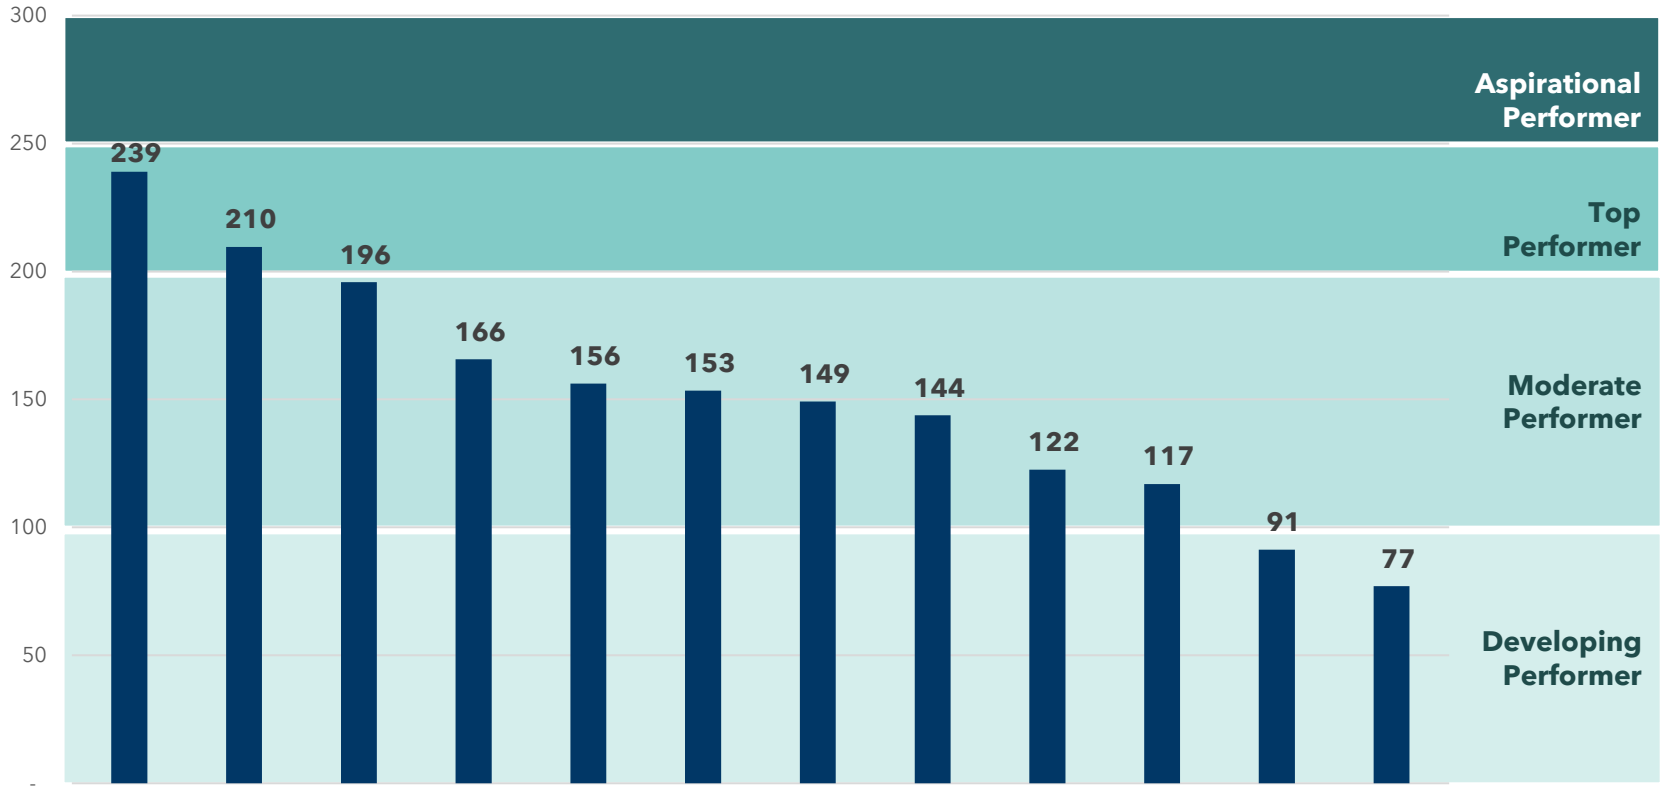
Scores represent 2021 data, to the best of utilities' and SGIN's abilities. Utility plans, actions and contexts may have evolved since then, and will be captured in future scorecards.

Data was reviewed with care, but some limitations apply. Data for certain indicators or utilities was difficult to obtain, due to its confidential nature, or to varying definitions across organizations and jurisdictions. Dunsky exercised judgement to assign scores and, in some cases, modified utilities' self-ratings to ensure consistent scoring across all entities.

Utilities face different contexts and cannot be compared one-to-one, given differences in sizes, jurisdictions, ownership type, etc. Several utilities do not control their own generation assets or other factors that may influence their score. The scorecard is most useful when used as a tool to support utilities' own engagement and learning with their internal and external stakeholders and does not purely measure 'performance'.

3. Scorecard Results

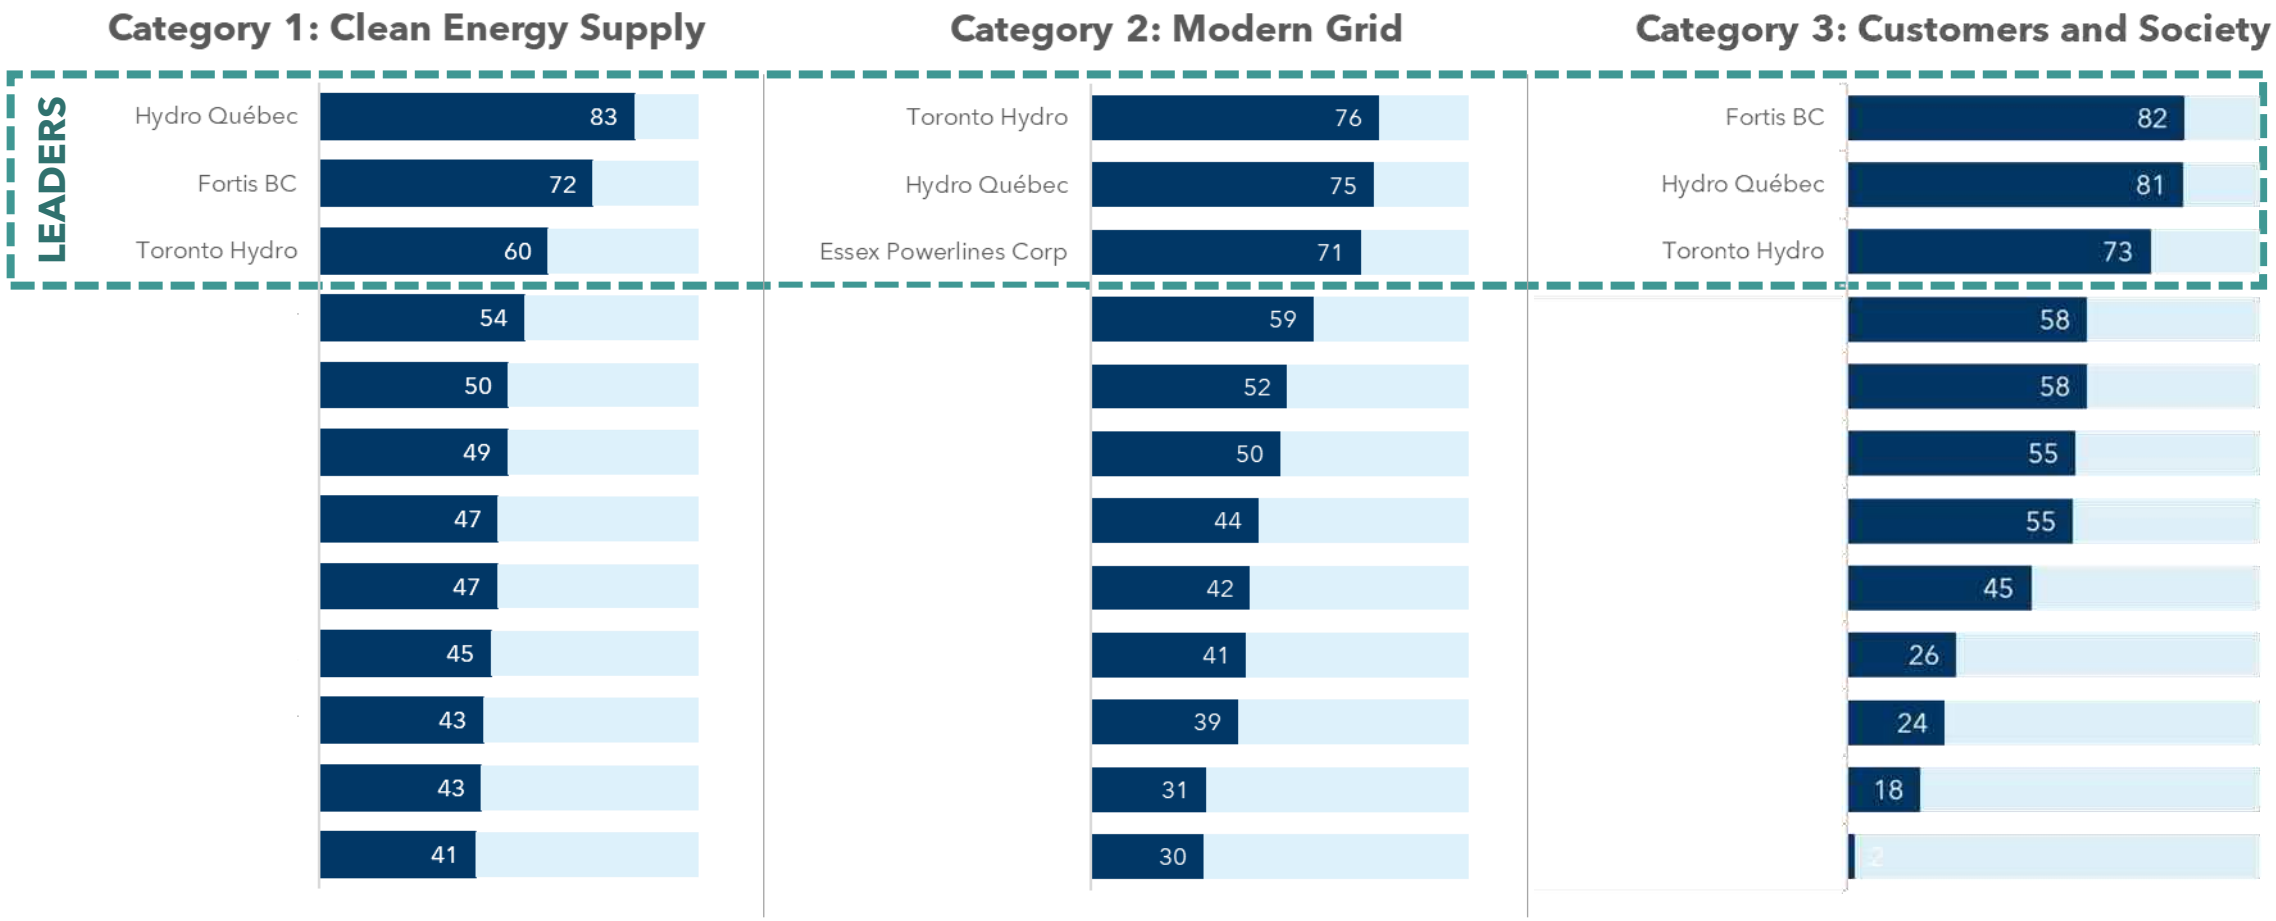
Aggregate Results



Canadian electric utilities are at varying stages of preparedness for the energy transition.

While no utility achieves aspirational performance, three utilities are recognized as top performers demonstrating leadership across all three categories (Clean Energy Supply, Modern Grid and Customers & Society).

Most utilities fall within the middle of the band.



In many cases, utilities' actions are constrained by the boundaries of their regulatory and/or policy environment.

While the overall score is important, understanding how utilities scored across indicators that contributed to the total score tells a more complete story. We discuss this in more detail next.

Results by Category

There are 100 total possible points in each category and a different utility takes the top spot across each of the three major categories.

Clean Energy Supply: Overview

1 Clean Energy Supply

1.1 Planning & Designing to Decarbonize the Grid	1.2 Clean Energy Procurement & Deployment	1.3 Integration of Clean Energy Supply	1.4 Corporate Leadership

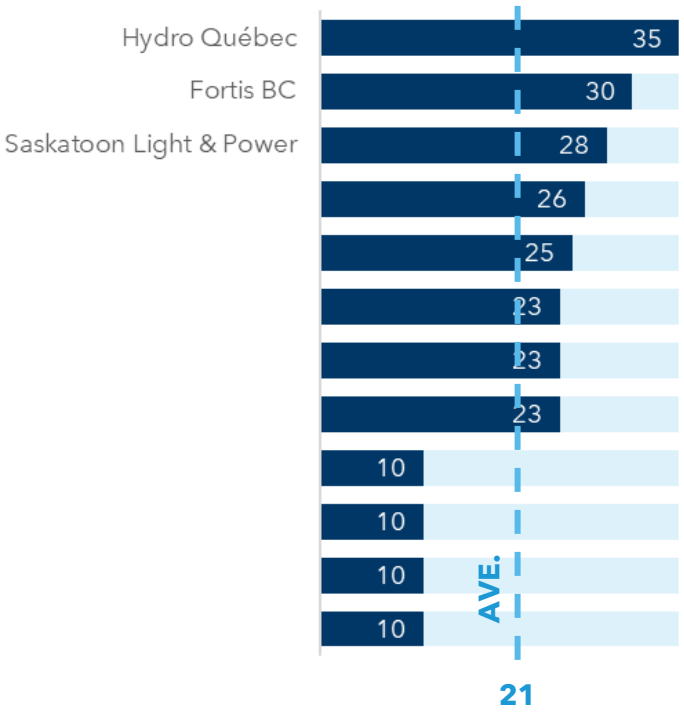
Planning, procuring and deploying clean energy is key to the clean energy transition. The current share of clean energy, the pace and approach to further decarbonize and corporate leadership is critical to transform our electricity sector to net zero by 2050.

Under Clean Energy Supply, we assess utilities on the following:

1.1. Planning & Designing to Decarbonize the Grid. Explicit clean energy commitments, the depth of those commitments, the timeframe to achieve them, and if utilities have a comprehensive plan to do it.

1.2 Clean Energy Procurement & Deployment. Utilities' current share of non-emitting supply and procurements for clean energy

1.3 Integration of Clean Energy Supply. Where ancillary markets exist, do clean energy resources have access to ancillary services payments and what are utility DER interconnection times and processes.



1.4 Corporate Leadership. Leadership, transparency, and accountability needed to facilitate the transition.

1 Clean Energy Supply

1.1 PLANNING & DESIGNING TO DECARBONIZE THE GRID

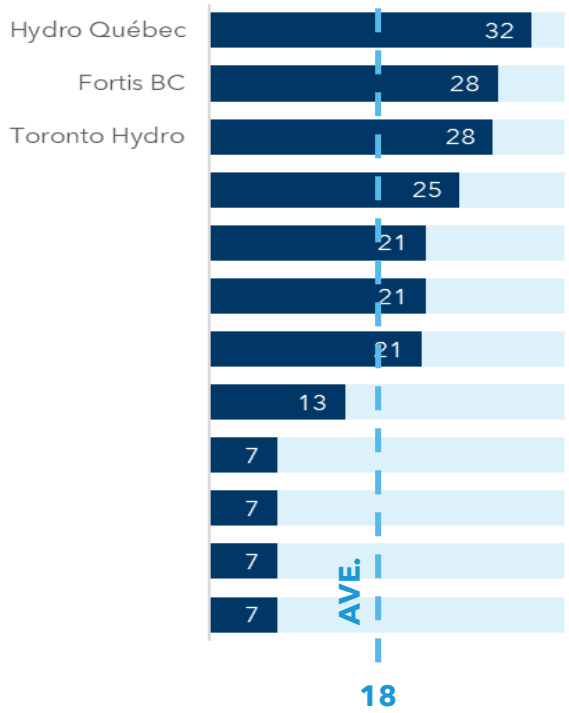
POINTS AVAILABLE **35**

Utilities and their partners (e.g., system operators, provincial government) have a key role in developing robust and actionable visions for a decarbonized grid. To achieve our net zero goals we need provinces, territories and regulators to set clear direction and for utilities to align their plans with net-zero pathways.

- **Clean grid goals are more often set provincially than at the utility level**. Three out of four provinces with carbon emitting generation resources have established decarbonization goals. Ontario is the exception: despite having a relatively clean grid, it is the only province that has not committed to maintaining existing and/or further decreasing its grid carbon intensity in the coming years. Ontario is now soliciting bids for new gas-fired power plants when several nuclear stations will be refurbished. If it proceeds, this will be Ontario's biggest increase in gas-fired generation in over a decade.[1]

- **Declared clean grid goals vary substantially.** Alberta aims for 30% by 2030, Saskatchewan 40% by 2030, and New Brunswick 100% by 2035. The federal Clean Electricity Regulation requiring 100% non-emitting generation by 2035 thus represents a considerable acceleration for some provinces. BC's and Québec's grids are already 99% clean, with plans to decarbonize remaining remote generation. While remote microgrids make up a small amount of production, they can be challenging to decarbonize.

- **As of 2021, several participating utilities had undertaken preliminary assessments of net-zero pathways, but most had yet to put together comprehensive plans (budgeted and timed) to achieve their targets.** In at least one case, a plan was in development (expected 2023), and in other cases plans existed for initial steps without covering the whole transition. Two of the three provinces with clean grid goals were on or above track towards meeting them (Alberta and New Brunswick). Only Saskatchewan was slightly short of its target, due to construction delays resulting from the covid-19 pandemic.



1. Source: IESO accessed at https://www.ieso.ca/en/Sector-Participants/Resource-Acquisition-and-Contracts/Long-Term-RFP-and-Expedited-Process In 2017, gas- and oil-fired generation was 4% of Ontario's electricity supply. By 2022, that figure reached 10.4%. Nuclear declined from 63% to 53.7% while Hydro Wind and Solar only increased from 33% to 36.3%. Source: IESO accessed at https://www.ieso.ca/en/Power-Data/Supply-Overview/Transmission-Connected-Generation..

SASKATOON LIGHT & POWER: Despite having limited control over provincial generation, the City of Saskatoon, which owns Saskatoon Light & Power, has developed a comprehensive implementation plan, *Alternative Currents*, for a low-emission energy transition, with specific actions and timelines to promote local baseload and distributed generation, storage, energy efficiency, and other measures.

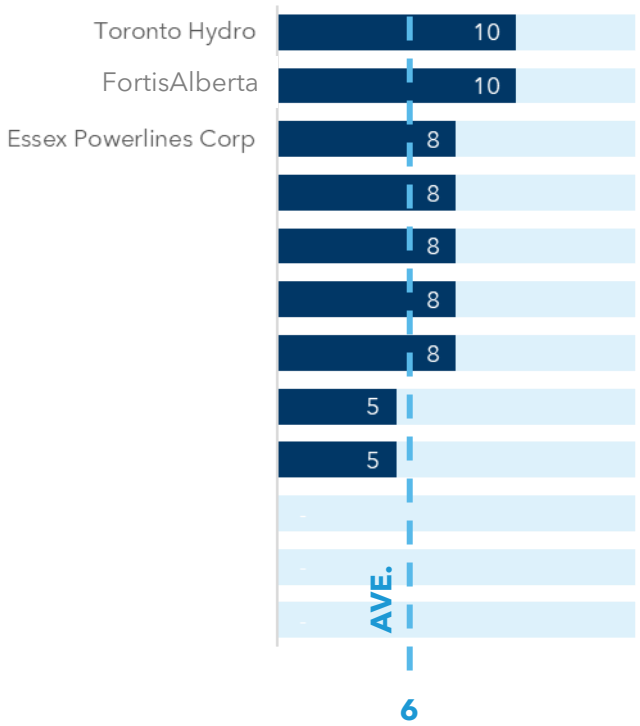
1 Clean Energy Supply

1.2 CLEAN ENERGY PROCUREMENT & DEPLOYMENT

POINTS AVAILABLE **35**

A clean energy future requires the transformation of a utility's total retail energy supply, changes to energy procurements and actions to reduce barriers to clean energy technology deployment.

- **Most sampled utilities do not directly control generation and are thus dependent on the state of the provincial grid.** Large, vertically integrated crown corporations like Hydro-Québec, New Brunswick Power and SaskPower constitute the exception.
- **The share of non-emitting generation varied widely across Canada**, from 99% in BC and Québec, to 80-90% in New Brunswick and Ontario, and 15-25% in Saskatchewan and Alberta. The associated grid emission intensities accordingly also varied greatly. Utilities with significant share of non-emitting resources from legacy hydro and nuclear power had a natural advantage.
- **Procurement strategies for renewable energy generation varied from targeted to agnostic.** Half the reviewed jurisdictions (BC, NB and QC) exclusively procured renewable generation capacity, while two others (ON, SK) had released some dedicated renewable procurements. Only AB had not posted dedicated renewable procurements, though several projects were nonetheless under way.
- **As of 2021, a small majority of utilities were proactively undertaking actions that reduce or remove barriers to the deployment of clean technologies.** This includes seven of 12 utilities of various types, sizes, and regions. Actions include forms of information-sharing (e.g., feeder lists, developer manuals, hosting capacity maps, customer costing frameworks), integrated approaches to interconnections (such as a 'Power Generation Partners Program' to accompany clients through the journey), and transmission investments to increase the interconnection potential. The remaining five utilities reported no facilitating actions, beyond minimal regulatory requirements.



HYDRO-QUÉBEC: Hydro-Québec's own generation projects and procurement opportunities are exclusively for renewable energy – some exclusively for wind power, other for any type of renewable generation. Moreover, it has laid out a plan to decarbonize 80% of remote, diesel-powered microgrids by 2030, through a combination of transmission lines and distributed generation and storage.[1]

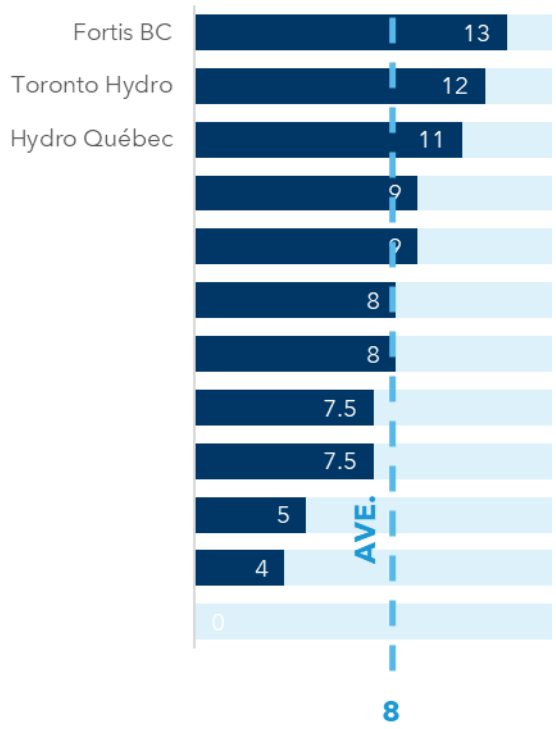
[1] See http://news.hydroquebec.com/en/press-releases/1815/hydro-quebec-reaches-a-major-milestone-in-the-decarbonization-of-its-off-grid-systems/.

1 Clean Energy Supply

1.3 INTEGRATION OF CLEAN ENERGY SUPPLY

POINTS AVAILABLE 15

As the penetration of intermittent renewables increase, procurement mechanisms and ancillary services market designs and rules may need to be modified. Additionally, streamlining and improving interconnection procedures will increase efficiencies and allow utilities to process more large-scale renewable interconnection requests, and accommodate newer and more complex systems.



- **Canada is still "behind" in general with only one utility obtaining more than 50% of the points** in this metric.
- **Access to ancillary services payments for distributed energy resources (DERs) is limited**. As of 2021, no utility reported full access to ancillary services payments for clean and distributed energy resources. Such access was under consideration in the deregulated electricity markets (Alberta, Ontario), but its future remained unclear in other jurisdictions, which mostly do not operate through market mechanisms and include ancillary services on an ad hoc basis, if at all.
- **The typical time to *approve* interconnection requests for large-scale renewable projects (>5 MW) was half a year or less**, once correct documentation is submitted, and payment received. This period covers the part of the process within utilities' control (e.g., conducting a connection impact assessment) and usually varies depending on project size and regional requirements. Time to *commission* a project may be substantially longer, influenced by parties other than the utility. Of note, half of the reviewed utilities had not yet experienced any or enough large-scale renewable project requests to determine a 'typical time'.
- **As of 2021, only a third of utilities were undertaking or planning steps to improve/streamline large-scale interconnection processes**. Steps include undertaking customer journey mapping exercises, sharing documentation (e.g., hosting capacity maps, interconnection requirements), and engaging with developers. The remaining utilities were not undertaking or facilitating steps, mostly because they were not expecting large-scale interconnections in their service territory.

ONTARIO: Clean distributed energy resources (e.g., storage, distributed generation, demand response) have partial access to some IESO markets for ancillary services, such as operating reserves. The IESO is working with stakeholders to further enable DER participation in its' markets.

1 Clean Energy Supply

1.4 CORPORATE LEADERSHIP

POINTS AVAILABLE **15**

In addition to decarbonizing the grid and supporting customers, utilities will need to make the clean energy transition a core mandate within their organization and culture. This includes leading by example to decarbonize corporate buildings and operations, linking executive compensation to carbon-reduction goals, and being accountable through transparent tracking and reporting.

- **Corporate emission reduction targets and plans have become an industry standard. As of 2021, all but one utility had a corporate sustainability plan and/or initiatives**, **but the nature of the plans vary widely**. Several plans – mostly of smaller utilities - focused on isolated initiatives, such as employee days, safety training, local outreach, headquarter efficiency measures, etc. Some larger utilities had comprehensive environmental, governance and social (ESG) objectives related to their environmental impact, human resources practices, etc. Of note, some medium-sized utilities had comprehensive plans due to their links to a larger parent entity (e.g., municipality or large corporation).

- **As of 2021, two thirds of utilities had targets in place related to the decarbonization of their own operations (e.g., buildings, fleet), but the target years and depths vary**. The most ambitious utility aimed to be net zero by 2030, while another targeted 2040, three targeted 2050, and another three had interim decarbonization targets without any net zero commitment. Finally, four utilities (mostly small) had not declared their decarbonization ambitions, though some have pursued isolated initiatives to reduce their carbon footprint.

- **Three quarters of utilities had a public sustainability report to track their progress and accountability**. However, as with plans, the quality of reporting varied widely, ranging from general brochures about sustainability initiatives to consistent and comprehensive tracking and reporting on the indicators laid out in the corporate sustainability plan. Few utilities resorted to independent verification and reporting of their progress.

- **Only two utilities have tied executive performance and compensation to the achievement of corporate decarbonization objectives**, and none to grid decarbonization. See leader spotlight for an example.

FORTIS BC: At FortisBC, sustainability performance measures for annual incentive purposes focus on climate, people, and reliability. In 2022, the weighting of climate will increase to 40% from 30%, and long-term incentive plans will include a measure associated with reducing corporate carbon emissions for all executives.

Clean Energy Supply: Additional Spotlights

FORTIS BC: Fortis BC's 2021 Long Term Electric Resource Plan (LTERP) aligns with BC's environmental goals and ensures consistency with provincial energy policies and objectives.

1 Clean Energy Supply

- 1.1 Planning & Designing to Decarbonize the Grid
- 1.2 Clean Energy Procurement & Deployment
- 1.3 Integration of Clean Energy Supply
- 1.4 Corporate Leadership

TORONTO HYDRO: Toronto Hydro executives are eligible for performance-based compensation tied to corporate objectives. Two of these objectives aim at managing climate related risks and opportunities: Building Emissions Reduction and Fleet Electrification.

Modern Grid: Overview

2 Modern Grid

2.1 Enhanced Grid Planning & Management	2.2 DER Enablement & Integration	2.3 Visibility & Control Capabilities	2.4 Innovation & Emerging Technologies	2.5 Climate Resiliency

A modern, smart, and dynamic grid is crucial to enable utilities to decarbonize the grid, enable greater electrification, prepare for climate impacts, and respond to shifting customer needs and preferences. This will require advanced grid capabilities, planning and operations, greater visibility and control, and a willingness to innovate.

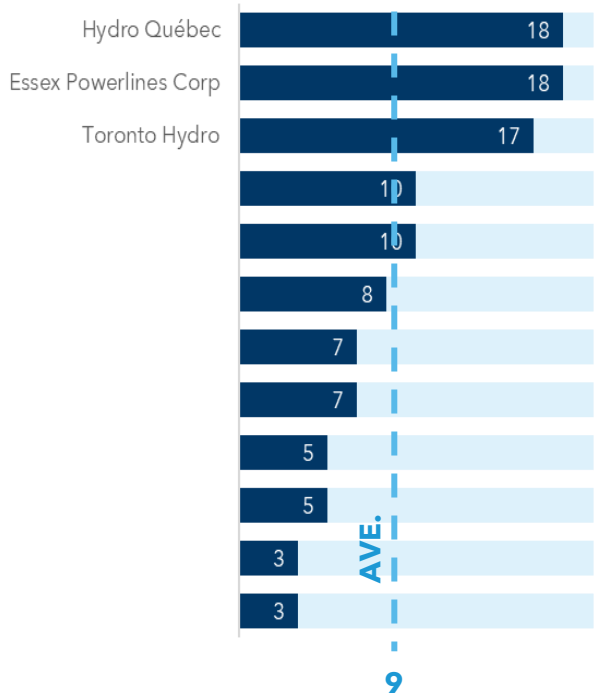
Under Modern Grid, we assess utilities on the following:

2.1 Enhanced Grid Planning & Management. Efforts to modernize or enhance load forecasting tools and planning processes.

2.2 DER Enablement & Integration. The portion of peak demand/system capacity represented by Demand Response (DR), share of energy savings from energy efficiency, how utilities are valuing Non-Wires Alternatives (NWAs), and whether utilities have a formalized DER strategy and/or roadmap.

2.3 Visibility & Control Capabilities. Current AMI coverage and capabilities, deployment of DERMS, SCADA, and ADMS.

2.4 Innovation & Emerging Technologies. Funding and/or spending on innovation, research and innovative pilots.



2.5 Climate Resiliency. Actions taken to fortify the grid to protect critical infrastructure and/or services during extreme climate events.

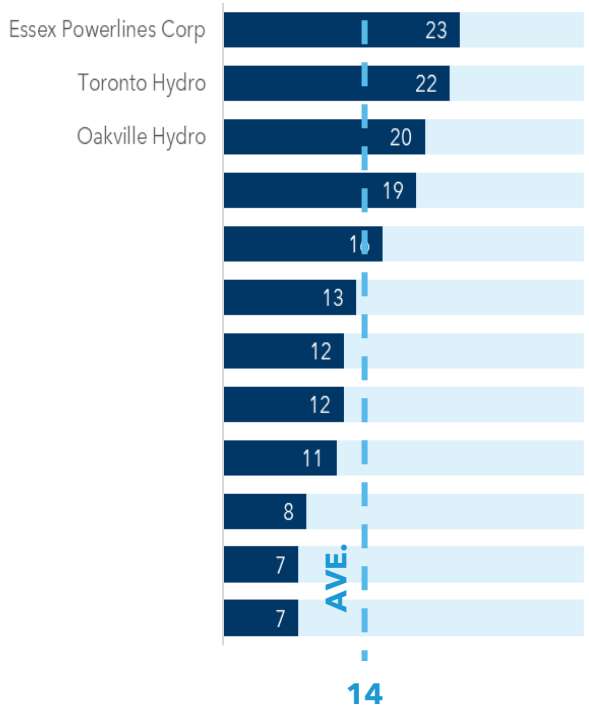
1 Modern Grid

2.1 ENHANCED GRID PLANNING & MANAGEMENT

POINTS AVAILABLE **20**

Grid planning must evolve to manage a complex mix of diverse, distributed and intermittent resources, and address increasingly localized grid challenges. This includes updating load forecasting practices to enhance their granularity and ultimately may require reframing utilities' roles, from one-directional to bidirectional operators.

- **As of 2021, all but one utility were modernizing or enhancing their load forecasting tools and processes to account for renewable growth, climate change, and/or vehicle electrification.** Several utilities were working with consultants and specialized service providers. Some utilities reported facing challenges calibrating existing studies and tools to their local contexts and customers.
- **Three quarters of utilities had DER forecasting capabilities**. Of these, two thirds relied on basic, top-down forecasts, with only three utilities – including at least one small utility – using bottom-up or advanced modelling to forecast DER adoption.
- **Most load forecasts were at the system level and on an annual or seasonal basis**, but two utilities – including at least one small utility – generated load forecasts that are both localized (at the bus level) and on a year-round, hourly basis ("8760", for the number of hours in a year) to capture the increased pressure on their distribution systems.
- **Half of assessed utilities were actively updating their operational model in the context of the energy transition**, for instance by developing a "Grid Transformation Roadmap". The other half had not laid out a comprehensive plan as of 2021.[1] Moreover, only two utilities were explicitly planning changes to their business model, such as transitioning to a Distribution System Operator (DSO) model – see leader spotlight for an example.



ESSEX POWERLINES CORP.: Essex implemented advanced temporal and spatial forecasting capabilities providing year-round hourly load forecasts. Moreover, their *SmartMAP* application, connected to their main dashboard, detects EV's and DER enhancing visibility of localized network impacts. Essex's 2021 application to the IESO Grid Innovation Fund outlines a roadmap to transform into a DSO.

[1] Some Ontario utilities pointed to the IESO's 2019 report about "Structural Options for Ontario's Electricity System in a High-DER Future", see https://ieso.ca/Sector-Participants/IESO-News/2019/06/ETNO-releases-report-on-system-options-in-a-high-DER-future.

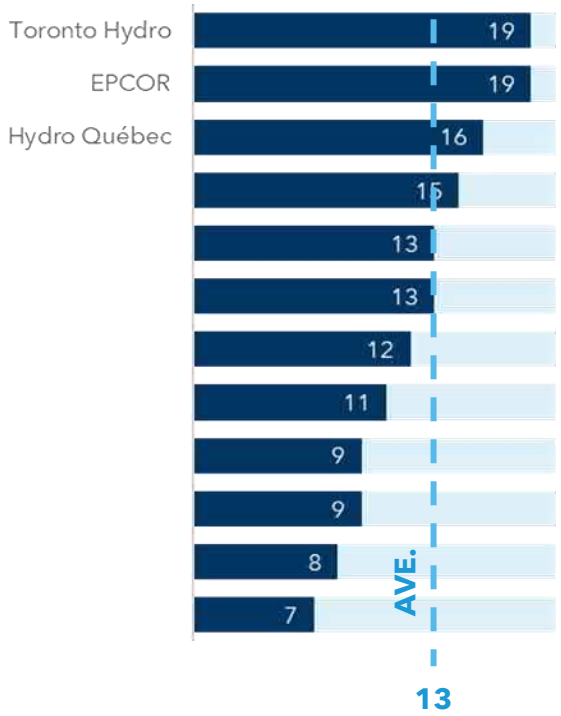
2 Modern Grid

2.2 DER ENABLEMENT & INTEGRATION

POINTS AVAILABLE **35**

To support the transition, utilities will need to integrate more DERs, consider non-wires alternatives (NWAs), address peak demand and system capacity, incorporate energy efficiency (EE) and demand response (DR) initiatives, streamline and improve DER interconnection processes, and manage the distribution system.

- **Few utilities – principally vertically integrated crown corporations – had a mandate for delivering EE and DR programs and savings**. In several provinces, public agencies or system operators administer programs, if any. Scores here are thus based on provincial savings as a percentage of domestic electricity sales (GWh) or annual peak demand (MW). Savings were highest in ON (0.75% of sales, 7.5% of peak) and QC (0.75% of sales, 4.5% of peak), followed by SK for peak savings (2%) and by AB, NB and BC for energy savings (0.5-0.6% of sales). By contrast, leading American states achieve over 2% of sales in savings.[1]
- **As of 2021, no utility had developed a comprehensive process for valuing DERs as NWAs**. Half had conducted preliminary research, for instance developed an "NWA staff toolkit" or "DER Value Registry", or reviewed approaches in other jurisdictions. The other half had not yet undertaken any steps.
- **No utility used DERs for ancillary services**. Two utilities in deregulated markets (AB, ON) were awaiting regulatory enablement to do so, while one large utility was running pilots (black start, frequency regulation).
- **Two thirds of utilities had a DER strategy or roadmap**, **though the level of detail varied** from basic documents to comprehensive, costed plans. Some DER strategies were integrated into a wider transformation vision (e.g., a grid modernization roadmap). The remaining third of utilities – of various sizes – had no formal plan or strategy related to DERs.
- **Interconnection processes and timings for small-to-medium renewable projects varied across and within jurisdictions, with no harmonized steps.** Timelines range from 14 days to 3 years (avg of 150 days) for medium-scale projects of 10 kW to 5 MW, and from 1 day (automatic approval) to 365 days (avg 61 days) for small projects below 10 kW. Two thirds of utilities were actively working to reduce these times. Measures include distributed generation maps, customer journey maps, restricted feeder lists, developer manuals and outreach.



OAKVILLE HYDRO: Oakville Hydro's distribution plan was reviewed by third party consultants to assess DER/NWA opportunities as alternatives to planned grid investments. Additionally, all 12 micro-embedded generation facilities added to the local grid in 2021 were connected within planned timelines.

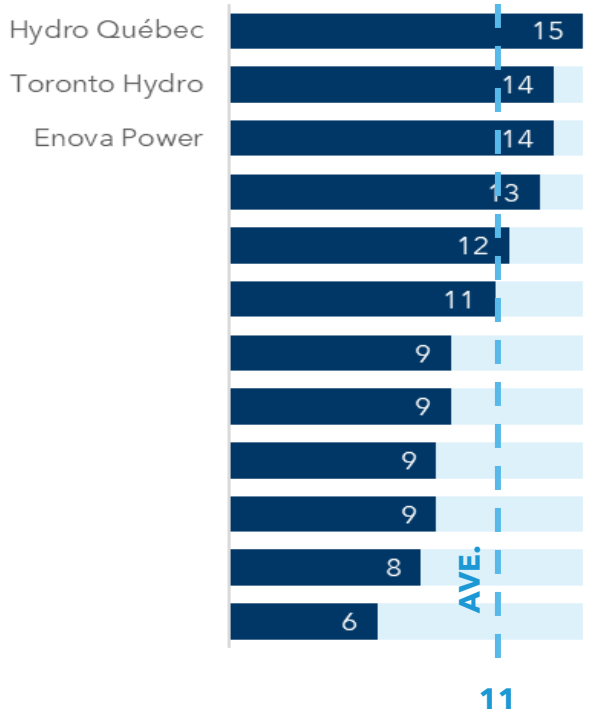
[1] Data for Canada from Efficiency Canada's 2022 Canadian Energy Efficiency Scorecard (data for 2021), and for the United States from the ACEEE State Energy Efficiency Scorecard: 2021 Progress Report, p.17 (data for 2020).

2 Modern Grid

2.3 VISIBILITY & CONTROL CAPABILITIES

POINTS AVAILABLE **20**

To effectively and safely operate increasingly diversified grids, utilities need an advanced understanding of assets' locations and capabilities. This requires enhanced visibility and control capabilities, using software solutions (e.g., AMI, ADMS, SCADA), and distribution automation.



- **AMI deployment is very advanced across Canada**. As of 2021, all but two utilities had deployed AMIs to 90+% of customers. Both remaining utilities were planning mass deployment, although a global microchips shortage slowed plans in one case.
- **Just over half of utilities leverage AMI capabilities beyond basic metering**, such as two-way control (e.g., remote disconnection), outage detection, power quality analysis, energy theft detection, etc. The remainder of utilities had either metering-only capabilities or did not have AMIs.
- **Only two utilities had deployed DER Management Systems (DERMS)**, with two other utilities in advanced planning stages. Utilities using or considering DERMS were more likely to be large. Utilities were primarily drawing on DERMS from external service providers, with some using funding from Natural Resources Canada (NRCan) to support DERMS deployment.
- **All except one (small) utility had deployed a Supervisory Control and Data Acquisition (SCADA) system as of 2021 or were about to do so**. Some utilities had deployed SCADA for their transmission system only and were only about to deploy it at the distribution level.
- **Three quarters of utilities had deployed an Advanced Distribution Management System (ADMS)** as of 2021 or were about to do so. Only three utilities had no ADMS or short-term plans to deploy one, ranging across different provinces and size categories. Moreover, several utilities of various sizes have recently deployed Fault Location Isolation and Service Restoration (FLISR) technology.

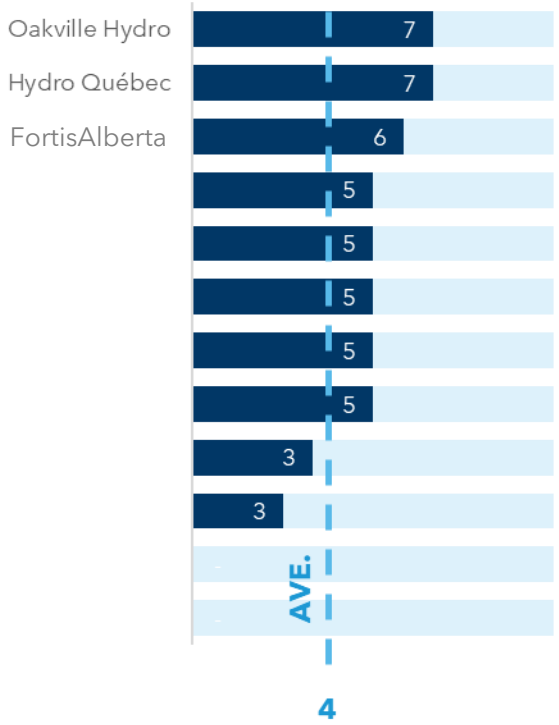
EPCOR: Over 99.9% of customers have AMI, and EPCOR has deployed ADMS, SCADA, and DERMS. The DERMS was supported by NRCan funding in 2018 and was being tested with the integration of E.L. Smith solar farm and a Battery Energy Storage System (BESS).

2 Modern Grid

2.4 INNOVATION & EMERGING TECHNOLOGIES

POINTS AVAILABLE **15**

Innovation, deployment of new technologies, strategic investments and collaboration with external partners will be needed to overcome today's challenges and achieve net zero by 2050.



- **Two thirds of utilities had dedicated envelopes for innovation and research in 2021**, with a third spending more than 1% of revenue, another third less than 1%, and the final third unable to provide a figure as costs were distributed across multiple budget lines and not earmarked for "innovation" specifically.
- **Large utilities are more likely to afford dedicated research and innovation budgets** (e.g., Hydro Québec's research division), but one medium and one small utility also had large innovation budgets. Several are leveraging innovation funding, such as the IESO's Smart Innovation Fund, or NRCan's smart grid funding.
- **All but two utilities had a dedicated innovation resource team or staff member**. Innovation is sometimes, but not always, explicitly part of the role description, with one utility for instance describing its Grid Transformation Team as its innovation lead. The two remaining utilities noted they pursue innovation in a cross-cutting way, without a designated resource.
- **All but two utilities demonstrated practical applications of their investments into visibility and control capabilities**, such as improved geographic information systems (GIS), data and enterprise analytics, system interoperability (GIS, ADMS, SCADA, AMI), DER mapping, or outage management (see leader spotlights). However, the value of these applications could rarely be quantified.
- **All but one utility were running innovative pilots/projects as of 2021**, with innovation defined relative to their context. Initiatives include process innovations (robotic process automation, data visualization tools), program innovations (EV demand response pilot, smart water heater pilots), organizational innovations (transitioning towards an integrated distribution system operator role), and asset-based innovations (mobile battery energy storage system, use of optical ground wire as both transmission neutral wire and internet cable).

ENOVA POWER: Enova established an Innovation and Business Transformation department and created a Manager of Innovation position. A formal innovation strategy is under development and an additional resource is planned to assist advance innovation and new technologies. Already, the implementation of a Fault Location Isolation and Service Restoration (FLISR) technology led to a 33 percent decrease in Customer Minutes of Interruption in 2021 for residents in Waterloo, Woolwich and Wellesley.

2 Modern Grid

2.5 CLIMATE RESILIENCY

POINTS AVAILABLE **10**

As our climate changes, utilities will need to anticipate, plan for and mitigate impacts to critical infrastructure that can affect their ability to deliver safe and reliable service. Utilities' must also consider their exposure to climate risk, which could impact their financial risk rating.

- **As of 2021, three quarters of utilities were pursuing several actions to protect critical infrastructure and services during extreme climate events**. Actions include developing a climate adaptation and management plan, setting up a storm operations center, reducing vegetation risk, modifying pole design to withstand more extreme or frequent weather events (ice storm, fires, floods), modifying materials (composite poles, stainless steel transformers), oversizing equipment, funding battery storage in remote areas, etc. One (large) utility cited its ISO 14001:2015 certification in this regard, as well as using the Public Infrastructure Engineering Vulnerability Committee Protocol developed by Engineers Canada.
- **However, initiatives are rarely part of an integrated plan**. Only a few utilities have developed a comprehensive plan, such as the "Climate Adaptation and Management Plan" or the "Climate Change Adaptation Roadmap" developed by one medium and one large utility, respectively.
- **Moreover, only a third of utilities explicitly consider climate change scenarios in their planning processes**. While several utilities report on climate change risks and some consider climate change in weather forecasts (wind, rain), only four utilities (one small, one medium, two large) have incorporated scenario analysis into their planning. The most elaborate analyses were undertaken by utilities which have made an organizational commitment to analyse and report risks against global standards, for instance Fortis BC and FortisAlberta (see leader spotlight).

FORTISALBERTA: A Task-Force on Climate-Related Financial Disclosures (TCFD) report was completed in 2021. The TCFD analyzed four climate scenarios and their possible impacts (transition, physical climate risks). FortisAlberta has since developed asset management programs to build grid resiliency (e.g., Wildfire Risk Mitigation Plan with specific actions).

Modern Grid: Additional Spotlights

EQUS REA: Since 2018, EQUS REA has deployed a next generation Ultra-Rural Radio Frequency mesh network of advanced metering infrastructure to automate meter readings, and support the increased penetration of renewable energy sources, EV charging stations, and storage systems. The project aims to address challenges associated with serving rural customers while improving response times and repairs to outages. Separately, EQUS inaugurated a new near net-zero facility in Innisfail in 2020, which incorporates a solar array and a 15-kilowatt battery.

2 Modern Grid

2.1 Enhanced Grid Planning & Management	2.2 DER Enablement & Integration	2.3 Visibility & Control Capabilities	2.4 Innovation & Emerging Technologies	2.5 Climate Resiliency

NB POWER: NB Power is taking several climate resiliency actions to protect critical infrastructure and/or services. For example, both transmission and distribution have right of way line widening programs to reduce vegetation risks, transmission line designs consider expected weather events, and distribution line standards ensure structure designs do not exceed 75% of structure strength (to provide buffer for ice loading, etc.). Salt contamination zones due to potential flooding are defined, and special design considerations and materials are used in these areas.

Composite poles are being implemented through pilots in 2023.

Customers & Society: Overview

3 Customers & Society

3.1 Changing Customer Preferences	3.2 Enabling Transport, Building & Industry Electrification	3.3 Being Intentional About Diversity, Equity & Inclusion	3.4 Aligning Actions & Engagement

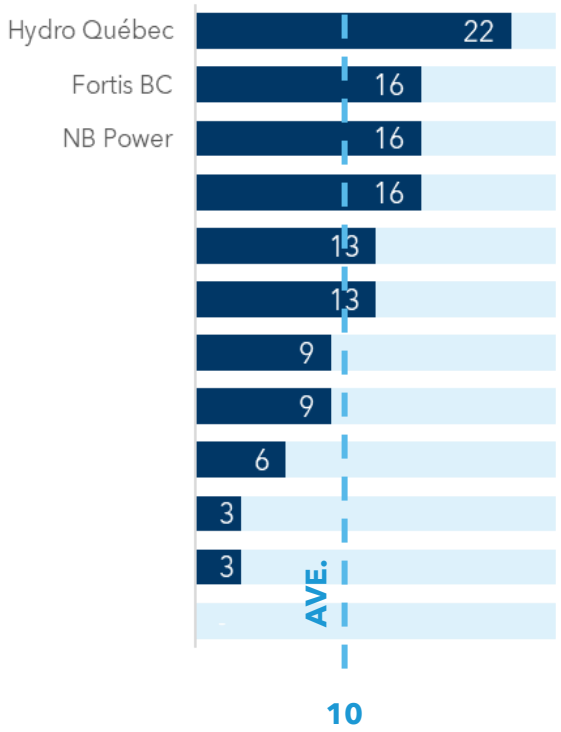
Electrification presents a significant economic opportunity for Canada's electric utilities. New technologies and platforms are increasing customers ability to participate in the energy transition and utilities can play an important role to educate, engage and enable customers to electrify their buildings, transportation and industry. Comprehensive and meaningful stakeholder engagement must be part of the process to inform all decisions, empower customers, obtain support and buy-in and ensure a just and equitable transition.

Under Customers & Society, we assess utilities on the following:

3.1 Changing Customer Preferences. Digital platforms, rate-based solutions, and awareness, education and energy services.

3.2 Enabling Transportation, Building & Industrial Electrification. Comprehensive electrification strategies and initiatives to catalyze transportation, buildings and industrial electrification.

3.3 Being Intentional About Diversity, Equity & Inclusion. Diversity, equity and inclusion goals and actions to ensure a diverse and inclusive workforce and mitigate impacts to vulnerable populations.



3.4 Aligning Actions & Engagement. Alignment, strategic partnerships and collaboration to facilitate the transformation

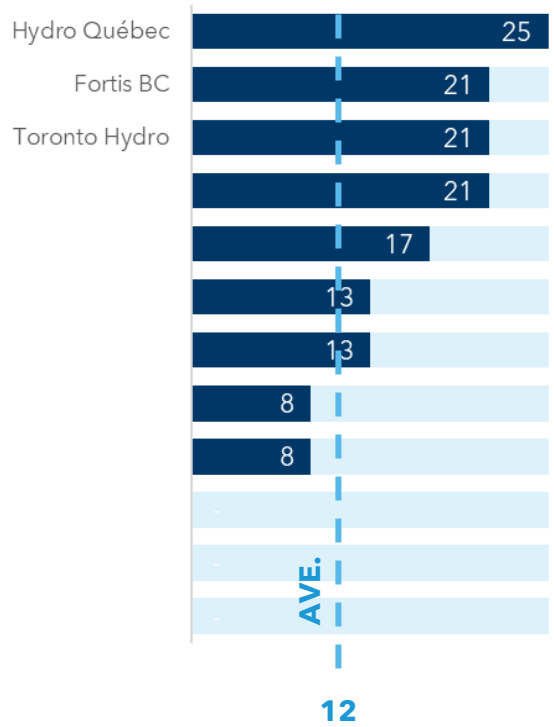
3 Customers & Society

3.1 CHANGING CUSTOMER PREFERENCES

POINTS AVAILABLE **25**

Utilities have an important role to play in raising awareness and empowering their customers to participate in the clean energy transition. This includes offering tailored products and services that enhance customer experience.

- **As of 2021, most utilities offered portals that allowed customers to view their consumption, but less than half offered additional support to help customers to act on the data**. Only four utilities offered digital engagement tools to support energy efficiency and building energy benchmarking, such as Home Energy Reports, Energy Star Portfolio Manager, Green Button,[1] or an online rebate marketplace.
- **Canada was split in terms of dynamic pricing, with half the reviewed jurisdictions/utilities offering it**. All Ontario utilities as well as two other utilities offered dynamic pricing. The other six utilities had yet to introduce rate-based solutions or investigate cost-drivers that could influence consumer behavior.
- **All utilities worked to build awareness and educate customers on the clean energy transition**. All offered basic education to engage customers, such as dedicated webpages for EVs, DERs and/or energy saving tips, media campaigns, bill inserts and tools/resources (e.g., developer manuals). One leading utility offered information in multiple languages and established an Indigenous customer care center. In one jurisdiction, utilities flagged that they had filed regulatory requests to support education initiatives but were denied.
- **Half the utilities were delivering services and solutions to remove barriers to increased electrification and efficiency**. Solutions included incentive programs for EVs and building efficiency, investments in charging infrastructure, renewable subscription services for commercial and industrial customers to buy renewable energy certificates to support their own carbon reduction targets, heat pump and smart thermostat programs. Some utilities were working with clean tech companies and seeking external funding to explore, pilot and/or design new initiatives (e.g., renewable generators, energy storage systems).



NB POWER: NB Power offers personalized energy management and peer-to-peer comparisons (e.g., Home Energy Reports and Energy Start Portfolio Manager). NB Power also launched new initiatives (e.g., Beat the Peak campaign and EV charging rebates) and is developing others, including a clean energy rate.

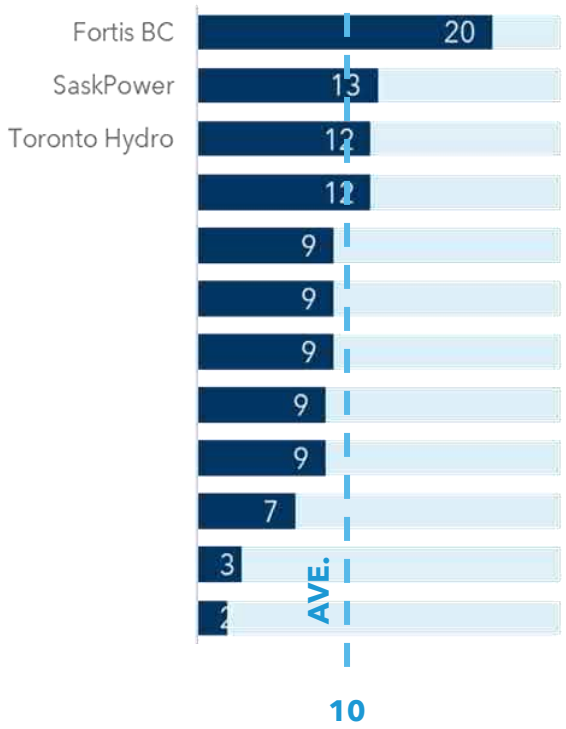
[1] The Green Button initiative is an industry-led effort that aims to provide utility customers with easy and secure access to their energy usage information in a consumer-friendly format for electricity, natural gas, and water usage.

3 Customers & Society

3.2 ENABLING TRANSPORT, BUILDING AND INDUSTRY ELECTRIFICATION

POINTS AVAILABLE **15**

As the grid decarbonizes, utilities should help to enable transportation, buildings and industrial electrification. To do so effectively requires careful planning and thoughtful discussion to identify and maximize opportunities.



- **Only half the utilities had developed electrification strategies, and only two had done so in a comprehensive multi-sector way.** One utility had centered its strategic plan on enabling the electrification of the local economy, while another had developed a climate action plan that considers the role of the utility in supporting actions, like electrification, that combat climate change and spur equitable economic growth. Four other utilities had draft electrification strategies and the remaining six utilities had no plan as of 2021.
- **Most utilities were undertaking actions to enable electrification, but often in a siloed or *ad hoc* manner.** Nine utilities offered programs or services to catalyze electrification, for instance dedicated account managers supporting large customers with building or transport electrification, or pilot projects related to EV smart charging or tariffs. Of the nine utilities with services, four focused on electrification in only one sector (e.g., transportation or buildings), rather than across multiple.
- **Electrification in certain sectors is challenging, and several utilities are pursuing hybrid approaches**. One utility is partnering with a gas utility to encourage a dual-fuel approach for peak demand management along with a dual-energy rate. Another is investigating hybrid systems while focusing on decarbonizing the gas supply for thermal applications.

HYDRO-QUÉBEC: A key pillar in Hydro Québec's 2020-2024 Strategic Plan is to Electrify Quebec. Hydro Quebec subsidiaries (EVLO, Hilo, Cléo) offer energy storage, smart energy management and transportation electrification solutions that help reduce GHG emissions, while generating economic spin-offs and collective wealth across the company and society.

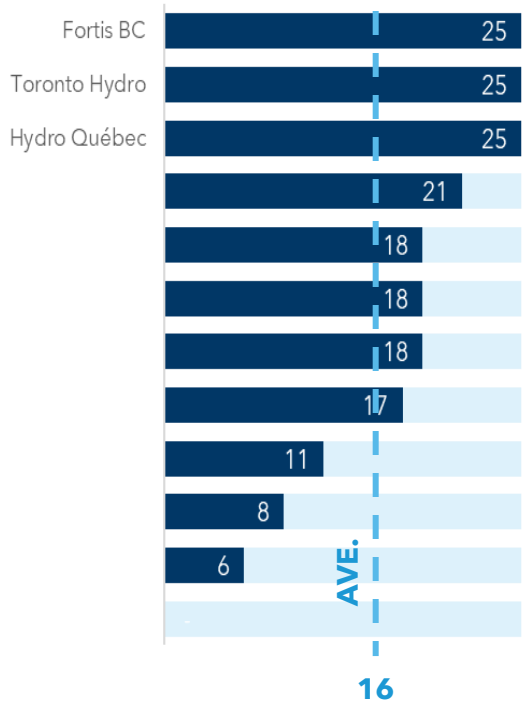
3 Customers & Society

3.3 BEING INTENTIONAL ABOUT DIVERSITY, EQUITY & INCLUSION

POINTS AVAILABLE **25**

The energy transition could disproportionately impact vulnerable communities unless utilities actively assess and consider the community impacts and prioritize and entrench equity in all decisions. Currently, Canada's electricity workforce has lower representation of women, BIPOC (black, indigenous and people of color), persons with disabilities, 2SLGBTQI+, and newcomers than what is reflected in the general population.[1] Establishing diversity, equity and inclusion (DEI) goals and actions, setting targets and tracking progress are necessary to create a diverse and inclusive workforce and to ensure a fair, just and equitable transition for all.

- **As of 2021, all but one utility had some kind of workplace DEI policy or strategy – but only five were comprehensive**, with baselines, representation targets, training, and dedicated DEI communications. Four utilities were signatories to the Leadership Accord on Diversity, Equity and Inclusion developed by Electricity Human Resources Canada, making a public commitment to advance, integrate and prioritize DEI. Others have achieved or are pursuing the Canadian Council of Aboriginal Business (CCAB) Progressive Aboriginal Relations (PAR) certification. The remaining half of utilities had only draft/basic plans, or no plan at all.
- **Community-wide DEI strategies, goals and targets were less common or clear, and there were few mechanisms to track progress and impacts.** Only one utility had a comprehensive strategy. Eight utilities offered underserved community programs (e.g., low-income, First Nations, multifamily, small business), with programs ranging from self-install energy saving kits to comprehensive turnkey solutions at zero upfront costs. Several utilities did not offer programs, but not always for lack of desire: one utility's regulatory application for a "Low Income Energy Efficiency Initiative" was rejected.
- **None of the benchmarked utilities or provinces spent 20+% of their Demand-Side Management (DSM) portfolio budgets on programs for vulnerable sectors in 2021.** Leading utilities in other jurisdictions have committed or been mandated to allocate 20% of DSM portfolio spend towards low-income programs.[3] This recognizes that different levels of investment and types of services and supports are needed to achieve the same outcomes for those most vulnerable.



1 See https://electricityhr.ca/
2 The state of New York requires that 20% of any energy efficiency investments through the utilities be directed to the LMI market segment. For the 2017–21 District of Columbia program cycle, low-income spending requirement was 20% of expenditures. See Subramanian, S., W. Berg, E. Cooper, M. Waite, B. Jennings, A. Hoffmeister, and B. Fadie. 2022 State Energy Efficiency Scorecard. Washington, DC: ACEEE. www.aceee.org/research-report/u2206.

SASKPOWER: SaskPower has a robust Diversity & Inclusion Strategy, which outlines numerous initiatives, such as Advancing Women in Leadership and Trades, Indigenous Employees Network, Pride Employee Resource Group, Employees with Disabilities Network, Cultural Diversity Group, Women's Resource Group; and PowerGen (leadership development network) It also outlines a communications and tracking plan.

3 Customers & Society

3.4 ALIGNING ACTIONS AND ENGAGEMENT

POINTS AVAILABLE **25**

Aligning goals and conducting comprehensive engagement with a wide range of stakeholder groups is needed to ensure success. Engagement must be proactive, iterative and inclusive around key topics (e.g., clean energy, modern grid, electrification). This will help utilities to understand stakeholder needs and motivations; identify challenges, innovative solutions, and potential partnership opportunities; support decisions, and obtain buy-in for new investments and approaches required to meet net zero goals.

- **Only three utilities completely aligned with government climate ambition, while seven were partially or indirectly aligned.** There is large alignment by nature at utilities owned by provincial and municipal governments in Canada. In most cases, a municipality is the sole shareholder, and three utilities are crown corporations. Utilities that received lower scores in this metric are in jurisdictions that have noticeably lower GHG emissions objectives and no regulator and utility mandates. Utilities need clear direction from governments, regulators and system operators to focus planning and investments on net-zero pathways and expand their efforts beyond maintaining and decarbonizing the grid to increasing clean-electricity economy-wide energy use.
- **Utilities are increasingly proactive in collaborating with other stakeholders**, such as local and provincial governments, energy efficiency organizations, electricity systems operators and regulators to advocate for and advance clean energy, grid modernization and electrification. While all utilities had integrated resource planning engagement processes, only four had comprehensive engagement plans specific to the energy transition. Leading utilities had robust public relations/engagement and policy teams to proactively and deliberately engage on climate, regional planning and electrification. Five utilities only had a draft or basic engagement plan, while two had no plan.

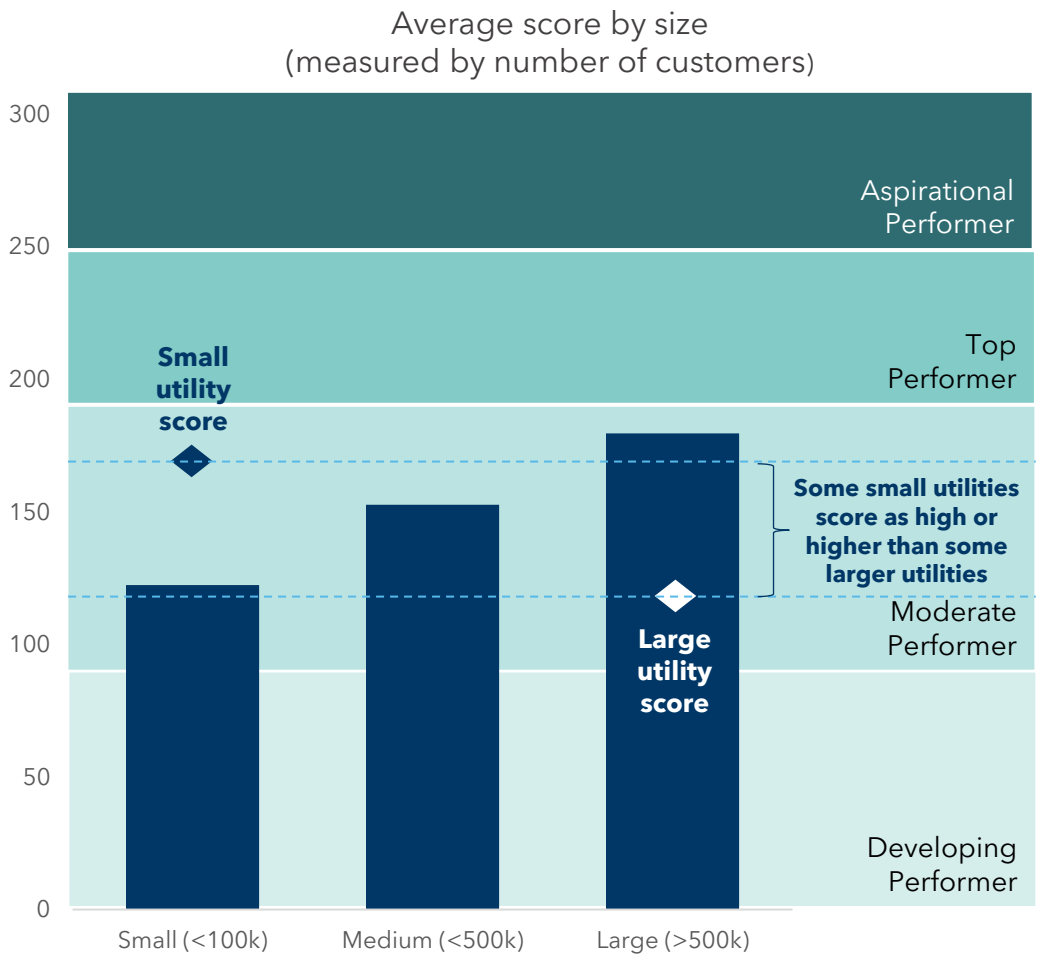
TORONTO HYDRO: Toronto Hydro is working with the IESO on pilots and participates in numerous stakeholder sessions about the energy transition, DERs, NWAs, and regional planning process with other utilities. Toronto Hydro also works closely with the City of Toronto; Toronto Hydro's Climate Action Plan that details how they can support the City's Net Zero Strategy.

Customers & Society: Additional Spotlights

ONTARIO: All Ontario utilities offered time-of-use and tiered pricing. Price signals charge higher rates during peak periods and lower rates at off-peak hours to encourage customers to reduce their consumption and lower electricity costs by shifting their usage to lower price periods. Tiered pricing charges customers higher prices when consuming more.

A new ultra-low overnight rate was introduced in Ontario in 2023 for customers that use more electricity at night, including shift workers, those that heat their home or charge their electric vehicles at night to save money when peak demand is lower.

3 Customers & Society



- **1.1 Changing Customer Preferences**
- **1.2 Enabling Transport, Building & Industry Electrification**
- **1.3 Being Intentional About Diversity, Equity & Inclusion**
- **1.4 Aligning Actions & Engagement**

EPCOR: EPCOR's 2021 comprehensive Environmental, Sustainability and Governance (ESG) Plan has established workplace DEI commitments and reports on the organization's progress. EPCOR has set targets at all levels across the organization and achieved or came close to achieving them in 2021. For example, the plan sets a Board Gender Diversity Target (at least 40% board are women), as well as an Employee Ethics Training Target (100% of eligible employees trained every second year).

Although no targets were set in 2021, EPCOR also reports on Diverse and Representative Workforce metrics (e.g., percentage of women, visible minorities, and women in senior leadership).

Utilities' average scores can be influenced by size, how clean the grid is, and ownership structure; however, these variables are not always indicators of success. Each utility is demonstrating leadership in various metrics and across the three main categories

- **SIZE:** Larger utilities tend to score more points, as they likely have more financial and non-financial resources to plan, execute, innovate and adopt best practices. However, some small utilities do well due to a combination of local innovation, jurisdictional opportunities and leveraging external funding sources. For example, one of the four small utilities achieves the fourth-best overall score.
- **GRID:** Utilities in jurisdictions with cleaner grids score higher on average. Those with already clean grids have a natural advantage in the clean energy supply category; however, this trend also applied to the two other dimensions (modern grid and customers & society). This may be because utilities with already-clean grids are able to devote attention elsewhere.
- **OWNERSHIP:** Crown corporations score highest on average, partly driven by their size, followed by municipally owned utilities, some of which are small. These utilities are organically aligned with government and community objectives.

Note: given the limited number of participating utilities, no statistically significant conclusions can be drawn about correlations or causations between performance and any utility characteristics.

4. Key Takeaways & Considerations

Ten Key Insights from the Results

INSIGHT 1	**Canadian utilities have embarked on the energy transition journey**. They recognize the climate emergency and have established plans to reduce emissions. While utilities are at various stages in the transition, every benchmarked utility demonstrated leadership in certain areas.
INSIGHT 2	**More effort is needed.** The pace and scale required to meet our net zero goals by 2050 and avoid the worst climate change impacts, requires greater leadership and ambition, comprehensive decarbonization and electrification strategies, detailed inclusive roadmaps, and the tools and resources to act. The clock is ticking; without accelerated action, several actors will be challenged to achieve their targets.
INSIGHT 3	**Utilities are a diverse group, which must be considered when comparing scorecard results, opportunities and solutions.** Utilities vary in terms of size, structure, services, context, and control over their environment. We must recognize this diversity when interpreting the results and crafting policy and/or regulations that will affect utilities. Where possible, utilities and others can leverage diversity of thought and approaches to adapt innovative solutions to their unique context. Jurisdictions with less clean grids will require substantial and coordinated support to quickly live up to their own goals, and in some cases, even more ambitious federal targets.
INSIGHT 4	**Utilities are facing a massive transformation**. An already complex electricity system is under greater pressure to continue to deliver safe, affordable and reliable electricity along with being clean, resilient and equitable. If not managed carefully, this transformation could leave some groups – including some utilities and their communities – behind.
INSIGHT 5	**Utilities can't do it alone and current government commitments and regulatory structures have constrained some utilities**. Government and regulators must give utilities concrete climate targets, direction and support to guide their net-zero pathways. Utilities need latitude to implement needed action and support to make significant investments to balance DER integration, facilitate greater electrification and resiliency, and enable customers to contribute to, and benefit from, the transition. In many cases, legislation and regulation needs to evolve to enable utilities and financial support is needed to complement utility investment.

Ten Key Insights from the Results

INSIGHT 6	**Utilities need a comprehensive strategy that covers all three dimensions of this transition**. All the scanned utilities are making progress and demonstrating leadership in certain areas, but more work is needed to effectively address and coordinate actions across all elements of the clean energy transition.
INSIGHT 7	**Distribution-oriented utilities have historically not been the main drivers of grid innovation but will become increasingly important as gateways for the integration of DERs into the grid**. As such, utilities will require considerable support (policy, regulatory, financial, technological) to increase deployment of, and leverage, DERs, including valuing DERs in ancillary services. Canada lags American and European jurisdictions in enabling and leveraging distributed grid flexibility.
INSIGHT 8	**Utilities are anchored in their communities and are thus valuable partners to relay information both ways**. It will be important for utilities to communicate messaging related to the energy transition to partners and customers and provide diverse services and solutions to help customers participate in, and contribute to, the transformation. Vice-versa, utilities can communicate customer needs, expectations and reactions to policy-makers to inform future policy.
INSIGHT 9	**More attention needs to be paid to equity implications of the transition**. Utilities are actively considering equity in the workplace to ensure that it is diverse and inclusive, but internal action has not yet translated to community-wide equity impacts and strategies (e.g., several utilities have set internal diversity targets and implemented actions, but most have yet to study community needs and establish comprehensive strategies to measure and mitigate the transition's impact on those most vulnerable).
INSIGHT 10	**Ultimately, the clean energy transition presents a significant opportunity for electric utilities and society**. Utilities' core service – deliver clean, safe, reliable and affordable electricity – is at the heart of the energy transition and set for significant growth. By becoming more sustainable, resilient, and efficient, electric utilities can contribute to communities' as well as to their own prosperity.

1 Clean Energy Supply

53/100

AVERAGE SCORE | High (80%+) | Mid (50-80%) | Low (>50%)

Reviewed utilities are at different stages of their decarbonization journeys, levels of commitment, degree of control over their supply and experience integrating variable clean resources at scale. While some benefit from existing non-emitting resources, others have only just begun the transition. Without bold leadership and accountability, utilities may be challenged to meet their corporate and community goals.

1.1 Planning & Designing to Decarbonize the Grid — 21/35

- Most jurisdictions had varying clean grid goals and timelines to achieve. These are often set provincially versus by utilities.
- Without commitment and accelerated action, several utilities will be challenged to meet federal clean energy regulations by 2035. Ontario demonstrates that procurements of fossil-based resources will continue in the absence of clean grid targets.
- As of 2021, almost all participating utilities have undertaken preliminary net-zero pathway assessments; however, few with clean grid goals had outlined a comprehensive plan to achieve these.

1.2 Clean Energy Procurement & Deployment — 18/35

- The share of provincial non-emitting generation varies widely, ranging from 15% to 99%. Jurisdictions with existing hydro and nuclear power have a natural advantage.
- Renewable energy procurement varies. While half of provinces studied procured renewable generation exclusively, 2 had some dedicated renewable procurements, and 1 (AB) did not earmark any.
- Distribution utilities rely on the state of the provincial grid with little control over the pace or scale of grid decarbonization, which affects scores (positively or negatively). However, they are expected to play an increasingly important role as a DER gateway into the grid.
- Several utilities were pursuing initiatives to reduce clean technology deployment barriers like information-sharing, integrated interconnection approaches, and transmission investments.

1.3 Integration of Clean Energy Supply — 6/15

- Canada appears “behind” in this metric, with a low average score.
- Most benchmarked utilities had limited to no experience with large-scale renewable projects (> 5MW). For those that did, approval times varied; thus, no ‘typical time’ could be established. Utilities explored opportunities to improve/streamline processes, for instance through customer journey mapping exercises.
- DER access to ancillary services payments remained limited across all utilities in 2021. While some were exploring how to integrate DERs into ancillary services markets, regulatory or market barriers remain.

1.4 Corporate Leadership — 8/15

- Corporate emission reduction targets and plans have become the standard, but the nature of plans vary. Smaller utilities tended to focus on isolated initiatives, while larger utilities had more comprehensive environmental, social and governance (ESG) plans and objectives. However, the level of accountability and quality of reporting varied widely.
- Most utilities had corporate decarbonization targets for their own buildings and fleet, but the target depths and timeframe differs (e.g., net zero by 2030, 2040 or 2050). Three have interim decarbonization targets without a net zero commitment and four (mostly small) have none.
- Tying executive performance and compensation to clean grid goals is limited across most utilities.

2 Modern Grid

51/100

AVERAGE SCORE | High (80%+) | Mid (50-80%) | Low (>50%)

Canadian utilities are in the process of upgrading their grids and grid capabilities. Most are following incremental pathways, with only a few pursuing transformational visions. Overall, there remains a gap between the roadmaps, innovative pilots, and control system investments, and the limited amount of actual DER enabled and integrated.

2.1 Enhanced Grid Planning & Management — 9/20

- Modernizing load forecasting to account for DERs, climate change, and electrification was common. External service providers, tools and studies are useful, but must be calibrated to local contexts.
- Most utilities took a basic, top-down approach to DER forecasting, while leading utilities used bottom-up or advanced modelling to forecast adoption.
- Most load forecasts were at the system level and seasonal; leading load forecasts were localized (at the bus level) and on a year-round, hourly basis to better capture distribution system impacts.
- Many utilities focused on changing operational models in the context of the energy transition; however fewer are explicitly planning changes to their business models.

2.2 DER Enablement & Integration — 14/35

- Demand side management (DSM) responsibilities vary. Vertically integrated Crown Corporations are typically responsible for DSM. Conversely, DSM was non-existent in some provinces.
- No utility had a comprehensive process for valuing DERs as NWAs.
- DER access to ancillary services markets was limited. A few utilities were awaiting regulatory approvals or in an exploratory pilot phase.
- Interconnection processes and approval times for small-to-medium renewable projects varied widely across jurisdictions. There are opportunities to improve and/or streamline.

2.3 Visibility & Control Capabilities — 13/20

- Visibility and control capabilities were advancing and expected to continue to grow.
- All but two utilities had deployed AMIs to 90+% of customers. Most utilities had access to AMI capabilities beyond basic metering, such as power quality analysis.
- Similarly, most utilities had deployed an Advanced Distribution Management System (ADMS) and Supervisory Control and Data Acquisition (SCADA) as of 2021.
- Other systems like DER Management Systems (DERMS) and Fault Location Isolation and Service Restoration (FLISR) technology were less common but growing.

2.4 Innovation & Emerging Technologies — 11/15

- Most utilities had dedicated research and innovation envelopes in 2021, and a dedicated innovation team or staff. A third were unable to provide a figure as innovation resources are distributed across multiple budget lines.
- Large utilities are more likely to afford dedicated research and innovation budgets, with some allocating over 1% of overall revenue to research and development.
- Running innovative pilots/ projects related to process, automation, programs, organization, and/or technology was common in 2021, with innovation defined relative to their context (i.e., what is innovative to one utility may not be innovative to another).

2.5 Climate Resiliency — 4/10

- Most utilities were pursuing actions to protect critical infrastructure and services during extreme climate events (e.g., Storm Operations Center, funding battery storage in remote areas, adding remote sensing and control devices).
- However, initiatives were in many cases siloed. Only some utilities had comprehensive Climate Adaptation and Management Plans.
- While several utilities report on climate change risks and/or consider climate change in weather forecasts, few considered explicit climate change scenarios in their planning processes, potentially exposing them to greater climate, operational and financial risk

3 Customers & Society

48/100

AVERAGE SCORE | **High (80%+)** | **Mid (50-80%)** | **Low (>50%)**

Utilities are increasingly engaging with key stakeholders to transform the electricity system. While few had developed comprehensive electrification strategies, many had focused on electrification in specific sectors. Many utilities considered equity within their organizations to varying degrees; vulnerable community groups will need to be prioritized to ensure an equitable transition.

3.1 Changing Customer Preferences

10/25

- While basic digital platforms with consumption and billing data are commonplace, tailored customer reports that support action, such as Home/Business Energy Reports, are offered by only a few utilities.
- There is partial penetration of dynamic pricing (e.g., time of use, tiered pricing) to encourage customers to reduce their consumption and lower electricity costs.
- All utilities delivered basic education and awareness campaigns through traditional channels, while leading utilities worked to communicate more equitably (e.g., information in multiple languages, Indigenous customer care centers, hands-on customer support).
- Half of utilities delivered solutions to remove barriers, enable electrification and enhance efficiency (e.g., incentives, charging infrastructure investments, emerging technology pilots). Several utilities' efforts to offer programs were stymied by regulators.

3.2 Enabling Transportation, Building and Industrial Electrification

12/25

- Comprehensive multi-sector electrification strategies are rare. Only one utility has developed and implemented a comprehensive electrification strategy, and another had a climate action plan.
- Most utilities are helping to enable electrification in various ways, but often taking a siloed approach. Only one had a coordinated, wholistic approach that considers all sectors.
- While greater electrification is needed to meet our climate goals, there are certain economic sectors where electrification will be challenging (at least in the near-term), requiring a diverse portfolio of solutions. A few utilities are implementing and/or exploring dual fuel approaches, dual-energy rates, and hybrid systems in parallel with decarbonizing the gas supply.

3.3 Being Intentional About Diversity, Equity and Inclusion

10/25

- Canada's electricity workforce has lower representation of women, BIPOC (black, indigenous and people of colour), persons with disabilities, 2SLGBTQI+, and newcomers. While some utilities had comprehensive workplace DEI strategies and initiatives, more work is needed to breakdown systemic barriers and create a diverse, inclusive workforce.
- Community-wide DEI strategies, goals and targets were less common or unclear. Accountability mechanisms to track progress and impacts were limited or non-existent.
- Spending on programs for vulnerable and underrepresented communities varied and was below other leading North American jurisdictions that mandate minimum budget allocations for lower-income communities.

3.4 Aligning Actions and Engagement

16/25

- There is large alignment by nature with utilities owned by provincial and municipal governments.
- Utilities that received lower scores in this metric are in jurisdictions that have noticeably lower GHG emissions objectives and no regulator or utility mandates.
- Utilities are increasingly proactive in collaborating with key stakeholders to advocate for, and/or advance the clean energy transition; however, many do not have comprehensive engagement plans to guide the process.
- Leading utilities had robust public relations/engagement and policy teams to proactively and deliberately engage on clean energy and electrification.

Considerations

The clean energy transformation requires collaboration and cooperation across stakeholders. Each has a unique role to play in promoting the adoption of cleaner energy sources and transitioning towards a sustainable energy future. We outline key considerations for utilities, SGIN, and government, regulators and system operators.

Utilities	• Participating utilities can use their scorecard results to **inform internal discussion**, diagnosis, planning and prioritization, as well as to **engage external partners** whose support is needed for progress, including regulators, governments, and others. They can also draw on the **community of practice** created by this initiative to share insights, good practices and lessons learned. • Other utilities in Canada can **review this scorecard to situate themselves,** obtain guidance for their own transition and consider participating in future scorecards.
SGIN	• SGIN should **publicize the scorecard to promote its takeaways as well as awareness of the smart utility concept**. • Phase B of this initiative – the Maturity Model – will **support select participating utilities** to build on their scorecard results and improve their specific capabilities. • Phase C of this initiative – the Knowledge Hub – will make smart energy benchmarking trends, and good practices **available to a broader audience**, such as other utilities across Canada as well as policy makers, regulators, system operators, and service providers. • SGIN intends to **repeat the scorecard** to monitor progress from existing utilities and include additional utilities. Future scorecards should include indigenous and northern utilities, and may consider other relevant metrics (e.g., cybersecurity).
Government, Regulators, and System Operators	• **Governments** can use this scorecard to help inform energy- and climate-policies, regulations and goals. They must guide, support, and as needed aid utilities in undertaking necessary actions, as well as support research and public engagement. • **Regulators** ensure that utilities comply with government policies and regulations. They can use the scorecard to set regulatory frameworks and observe the impact on utilities' abilities to accelerate the energy transition. Regulatory innovations are needed to enable required investments, accelerate the adoption of new technologies, processes, tariffs and programs, and ensure that no one is left behind. • **System operators** can use this scorecard to pinpoint barriers to the integration of DERs and intermittent generation assets into the grid and wholesale markets. They play key roles in outlining clear standards and pathways for decarbonization, and in some cases, in implementing demand response and demand side management programs.

5. Appendix –
Individual Utility Scorecard Results

Category 1: Clean Energy Supply

ID	Sub Metric	Total Points[1]
Metric 1.1: Planning and Designing to Decarbonize the Grid		
1.1.1	Does the utility or their partners have clean grid goals (e.g., the Clean Energy Standard or similar clean energy penetration targets)?	5.0
1.1.2	What is the depth of the clean energy supply target (as % of MWh energy delivered)?	5.0
1.1.3	What is the timeframe to reach their clean energy supply target?	5.0
1.1.4	Does the utility have a clear roadmap to achieve its targets?	10.0
1.1.5	Has the utility followed through with their clean energy supply plan and commitments?	10.0
Metric 1.2: Clean Energy Procurement & Deployment		
1.2.1	What is the current share of clean energy (in % of MWh energy delivered) on the grid?	7.5
1.2.2	What is the current grid emission intensity (for MWh energy delivered)?	7.5
1.2.3	Has the utility or their partners released procurement opportunities and/or developed projects (if the utility builds its own generation) exclusively for non-emitting resources?	10.0
1.2.4	Has the utility demonstrated actions that reduce or remove barriers to the deployment of clean technologies (e.g., energy storage or distributed energy resources)?	10.0

1. Total points may not add up due to rounding.

Category 1: Clean Energy Supply

ID	Sub Metric	Total Points[1]
Metric 1.3: Integration of Clean Energy Supply		
1.3.1	Do clean resources have access to ancillary services payment to promote their use across all grid services such as through the utility, parent company, market, etc.?	5.0
1.3.2	What is the typical time for interconnection approval of large-scale renewable projects (5>MW)?	5.0
1.3.3	Is the utility taking steps to improve/streamline its interconnection process of large-scale renewable projects (5>MW)?	5.0
Metric 1.4: Corporate Leadership		
1.4.1	Does the utility have a corporate sustainability plan and/or initiatives (e.g., ESG plan)?	3.8
1.4.2	Does the utility have a corporate commitment to become carbon neutral in its own operations?	3.8
1.4.3	Are executives' compensation tied to a reduction in carbon emissions of clean energy supply and/or corporate operations?	3.8
1.4.4	Does the utility have a public corporate sustainability report to track progress and accountability?	3.8

1. Total points may not add up due to rounding.

Category 2: Modern Grid

ID	Sub Metric	Total Points[1]
Metric 2.1: Enhance Grid Planning & Management		
2.1.1	Is the utility modernizing or enhancing load forecasting tools and planning processes (e.g., IRPs, IDPs)?	5.0
2.1.2	Does the utility have DER forecasting capabilities?	5.0
2.1.3	At what level of granularity does the utility load forecast/planning consider the impacts of electrification/ decarbonization on load growth?	5.0
2.1.4	Does the utility have a plan, feasibility study, or assessment to consider whether changes to its business and operation model is warranted (e.g., DSO)?	5.0
Metric 2.2: DER Enablement & Integration		
2.2.1	What portion of peak demand/system capacity is represented by DR?	7.0
2.2.2	What was the average share of annual energy savings provided by energy efficiency initiatives in the utility's service area?	7.0
2.2.3	Has the utility determined the value or a process for valuing DERs as NWAs?	6.0
2.2.4	Is the utility considering DERs for ancillary services?	2.0
2.2.5	Does the utility have a formalized DER strategy and/or roadmap?	4.0
2.2.6	What is the typical time for interconnection approval for medium-scale renewable projects (10kW to 5MW)?	3.0
2.2.7	What is the typical time for interconnection approval for small-scale renewable projects (<10kW)?	3.0
2.2.8	Is the utility taking steps to improve/streamline its interconnection process for small-scale (<10kW) and/or medium-scale (10kW to 5MW) renewable projects?	3.0

1. Total points may not add up due to rounding.

Category 2: Modern Grid

ID	Sub Metric	Total Points[1]
Metric 2.3: Visibility and Control Capabilities		
2.3.1	What is the current coverage of AMIs (% of total costumer coverage)?	4.0
2.3.2	What capability does the utility have access using AMIs? (ex:, remote reading, connect/disconnect, outage detection, system voltage monitoring, IoT, etc.)	4.0
2.3.3	Has the utility deployed DERMS?	4.0
2.3.4	Has the utility deployed SCADA?	4.0
2.3.5	Has the utility deployed ADMS?	4.0
Metric 2.4: Innovation and Emerging Technologies		
2.4.1	How much is the utility funding and/or spending on innovation and research (as % of overall revenue)? (innovation is defined as outside of BAU)	3.8
2.4.2	Has the utility demonstrated applications of their investment under Visibility and Control Capabilities (AMIs, DERMs, ADMs, etc.)?	3.8
2.4.3	Is the utility running innovative pilots/projects?	3.8
2.4.4	Does the utility have an innovation resource (team or person)?	3.8
Metric 2.5: Climate Resiliency		
2.5.1	What actions are being taken to harden the grid to protect critical infrastructure and/or services during extreme climate events?	5.0
2.5.2	Is climate change included in the forecasts for the utility's planning process?	5.0

1. Total points may not add up due to rounding.

Category 3: Customers and Society

ID	Sub Metric	Total Points[1]
Metric 3.1: Changing Customer Preferences		
3.1.1	Is the utility leveraging digital platforms to engage customers?	6.3
3.1.2	Is the utility offering rate-based solutions to encourage and influence electrification and/or behaviour?	6.3
3.1.3	Is the utility providing energy services and solutions to customers?	6.3
3.1.4	Is the utility building awareness and educating its customers on clean energy issues/energy transition?	6.3
Metric 3.2: Enabling Transportation, Building, & Industrial Electrification		
3.2.1	Has the utility or their partners developed and implemented comprehensive electrification strategies that sends a clear signal to investors on the increasing need for decarbonization?	12.5
3.2.2	Is the utility or their partners catalyzing building (C&I and/or residential), transportation, and/or industrial process electrification?	12.5

1. Total points may not add up due to rounding.

Category 3: Customers and Society

ID	Sub Metric	Total Points[1]
Metric 3.3: Diversity, Equity & Inclusion Goals & Actions		
3.3.1	Does the utility have a diversity, equity & inclusion (DEI) plan or is DEI considered during the planning/decision-making process?	6.3
3.3.2	Is the utility actively engaging indigenous, low-income, or other under-served communities to ensure their voices are considered in the decision-making process for a clean energy transition?	6.3
3.3.3	How much (as a share of total revenue) is the utility investing in electrification and/or distributed energy resources (DER) programs targeting indigenous, low-income, or other under-served communities?	6.3
3.3.4	Does the utility promote diversity and inclusion in the workplace (reducing barriers and challenges for women, minorities groups, etc.)?	6.3
Metric 3.4: Aligned Actions and Engagement		
3.4.1	Does the utility have a stakeholder engagement plan that addresses related topics (i.e., clean energy, grid modernization, IRP and IDP, electrification, regulatory requirements, etc.)?	8.3
3.4.2	Is the utility undertaking proactive efforts and/or supporting initiatives within or across jurisdictions to realize the clean energy transition?	8.3
3.4.3	Has the utility aligned its planning and investment decisions with governmental (provincial/municipal) climate ambitions?	8.3

1. Total points may not add up due to rounding.

“NO DISCLAIMERS” POLICY

This report was prepared by Dunsky Energy + Climate Advisors, an independent firm focused on the clean energy transition and committed to quality, integrity and unbiased analysis and counsel. Our findings and recommendations are based on the best information available at the time the work was conducted as well as our experts' professional judgment. **Dunsky is proud to stand by our work.**

1 Background and Context

This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them

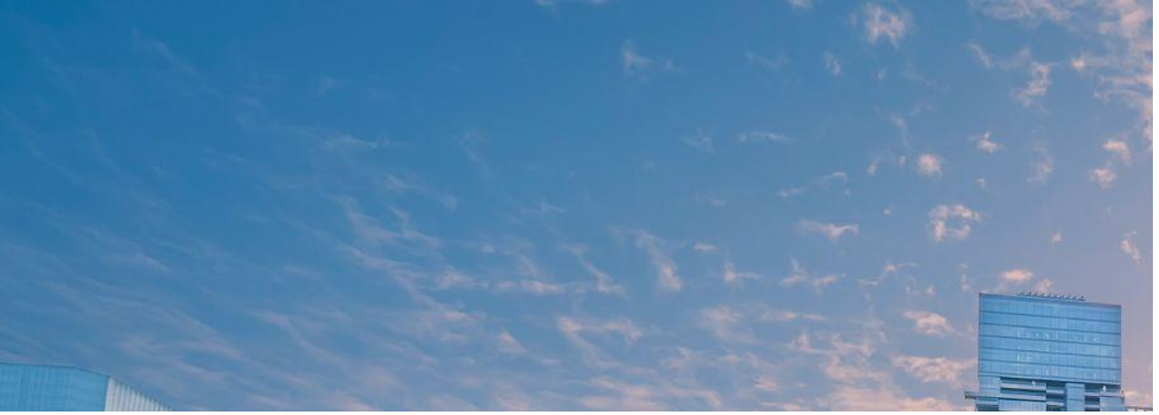
Introduction and context

Toronto Hydro has an opportunity to elevate its ESG disclosure practices, taking into consideration leading peer and stakeholder practices trends.

To inform its approach, a review has been conducted to help Toronto Hydro better understand its overall ESG disclosure maturity, which included a current state assessment and comparative analysis of disclosed leading practices, including Toronto Hydro's. Based on the assessment, a report has been prepared to outline the results.

The objective of the assessment report is to:

- Summarize the assessment approach and ESG disclosure positioning within Toronto Hydro; and,
- Understand Toronto Hydro's overall disclosure maturity compared against peers.



This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party a
sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or lia

How is Toronto Hydro currently positioned on ESG?

Purpose: We're committed to delivering excellent customer service, providing a safe and reliable supply of electricity, and delivering long-term value to the City of Toronto.

Talent management and diversity	• Diversity and inclusion • Talent development and training	• Attraction, retention and engagement • Health and safety
Accountable and transparent leadership	• Data and systems driven • Personalized, transparent interactions with members and employees	• Board composition for good governance • Ethics and integrity
Customer satisfaction	• Customer engagement • Continuous improvements	• Product/service offerings innovation • Affordability programs
Community impact	• Fundraising • Community partnerships	• Employee volunteering • Education and sponsorships
Innovation and digital transformation	• Robust, secure products and services • Innovation in energy systems	• Risk management and data security • New technology investments

This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them

2 Report Approach

This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them.

Data report approach

To conduct the analysis, a four-step process was undertaken as described in the table below:

Step 1

Identified current state of Toronto Hydro along with peer benchmarking

Toronto Hydro was assessed through document review and interviews with its the sustainability group as well as key staff within Facilities and fleet, Customer services, Conservation programs, Organizational effectiveness, Talent development, Including:

- Joe Bile, Manager, Business Development
- Dave Clark, Director, Organizational Effectiveness
- Bryan Desouza, Manager, Supply Chain Services
- Phil Genoway, Director, E, H & S
- Jen Grado, Manager, Large Customer and Key Accounts
- Kees Homsma, Director, Facilities & Fleet
- Jen Stulberg, Director, Talent Management

Additionally, 11 sector peers and core stakeholders (see page 14) were assessed through a desktop comparative review to understand leading practices and priority areas of focus.

Step 2

Assessed ESG disclosure program maturity and priority topics areas of Toronto Hydro and peers

ESG disclosure program maturity areas included:

1. Corporate culture and policies
2. Accountability
3. Strategy
4. Programs
5. Performance and review
6. Reporting

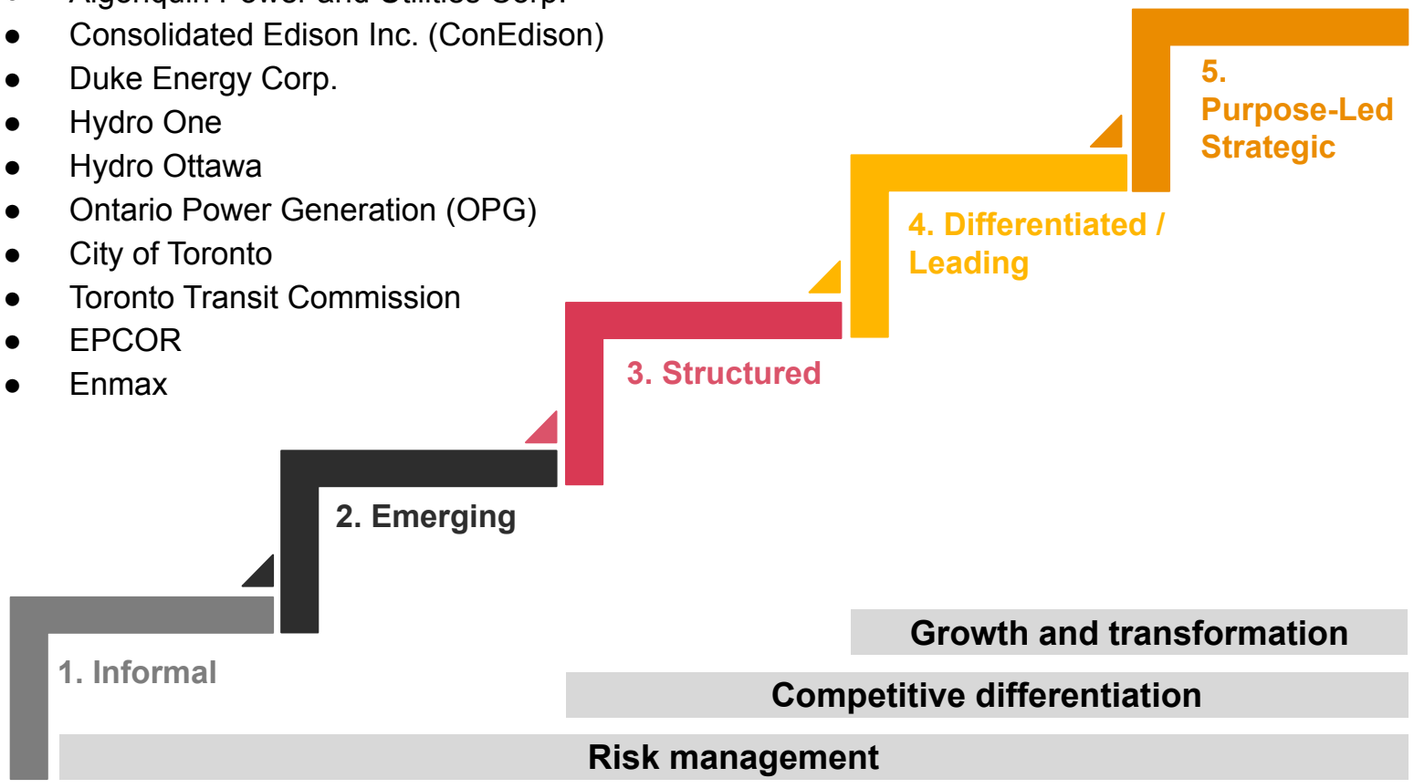
ESG topics of focus included:

1. Equity, diversity and inclusion
2. Health and wellbeing
3. Community and partnerships
4. Talent and training
5. Indiginous relations
6. GHG emissions (including energy)
7. Climate change
8. Resource management (including land and biodiversity)
9. Waste
10. Environmental compliance
11. Affordability and accessibility
12. Service reliability
13. Customer service
14. Risk management
15. Ethics and integrity
16. Profitability

Step 3

Assessed Toronto Hydro's disclosure program maturity against peers and core stakeholders

Assessed Toronto Hydro and peers' and stakeholders' disclosed data against the following scoring criteria:



Score	Maturity	Initiatives
0-1	Informal	[redacted]
1.1-2	Emerging	
2.1-3	Structured	
3.1-4	Leading	
4.1-5	Strategic	

This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them

Disclosure maturity analysis

We defined the key elements of the ESG maturity journey on a scale from 1 to 5 and assessed Toronto Hydro's performance against its competitive landscape to provide a reference point for performance.

- Alectra Inc.
- Algonquin Power and Utilities Corp.
- Consolidated Edison Inc. (ConEdison)
- Duke Energy Corp.
- Hydro One
- Hydro Ottawa
- Ontario Power Generation (OPG)
- City of Toronto
- Toronto Transit Commission
- EPCOR
- Enmax

Overall disclosure maturity framework on ESG management

A. **Corporate culture and policies:** [redacted]

B. **Accountability:** T[redacted]

C. **Strategy:** [redacted]

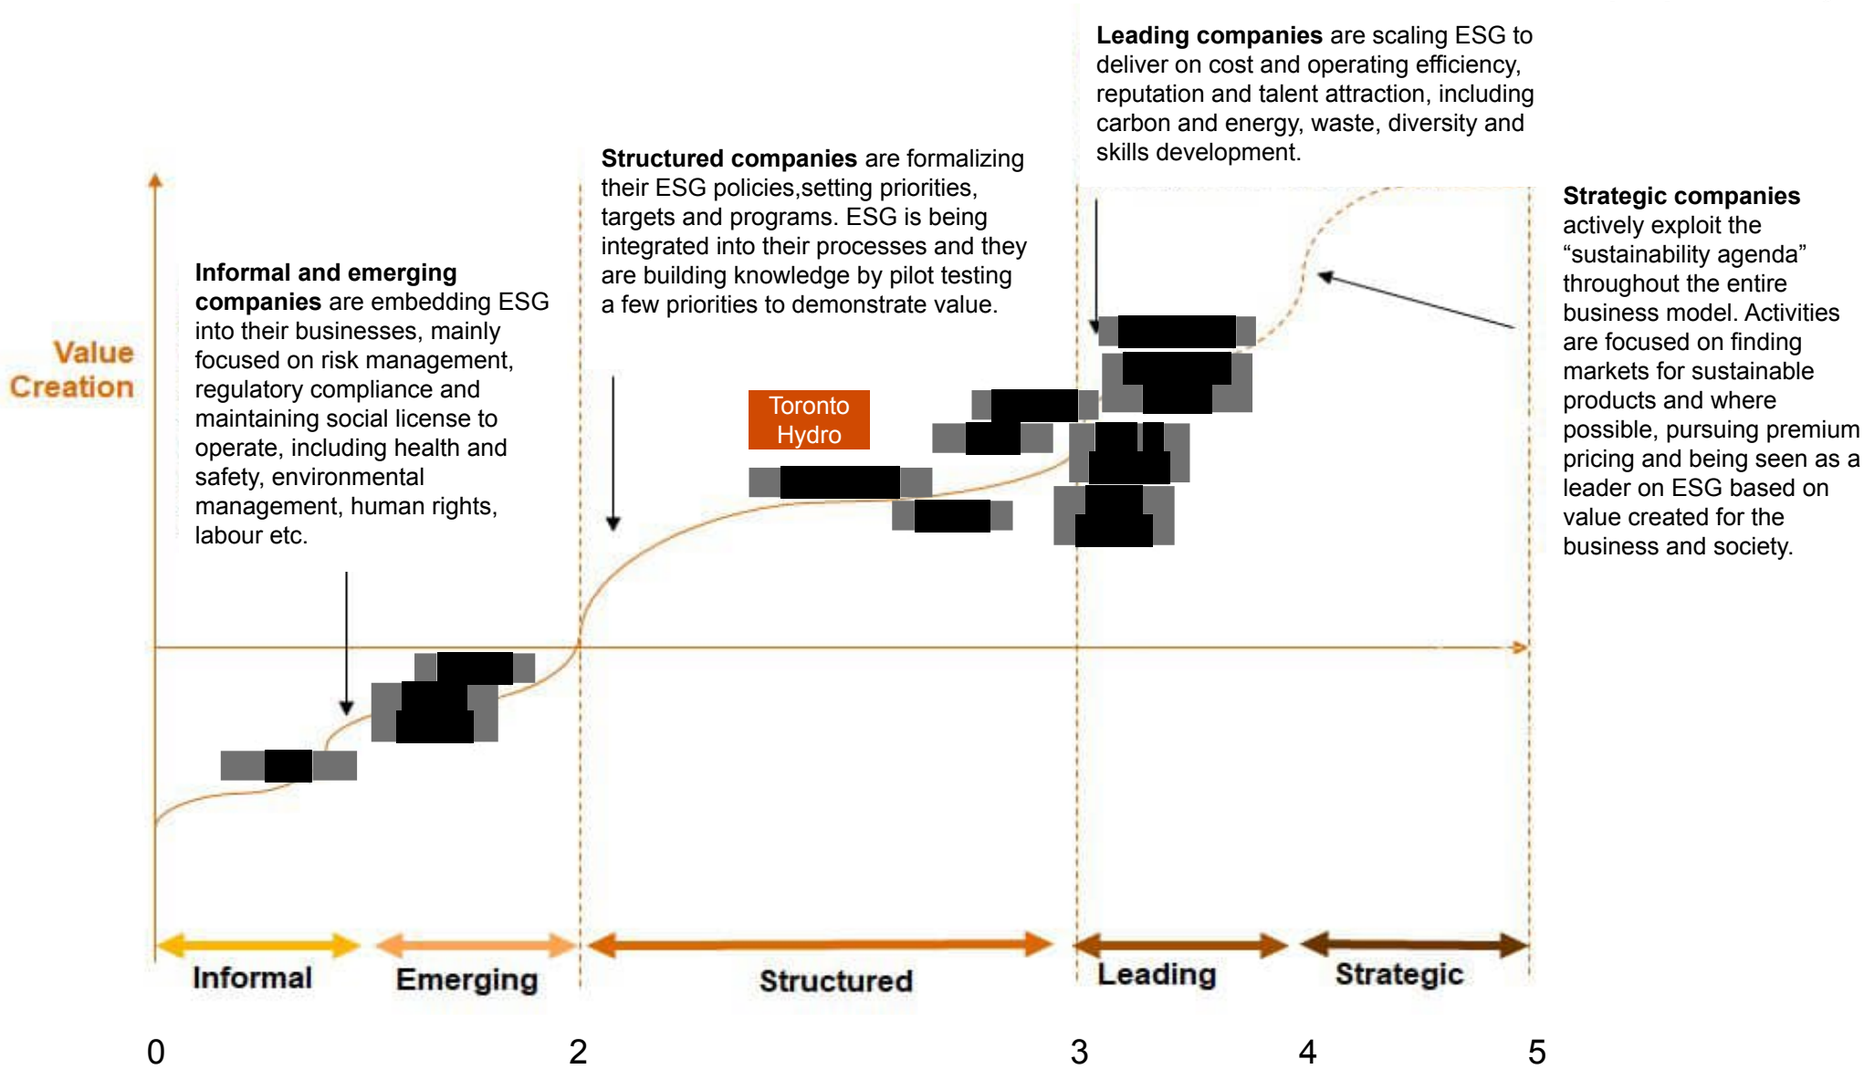
D. **Programs:** [redacted]

E. **Performance monitoring and review:** [redacted]

F. **Reporting:** [redacted]

This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them

3 Maturity Results



This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them

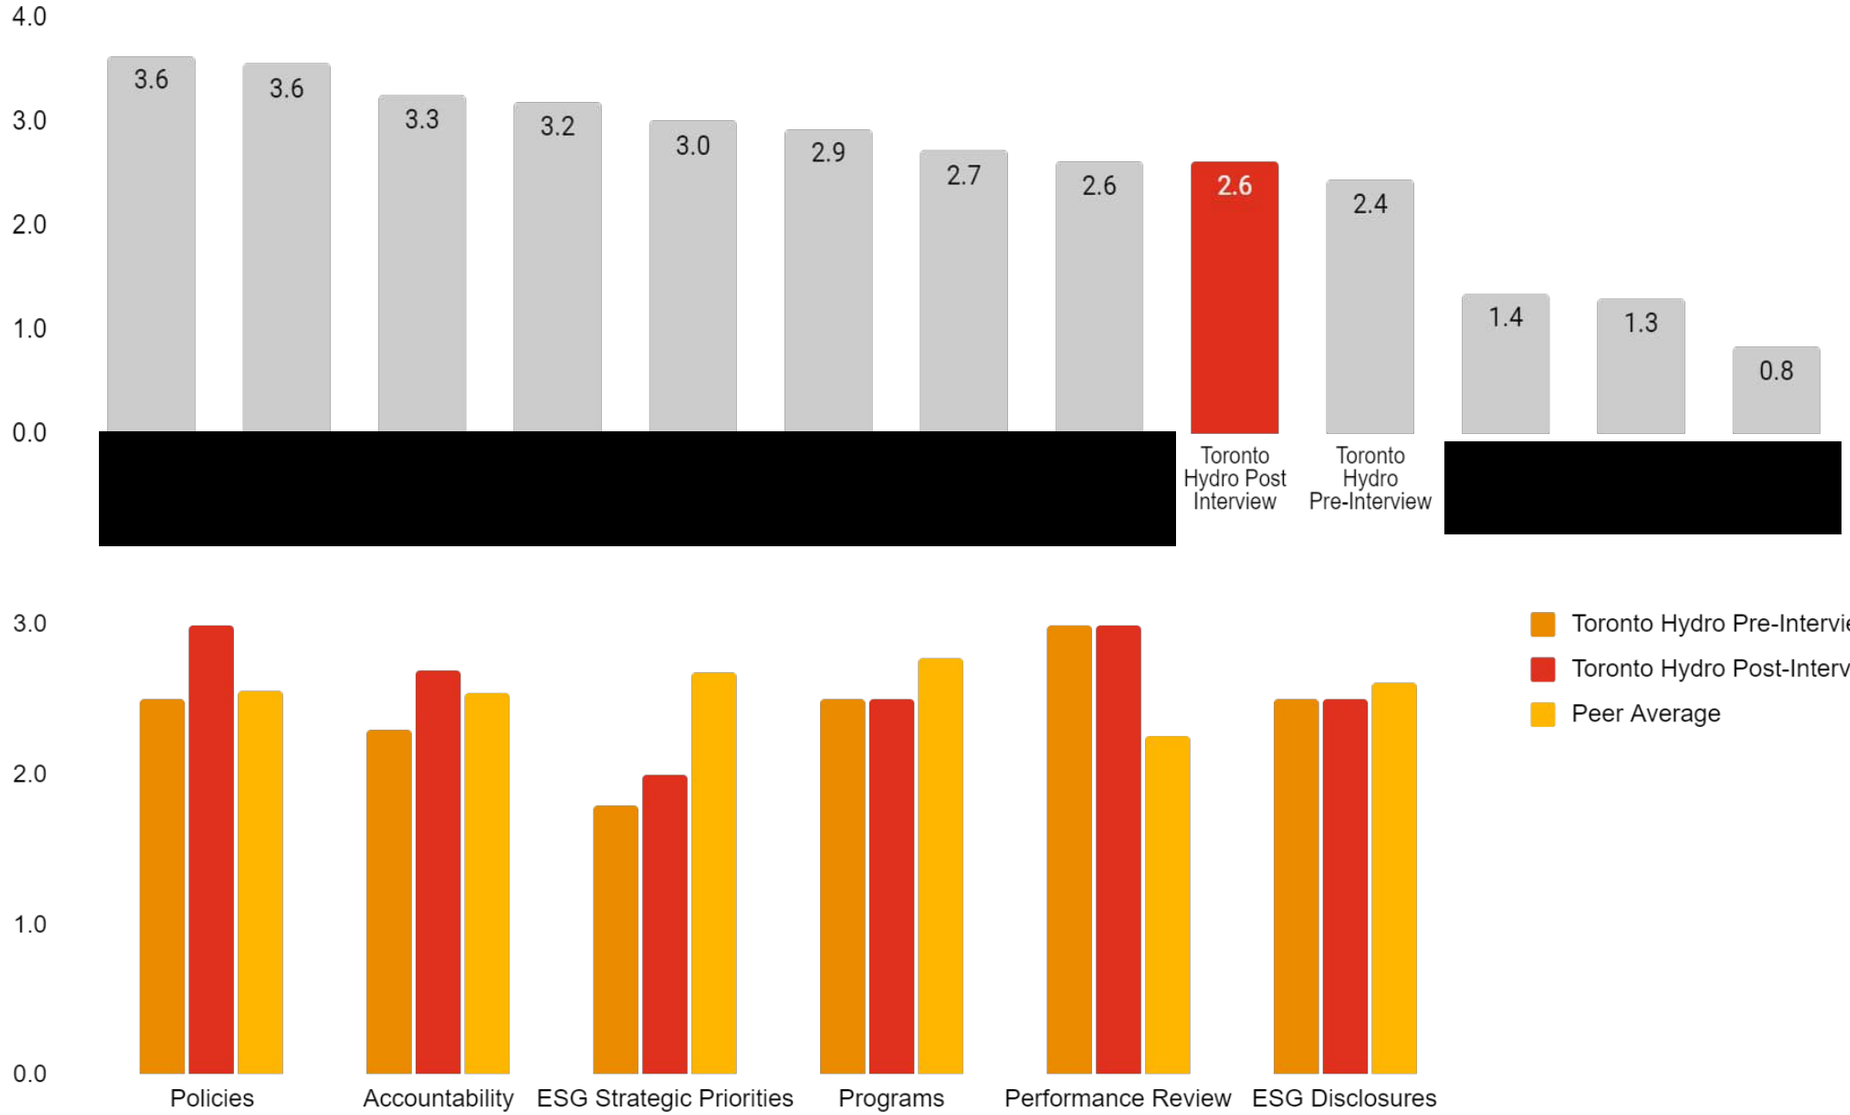
Overall ESG maturity

For illustrative purposes only

Toronto Hydro's overall disclosure ESG maturity demonstrates it is at a "structured" level of maturity. Many of its direct peers, on average, are in similar states of maturity.

[redacted] are on the leading edge of ESG program maturity and offer lessons learned for Toronto Hydro as it advances to a leading program.

This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them



Overall ESG maturity

The graph shows a breakdown of the maturity score of Toronto Hydro's overall disclosure ESG program as compared to its peers.

Note that Toronto Hydro performed above the average on policies, accountability and performance review.

However, it fell behind the peer group on ESG strategy and programs.

With disclosing more information , the program maturity would increase.

This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them

ESG disclosure program maturity: Peer best practices

ConEdison's sustainability strategy has oversight from the board and there is an ESG committee at the executive level. Executive compensation is tied to key ESG KPIs (i.e., D&I)

Operational Excellence

Accountability

Our company made Newsweek's list of America's most responsible companies. Newsweek honors companies that are "good citizens and give back to the communities they operate in."

EPCOR has established and disclosed an ESG scorecard with key performance measures, data and targets aligned to its most material ESG factors and incentive-based pay.

SOCIAL		2017	2018	2019	2020	TARGETS AND COMMENTARY
Health and Safety						
S1	TOTAL RECORDABLE INJURY FREQUENCY Continuous reduction in total incidents (TRIF) *SASB Code: IF-EU-320a.1(1)* *GRI 403-9(a)(iii)*[E]	1.12	2.35	1.44	1.03	A safety-first culture, driving to zero incidents.
S2	LOST-TIME INJURY FREQUENCY Continuous reduction in lost-time incidents (LTIF)	0.16	0.35	0.13	0.06	A safety-first culture, driving to zero incidents.

Algonquin Power discloses its approach to stakeholder engagement, including how they engage, frequency, key concerns raised, and how concerns are addressed.

Stakeholder engagement

GRI: 102-21, 102-40, 102-42, 102-43

Stakeholder dialogue not only guides our reporting process and informs our report content selection, but is an essential element of our core business practices. Our key stakeholder groups include our customers, employees, investors, communities, and government and regulatory bodies. An overview of these stakeholder groups, our engagement methods, and priority concerns can be found below.

Stakeholder group	How we engage	Frequency of engagement	Key concerns raised	How we address those concerns
Customers	• Annual J.D. Power Customer Satisfaction Survey • Call centers • Community education programs • Conservation and outreach programs • Regular email communications • Focus groups • Local customer walk-in centers • Local media outlets • Participation in and sponsorship of local events, teams, and charitable foundations • Social media	Annual and ongoing	• Customer service improvements • Rates and pricing • Digital billing and payments • Communications (i.e., outage alerts) • Increased community involvement • Low-income household needs	• Customer First program • eCustomer project: new MyAccount customer experience improvement • Updated Outage Management system • Continuous communications through email, social media, and bill inserts on local community engagement • Customer Savings Program (expected savings of approximately $300 million over 30 years)

Duke Energy discloses an annual ESG report aligned to international standards, reports to various ESG raters, and identifies links between disclosures and corporate strategy.

Global Reporting Initiative (GRI) Index

Duke Energy uses the GRI Sustainability Reporting Standards to help guide our reporting. This index is based on the most recent versions of the Standards available as of May 2020 and includes the Electric Utility Sector Supplement. For most indicators, we refer users to information on our website or other public documents. For some indicators, we provide brief narrative responses. Most data in this index address calendar year 2020, in coordination with our most recent Sustainability Report.

General Disclosures

Number	Topic	Response
Organizational Profile		
102-1	Report the name of the organization	Duke Energy Corporation
102-2	Activities, brands, products and services	The Businesses We're In Duke Energy at a Glance

Hydro One has established comprehensive ESG pillars and priority areas, including accompanying goals.

People

Priorities

- Set broader diversity and inclusion hiring goals
- Identify, eliminate and prevent systemic barriers in the workplace

Goals

- Hydro One signed the BlackNorth Initiative Pledge and is commited to achieving 3.5% Black executives and board directors, and 5% Black student hires by 2025.
- As a signatory to the Catalyst Accord, Hydro One is commited to achieving at least 30% female executives and board members

Planet

Priorities

- Achieve established targets for GHG reductions
- Continue to include climate change considerations into decisions and plans to ensure grid resiliency

Goals

- Hydro One is committed to achieving net-zero GHG emissions by 2050
- We have established a target to achieve a 30% reduction of GHG emissions by 2030

Community

Priorities

- Continue to support the Ontario economy through partnerships
- Build safe communities by supporting youth initiatives that promote safety training and safe play

Goals

- Hydro One is committed to increasing our Indigenous procurement spend to 5% of the company's purchases of materials and services by 2026
- As part of our community investment program, we are committed to ensuring that 20% of our corporate donations and sponsorships support Indigenous communities

The City of Toronto has established goals, targets and programs to achieve its priority areas, outlined in its strategy documents.

If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them

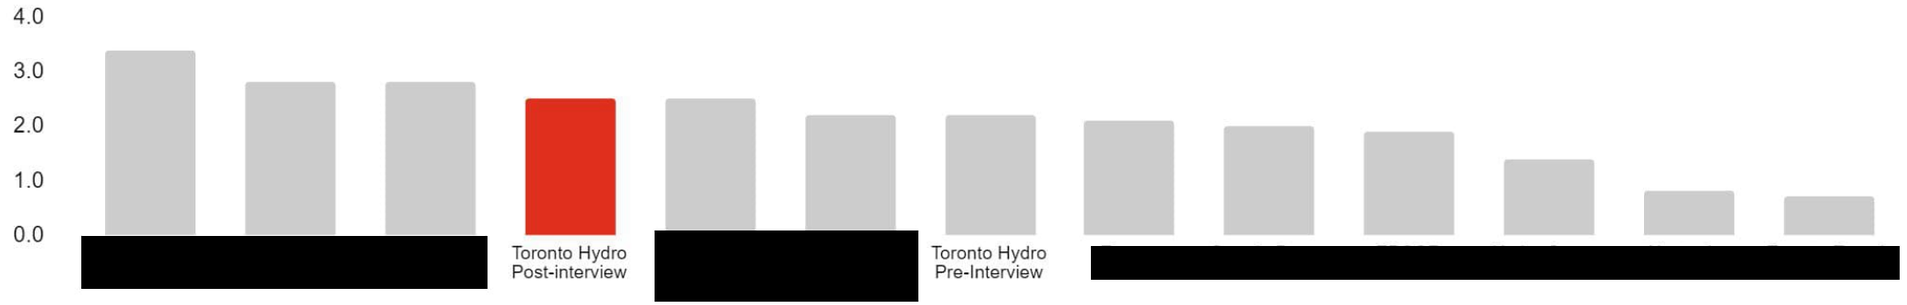
ESG pillars performance



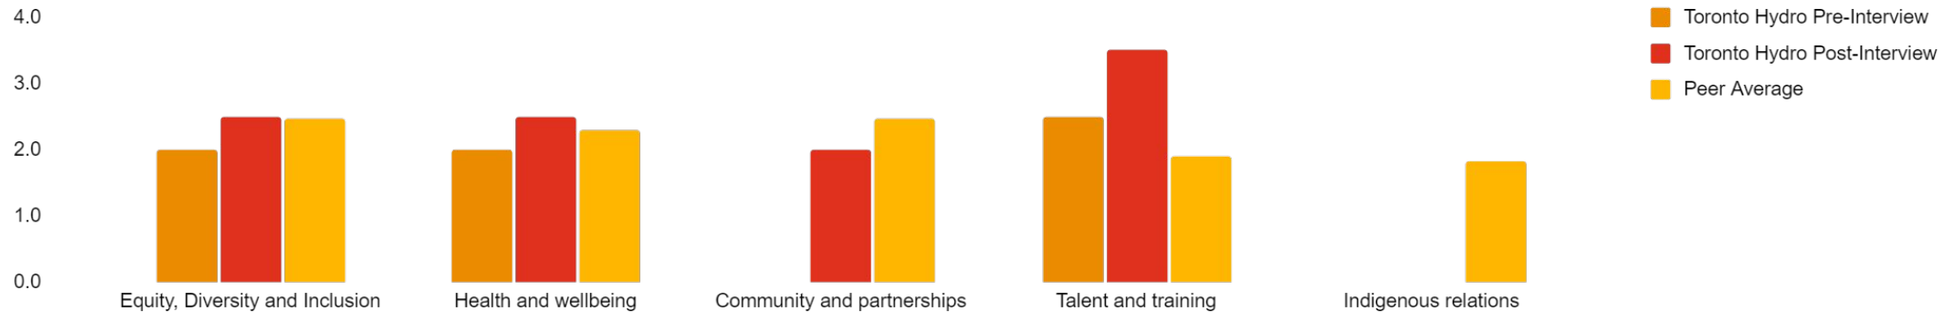
Toronto Hydro achieved a structured level of overall disclosure maturity in each ESG pillar, which is at average-levels amongst its peers.

In review of ESG the pillar areas as a whole, [redacted] and [redacted] scored at a leading or differentiated level (see page 13 and 14 for definitions and detail) amongst the peer and stakeholder group.

Human Capital

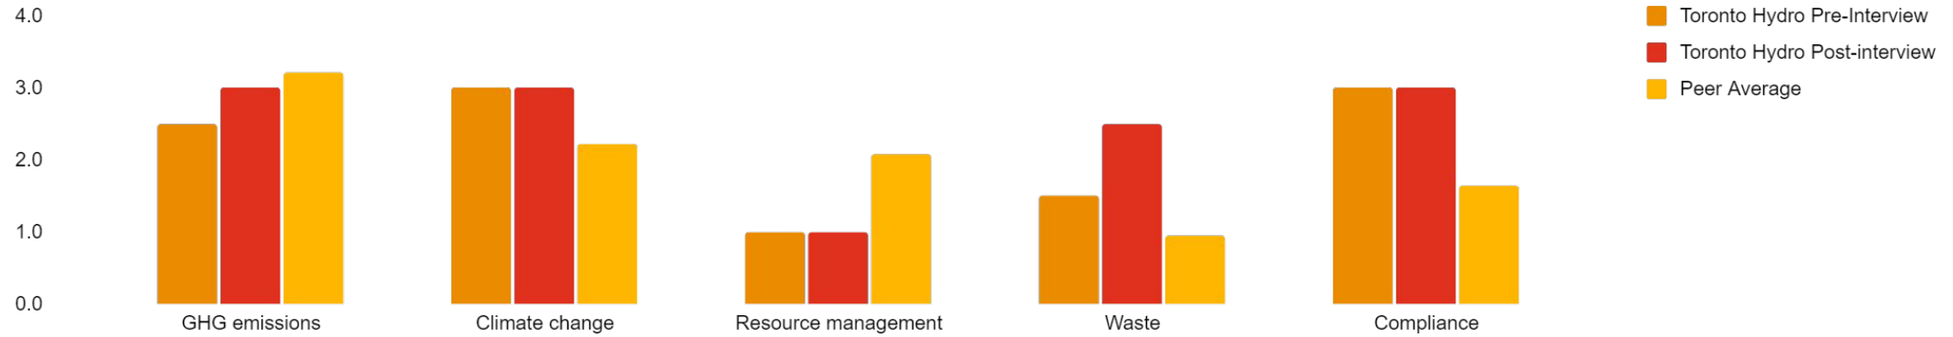
Environmental Stewardship

Responsible Business



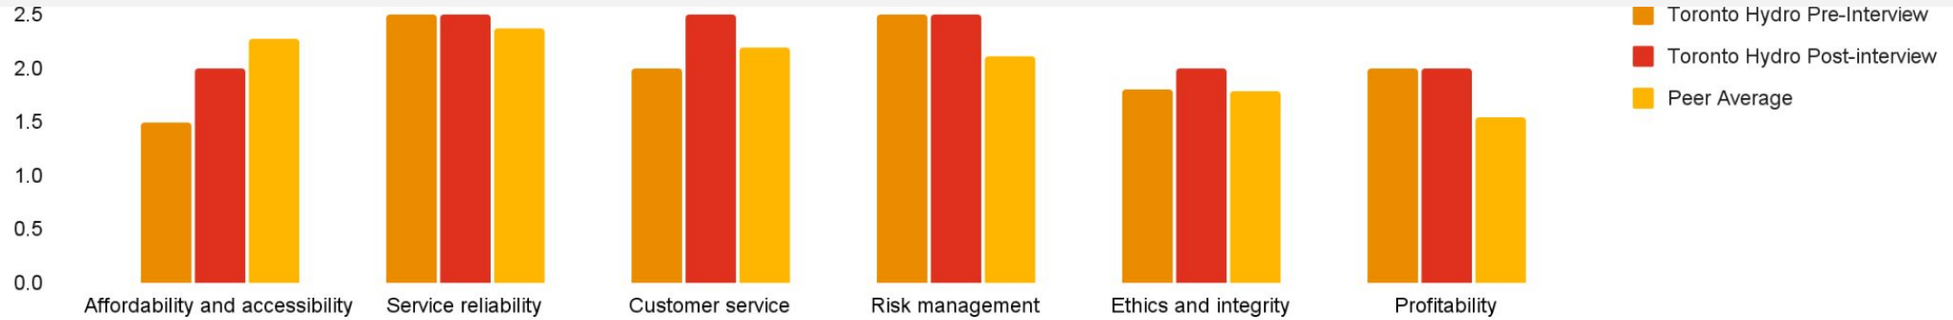
This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. If any unauthorized party obtains this report, such party agrees that any use of the report, in whole or in part, is their sole responsibility and at their sole and exclusive risk; that they may not rely on the report; that they do not acquire any rights as a result of such access and that PricewaterhouseCoopers LLP does not assume any duty, obligation, responsibility or liability to them

ESG focus area performance



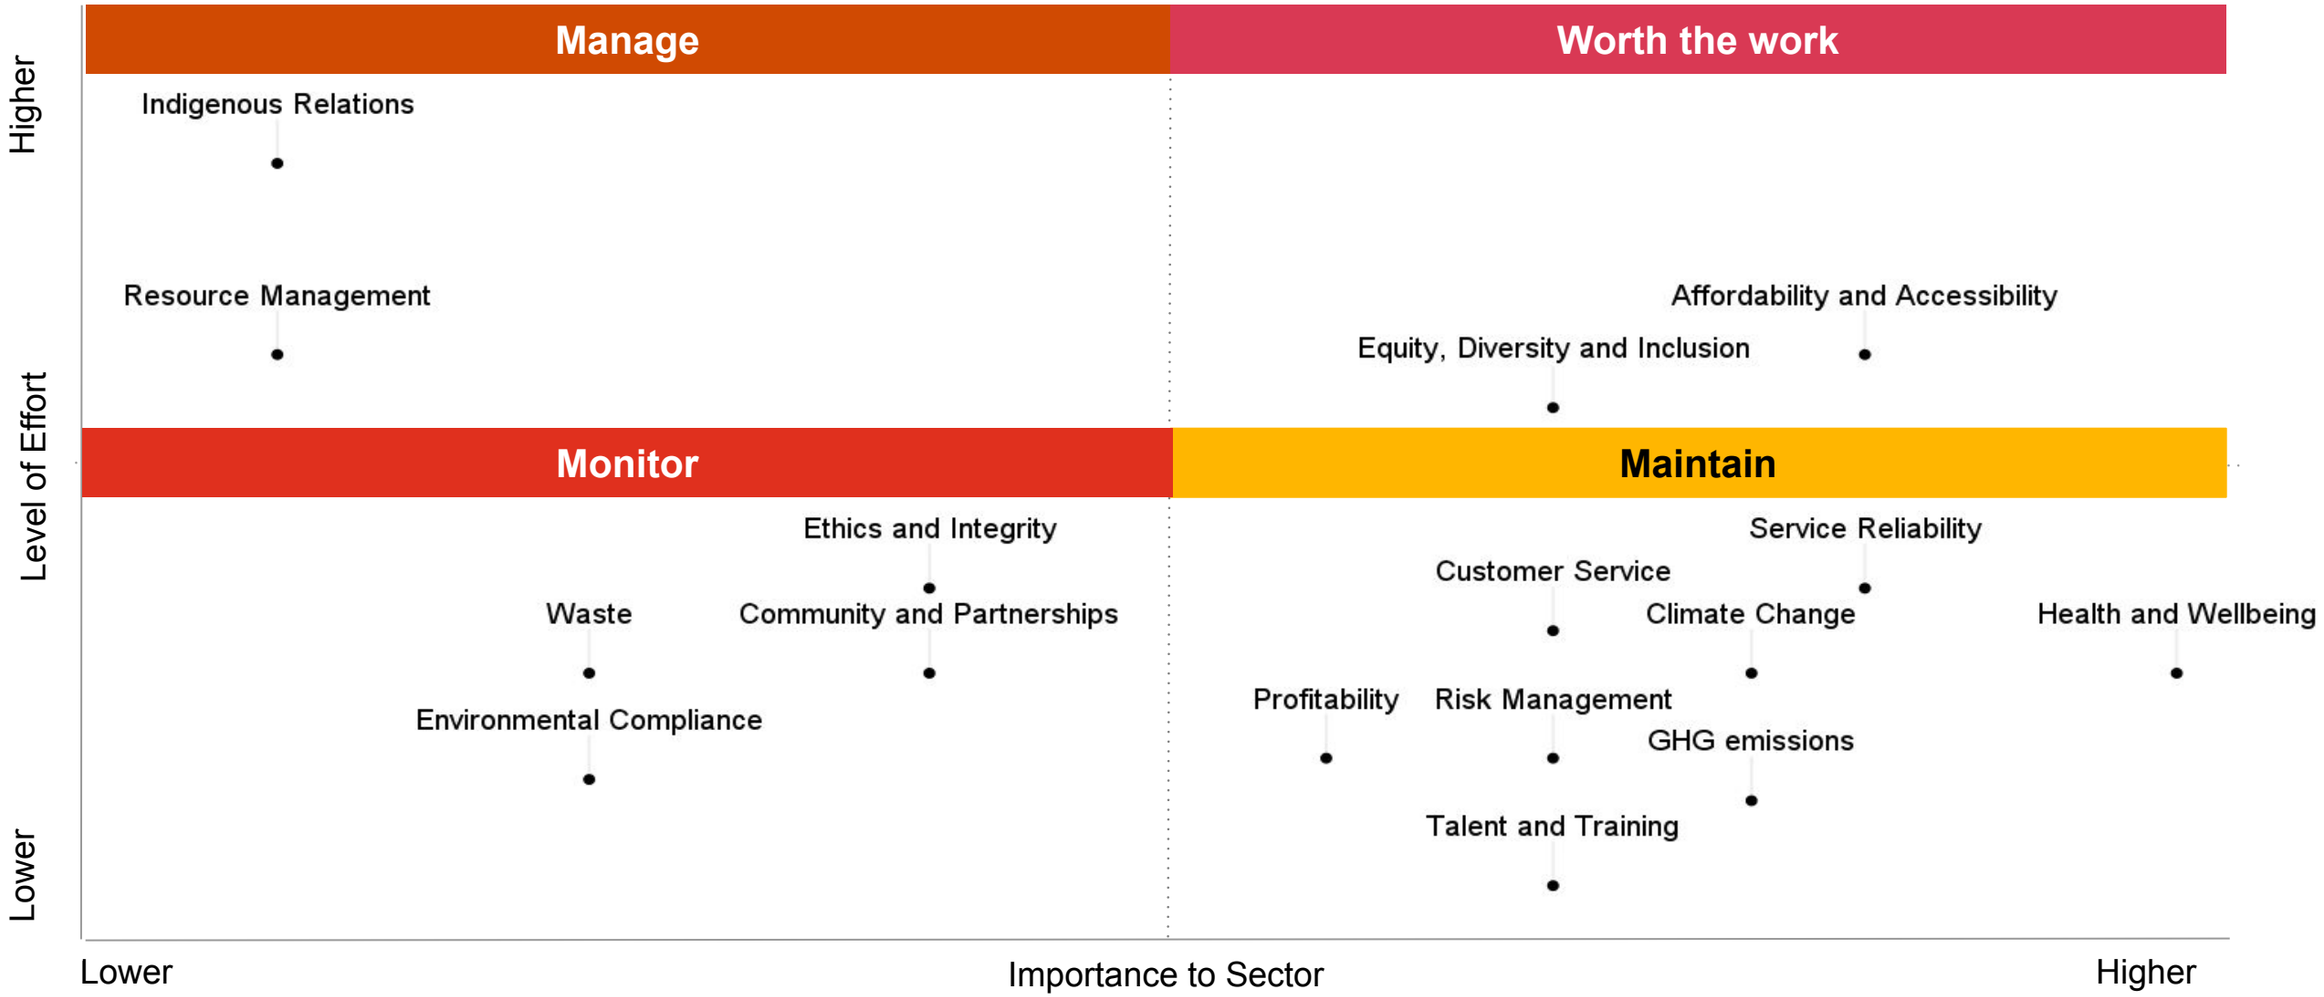
Toronto Hydro's strongest areas, in terms of information disclosure, are in talent and training and equity, environmental compliance, service reliability, customer service and risk management.

Opportunities relate to community and partnerships, Indigenous relations, and affordability and accessibility, where a higher level of effort and peer focus exists.



Human Capital

Environmental Stewardship



Responsible Business

This report is confidential. The report is intended solely for use by the management of Toronto Hydro and is not intended or authorized for any other use or party. ESG focus areas: Peer best reporting practices

HydroOne tracks spend on Indigenous businesses and set targets for 20% of community investment to support Indigenous communities and 3% to promote investment in Black communities.

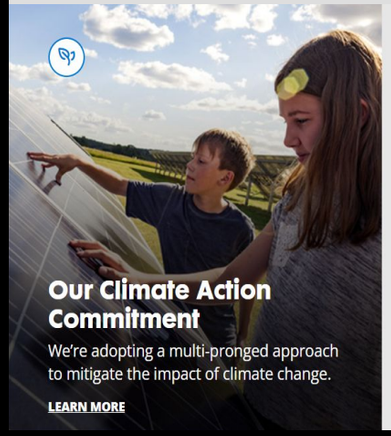
We are committed to increasing our Indigenous procurement spend to 5% of the company's purchases of materials and services by 2026.

While several Indigenous communities closed their borders to visitors in order to limit exposure to COVID-19, Hydro One respectfully adapted to these realities and hosted numerous public community engagement sessions and meetings online. Post-COVID-19, we will review opportunities to enhance our online engagement which has, in some cases, made communication more efficient. However, we still plan to continue to focus on reconnecting with Indigenous communities through in-person meetings.

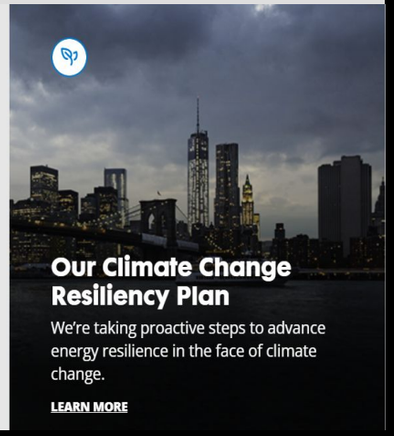
We fast-tracked $32.9M in payments to 124 Indigenous and small business suppliers in Ontario.

Algonquin Power provides education grants to eligible employees and offers work flexibility programs.

Talent attraction and retention



Talent attraction and retention are the pillars upon which we build our employee lifecycle. We know that the competition for talent is real, and an organization is only as good as their workforce. At Algonquin and Liberty, our workforce is our family, and we pride ourselves in the way we grow our family.



Duke Energy has disclosed a net zero by 2050 ambition and an interim target of reducing CO_2 emissions from electricity generation by 50% by 2030 through its 2020 Climate Report.

ConEdison discloses against the TCFD recommendations and has published its climate change and climate resilience and adaptation implementation plans.

Enmax is conducting pilot projects to test programs to remove barriers to energy access and affordability, delivering energy saving kits to select households.

Our approach

Our energy affordability efforts will be geared towards supporting customers at each stage of the affordability lifecycle (noted below), incorporating efforts from across business units in Alberta and Maine, informing community investment strategies and laying the groundwork for advocacy with policymakers and regulators in an effort to advance broader strategies in the years ahead.

SUPPORTING CUSTOMERS IN THESE STAGES

1. Affordability
   Provide sustainable energy solutions, including tools, education and awareness
2. Prevention
   Invest in programming to reduce barriers to affordable-energy access across all our operating communities
3. Crisis Management
   Provide relief to customers in energy-need crisis through agency partnerships

City of Toronto incorporates ESG and climate change into its new ERM framework and has implemented a climate change risk management policy.

The City's risk factors identified through the ERM process

AGENDA

1. Executive Summary
2. Project Overview
3. Project Methodology
4. Utility Interviews
5. Oracle Interview
6. Risk Assessment
7. FLISR Operation Readiness Strategy
8. Potential Timeline
9. Items for Consideration

Project
Executive Summary

THESL is currently progressing the use of Fault Location, Isolation, and Service Restoration (**FLISR**) and seeks to move the deployment of automated FLISR, aka Auto-FLISR.

A six-week assessment was conducted to identify key aspects, risks and mitigations for the journey to Auto-FLISR. The assessment also considered aspects of a high-level timeline for Auto-FLISR.

Key Conclusions

1. The deployment of Auto-FLISR will be a multi-year, multi-stakeholder undertaking and will require participation by system operations, engineering and IT.
2. The planned manual FLISR evaluation pilot will serve to provide valuable insight and deployment risk mitigation for Auto-FLISR.
3. Successful Auto-FLISR implementation will ensure continued safety of operation.
4. Auto-FLISR has delivered operational benefit to utilities using the technology.
5. Auto-FLISR performance objective of resolution in under one minute (the momentary criterion), is a stretch goal impacted by various factors including circuit topology, communication latency, number of switching plans to be run, and solution duration.

Project Overview

TRC Companies (TRC) started a *six-week project* on 22 May 2023, and completed 30 June 2023.

The intent of the assessment was to conduct a series of activities which would result in the development of *a report as an information and decision support tool*.

The assessment was designed to allow for the following **key areas of consideration**:

- Potential timeline for the deployment of Auto-FLISR
- Risks relevant to the deployment of Auto-FLISR
- How risks may be mitigated
- Insights as to high-level cost impacts

The assessment process involved activities to provide insight to THESL's internal approach, consideration of the key enabling technology (Oracle NMS), and lessons learned from other utilities who have progressed with Auto-FLISR deployments.

TRC added to this its own expertise with Auto-FLISR and other utility solution deployments.

Project Methodology

TRC undertook the following activities:

- THESL data review
- THESL discovery meetings
- Utility benchmarking interviews
- Oracle interview

TRC identified various *items which may impact the deployment of Auto-FLISR* at THESL and grouped these into **10 categories** which were then tracked to impact in the areas of **Safety, Performance, Schedule, and Cost**.

TRC produced a detailed report of their findings and this project briefing deck.

Utility Interviews

The following utilities were either interviewed or investigated as part of the utility benchmarking, with the following main themes:

- **The deployment of Auto-FLISR will be a multi-year, multi-stakeholder undertaking and will require participation by system operations, engineering and IT.**
- **Data quality remains one of the most important dependencies to enable Auto-FLISR operation.**
- **Change management was highlighted as key to Auto-FLISR acceptance.**

[redacted]

- OSI ADMS Platform
- Data quality, particularly for SCADA keys, was considered critical
- Consistency of procedure approach was key.
- Established a test laboratory (8 devices) before deploying further.
- Testing needs to cover failure modes and be very deliberate around how Auto-FLISR fails.

[redacted]

- OSI ADMS Platform
- [redacted]s Auto-FLISR objective is to improve SAIFI / SAIDI but safety is another a priority
- Focus on configurable functionality not customization.
- SCADA data preparation is a key factor.
- Established a specific Change Manager role for ADMS and then Auto-FLISR acceptance.

[redacted]

- [redacted] has Oracle NMS but is not using it for any FLISR operations at this time
- [redacted] engineering staff participated in an initial qualifying conversation

[redacted]

- Schneider Electric ADMS Platform
- Auto-FLISR was taken offline in March 2023 due to an operational fault.
- A five stage validation criteria on model fine tuning (Analysis Ready – AR) was set for critical review of a feeder for Auto-FLISR enablement.

[redacted]

- Survalent ADMS Platform
- Alectra has had FLISR experience but has not transitioned to Auto-FLISR
- No interview scheduled at this time

[redacted]

- Oracle has advised that [redacted] has manual FLISR in production on 200+ feeders but does not have Auto-FLISR
- No interview scheduled at this time

Utility Interviews

[redacted]

- Currently on Oracle NMS 2.5
- Auto-FLISR ran for one year during which there were 30 Auto-FLISR events which generally successfully operated.
- The original benefits [redacted] hoped to gain from Auto-FLISR was Auto-FLISR was disabled for several reasons:
    - SCADA issues giving either false positives on device outages or RTU communications issues.
    - Oracle upgrade from NMS 2.3 to 2.5 caused issues. Oracle NMS 2.5 has many different elements to Oracle NMS 2.3 including a different power flow engine, with algorithm changes, and different processes for ingesting data such as weather.
    - SCADA system change from ACS to OSI
    - Network areas re-defined to more identified as high fire risk and so Auto-FLISR is not able to be used in these areas

[redacted]

- Currently on Oracle NMS 2.5
- [redacted] has been guided by the principle that Auto-FLISR should be quicker while adhering to the controllers' established practices.
- On average, there were 1-2 SCADA controlled devices, excluding the tie switch for early auto-FLISR adoption, and currently 2-3 SCADA controlled devices per feeder.
- The introduction of Auto-FLISR has notably improved reliability, reducing fault response time from 10-30 minutes (manual) to less than 1 minute. Though [redacted] has adjusted their momentary criteria to 3 minutes recently, their aim remains a 1-minute operational time. On average, the entire process took around 45 seconds, with approximately 15-20 seconds allocated for fault detection, demand scanning from NMS, and resolution time, along with an additional 20-40 seconds for command issuance.
- Efforts have been dedicated to enhancing communications, including upgrading device firmware and standardizing configuration settings.
- [redacted] opted for a comprehensive deployment of auto-FLISR, enabling its activation circuit-wide once the confidence period had been successfully navigated.
- Scenarios warranting the disabling of auto-FLISR encompass live Line work, bush fire days, and sensitive earth faults.
- The average turn around time for updating GIS model is 2 days.
- Auto-FLISR has been turned on even during “grey-sky” conditions due to the outweighing benefits over associated risks.

Oracle Interview

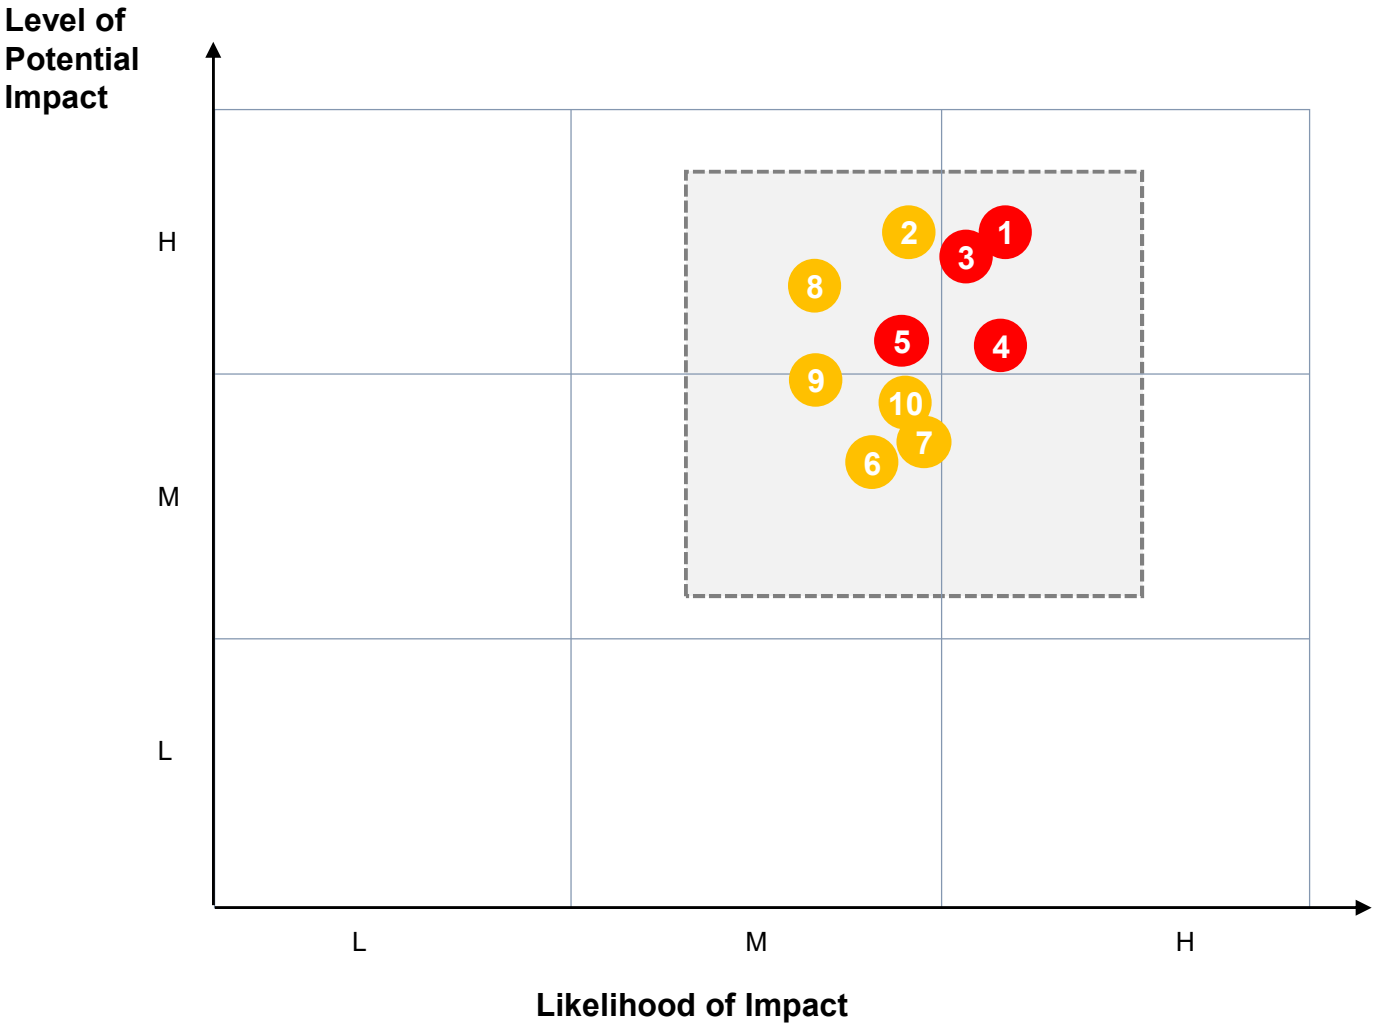
Oracle provided for interview a team of subject matter expertise with knowledge of the THESL NMS deployment.
Below are the key points:

- NMS 2.3 is nearing end of life and will move to **limited support mode** as of December 2024.
- THESL's upgrade to NMS 2.6 is seen as more complex than the norm due to the **high amount of customization** of the platform. Oracle has assessed that the level of effort necessary for the NMS 2.3 upgrade resembles that of a comprehensive re-implementation. As a result, both Oracle and TRC have collaboratively reached a consensus on the projected upgrade timeframe, which now spans from **24 to 36 months**.
- In NMS versions 2.3 and 2.5, the system experiences slowdowns or diverts additional resources to carry out computations within a single thread. The assumption is that NMS 2.6, designed with **multi-threading capabilities**, is more efficient and capable of simultaneous multitasking with less impact. It is important to emphasize that there exists a definite computational capacity, and the system must be tailored to meet specific performance benchmarks.
- The objective of **1-minute Auto-FLISR solutioning is a stretch objective** and can be impacted by various factors:
  - Circuit topology (# of feeders and devices),
  - Device status validation time,
  - Adjacency to and leveraging of other circuits as part of the solution,
  - Post switching plan protection validation,
  - Number of switching plans to be run,
  - Forward forecasting time for which the switching plan is to solve
- Oracle recommends expanded testing of use cases during the planned FLISR pilot to be able to learn and solve for various potential issues.

Auto-FLISR
Risk Items

TRC identified various *items which may impact the deployment of Auto-FLISR* at THESL and grouped these into **10 categories** which were then tracked to impact in the areas of **Safety, Performance, Schedule, and Cost**.

These items are all expected to be encountered to some extent during the Auto-FLISR journey.



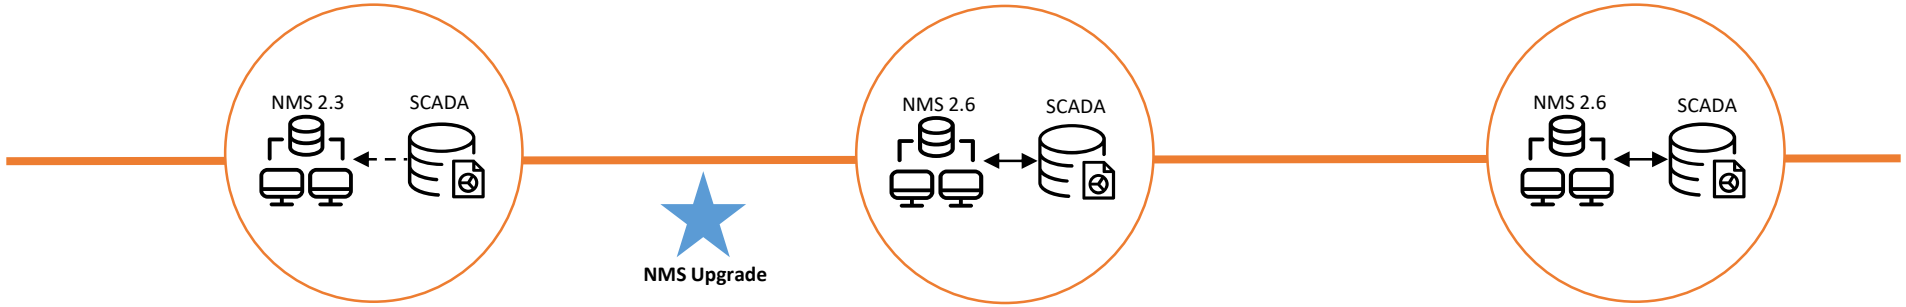
The 10 items of risk are as follows:

1. **Auto-FLISR Performance** – Solution expectations and how different factors impact the performance of Auto-FLISR
2. **Dependency on NMS Upgrade** – How NMS upgrade impacts the deployment of the Auto-FLISR (Operations and IT)
3. **Data Quality** – How data quality impacts Auto-FLISR performance and the ability to maintain the required data standard
4. **NMS Product Gap** – How well the core software does what THESL needs and extent to which additional unique coding is needed
5. **Auto-FLISR Testing** – Validating the FLISR switching models for each circuit and equipment operation
6. **Standard Approaches to Work** – How work process are aligned and simplified to allow for improved automation
7. **Change Management / Acceptance** – How will staff be impacted by Auto-FLISR and communication of benefits of automation
8. **Operational Safety** – How system operators and field crews safely work with automated controls
9. **Cyber Security** – Security of the technologies executing the automated control
10. **Auto-FLISR Deployment Strategy** – How will Auto-FLISR be rolled out to various circuits at different times and how will this be coordinated

The following slide provides a high-level view of their impact.

Auto-FLISR
Risk Assessment

#	Risk Item	Difficulty of Mitigation	Impact			
			Performance	Schedule	Cost	Safety
1	Auto-FLISR Performance	High				
2	Dependency on NMS Upgrade	Medium				
3	Data Quality	High				
4	NMS Product Gap	High				
5	Auto-FLISR Testing	High				
6	Standard Approaches to Work	Medium				
7	Change Management & Acceptance	Medium				
8	Operational Safety	Medium				
9	Cyber Security	Medium				
10	Auto-FLISR Deployment Strategy	Medium				



FLISR
Operation Readiness Strategy

STAGE 1:
MANUAL FLISR 2.3 - EVALUATION

STAGE 2:
MANUAL FLISR 2.6 - EVALUATION

STAGE 3:
AUTO-FLISR

- NMS 2.3 FLISR module
- THESL team validates FLISR switching plan periodically, but does not use it during system operation
- Confidence period

- NMS 2.6 FLISR module
- THESL team validates FLISR switching plan periodically, but does not use it during system operation
- Confidence period

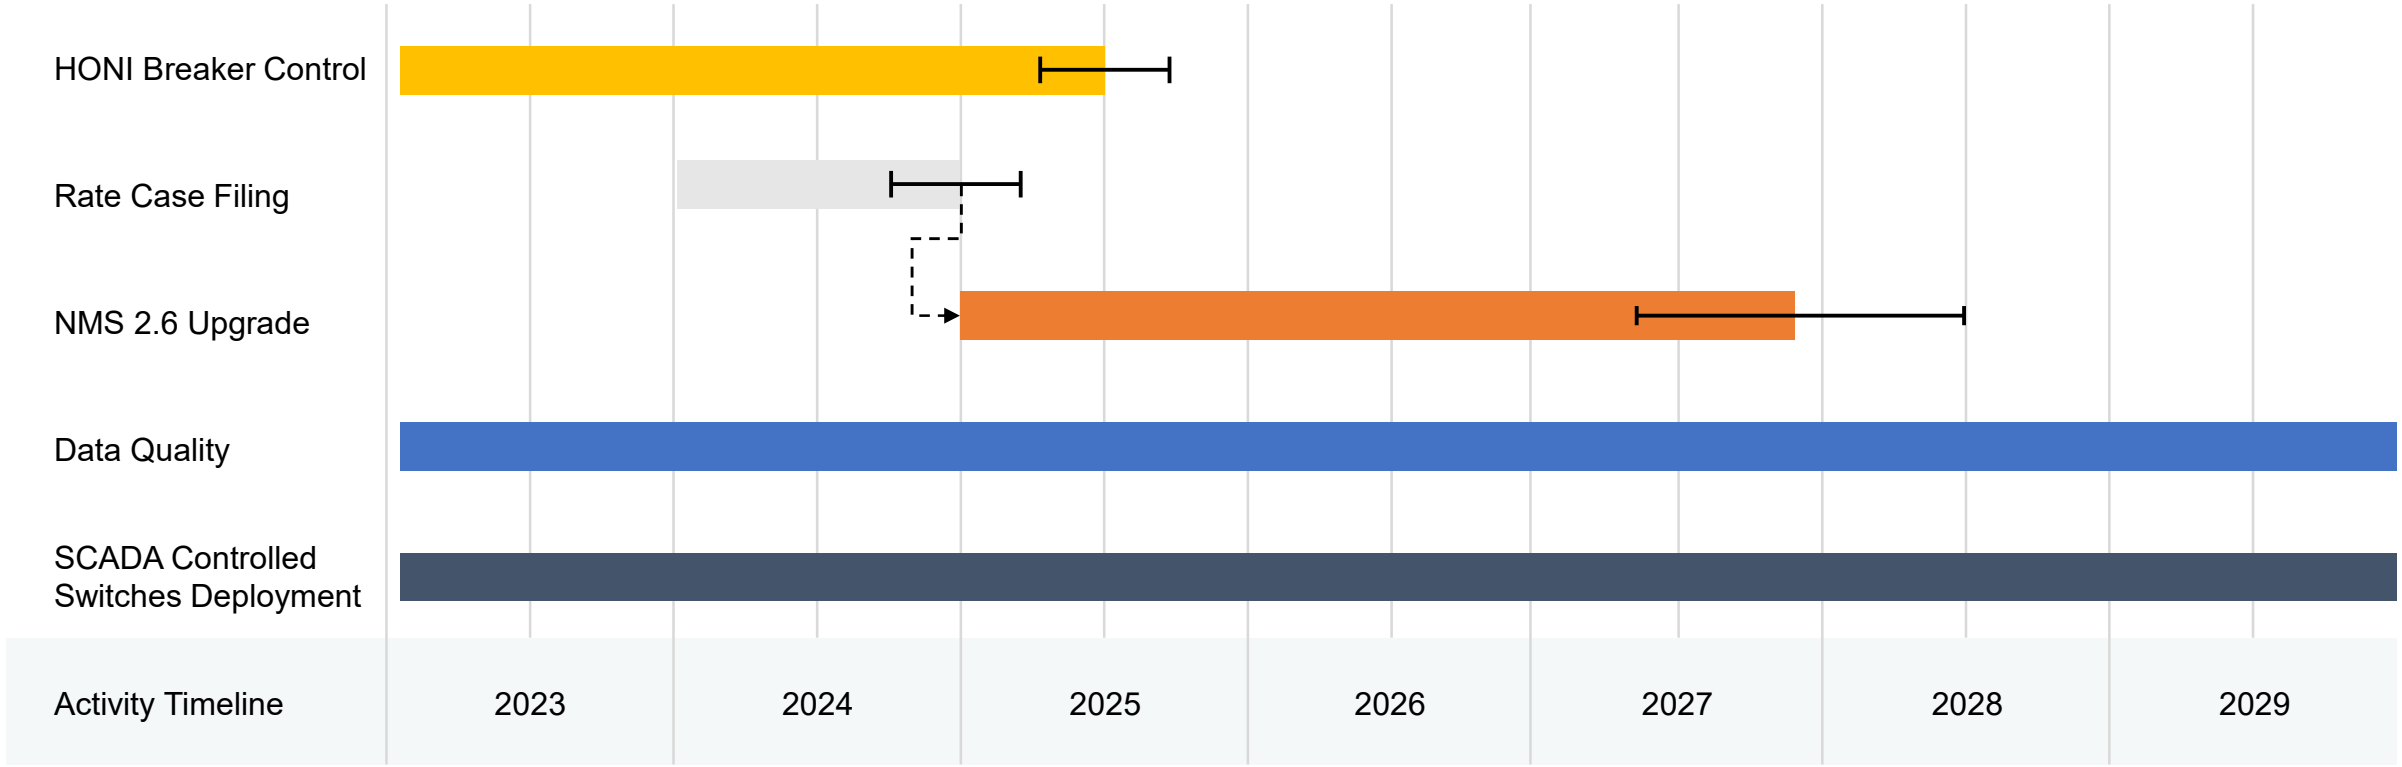
- NMS 2.6 FLISR module in automatic mode
- NMS FLISR executes the switching steps automatically with manual intervention only when required

IMPORTANT NOTES

- These stages are those used by various utilities. Not all stages need to be taken and are provided as reference only
- An entry/exit criteria should be set to move between FLISR stages
- System circuits may be in different FLISR stages
- Procedures should be established for operating in various FLISR stages

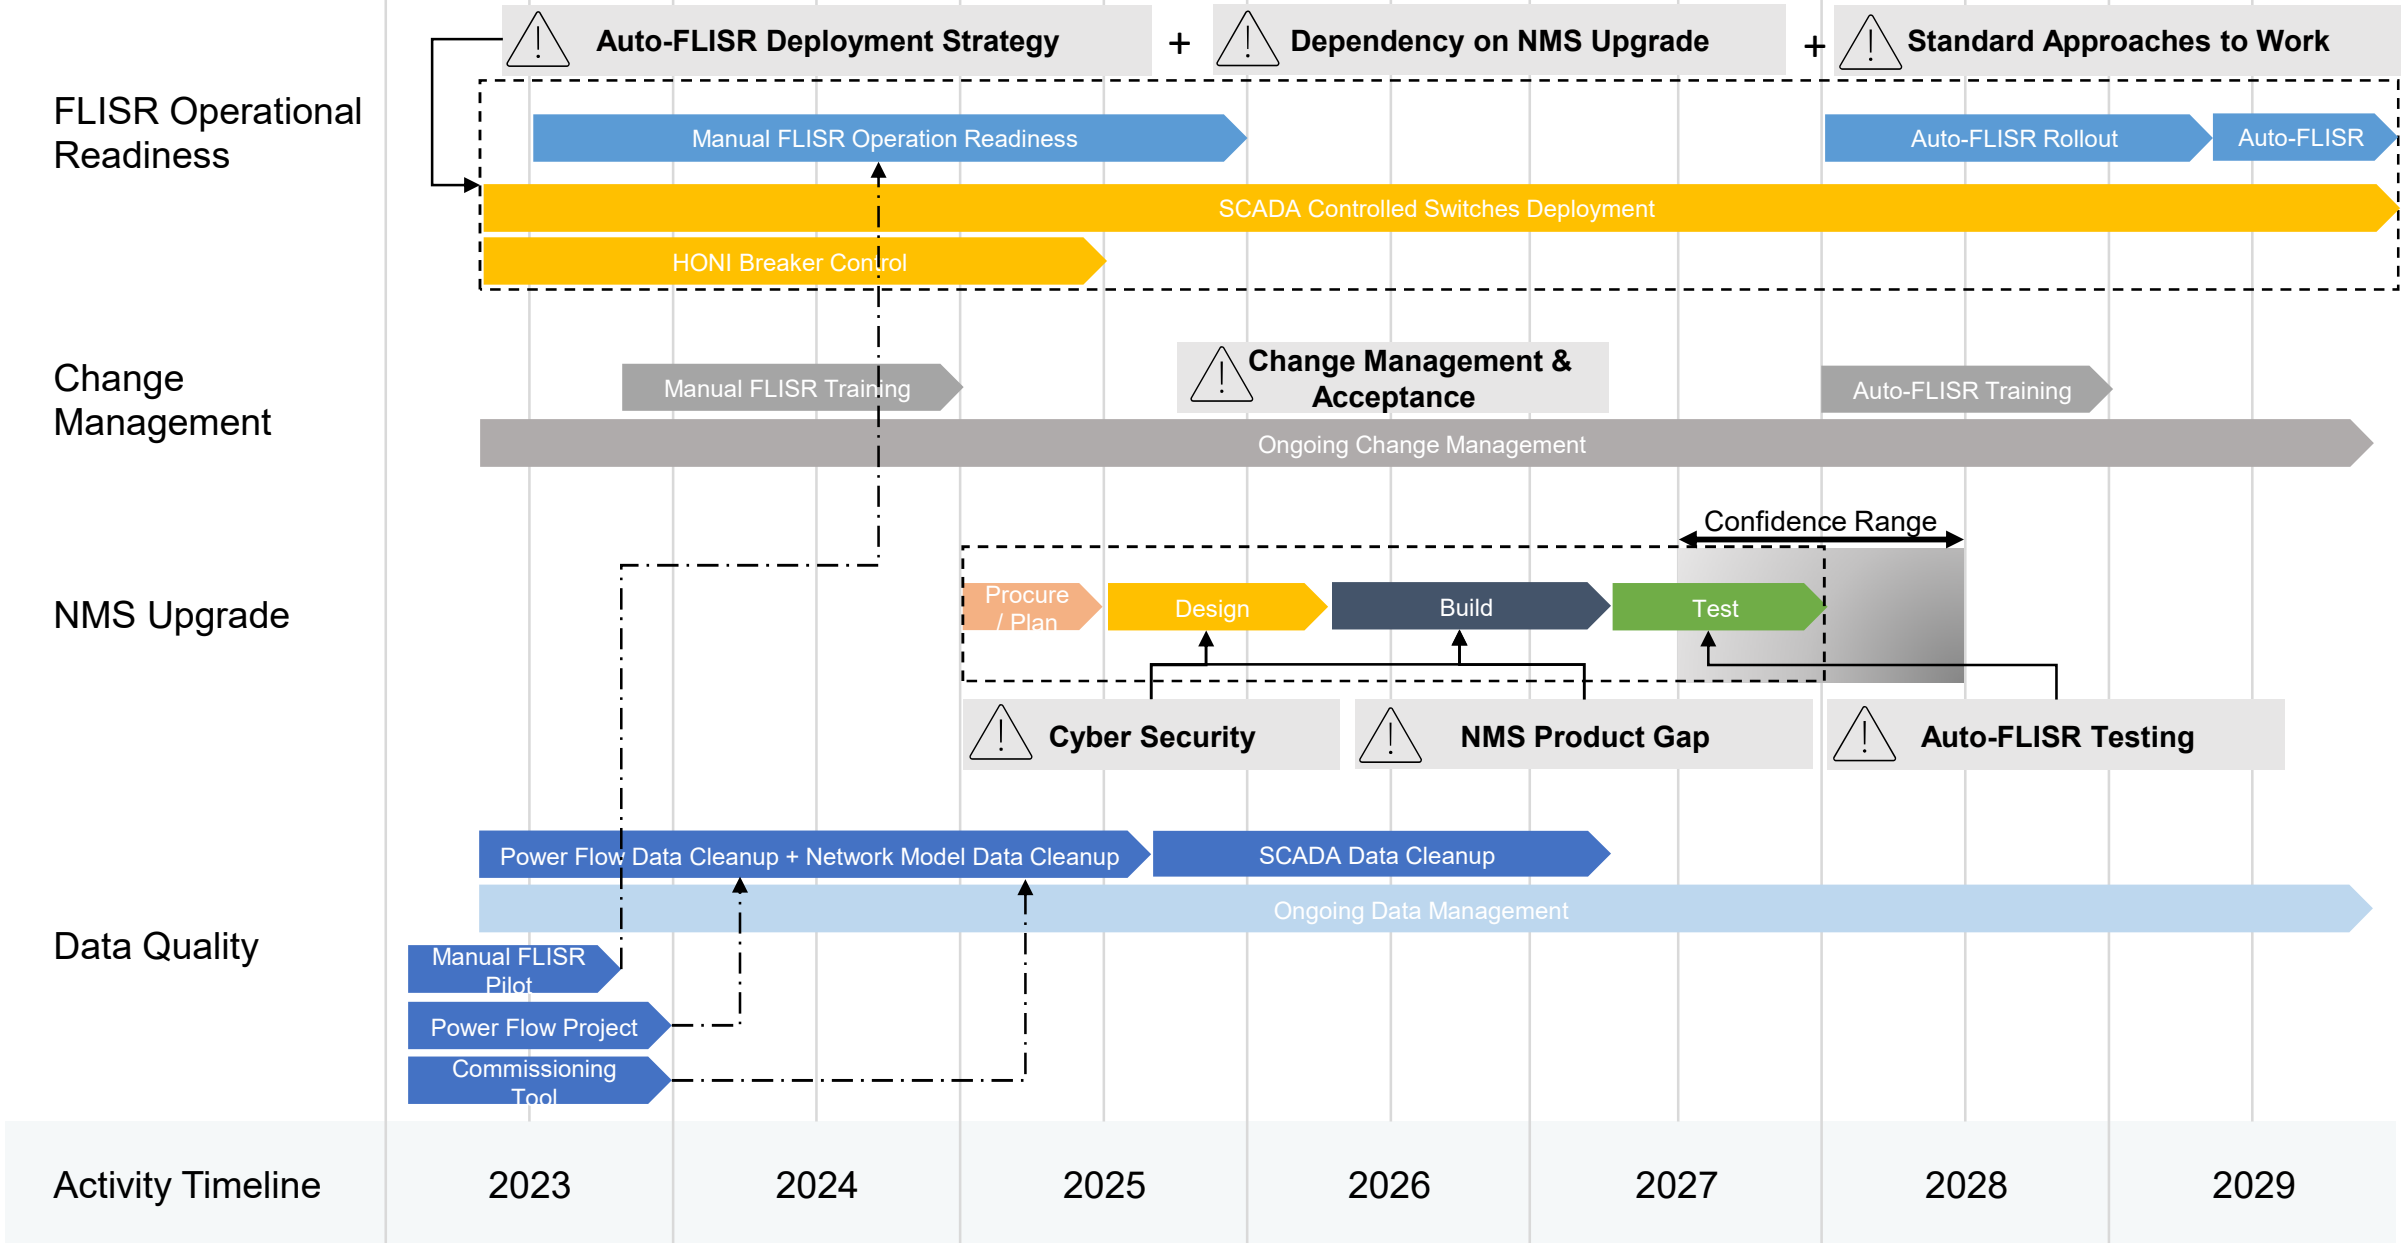
Auto-FLISR
Timeline

The following three slides provide a view of various timeline aspects:



Related Timeline
- This slide serves to provide a high-level context of when aspects relevant to Auto-FLISR enablement may be expected to occur and therefore establish context for scheduling.

High-Level Timeline
- This slide provides a view of the high-level Auto-FLISR specific activities, their relationship and representative timing for these activities.



Indicative Activities
- This slide provides a view of activities that may be expected to be conducted within the specific focus of the technology deployment, their sequencing and potential timing.

Auto-FLISR

Auto-FLISR
Items for Consideration

The following items will potentially impact the Auto-FLISR deployment and warrant further review. These items have not formed part of the assessment.

Hydro One – Switch Ownership and Control
- A large population of circuit breakers on the THESL system are owned and controlled by Hydro One.
- This is potentially a significant complexity for the deployment of Auto-FLISR at THESL.
- Note – An interview is scheduled with Hydro One for June 30, 2023, to gain more insight.

Procedure Governance
- THESL's current operational performance has not been reviewed to establish a performance baseline for the Auto-FLISR assessment.

Staffing and Skills
- The aptitude and training of the existing THESL staff in the context of a transition from a manual to an automated operating environment have not been assessed.

1 Executive Summary

Toronto Hydro-Electric System Limited (THESL) owns and operates an electricity distribution system for the city of Toronto. Its priority is delivering safe and reliable electrical power to about 787,000 customers in the largest city in Canada. THESL's distribution represents approximately 18 percent of the electricity consumed in the province of Ontario servicing residential, commercial, and industrial customers.

THESL is currently progressing the use of Fault Location, Isolation, and Service Restoration (FLISR) and seeks to move the deployment of automated FLISR, aka Auto-FLISR.

THESL hired TRC Company (TRC) to conduct a six-week high level assessment of THESL's journey to Auto-FLISR with a focus on learnings from other utilities, expected benefits, potential timeline, and the significant risks and potential mitigation of the risks.

During the course of the six weeks TRC conducted discovery interviews with THESL staff, benchmarked Auto-FLISR experience with other utilities and interviewed THESL's key Auto-FLISR technology platform provider, Oracle.

TRCs key findings fall into categories of impact: Safety, Performance, Schedule, and Cost.

Safety

Safety is key for utility operations. The key potential aspect of safety was identified as being the ability to ensure that field crews and operators follow clear procedures to ensure that automated control is turned off to switches associated with faults to which field crews are deployed. Utilities using Auto-FLISR see this as controllable in the normal course of business practice, augmented by clear control status on the Auto-FLISR system.

Performance

An important aspiration for THESL, and other Canadian utilities, is for Auto-FLISR to operate in under one minute to meet the standard for an outage to be considered a momentary outage. Oracle noted this as a challenging goal, with various factors that may impact this performance goal. Most of the Auto-FLISR deployments benchmarked for performance are in US utilities where the standard for a momentary outage is less than five minutes.

TRC has been unable to interview any utilities currently operating to the Auto-FLISR momentary objective of one minute. Oracle has identified [redacted] in [redacted] meeting this objective. Initial information and interview suggest that [redacted] have achieved this goal in a limited fashion.

The performance of Auto-FLISR is influenced by various factors, some of which a utility has control while others have more potential for variability. Factors such as the number of communicating controllable devices on the electric network and the quality of data provided to the automated system are within the utility's control. The number and extent of outage events occurring due to, for example, extreme weather events at any one time are out of the control of the utility. It is likely that achieving this timing goal will require a simple switching plan which may result in fewer customers being returned to service overall and THESL will likely have to make trade offs in performance preferences.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Schedule

The deployment of Auto-FLISR at THESL will be a complex undertaking with many aspects contributing to the final outcome. Foundational to the operation of Auto-FLISR will be the upgrade of the Oracle NMS platform and moving this platform into the higher security operating environment. The platform will also be upgraded to a high availability architecture to supply 5 x 9 reliability (system to be available 99.999% of the time). Complicating this work is that THESL's NMS is highly customized, meaning specific code has been added for THESL rather than native system configuration being leveraged. If extensive customization is to be applied to the upgrade, the already complex project can expect to be delayed beyond what may be considered typical. Given what is mentioned above, the NMS upgrade should be acknowledged as a multifaceted project with an estimated minimum duration of two years, with many dependencies on both business operations and IT staff.

Integrating Auto-FLISR function testing and enablement as a separate work stream contributes to the complexity of the NMS upgrade schedule. Notably, changes in power flow algorithms in NMS 2.6 might necessitate further efforts in model tuning and data gathering. Additionally, achieving the desired 1-minute target for Auto-FLISR function in NMS 2.6 will involve an iterative process of configuration work. Establishing practical yet effective test exit criteria for Auto-FLISR function in the NMS 2.6 upgrade will be crucial in managing these aspects.

The outcomes of the manual FLISR pilot project conducted in 2023 have the potential to inform the overall schedule. The insights gained from the pilot, such as assessing data readiness, configuring FLISR settings in NMS, and building operational confidence, will inform the design of the NMS 2.6 upgrade and the test strategy for the Auto-FLISR module. These learnings will play a crucial role in shaping the subsequent stages of development and deployment of the FLISR system, potentially leading to adjustments in the overall timeline and implementation approach. Once the NMS platform upgrade is complete the transition to Auto-FLISR for various substations can commence as soon as operator and field training, supported by appropriate operating procedures are in place. It is common to deploy Auto-FLISR to select circuits to develop operational confidence before wider deployment. Deployment will also be enhanced by further deployment of communicating controllable field devices in support of switching optionality. THESL is currently in the process of implementing an average of 2.5 SCADA controllable sectionalizing devices per feeder, which will enable an initial level of FLISR performance. To mitigate impact to the rollout schedule of Auto-FLISR these aspects should be planned well in advance of Auto-FLISR software platform go-live.

Cost

Feedback from other utilities has confirmed that the cost of the field equipment and communications is by far the costliest aspect of an Auto-FLISR deployment, especially if a key objective is to have increased switching optionality for effective fault mitigation. THESL's deployment of the NMS platform to the high security and high availability environment can be expected to considerably increase cost to a typical software upgrade.

Impactful Items

In this report we have also noted other potentially impactful items that could impact the Auto-FLISR deployment, and which warrant further review. These are:

- Operation of Hydro One owned breakers.
- Procedure Control.
- Staffing and skills.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Impactful Opportunity

While there is no specific industry roadmap for an Auto-FLISR deployment, TRC believes that THESL's planned initial step of piloting a manual use of FLISR output from the existing NMS platform is an important opportunity and should be conducted at depth including a wide set of potential use cases in the pilot. This pilot, if conducted comprehensively with broad stakeholder engagement, has the potential to provide insight which will either serve to mitigate or manage expectations for the overall Auto-FLISR deployment.

TRC recommends that the FLISR pilot be recognized as the most important initial step for the THESL Auto-FLISR journey and that it is approached with suitable rigor, support, and transparency.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

2 Project Description

2.1 Scope Overview

The services of TRC were retained to conduct a six-week assessment of THESL's journey to the deployment of Auto-FLISR. The intent of this assessment was to conduct a series of activities which would result in the development of this report as an information and decision support tool for THESL leadership when considering Auto-FLISR.

The assessment was designed to allow for the following key areas of consideration: the potential timeline for the deployment of Auto-FLISR, risk relevant to the deployment of Auto-FLISR, and how risks may be mitigated. TRC has also provided insights as to high-level cost impacts from the deployment of Auto-FLISR, which are provided in the appendix of this document.

The assessment process involved activities to provide insight to THESL's internal approach, consideration of the key enabling technology (Oracle NMS), and lessons learned from other utilities who have progressed with Auto-FLISR deployments. TRC added to this its own expertise with Auto-FLISR and other utility solution deployments.

2.2 Auto-FLISR Principles

As a level set and to provide context for the rest of the conversation in this document it is important to provide a definition of Auto-FLISR and what may be considered reasonable expectations from the tool.

The central purpose of FLISR operations is to reduce the magnitude and time of any system outages experienced by customers. This is done by identifying the location of a specific system fault, determining how devices such as breakers, reclosers and tie-lines may be leveraged (switched) to isolate the impacted fault area to the minimum number of customers, and to then execute a switching plan to return all other customers to service as quickly as possible.

FLISR can be a broad term that encompasses various approaches and technologies used for fault management and power restoration in distribution networks. Generally decentralized and centralized FLISR.

- Decentralized FLISR: FLISR systems leveraging intelligent electronic devices which have pre-defined trigger rules to allow them to operate autonomously, and quickly. These devices are relatively simple to configure and can be quickly to deploy. These systems typically operate in seconds and re-route power and shed non-essential load under multi-contingency situations. These are not centrally coordinated for optimized outcomes.
- Centralized FLISR: Centralized FLISR systems use SCADA-enabled switches and sensors located at key points in the distribution system to detect an outage, locate the faulted area, isolate the fault, and restore service to unfaulted areas. Some switching operations can be performed automatically depending on the capabilities of the IEDs and sectionalizing devices, and the speed of SCADA system communication.

While the decentralized FLISR can be said to be automated, the discussion of manual or automated operations tends to focus on the centralized FLISR. In this context the manual and automated FLISR, aka Auto-FLISR, are as follows:

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Manual FLISR: This approach involves manual intervention by utility operators to execute switching instructions determined by FLISR system to detect faults, locate their exact positions, isolate affected sections, and restore power to customers. It involves the use of either SCADA controlled devices.
- Automatic FLISR: This approach involves a FLISR software system connected to the SCADA control automatically locating the fault, solutioning to isolate the fault, executing switching actions to isolate the faulted part of the feeder, and restoring power to healthy elements of the feeder without operator intervention. This Auto-FLISR solution is generally able to execute with greater speed than the manual FLISR approach.

It is assumed that THESL will seek to deploy a centralized automated FLISR solution.

Generally, the objectives of FLISR relate to electric utility service performance metrics such as System Average Interruption Frequency Index (SAIFI) and System Average Interruption Duration Index (SAIDI). Additionally, effective FLISR, automatic or manual, operations improve the efficiency of field trips in that crews are directed to a narrowed potential location of the fault to be resolved and the opportunity to dispatch crews with the correct equipment is increased.

There is also generally a particular focus on momentary versus sustained interruptions of supply. A momentary interruption is the brief loss of power delivery caused by the opening and closing operation of an interrupting device. In many jurisdictions a momentary interruption is defined as being less than five minutes in duration. A sustained interruption is any interruption lasting longer than a momentary interruption.

It should be noted that THESL and other Ontario utilities use the more rigorous one minute (60 seconds) as the defined time period for a momentary interruption.

A momentary interruption is quite often able to be resolved with the operation of a recloser which is a switch that automatically opens when a specific voltage change is detected and then tests the electrical line to determine whether the trouble has been removed. If the problem was only temporary, say a brief tree contact, then the recloser automatically resets itself (closes) and restores electrical power.

In the case of the recloser operation it is normally the case that the recloser is operating in isolation of other components on the powerline (feeder) or circuit as a whole. The device may try multiple attempts, generally two to three times, to reclose without any external control and only when it fails to be able to close does it move to an open condition, or lock out, and send notification to the Supervisory Control and Data Acquisition (SCADA) system of a sustained outage. Depending on the number of recloser attempts, the time to the lock out stage can be up to 10 to 15 seconds based on peer utility interview results. Currently THESL is utilizing one reclose attempt scheme with lock out stage under 1 sec but will be soon evaluating a multi-reclose scheme (2 recloses instead of 1), with a projected lock out stage to be 4-5 seconds.

Once the lock out condition is received by the SCADA system it will need to be parsed to the Auto-FLISR system, Oracle NMS in the case of THESL, and a FLISR solution determined. The speed at which the solution can be impacted by many factors:

- The number of devices on the feeder which can potentially be operated.
- Whether device(s) are communicating as expected
    - Communication can be impacted by various issues. Potential contributors include network or connectivity latency, faulty hardware or equipment, power supply issues, incorrect configuration or settings, software or firmware issues, and environmental factors.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- The forward-looking duration of the switching solution (for example is the switching solving for 4 hours, or 8 hours, or 12 hours).
- The quality of the data available to feed the solution calculation.
    - Data quality includes the accuracy, completeness, and consistency of the data, across diverse data sources. Data may include engineering data such as equipment capacity and ratings, relay trip settings, customer energy use data; and operational data such as fault target, breaker lockout status, and bus voltage.
- The compute capacity of the FLISR system and whether that compute capacity is under constraint at the time
    - Compute capacity constraints can be generated from such as a high demand for FLISR/SCADA transactions due to multiple events occurring in parallel.
- The latency between any device communication and system pass-throughs such as security gateways.
    - Compared to SCADA, the system response in NMS will be slower as it does not talk directly to RTUs.
    - [redacted] breaker control may require signals to transit via more gateways which could result in latency.

There are specific instances where Auto-FLISR will be restricted from running. Generally, these are instances where field crews are preparing to work on the feeder and breaker protection is in place for the safety of the field workers. There may also be different protocols applied during significant storm days.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

3 Methodology And Observations

3.1 Data Discovery

TRC provided THESL with an initial data discovery request which was designed to provide material from which TRC could gain a foundational insight into THESL Auto-FLISR plans and current situation. THESL was able to provide various data in the context of this data request from which TRC was able to gain a view of THESL operations and technology approach to Auto-FLISR.

The initial data set, while high level, provided a view of how the control room is currently organized, how switching is currently conducted, and the potential future switching approach. Also provided were swim lane diagrams with representation of various technology projects relevant to the journey to Auto-FLISR, including power flow related data cleansing, a manual FLISR pilot, alignment with Hydro One for breaker control, and the Oracle NMS upgrade and testing.

This data set was augmented by the discovery meetings discussed in the next step.

3.2 THESL Discovery Meetings

In the initial project plan, it was intended that project workshops would be conducted with a broad population of THESL staff, representing both operational and technology responsibilities. Potential participants were identified during the kick-off phase of the project and a formal project kick-off briefing was conducted for these participants.

In discussion with the project team, it was determined that the initial workshop would be conducted as a discovery meeting with a key business operations lead, Ali Syed (Senior Manager – System Operations), and a key technology lead, Frank Ning (NMS Solution Architect). Both were able to provide knowledge of the current operational and technology aspects for switching operations and insight into the planned approach for moving to Auto-FLISR at THESL.

In total three discovery calls were conducted with Ali and Frank, supported by members of the project team, over a two-week period. Ali and Frank were able to provide clarity and context for the data discovery material and insight as to the FLISR operations, objectives, and technology dependencies.

During the discovery calls the swim lane diagrams were advised to be initial, dates to be developed/confirmed, and no formal project plans or regulatory filing documents in support of the approach has been developed. It did become clear from the material and discussions that there are three anticipated foundational aspects for THESL Auto-FLISR journey, the upgrade of the Oracle NMS 2.3 platform, the initial target service area for Auto-FLISR is the area known as “the horseshoe,” and the field deployment target is for an average of 2.5 Auto-FLISR capable switches per feeder.

3.2.1 Oracle NMS

The Oracle NMS 2.3 platform is currently staged in the corporate IT environment but accessible from corporate environment. NMS 2.3 has control capability that THESL does not utilize due to security concern. The intended upgraded is to Oracle NMS 2.6 combined with a re-build of the NMS platform in the secure corporate environment to allow for SCADA control, and to deploy on a high availability architecture.

The objective of the high availability deployment is for the upgraded NMS platform to perform with three nines reliability. According to THESL's latest design, this reliability criterion means that the system in

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

question will be available 99.96 percent of the time, which allows for less than 3 hours of downtime a year. This is a substantial improvement compared to the previous downtime of approximately 56 hours per year. The complexity of this system design requires the elimination of any single points of failure, the establishment of reliable crossover to redundant systems, and the implementation of rigorous failure detection measures. These approaches are typical for critical systems. It was identified that this performance criterion is to be established for the NMS platform and not to other non-operational input systems.

The target date is to have the upgrade to NMS 2.6 complete by late 2026.

The drivers for the NMS 2.6 upgrade include improving system's operational standard (including high availability, one operator GUI and better NMS patching experience, etc.), enabling the SCADA control in support of Auto-FLISR operations, and gaining synergies from undertaking these activities as an aligned and coordinated project.

3.2.2 Auto-FLISR Service Area

The targeted service area for the Auto-FLISR deployment, the service area known as the horseshoe, is a 27.6 kV supply in the northeast and northwest of the THESL service territory. The intention is to have deployed the minimum average of 2.5 switches to all feeders on the horseshoe service territory by 2029. Currently there are approximately 196 feeders that meet this criteria, 99 feeders with less than 2 sectionalizers and 36 feeders with no SCADA ties.

Two substations have been identified as the initial pilot locations.

A manual FLISR pilot is to commence at the two targeted substations as of August 2023. In this pilot the existing instance of NMS will be used to run FLISR switch sheets in real-time and these switch sheets will be compared bi-weekly with the actual switching approach that was conducted. This will create the opportunity to educate operators as to the FLISR output and to identify opportunities to improve the NMS output. NMS FLISR timestamps will be recorded and tracked to identify performance criteria for key elements of the NMS FLISR output. These two substations have also been used for a recent power flow study.

[redacted]

During the course of discovery conversations, it was identified that there is a significant amount of system control coordination with [redacted] Approximately thirty percent of circuit breakers are owned and operated by [redacted]. Parallel discussions are underway between THESL and [redacted] leadership as to how future control of [redacted] breakers by THESL may be enabled in the future. THESL provided in their technical project swim lanes representation of the potential to resolve the issues of [redacted] breaker control, including implementation and testing of a technical solution, prior to the commencement of the Oracle NMS upgrade project.

This is an aspect which may provide potential complexity to the deployment of Auto-FLISR at THESL. Due to the nature of the project being a high-level review of issues there has not been an opportunity for insight as to the potential scope and resolution of this aspect of THESL operations. However, it does warrant further review.

THESL is aware that HONI has also made some progress with Auto-FLISR and asked that TRC interview [redacted] in this context. The summary of TRC's interview findings can be found in section 3.3.3. Below is a summary of THESL's latest engagement status:

- THESL started discussion with [redacted] in 2022. A working level agreement with was reached with a Memorandum of Understanding (MOU) circulated (still needs to be signed) to form a technical and

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

operational working group between the two utilities to define the operational parameter and a scope of work.

- Working group sessions were initiated in April 2023. The two teams meet bi-weekly and are aiming to have requirements drafted by Sept 2023 and a Scope of Work (SOW) developed in October/November.
- THESL has historically had supervisory control of [redacted] assets. This was a legacy setup, that [redacted] continuous to retire.
- The working level agreement between the two companies, revolves around the following:
    - [redacted] will provide operating control for the FLISR application only. TH will continue to contact HONI for controller driven switching and planned work.
    - The breaker controls will be done for outage restoration only, and not a return to normal i.e., THESL will not be making any parallels between feeders without [redacted] consent.
    - The utilities will rely on ICCP for controls, similar to the existing setup with Hold-off requests.
- In parallel with the technical and operating discussion, legal/regulatory teams on both organizations are working on the regulatory arrangement and legal agreements.
- THESL expects a Scope of Work to be signed off by the end of 2023, with implementation in 2024.

3.2.4 Distributed Energy Resources (DERs) Integration

DERs are a new complexity likely to expand in presence and impact on the operations of electric systems. In the context of grid switching operations the potential for DERs such as solar, wind, storage, and electric vehicles (EV) to create power flow changes and to impact switching decisions, and protection schemes, is significant. DERs are an emerging area of consideration for Auto-FLISR operation and are an area which THESL is investigating.

The potential impact of DERs have not been investigated as a specific control aspect have not been considered in this high-level assessment. In general, utilities are considering both the risks and opportunities that will arise from expanded DER deployment in the context of grid operations, and the use of FLISR:

- Increased Complexity: High DER penetration potentially introduces bi-directional power flows. This increased complexity can pose challenges for FLISR implementation as the system needs to accurately identify fault locations, isolate affected areas, and restore power while considering the presence and behavior of DER related power flows.
- Communication and Coordination: With DERs integrated into the distribution grid, effective communication and coordination between FLISR systems and DER control systems becomes crucial. FLISR must be able to receive real-time information on DER operation and adjust its responses accordingly to ensure safe and efficient fault management.
- Enhanced Situational Awareness: DERs can provide additional data points and enhance situational awareness for FLISR systems. With the ability to monitor DER generation, voltages, and power flows at different points on the distribution grid, FLISR can make more informed decisions during fault detection, isolation, and service restoration processes.
- Improved Resilience: When properly integrated, DERs can enhance grid resilience by providing localized generation and storage capabilities. FLISR can leverage these DER assets to support quicker service

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

restoration by utilizing their power sources to re-energize isolated sections of the grid during fault events.

3.3 Utility Benchmarking

TRC identified utilities that would likely serve to provide useful insight and lessons learned for THESL's Auto-FLISR journey. The initial utilities targeted were [redacted]. During the course of conversations with THESL staff [redacted] and [redacted] were added to this group. TRC was also asked to provide insight to the Auto-FLISR operations at [redacted].

Key themes from the peer utilities benchmarking call included:

- Auto-FLISR Maturity: Auto-FLISR implementation has been perceived as an ongoing journey rather than a one-time endeavor for each utility. Note that there are no specific performance results over an extended period of time, however, all of the utilities remain committed to the journey. The maturity level of Auto-FLISR varied across different utilities and regions. The implementation and adoption of Auto-FLISR technology have been progressing steadily, but the maturity level can differ based on several factors such as Utility Size and Resources and Technological Advancements. The prevailing consensus is that Auto-FLISR will realize its intended benefits once it reaches a state of full maturity in its implementation.
- Data Accuracy and Quality: Auto-FLISR heavily relies on accurate and high-quality data from monitoring devices for fault detection and decision-making. Ensuring the accuracy and reliability of the data is essential to avoid false alarms or incorrect actions during fault events.
- Operational Training and Operation Confidence: Auto-FLISR implementation requires proper training for utility personnel to effectively operate and manage the system. Skilled operators must understand the high-level automation logic, data analysis, and coordination processes to ensure smooth operations. Apart from providing operational training, operation confidence can be built by involving operators during User Acceptance Testing (UAT), drawing insights from well-planned pilot projects, and addressing and resolving unique scenarios encountered during day-to-day FLISR operations.

3.3.1 [redacted]

[redacted] have advanced experience with the deployment of Auto-FLISR and while [redacted] uses the OSI platform rather than Oracle NMS, the insights from [redacted] are transferable across operations and technologies. OGE was generous with their time in making a key project lead available for interview and in providing briefing material to provide broad insight. This cooperation from OGE was augmented by TRC subject matter experts (SMEs) who have worked with [redacted] on various stages of their Auto-FLISR journey, both in the context of operational technology (OT) strategy and for key operational aspects.

Key take aways from the [redacted] benchmarking call included:

- Data quality, particularly for SCADA keys, very important.
  - OGE conducted a $30 million system data validation project.
- Consistency of procedure approach was key.
- Established a test laboratory (8 devices) before deploying further.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Testing needs to cover failure modes and be very deliberate around how Auto-FLISR fails.
- Auto-FLISR creates new challenges to old rules, for example operators have automation steps in their processes and confirmation of automation override/shut off steps when appropriate.
- Change management is an important point of focus for solution acceptance.
- Training of operators, field and IT staff needs to be planned and budgeted (O&M).
- ADMS and other system upgrades results in continual cost generation, both capital and O&M, to maintain a system which is heavily integrated and dependent on other systems for source data.
- Auto-FLISR software module cost was not large compared to recloser costs.
- FLISR overall "dramatically" improved performance.

3.3.2 [redacted]

PGE, who also use the OSI platform, was responsive to the request for a benchmarking interview and made several SMEs available who were able to provide a broad range of insight. Similar to [redacted] was able to discuss technology and operational aspects which are pertinent to any Auto-FLISR progression, including important lessons learned which have impacted the deployment of Auto-FLISR at [redacted].

Key take aways from the [redacted] benchmarking call included:

- [redacted] objective to improve SAIFI / SAIDI but safety a priority.
- System integrations are challenging.
- Focus on configurable functionality not customization.
- SCADA data preparation is a key factor.
- Split ADMS and OMS teams, and TSO and DSO teams.
- Transitioning from radios for device communication to Verizon VPN to omni-cellular (multiple carrier solution).
- Established a specific Change Manager role for ADMS and then Auto-FLISR acceptance.
- Conducted Just-in-Time training then experienced an unplanned deployment delay.
- Clear language key for communication between operators and field crew.
- Confidence in Auto-FLISR being disabled during field work is key – supported by operator training and system indicators.
- Load forecast is an 8-hour look ahead, objective to get to 24-hours but this slows solution execution.
    - The forecast look ahead is the duration for which the FLISR solution must solve, considering the expected load fluctuations over the period in question. A longer the duration to be solved the more complex the analysis and the longer it is expected to take the FLISR system to respond.
- Allow for additional recloser deployment and substation relay work, beyond simple upgrades.
- PGE established a FLISR laboratory test site and conducted field testing to gain confidence.
- Issues around functionality delayed the project.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

3.3.3 [redacted]

As noted in the prior section, [redacted] was identified during the THESL discovery discussions as a key relationship for THESL in the context of the Auto-FLISR journey. It was identified that there is considerable device switching coordination required between THESL and [redacted] with as many as 30 percent of substation breakers owned and operated by Hydro One.

HONI was contacted and responded to an interview request by making several subject matter experts available for an interview. As requested by THESL the issue of THESL operating [redacted] devices was not covered in the interview.

- HONI currently has Auto-FLISR scheme developed on eight 27.6 kV sub-transmission feeders out of two different substations. The eight feeders are modeled in SCADA and were migrated to DMS with FLISR profiles.
- HONI moved through two stages with the initial stage being the FLISR solution being provided to the operator to execute and stage two being Auto-FLISR.
- Intended to initiate Auto-FLISR from August 2022 but delayed due to operator concerns and need to conduct additional operator training. Additional operator training over a three-month period resolved issues in January 2023 and Auto-FLISR ran until March 2023.
- A five stage validation criteria on model fine tuning (Analysis Ready – AR) was set for critical review of a feeder for Auto-FLISR enablement.
- Auto-FLISR was taken offline in March 2023 due to an operational fault. FLISR correctly executed but it was determined that field devices were not correctly tagged in SCADA (devices set as switches not reclosers).
- The scheme is working as intended but [redacted] is having issues fine tuning data. The main issue is that the operators identified that the state estimation convergence criteria, which is required to perform within a 10 percent range, is not performing within range.
    - State estimation is the basis for building the real-time system model and is a static mathematical representation of the current conditions in an interconnected power network.
- The operators have a high sense of ownership for switching and are risk adverse, improving communication has been important to gain operator engagement.
- [redacted] does not have a significant history of automation and so change management / communication has been important to overcome resistance.
- [redacted] has not received resistance from field crews as yet, but communication needs to grow so field crews have a good understanding.
- Maintenance of automated devices has been an issue with twenty percent of automated devices not available at any one time due to maintenance issues, which puts the automated grid at risk.
- Field crews need to be trained to conduct different types of maintenance and to be scheduled in support of automated system operations.
- [redacted] is focused on improving SAIFI and SAIDI but also see Auto-FLISR as important to demonstrate capability to the regulator for [redacted] to be the Distribution System Operator (DSO). [redacted] is also focused on supporting DER growth.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- [redacted] currently attempts to auto-reclose three times but may add an additional reclose attempt to reduce the number of sustained outages.
- Auto-FLISR is seen as component of overall grid modernization effort and is what drives the value from foundational investments such as the DMS and SCADA enabled devices.
- [redacted] has moved from grid modernization discovery of a range of technologies to deployment of individual technologies with their own cost / benefit justification.
- [redacted] uses the Schneider Electric FLISR application as part of the Schneider v3.7 DMS platform.
- Significant costs have been SCADA enablement of devices and the DMS deployment. Other notable costs have included system upgrades, licensing, system studies and establishing FLISR profiles.

3.3.4 [redacted]

[redacted], which was also identified by Oracle as a good customer example of use of the Oracle NMS platform for Auto-FLISR, advised their openness to participate in an information session for Auto-FLISR. [redacted] has advised that they went to Auto-FLISR but then returned to manual FLISR mode due to data related issues. This has the potential to be valuable insight for THESL. Key take aways from the [redacted] benchmarking call included:

- Auto-FLISR ran for one year during which there were 30 Auto-FLISR events which generally successfully operated. The original benefits SDGE hoped to gain from Auto-FLISR was to improve SAIDI scores and to allow operators to focus on other matters while Auto-FLISR took care of more easily automated switching.
- Prior leadership was aggressive in deploying Auto-FLISR to networks on which it was not originally intended to operate.
- Auto-FLISR has been turned off for 5 years. [redacted] currently runs FLISR in manual mode, in that FLISR generates a result which the operator checks and then either executes their own switching solution or they can execute the FLISR recommended switching, both via NMS. Now operators are manually checking NMS FLISR outputs it is, in some cases, taking longer than it would without FLISR.
- Auto-FLISR was disabled for several reasons:
  - SCADA issues giving either false positives on device outages or RTU communications issues.
  - Oracle upgrade from NMS 2.3 to 2.5 caused issues. Oracle NMS 2.5 has many different elements to Oracle NMS 2.3 including a different power flow engine, with algorithm changes, and different processes for ingesting data such as weather.
  - SCADA system change from ACS to OSI
  - Network areas re-defined to more identified as high fire risk and so Auto-FLISR is not able to be used in these areas
- A heartbeat of RTU check process was put in place to better recognize RTU communication issues.
- The upgrade to Oracle NMS 2.5 has been a challenge and Auto-FLISR has been put on the backburner while this is resolved.
- Operators are not confident (“suspicious”) in the FLISR outcomes as a consequence of all of the issues.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- The NMS 2.3 power flow engine is based on the original OpenDSS system which was designed for offline study and not for real-time outcomes. This results in long-solution time as many iterations are run. While these are run other NMS services tend to slow down.
- NMS 2.5 is based on the single threaded architecture. [redacted] has heard Oracle 2.6 is multi-thread (TRC team were able to confirm this is what Oracle has told).
- [redacted] uses the NMS Fault Location Analysis (FLA) as a separate function from FLISR. FLA focuses on the most accurate location for the fault so crews patrol time can be reduced, very important to SDG&E for fire areas.
- [redacted] note that FLISR only identifies location in the context of the nearest switching device to operate, not to the specificity of FLA.
- Prior to originally deploying Auto-FLISR, [redacted] ran 1,700 test cases to test switching recommendations. They did not create a test laboratory environment. They assumed devices would work as expected.
- [redacted] is aware that utilities like Louisville and [redacted] (Australia) run during storms but noted that both have fewer SCADA devices and not as many set points.
- Cost – [redacted] highlighted that investment in communication infrastructure/bandwidth is an area of focus they recommend as SCADA device communication has been an issue.
- Costs – [redacted] highlighted the need to budget for staff to create, test and check models is important.
- Costs – [redacted] highlighted the need to prepare for system upgrade costs.

3.3.5 [redacted]

[redacted] Australia was identified by THESL as a utility of interest. Oracle was able to provide an amount of insight. UEC is currently running in Auto-FLISR mode. As a representative example they managed six events over three weeks via Auto-FLISR. One event was executed successfully in automatic mode, one event correctly terminated due to adverse conditions on the network, and for four events no solution was possible due to faults being at the end of the feeder.

For the one event that ran successfully in Auto-FLISR mode customers were restored 40 seconds after outage. Oracle advised the following transaction timings:

- 10 seconds wait for demand scan to complete.
- 1 second for FLISR to find the solution.
- 2 seconds to create and start executing the switch plan.
- 27 seconds to execute the steps in the plan that led up to the re-energization of customers.

[redacted] was contacted and responded to an interview request by making several subject matter experts available for an interview. The interview was also joined by THESL's system operations manager for Q&A. Below are the key takeaways:

- [redacted] has been guided by the principle that Auto-FLISR should be quicker while adhering to the controllers' established practices.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Prior to the implementation of Auto-FLISR, [redacted] had a large number of distribution automation devices in operation. On average, there were 1-2 SCADA controlled devices, excluding the tie switch, for early auto-FLISR adoption, and currently 2-3 SCADA controlled devices per feeder.
- The introduction of Auto-FLISR has notably improved reliability, reducing fault response time from 10-30 minutes (manual) to less than 1 minute. Though [redacted] has adjusted their momentary criteria to 3 minutes recently, their aim remains a 1-minute operational time. On average, the entire process took around 45 seconds, with approximately 15-20 seconds allocated for fault detection, demand scanning from NMS, and resolution time, along with an additional 20-40 seconds for command issuance.
- Efforts have been dedicated to enhancing communications, including upgrading device firmware and standardizing configuration settings.
- Currently operating on NMS 2.5, FLISR is employed on [redacted] high-voltage (HV) network model rather than the low-voltage (LV) network.
- While the initial release of Auto-FLISR functioned on legacy kVA mode, which was deemed highly successful, [redacted] has shifted to kVA mode and is transitioning to full power flow mode. This transition results in approximately 40 seconds of the solution time.
- The adoption of power flow mode is driven by UE's intention to utilize more PF-based applications such as Fault Location Analysis (FLA).
- Significant cost components include field work (estimated at 2 - 2.5 million) and NMS upgrades.
- [redacted] opted for a comprehensive deployment of auto-FLISR, enabling its activation circuit-wide once the confidence period had been successfully navigated.
- Scenarios warranting the disabling of auto-FLISR encompass live Line work, bush fire days, and sensitive earth faults.
- The average turn around time for updating GIS model is 2 days.
- Auto-FLISR has been turned on even during “grey-sky” conditions due to the outweighing benefits over associated risks.
- A risk assessment workshop was conducted across different organizational sectors including control room, asset management, and protection.
- Key lessons learned emphasize the importance of meticulous attention to detail. Unique challenges may arise for each circuit, making precise configuration of protection and fault Indicator settings crucial for successful FLISR operations. UE conducted a comprehensive office review to address these aspects.

3.3.6 [redacted]

[redacted] is another Ontario based utility that was identified as a good interview target during the THESL discovery meetings. Alectra was contacted and agreed to a meeting, but as of writing a time for the interview has not been scheduled.

[redacted] advised that they have some experience with FLISR in their “east region,” but the solution is currently de-activated due to an issue in their SCADA system. [redacted] advised that they previously operated FLISR in semi-automatic mode and did not transition to fully automatic mode.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

3.3.7 Other Utilities

[redacted] was identified by THESL as a utility of interest Oracle was able to provide an amount of insight. FirstEnergy conducted a wide ranging ADMS deployment project to deploy the solution across five US states and ten operating companies. The project commenced in 2019 with Go Live millstones for ADMS and FLISR set for Q3, 2022. Manual FLISR is in production on 200+ feeders. In this manual mode suggested switching is provided but not automatically initiated. [redacted] are analyzing the events generated and they also run a Loss of Voltage functionality in production for both substations and feeders.

[redacted] was able to make an operational resource available and email exchange with their technology lead confirmed that while [redacted] uses Oracle NMS it is focused on outage management and is not leveraged for Auto-FLISR. [redacted] has isolated automatic switching on their radial system but not an Auto-FLISR model.

3.4 Oracle Interview

An interview was conducted with key Oracle team members in the context of THESL's intended upgrade for the Oracle Network Management System (NMS), which is intended to be the foundational technology platform for THESL's Auto-FLISR operations.

The Oracle team were able to provide insight as to the status of THESL's current deployment of NMS version 2.3 and the issues and opportunities associated with the upgrade to NMS 2.6 in the context of future Auto-FLISR operations. It was a key point of focus for the Oracle team that THESL should be encouraged to act on the upgrade of NMS 2.3 to NMS 2.6 as a matter of priority as NMS 2.3 will move to a limited support mode, called sustained support, as of December 2024.

The Oracle team also noted that the objective of solving and executing switching solutions in under one minute will be challenging. It was identified that based on studies to date this will require Oracle NMS to establish the switching solution in 15 seconds.

In the context of the upgrade in general the Oracle team noted that the THESL deployment of NMS 2.3 has what Oracle would consider to be a high level of customizations. It was noted that some of these customizations were deployed to delay the need for an upgrade from NMS 2.3 and Oracle identified that NMS 2.6 provides increased configuration options which THESL can leverage. Oracle stressed that should THESL decide to carry forward current NMS 2.3 customizations they would need to be rebuilt in NMS 2.6 which would complicate the upgrade. More detail is provided in this regard in section 5.6 of this document.

In addition to the points around support, Auto-FLISR transaction time, and customizations, the following are key elements from the Oracle interview:

- Establishing data for the manual FLISR pilot has been a key factor.
- Oracle has provided THESL with a "cheat sheet" of the key data needed for a successful FLISR output.
- Oracle has identified the prioritization of the data by its impact on the quality of the FLISR result, and how missing data will impact the FLISR outcome.
- NMS 2.6 will be simpler, less complex, and more powerful than NMS 2.3 with a dedicated power flow engine and various processes running in parallel and more efficiently resulting in quicker processing speed.
- 2.6 manages data in a better manner than 2.3 and does not share services for functions.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Performance in a higher security zone may be expected to be slower if transitioning security layers however the build of the new environment will create the opportunity for deployment of new servers with improved processing.
- Auto-FLISR can be run in NMS 2.3 but only if deployed in secure zone with SCADA control.
- Oracle recommends manual mode testing of FLISR in NMS 2.3 be expanded to more than only two substations so more edge cases can be identified and tested in manual mode.
- Oracle estimates a standard upgrade to NMS 2.6 to take one year to 18 months but note that the following factors add to the complexity and required time for the upgrade:
  - Building in a secure control environment.
  - Extent of data cleansing and ETL issues.
  - Amount of customization.
- Oracle advised that THESL have identified 15 to 20 NMS 2.6 enhancements (customizations), not Auto-FLISR related, which are not on the NMS roadmap.
- NMS 2.6 has an extensive set of business rules (called SRS) which allow for considerable configuration flexibility.
- Oracle recommends aligning to product configuration to mitigate upgrade timing, complexity, and cost risk.
- Oracle notes that acceptance of "out of the box" use of systems is a strategy emerging with many utilities and that THESL is potentially following this strategy with their Oracle Customer Care and Billing (CC&B) upgrade.
- Oracle does not believe any new cyber risks as being introduced by NMS 2.6.
- Oracle believes THESL may be a head of some of Oracle's other customers by having a project team with a depth of Auto-FLISR knowledge on the project team.
- Auto-FLISR is included in the overall NMS 2.6 licensing.
- NMS 2.6 can be run in FLISR manual mode where NMS produces the switching solution but waits for operator approval before executing the solution in NMS.
- Oracle identifies that testing can be improved with the inclusion of a real-time SCADA feed to the test environment so edge cases can be found and tested.
- Oracle identified San Diego Gas and Electric (SDGE) as an example of a good NMS Auto-FLISR deployment.

3.5 Observations on FLISR Benefits

Overall, Auto-FLISR offers potential benefits in terms of faster power restoration, improved reliability, enhanced grid resilience, operational efficiency, and increased customer satisfaction. By leveraging advanced automation and smart grid technologies, Auto-FLISR helps utilities respond more effectively to outages and maintain a more reliable power supply. Quantifying the specific benefits of Auto-FLISR can be

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

challenging as they depend on various factors such as the specific implementation, network configuration, and operational context.

The utilities interviewed for this assessment have generally considered Auto-FLISR within the context of overall grid modernization type strategies and while there is consistency in the desire to improve SAIFI and SAIDI scores, and to increase field work efficiency via accurate fault location (note that Oracle FLISR and Fault Location Analysis are separate modules unlike OSI or SE ADMS products), definitive improvement goals for these elements have not been established specifically in the context of Auto-FLISR. There is also a theme of a foundational drive to improve situational awareness and automation where appropriate across their business.

In seeking to gain insight into benefit metrics, TRC sourced commentary of FLISR related benefit findings beyond those utilities interviewed. Following are the insights gained:

- Reduced Outages and Momentary Disturbances: Florida Power & Light (FPL) utilized automated feeder switching and FLISR operations to reduce customer interruptions and momentary disturbances: 9 operations serving almost 16,000 customers led to more than 9,000 fewer customer interruptions and approximately 2,500 fewer upstream momentary disturbances. FPL also achieved a significant increase in annual customer minutes of interruption avoided. This leads to benefits like convenience, cost savings, and avoidance of medical and safety problems for residential and commercial customers.[1]
- Reduced Outage Minutes and Increased Member Satisfaction: FLISR actions, such as automated feeder switching, contribute to reducing the number of customers affected by sustained outages and the duration of outages. Pacific Gas & Electric (PG&E) in its 2020 Smart Grid Annual Report[2], identified that Customer Reliability Benefit for FLISR since inception (2014) is $1,320 million, with 472 million customer minutes avoided, as well as approximately 35% Customer Minutes of Interruption (CMI) improvement on 5-year average outage minutes basis.

  In comparison, the Rural Electric Cooperative Smart Grid Benchmarking Report mentioned that FLISR implementation led to a significant reduction (average 10%) in outage minutes reported by members and that members expressed higher satisfaction (with 65% of participating utilities giving a 5-star rating) due to improved reliability.

  The following chart is a summary provided by the Rural Electric Cooperative of their results.

[1]Source: Distribution Automation – Results from the Smart Grid Investment Grant Program (https://www.energy.gov/sites/prod/files/2016/11/f34/Distribution%20Automation%20Summary%20Report_09-29-16.pdf)

[Triangle indicator for weighted average of the responses]

In the EPRI DA/FLISR State of Industry Survey, provided by THESL, which collects data from 48 respondents worldwide, it is identified that DMS With FLISR system contributes to approx. average reduction of SAIDI by 25%. Often, the benefits of FLISR and Distribution Automation (DA) can become intertwined, especially for utilities with existing DA devices in the field. This is evident in the EPRI report, where most participating utilities already possess Distribution Automation. Therefore, the adoption of Auto-FLISR is seen as an incremental improvement. However, this is not the case for THESL as the distribution automation deployment is still at its early stages, leading to possibly greater benefits (e.g., SAIDI reduction) from Auto-FLISR implementation than the industry average.

Overall, it is important to note that the specific quantification of FLISR benefits will vary depending on the utility's circumstances, the extent of FLISR implementation, and the available of data for comparison.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

4 Potential Timeline

4.1 High-level Potential Timeline

TRC has reviewed the material available on THESL's potential Auto-FLISR timeline and related projects. Insight was also gained from the experience of the benchmark utilities, Oracle and TRC's own project experiences.

The foundational project to the deployment of Auto-FLISR at THESL will be the upgrade of Oracle NMS and the deployment of the platform in the higher security control environment, supported by high availability architecture. Oracle identifies that a typical NMS upgrade takes 18 months but has noted that the THESL deployment is more complex than the norm due to the high amount of code customizations. TRC believes that the complexity of the move to the higher security environment with the high availability architecture argues for a more conservative timeline of 30 to 42 months. Under the worst-case scenario, the NMS 2.6 could be nearing the end of its support cycle once the Auto-FLISR implementation is finalized.

Mitigation to the NMS upgrade schedule impact will be early identification and prioritization of the design elements of the system, expected performance criteria and reduction of system customizations.

There are various activities that are part of any technology deployment, for example planning, design, build, and testing. Each aspect of these can have risk to their execution time and require a dedicated project team of both business owners and technology staff to be successfully executed.

The fact that the platform is to be built in the higher security environment will provide a higher level of cyber security than applied to a typical corporate IT environment. This can be expected to add complexity, and potentially time, to the platform design and build. However, the deployment of technology platforms in a secure operating environment is a known process (similar to what THESL currently has for SCADA) and can be mitigated with effective planning and the deployment of resources with experience building technology in these environments.

THESL has two projects which could potentially impact the Oracle NMS upgrade in the context of the Auto-FLISR functionality. These are the SCADA upgrade and the [redacted] Breaker Control agreement.

The SCADA upgrade is one significant undertaking. TRC has not reviewed the detailed plans for this upgrade, but our understanding is that the SCADA upgrade project is to be completed prior to the NMS upgrade project starting. We recommend that the SCADA upgrade team be advised of the objective of NMS control of SCADA devices so they may plan accordingly. Integration of these systems will be key to the success of the Auto-FLISR deployment and so close coordination between the projects will be important and potentially resources working on the SCADA upgrade can be deployed to support the NMS integration and can potentially be considered as an additional SCADA upgrade phase.

[redacted] Breaker Control agreement will impact the scale of Auto-FLISR rollout. The exact level of the potential impact of the [redacted] Breaker Control agreement is not known at this time but with a level of clarity expected to be gained by the end of 2023, insight as to potential impact, and the potential to plan for this, should be available well in advance of the NMS upgrade planning.

A common issue identified from the utilities who have deployed Auto-FLISR is the requirement for quality data. This is both in the context of existing data and for a process to ensure the quality of new data inputs, both of these are covered under the term data quality. In any integrated technology the Extract, Transform, Load (ETL) process is complex and not fully appreciated by those generating the original source data input, quite often in a system somewhat distant from an end goal such as Auto-FLISR.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Fortunately, THESL has planned an initial FLISR pilot commencing in August 2023 where the switching outputs from the current NMS system will be compared to the switching plans executed by operators. It is likely this pilot will surface data quality issues and create real-life examples to inform data correction and education. THESL already has a data "cleansing" project planned as part of the manual FLISR pilot and is expected be effective as it will be informed by the outcomes of the FLISR pilot. Conducting these activities prior to commencement of the NMS upgrade will provide insight as to the design of the system for data acquisition and will reduce data related delays during the upgrade project.

If conducted in a broad, collaborative, and transparent fashion the FLISR pilot will also provide a starting point for the change management process. Commencing the change management process prior to the NMS upgrade is another aspect which will mitigate potential design and acceptance delays in the NMS upgrade. Not only will potential procedure changes be able to be discussed in advance of system design meetings but knowledge exchange, and relationship building, between project stakeholders will serve to mitigate communication issues which are the most common point of failure for any technology project. It should also be noted that Oracle identified a fundamental understanding of Auto-FLISR across the project team as an opportunity to improve the NMS upgrade project execution. As it stands, THESL has a dedicated and independent change management team engaged in the NMS upgrade project.

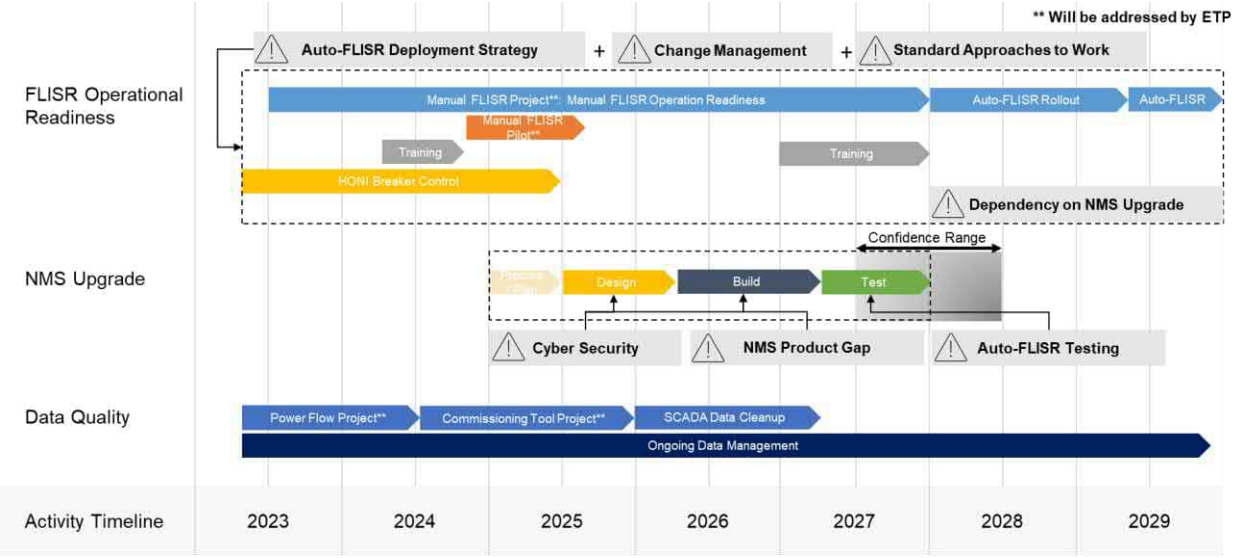
4.2 Deployment Sequencing

The sequencing of major activities is informed by dependencies, the ability of an activity's timing to impact the project success and opportunities for parallel activities to shorten an overall outcome time.

THESL is seeking regulatory approval in order to undertake the activities to enable Auto-FLISR. It is expected that this approval will be for both the field devices and the NMS technology platform upgrade. This regulatory process is expected to take place during the course of 2024 with a decision expected prior to commencement of a new rate period as of January 1, 2025.

Subsequent to regulatory approval THESL will be able to progress with the procurement elements of the Auto-FLISR project. While some of the procurement activities may be able to commence prior to the rate period THESL will not be able to issue any Request for Proposal (RFP) or contracting activities until after the regulatory approval.

As noted above the SCADA upgrade is due to complete prior to the NMS upgrade. It is also recommended that the [redacted] Breaker Control agreement be completed prior to the NMS upgrade project.



The FLISR pilot scheduled to commence in August 2023 is a sound approach by THESL, and not only will it inform the NMS upgrade, data quality, and change management but it can be expected to provide insight valuable to the regulatory filing and procurement activities.

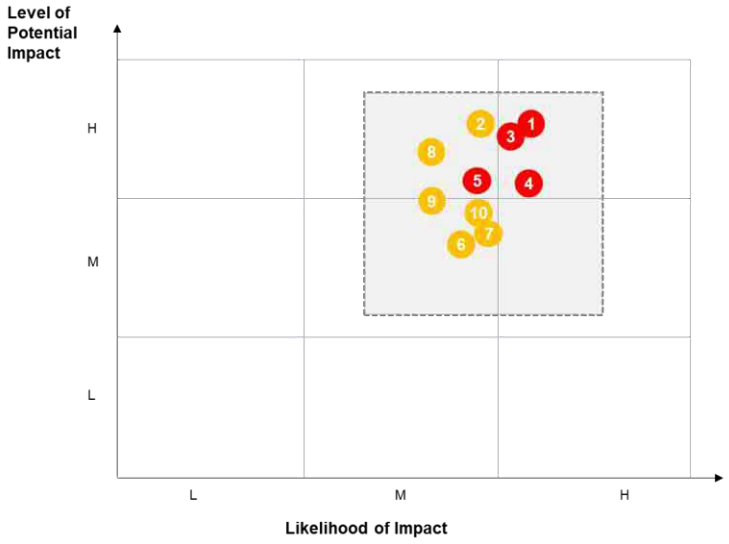
While the data improvement process has already begun it should be expected to be an on-going process that will most like continue in parallel to all other activities and subsequent to the initial Auto-FLISR deployment, as operational experience is likely to create know inputs.

Another parallel activity which will be most important, and most likely the most expensive element, of Auto-FLISR capability will be the continued deployment of remotely controllable switches to allow for greater switching flexibility. THESL's objective is to get to an average of 2.5 controllable devices, with a minimum of 1.5 controllable devices, on each feeder in the horseshoe service area by 2029. Currently there are approximately 196 feeders that meet the 2.5 sectionalizers criteria, 99 feeders with less than 2 sectionalizers and 36 feeders with no SCADA ties.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Based on the information above the following is a representative high-level time for the Auto-FLISR project at THESL.

[**NMS UPGRADE/AUTO-FLISR IMPLEMENTATION** – SCHEDULED BASED ON THE MID-POINT OF THE ESTIMATED DEPLOYMENT TIME RANGE. THE RANGE IS 30 TO 42 MONTHS AND THE MID-POINT IS 36 MONTHS.]



This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

5 Risks and Mitigations

In the sections below items are identified which will to some extent result in an impact to THESL's journey to Auto-FLISR, and subsequent operation of the solution. The insight into these items have been derived from the activities identified earlier in this document. Due to the nature of the investigation these are provided as high-level insights and should be considered as directional rather than definitive.

While all warrant further detailed consideration they should provide a strong basis for consideration of more significant risks that may arise and how these risks may be mitigated. While certain risks are inherently inter-related (e.g., #2 and #4, #6 and #7), it remains crucial to classify them as distinct risks. This approach enables THESL to implement targeted measures more effectively and address each risk with greater attention.

For ease of reference the following table provides a summary of the risk items and the Auto-FLISR aspect which they may impact, to what potential level, and the mitigation difficulty.

#	Risk Item	Category	Difficulty of Mitigation
1	Auto-FLISR Performance	Performance	High
2	Dependency on NMS Upgrade	Schedule	Medium
3	Data Quality	Schedule, Cost, Performance	High
4	NMS Product Gap	Schedule, Cost, Performance	High
5	Auto-FLISR Testing	Schedule, Cost	High
6	Standard Approaches to Work	Schedule, Safety	Medium
7	Change Management & Acceptance	Schedule, Cost, Performance	Medium
8	Operational Safety	Performance, Safety	Medium
9	Cyber Security	Schedule, Cost, Performance	Medium
10	Auto-FLISR Deployment Strategy	Schedule, Performance	Medium

5.1 Auto-FLISR Performance

Likelihood	High
Impact	High – Performance
Difficulty of Mitigation	High

5.1.1 Description

As with any investment it is important to correctly appreciate the expectations for the outcomes or benefits that will result from the investment. This is no different for Auto-FLISR. The primary risk identified is the consistent achievement of the intended 60-second Auto-FLISR performance.

Auto-FLISR is a tool which is expected to complement the operations of the electric system to minimize the extent and time that customers are exposed to the loss of electric supply. Based on pre-set algorithms the Auto-FLISR solution is intended to quickly determine the location of the fault, isolate the location of the fault

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

and return service to as many customers as possible. THESL has the goal of solving for these objectives within a period of sixty seconds or less, which results in the incident being considered a momentary outage rather than a sustained outage in the context of performance reporting.

There are many elements that will impact the ability to conduct the required steps in the prescribed time.

Working in cooperation with Oracle, THESL has identified a best-case timeline where a restoration via Auto-FLISR can potentially be expected to be around the 55 second mark. This will be made up of the following components:

- 5 seconds for lockout message.
- 15 seconds for demand scan (Note that Demand Scan in the Oracle Operating Manual is not currently supported in THESL's NMS product).
- 15 seconds for FLISR solution.
- 10 seconds to block reclosers, and isolate.
- 10 seconds to confirm isolation and send restore commands.

The Oracle team identified that the time allocated to NMS to complete the required transactions (solution time) is 15 seconds which is considered challenging. It should be noted that the utility use cases that Oracle references as the most robust Auto-FLISR deployments on their platform are in the United States (US) where a momentary outage is considered under five minutes. The solution time is measured from when the recloser first opens to the time that the Auto-FLISR platform identifies and performs the switching. Benchmarking with [redacted] and [redacted] and other informal enquiries, has identified that their Auto-FLISR solution timing ranges from 90 seconds to three minutes.

The complexity of the solution to be calculated considerably impacts the potential solution time. The complexity is a result of factors such as the following:

- Circuit topology (# of feeders and devices),
- Device status validation time,
- Adjacency to and leveraging of other circuits as part of the solution,
- Post switching plan protection validation,
- Number of switching plans to be run,
- Forward forecasting time for which the switching plan is to solve.

[redacted] noted that their most complex cases can take up to 10 times longer to solve than their less complex standard cases.

The overall solution time can then be further impacted by communication latency and demand on compute resources if a major event requires many simultaneous solutions and actions to be conducted. It should be noted that some utilities may turn off Auto-FLISR during major events due to the constant change of the network and as standard indices may not apply.

In addition to timing, the ability to segment the grid or tie in other supply pathways creates the flexibility to reduce the number of customers impacted. If there are limited controllable devices available on the circuit to isolate the fault the overall potential of Auto-FLISR will be mitigated. This results in a situation where a less impactful solution will run quicker than a solution with the potential to be more impactful.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

It should also be noted that the introduction of distributed energy resources (DERs) adds further complexity to the potential switching approaches and fault solutions. The industry is not yet well advanced in solving for the complexity of DERs via Auto-FLISR and typical solution timing for such are not known.

While Auto-FLISR is an important tool to demonstrate to stakeholders such as customers and regulators THESL's commitment to mitigate the impact of service outages, and certainly [redacted] confirmed that Auto-FLISR "dramatically" improved their performance, particularly in response to storm events, it will be important to not create expectations and/or goals which cannot be met.

5.1.2 Likelihood and Impact

The likelihood of the risk is considered as high for the following reasons:

- In peer utility interviews, it was observed that only 2 utilities ([redacted] and [redacted] during pilot phase) consistently achieved the 60-second target for Auto-FLISR performance.
- The THESL team has not fully explored the complexities of the solutions and communication latency.
- The Oracle team's experience in assisting THESL to achieve the 60-second performance target appears to be limited. In addition, the 55 second target is best-case, implying that there are more cases that are not less than 60 seconds.

The impact of the risk is considered as high in the performance category for the following reasons:

- The risk factors mentioned directly impact the system performance and the expectations that should be set for business units during the Auto-FLISR implementation journey.

5.1.3 Mitigation

Set clear expectations – Clear expectations should be set for what an Auto-FLISR will be able to improve and what may limit these benefits. An Auto-FLISR solution is not a panacea but rather a tool that if correctly deployed will support the expedited return of customers to service.

There may be circuits which have less complexity, essentially fewer options, than other circuits and so these circuits have a higher potential of resolution within the target time than other networks with more complexity. Being able to understand and explain the performance expectations based on the different circuit topology is important. THESL plans to target two pilot circuits with THESL breakers for Auto-FLISR, and the complexity of these circuits should be considered for performance expectations and the likely comparative Auto-FLISR performance as deployment of Auto-FLISR expands to other circuits with different complexity. It may be informative for THESL to deploy to a complex and a less complex circuit to provide some comparative insight.

Consider multiple attempts to reclose – As the initial step in fault response, we note that THESL currently conducts only one reclose attempt before the recloser locks out. Events such as tree contact are the most common reason for transient faults for above ground systems and as a consequence it is industry common practice to conduct two or three reclose attempts before lock-out. THESL is in the process of moving to two recloser attempts instead of one. Another common practice is to program the recloser for what is known as a single-phase trip / three phase lockout which can reduce events on unaffected phases. Reducing the number of transient faults that are treated as a real or sustained outage will reduce the demand on the Auto-FLISR system. Nevertheless, the recloser settings should be driven by THESL's business unit (i.e.: system

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

operation and protection team) considering both the need of coordinating FLISR operation and the best practice for improving system reliability for THESL.

Verify communications – To maximize the performance of Auto-FLISR THESL should also ensure that there is a formal process to run daily validation of the communication status of devices and to proactively resolve any issues identified.

Consider sizing infrastructure for high impact – Shared resources, such as compute and communications, are normally sized to perform at the target transaction speed during predetermined conditions. In most cases these predetermined conditions are not high impact, low frequency events. Many utilities have experienced difficulty during unanticipated extreme events as a consequence. THESL should either size infrastructure and develop redundant pathways for high impact, low frequency events or manage the expectations of the ability of the Auto-FLISR solution to perform at the optimal level during such events. A goal of a percent of Auto-FLISR resolutions within one minute should be informed by such inputs.

Consider different solution plans – Simplifying the solution plan will reduce compute time but this may be at the cost of the number of customers that can immediately be returned to service. In this context a clear priority needs to be established so logic can be designed in an appropriate fashion. THESL may be able to investigate with Oracle whether the NMS 2.6 platform allows for a two-step switching solution where optimized solutioning is conducted to meet the response time criteria and then a secondary approach is deployed to return additional customers, even if the return of this additional customer set may be after the one-minute target time.

Considering all the aspects mentioned above, the difficulty of mitigations is regarded as high. This is due to the need for resolving engineering details to optimize performance and concurrently managing expectations for performance as THESL progresses on its Auto-FLISR journey.

5.1.4 Key Recommendations

- Set clear goals and expectations.
- Evaluate performance expectation and FLISR implementation complexity of each feeder. (e.g., is 60s achievable for any specific feeder? What is the expected performance for each feeder?)
- Identify key internal and external stakeholders and establish an education/communications plan.
- Review approach to transient faults and number of reclose attempts.
- Identify circuits by complexity, and by association target Auto-FLISR performance criteria.
    - Complexity may be represented by such as length of the circuit, number of devices to be operated, and diversity of customer operations.
- Communicate where Auto-FLISR is deployed or not deployed.
- Establish device communication status review process.
- Establish transparent performance reporting and goal setting.

5.2 Dependency on NMS Upgrade

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Likelihood	Medium
Impact	High – Schedule
Difficulty of Mitigation	Medium

5.2.1 Description

A foundational aspect of THESL's journey to Auto-FLISR will be the upgrade of the Oracle NMS platform from the current NMS version 2.3 to version 2.6. NMS will then be configured to enable control of SCADA devices, and as a consequence will be moved to the more secure control environment. This will be a complex undertaking. The complexity of this upgrade will increase your Auto-FLISR schedule risk. TRC's experience indicates that NMS upgrades and implementations are complex endeavors and clients typically accept schedule delays in lieu of compromises elsewhere in the project. Compromises such as scope and business process changes.

Enabling and testing SCADA control configuration from NMS is identified as one of the most important dependencies for THESL's Auto-FLISR implementation. It is THESL's intention to move to the configuration, testing and deployment of Auto-FLISR only after the NMS upgrade, environment relocation and SCADA control is successfully deployed in production for operation. The intent is that enablement of Auto-FLISR operations will be a distinct phase of the NMS upgrade project.

The planned NMS upgrade requires THESL to redesign its current system architect and build a new platform environment in a secure zone, and to design with high availability architecture. Integration to key systems will also be of great importance and system integration is an aspect of Auto-FLISR that [redacted] identified as having been challenging. This undertaking inevitably will introduce more complexity in planning and preparing the test cases across identified NMS use cases, especially as the THESL NMS team will be working with new environment conditions. The combination of a software upgrade, new functionality, and a significant infrastructure architecture change will increase the risk of the project getting delayed and delaying the Auto-FLISR go-live.

Oracle has also noted that the current NMS 2.3 deployment is highly customized which further complicates the planned upgrade. We discuss the issue of customizations further in section 5.6.

[redacted] noted that they have the Oracle NMS platform for OMS. [redacted] split their OMS and ADMS team with the ADMS (using the OSI product) in the secure CIP zone while OMS remains in the corporate environment managed by a specific OMS team. PGE was concerned with the challenge of training operators on NMS in addition to the other changes and so keeps this as a separate function. OGE mitigated this risk by moving to a single pane of glass and one system for DMS, OMS, and D-SCADA.

It is common among utilities to first gain confidence by putting NMS-initiated SCADA control into daily operations for some time before enabling Auto-FLISR. There are process changes to be managed once the SCADA control from NMS is enabled, such as the operation process, device commissioning process, and NMS IT-related process, such as increased security monitoring, alarm management, and fault resolution. In this context the transition to Auto-FLISR is a distinct phase after the completion of the NMS upgrade and once SCADA control has been established.

It is quite often the case when technology projects are late against deployment schedules or trending over budget that project elements are reduced or changed to meet amended targets. While THESL will have much to consider should such a situation arise, the impact to the timing and performance of Auto-FLISR should be considered.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

5.2.2 Likelihood and Impact

The likelihood of the risk is considered as medium for the following reasons:

- THESL is actively involved in the NMS upgrade planning, but the scope and exit criteria for NMS core and Auto-FLISR testing as separate release phases are yet to be specified.
- The manual FLISR project will provide THESL with more clearly defined requirements for the NMS 2.6 design phase.
- Constructing a new platform environment in a secure zone with a high-availability architecture is a novel undertaking for THESL.
- The likelihood of the risk is assessed based on the adjusted NMS upgrade schedule estimates, which fall within a range of 30 to 42 months.

The impact of the risk is considered as high in the schedule category for the following reasons:

- As discussed in section 4.1, the TRC team estimates that the NMS upgrade will take between 30 to 42 months to complete, and the enablement of Auto-FLISR depends on the NMS 2.6 go-live. Therefore, the risk is considered high due to the complexity of the NMS upgrade mentioned earlier.

5.2.3 Mitigation

Set NMS Upgrade project dependencies for Auto-FLISR – The scope and project detail of the NMS upgrade and enablement of SCADA control is foundational to the enablement of Auto-FLISR. The expectation should be set that the NMS upgrade and SCADA control is a schedule dependency for the deployment of Auto-FLISR.

The NMS upgrade and Auto-FLISR implementation project will have a comprehensive set of requirements, dependencies, and objectives. The deployment of the new system will also be complemented by new business and technology processes. The elements of the project and processes which track to Auto-FLISR enablement should be identified and tracked. If project decisions are anticipated which will impact these elements the Auto-FLISR leads should be engaged.

We discuss further below the benefits of process standardization and avoidance of customization and note that any technology deployment is helped by simplifying the processes that the technology will support.

Set Auto-FLISR as goal of NMS Upgrade – Due to the dependency of Auto-FLISR on the NMS upgrade with SCADA control enabled we recommend that Auto-FLISR is identified as a specific NMS go-live project goal so connection to the FLISR functionality remains clear and is a success criterion for the NMS upgrade and SCADA control project team. This will also allow for clear tracking of project schedules should there be delays to dependency tasks.

The difficulty of mitigation is considered as medium since the action items primarily revolve around project planning activities.

5.2.4 Key Recommendations

- Identify key project elements and processes which impact Auto-FLISR.
- Leverage learnings from the FLISR pilot in project planning.
- Establish Auto-FLISR functionality as a key project goal.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

5.3 Data Quality

Likelihood	High
Impact	High – Schedule, High – Cost, High – Performance
Difficulty of Mitigation	High

5.3.1 Description

Data quality has been identified as one of the key activities for successful Auto-FLISR implementation. The data quality should cover both data maintained by operational teams, including connectivity models, network model parameters, SCADA data, and other data collected via IT system integrations. Below is a high-level breakdown of Auto-FLISR data requirement based on our current-state analysis for THESL:

Data Category	Impact to Auto-FLISR	Level of Confidence	Level of Mitigation
Connectivity Model	High	High	High
Engineering Data (Impedance, Loading info…)	Medium	Medium	High
Operational Data (Fault Current, Lockout Status…)	High	Medium	Medium

- Connectivity Model: Data quality issue includes problems related to unknown or incorrect transformer connections, consumer-to-transformer connectivity, voltage level discrepancies, partial energization, inconsistent phases, non-existing loops, parallels, and breaks in the network.
- Engineering Data: This category of data quality issue directly impacts the power flow results. It involves inaccurate SCADA reading positions, unknown or incorrect element catalogs or parameters, inaccurate load information (e.g., transferring load from the adjacent feeder), inadequate load profiles, low average annual power values, incorrect status of generation units, inaccurate capacity ratings, and missing load data (load or consumer transformer data not imported).
- Operational Data: Data quality issue includes Inconsistencies in fault indicator SCADA readings, such as duplicate phases, number of signals, or signal existence, and inconsistencies in fault amplitude SCADA readings, including duplicate phases and number of signals.

Both OGE and PGE identified that data quality was a challenge in their Auto-FLISR deployments as gaps or inconsistencies in data impacted the effectiveness of the Auto-FLISR operation. The data comes from a range of sources with a spectrum of parties responsible for the data, which transits via various IT systems.

THESL is seeking to mitigate its data quality issues with data cleansing projects. The extent of this activity, the ability to maintain the quality and consistency of new data, and whether the standards for data quality are set at an enterprise level will be an important consideration. [redacted] advised that they undertook an extensive system-wide data validation project which cost in the range of $30 million . This project verified

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

the connectivity and impedance model (wire sizing). The data from the field verification was critical for load flow to operate, which was the foundational component Auto-FLISR and Integrated Volt VAR Control.

Without a strong data quality approach there will likely be a higher percent of data gaps and inconsistencies that will reduce the effectiveness of Auto-FLISR, and which may result in detrimental switching outcomes. It should be noted that this would also be expected to be the case for current operations and so strong data quality has benefits beyond the deployment of Auto-FLISR.

5.3.2 Likelihood and Impact

The likelihood of the risk is considered as high for the following reasons:

- Data quality issues continue to be a prominent concern in peer utility Auto-FLISR implementations. While THESL has proactively undertaken several projects, such as manual FLISR, power flow, and commissioning tools, to create a robust data foundation for Auto-FLISR enablement, it is reasonable to anticipate that some data quality challenges may still emerge along the Auto-FLISR journey.
- According to the Auto-FLISR data requirement analysis in section 5.4.1, the THESL team possesses an overall medium level of confidence in their data quality to facilitate Auto-FLISR implementation.

The impact of the risk is considered as high in the performance, schedule, and cost category for the following reasons:

- As stated in the peer utility interview summary, data quality continues to be a significant factor contributing to Auto-FLISR deactivation. Poor data quality can directly affect Auto-FLISR's performance, leading to solution failures, incorrect switching plans, or solution time-outs.
- Addressing data quality issues is generally perceived as a costly and time-consuming process that necessitates coordination at the corporate level.

5.3.3 Mitigation

Long term view of data quality – Data quality should be planned and budgeted as a broad opportunity across a variety of grid modernization programs, and staff should be encouraged to take ownership of data quality. Some of the activities can be time-consuming and costly. For example, manually validating the network data models and their data mappings over all overhead lines is no small undertaking. Such endeavors need to be backed by a process of data validation and quality control at the initial point of entry. There are various ways this can be done, for example expected number control ranges can be established within electronic forms, barcode reading of components on installation, and verbal three-way communication of activities to confirm data being reported.

Plan for poor data quality – While data quality should be a key objective, it is also important to design for a tolerance to data quality issues during testing and to establish criteria for how Auto-FLISR is deployed where it is known that a specific circuit may have data issues beyond a specific baseline level. For example, how to interpret the circuit violation constraints given the confidence level of a network model.

The FLISR pilot, power flow project, commissioning tool project, upgrade of NMS and development of NMS SCADA control will establish an opportunity to improve foundational data quality and integration quality. The project team should work to determine how to configure the system in a way to better respond to different data quality issues while still reaching the intended system operation target.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Budget for data quality -- Budgeting should be established for data quality baseline identification and improvement activities as an ongoing effort as part of normal operational activities.

Considering all the aforementioned activities, the difficulty of mitigating data quality issues should be regarded as high, aligning with the experiences of most peer utilities.

5.3.4 Key Recommendations

- Leverage the manual FLISR evaluation pilot to establish a data baseline, validate and correct data.
- Where data quality issues are identified, test the same data elements for use cases beyond the pilot location use cases and correct as required.
- Establish a broad data quality approach. This includes establishing working group to address data quality issue, leveraging data analytic to address data quality issues and establishing data quality framework, etc.
- Broadly communicate and educate staff about data quality objectives.

5.4 NMS Product Gap

Likelihood	High
Impact	High – Cost, High – Performance, High – Schedule
Difficulty of Mitigation	High

5.4.1 Description

It is generally considered best practice when deploying software to use the software as designed, leveraging the configurations that are native to the software. Functionality and configurations that are native to the software are expected to be maintained and upgraded as part of the quality assurance and performance standards included within the software licensing. Software is not an exact match for all of a company's operations and processes and that either the company needs to adapt to the software or that they need a specific change, a customization, to the software to meet their operational process. This section highlights the intricacies associated with the NMS 2.6 implementation, primarily stemming from extensive customizations and configurations. In comparison, the dependency on NMS upgrade risk centers around the activity schedule risk, while the Auto-FLISR performance risk pertains to the limitations of the NMS Auto-FLISR product. Acknowledging that there are overlaps among the three risks, it is important to designate them as separate entities. Doing so enables THESL to implement targeted measures more effectively and address each risk with precision.

During the interview with Oracle, they identify that they consider THESL's NMS 2.3 deployment to be at the high range of customizations that may be deployed to their NMS software. While Oracle noted that some of these customizations were developed to delay THESL's need to upgrade from NMS 2.3, Oracle identified that the extent of customizations will increase the complexity of the upgrade to NMS 2.6. Oracle identified that approximately 90 percent of the NMS customizations to NMS 2.3 are not native within NMS 2.6 and will provide a range of difficulty to reproduce in NMS 2.6.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Some examples of customizations have been identified by THESL SMEs:

- UWPC (Utility Work Protection Code): Customization of Switching and Safety Document Modules (Custom cross record views, custom validations, custom emailing, printing, etc.).
- Customization of event management.
- OMA (NMS Operations Mobile Application).

Oracle has identified the NMS 2.6 has an expansive set of rule configurations, known as SRS rules, that create the opportunity for considerable configuration flexibility in the product. Oracle believes that these configurations will allow for most use cases. Oracle further noted that there is a common move within utilities to work to leverage software as designed, using native configuration, rather than for extensive customization.

Oracle advised that their experience is that a typical upgrade for NMS takes 12 to 18 months but believe that the THESL upgrade will take longer due to the complexity of the customizations. Also noted that THESL has already made 15 to 20 NMS 2.6 customization requests that are not on the NMS roadmap, meaning that such customizations would need to be supported at THESL's expense.

Oracle also took the opportunity to stress that they will discontinue the full support of NMS 2.3 after the end of 2024. After this time Oracle will offer only sustained support which does not support patches or bug fixes, only support critical issues. With the upgrade expected to take over 18 months THESL will need to plan internally to mitigate any potential operation and cyber security risks until the upgrade is in production.

5.4.2 Likelihood and Impact

The likelihood of the risk is considered as high for the following reasons:

- The current state analysis revealed that there are a number of customizations on the horizon planned for NMS 2.6 upgrade.
- It is unknown if the Oracle NMS team will enhance their current product to address THESL's specific use case in the near future.
- Given that the future state documentation on Auto-FLISR is still pending finalization, this may lead to additional customization or configuration work to bridge any product gaps.

The impact of the risk is considered as high in the cost, schedule and performance category for the following reasons:

- Extra time and budget are expected to be allocated to the Oracle team during the NMS 2.6 build phase due to the additional customizations required to address product gaps.
- As noted in the Auto-FLISR Performance section, configuring NMS Auto-FLISR settings is a critical factor in achieving the 60-second performance target and is inherently an interactive process.

5.4.3 Mitigation

Challenge status quo processes – THESL should seek to use the native functionality of the NMS product. In many cases this may involve product training and coaching managers/leaders to help drive organizational change, especially in the context of long held legacy process.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

[redacted] has had success in creating system super-users during the User Acceptance Testing (UAT) who are persons of influence within the organization to drive change acceptance. Such champions can be developed earlier in the use case review and product configuration stage to support use of the native system functionality and provide credible insight and support for resulting process change.

Establish rigorous customization approval process -- Where it is deemed that customizations are required a criterion should be established for their creation, and in the case of the upgrade from NMS 2.3 to NMS 2.6, their migration to the new version. The criterion should include the following:

- Degree of variance from existing configuration capability.
- Extent of use.
- Extent of operational impact.
- Level of effort to develop and maintain.

Apart from individual customizations, the overall extent should be understood as the sum of the parts may be greater than anticipated. There is a point where an extensive set of customizations has to generate consideration of whether the selected solution is a good fit and raises the question as to whether extent of customization was understood prior to solution selection. The difficulty of mitigation should be deemed high due to the extensive volume of activities that may be involved.

5.4.4 Key Recommendations

- Establish change management / training to leverage tool native functionality.
- Establish an approval criterion for customizations.
- Identify and establish agreement between THELS and Oracle to enhance Oracle NMS product to minimize the customization needs.

5.5 Auto-FLISR Testing

Likelihood	Medium
Impact	High – Schedule, High – Cost
Difficulty of Mitigation	Medium

5.5.1 Description

There are various Auto-FLISR testing approaches among peer utilities depending on the IT/OT system readiness and the FLISR implementation journey. The approach to testing impacts how the utility transitions through the stages of FLISR operation from manual FLISR evaluation through to full Auto-FLISR deployment. Based on our findings regarding THESL's current state, there is a potential risk that THESL may not be entirely prepared for the Auto-FLISR testing to achieve the desired outcome. The significant test areas are:

- Point check remotely controlled switches
- Adding remotely controlled switches into operator's processes

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Verify switching plans developed by NMS
- Verify Auto-FLISR

Standard switching scenarios are normally tested with a level of rigor. Commonly known as edge cases or end cases, there are a handful of test cases surrounding system abnormal conditions (e.g. situation where there is large generation on the feeder). The process of planning for and gracefully addressing edge cases can be a significant task, and yet this task may be overlooked or underestimated. In particular, building testing cases around edge cases with real time system inputs should be given attention during the manual FLISR testing and are considered as a critical part of successful Auto-FLISR implementation both by Oracle and peer utilities. Different failure modes, protection miscoordination, N-1 operations or non-standard network configuration are not always considered as part of the test case inventory development.

Another aspect of testing is gaining confidence about network system behavior. For manual FLISR testing it is common to leverage a test simulator to test cases around switching plan validation. However, a robust Auto-FLISR testing strategy generally involves end-to-end testing as the last step before enabling the pilot circuits in production environment. Setting test environment around end-to-end testing can be a challenging process and if not planned, is likely to introduce additional schedule and cost impact.

As a major component of the Auto-FLISR journey, outbound SCADA control, is likely to be included in the NMS 2.6 upgrade test cases based on the interviews with THESL, failing to clearly specify the exit criteria for Auto-FLISR related testing during NMS upgrade period may lead to misalignment of expectations from business and IT stakeholders.

5.5.2 Likelihood and Impact

The likelihood of the risk is considered as medium for the following reasons:

- THESL is actively engaged in the NMS upgrade and Auto-FLISR planning, but the finalization of the master Auto-FLISR test strategy is pending. Additionally, the introduction of power flow algorithm changes and other FLISR-related functional modifications in NMS 2.6 could introduce uncertainties for Auto-FLISR testing.
- THESL has limited experience in distribution automation testing, which could be leveraged to inform the Auto-FLISR test strategy.
- In terms of Auto-FLISR testing, utilities often adopt diverse test approaches based on their system maturity and business case, leading to no universally applicable "golden standard" for testing. Consequently, THESL will need to invest time in identifying the most suitable test strategy for their specific requirements and operational confidence level.

The impact of the risk is considered as high in the schedule and cost category for the following reasons:

- If not planned properly, additional Auto-FLISR testing could lead to schedule slip for NMS Upgrade. Failing to include important edge cases into testing could also result in turning off Auto-FLISR after feeder becomes operational.
- The establishment of a dedicated test lab and the extensive point-to-point testing required could present significant costs for THESL.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

5.5.3 Mitigation

Test Case Completeness -- It is important to take a holistic approach to revisit the test case inventory to include both common cases and high-priority edge cases driven by THESL's system failure modes, as well as clearly align the Auto-FLISR test cases with the overall NMS upgrade test cases.

Use of Test Lab for Power Hardware -- As for good practices to prepare a rigorous yet efficient Auto-FLISR testing, key activities, and the timeline to set up a test environment for Auto-FLISR on the NMS 2.6 platform should be established. THESL should consider setting up a test laboratory with several control devices or using (power) hardware in the loop testing to further gain confidence for field device behavior in the context of Auto-FLISR operations. In the case of lab testing with field devices, THESL may consider testing different recloser settings during the test period. For example, configure some reclosers to have multiple operations before lock out. This shall help THESL determine if Auto-FLISR operation requires any protection setting change from the business side. For the purpose of gaining confidence of SCADA outbound control in production mode, advisory mode, where the operator approves the switching plan before permitting NMS control of SCADA devices, can be used for the transition of operations.

Inclusion of Business in Testing – The inclusion of the business in the development and execution of test cases can help with two items. First, including the business will help identify the edge cases as mentioned above. Second, business involvement will help with the change management needed to implement Auto-FLISR.

The difficulty of mitigation is regarded as medium since the main action items focus on establishing appropriate testing planning.

5.5.4 Key Recommendations

- Leverage learnings from FLISR pilot to inform Auto-FLISR testing.
- Establish end-to-end test plan which includes edge cases.
- Establish a test environment and test laboratory.
- Stage deployment based on confidence.

5.6 Standard Approaches to Work

Likelihood	Medium
Impact	Medium – Schedule, Medium – Safety
Difficulty of Mitigation	Medium

5.6.1 Description

[redacted] noted during their 20-year journey to Auto-FLISR that sophisticated protection schemes could not be easily adapted to permanent system changes. Complex relay logic was prone to settings errors and logic holes. Unique procedures for each system were identified as unsustainable and created system complexity, training difficulties and the potential for temporary switching changes to have unintentional impacts. [redacted]

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

stressed the need to avoid individual procedures for each sub-station, and the need for consistency of approach with the deployment of Auto-FLISR.

[redacted] identified that a lack of ownership of recloser point architecture resulted in inconsistent point numbering / point mapping. When retrofitting these devices with additional points and/or modifying existing points some years later, a standardized template (currently in use) could not be used. Each point of each device had to be examined and modified by a DMS technician which is time consuming.

Humans have the capacity to deal with variance and to fill gaps where they may exist. While this does increase the risk of human performance errors it is relatively common that some level of variance is accepted. A technology solution is more cost effective when processes are simplified and standardized before their deployment. This reduces the cost of system deployment (reduced configuration work, consistent testing approaches and resolution) and improves the transaction success rate and execution speed.

Oracle noted the high number of customizations that THESL have on their NMS 2.3 platform. While the issue of configuration verse customization is discussed in detail in the next section, variation in processes can be a source of the need for customized solutions and generally do not support the case for the software vendor to develop and support a solution within their core codebase.

5.6.2 Likelihood and Impact

The likelihood of the risk is considered as medium for the following reasons:

- The current state analysis (manual FLISR pilot phase) has not revealed any significant process gaps, but specific process changes and documentations for Auto-FLISR are yet to be determined.
- While a dedicated change management team exists for the NMS upgrade project, there is currently no dedicated change management team specifically focused on Auto-FLISR implementation.

The impact of the risk is considered as medium in the schedule and safety category for the following reasons:

- Process changes generally requires additional work during design phase and additional training time before system goes live, which may result in overall schedule delays if not adequately planned.
- The standardization of Auto-FLISR processes related to protection coordination is expected to directly enhance operational safety.

5.6.3 Mitigation

Establish standard for interrelated activities – The process for standardization starts with standard devices, standard engineering guides, standard protection, and coordination settings (distribution and substation). The standardization has to be backed by ownership and accountability.

The manual FLISR pilot THESL is starting August 2023 will provide an excellent opportunity to identify inconsistencies in processes and their potential impact. The testing team should look to streamline and align processes as their first approach, before any technology solution is found to support inconsistent processes.

Quite often process variation in the field comes from legacy, regional and somewhat siloed operations. Finding those variations and working to consensus does not need to wait for a technology deployment. THESL can commence the identification of misalignment and the opportunity for consistency at their

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

convenience. This can in fact serve as a foundational step for change management and for opening the dialogue for process improvement, including the role to be played by Auto-FLISR.

The difficulty of mitigation is considered as medium, as the main action items primarily involve business process improvement and management, which are within the project team's control.

5.6.4 Key Recommendations

- Establish process review and alignment as a goal of the manual FLISR pilot.
- Establish change management working group.
- Monitor compliance with process for training gaps.
- Apply accountability for compliance.

5.7 Change Management and Acceptance

Likelihood	Medium
Impact	Medium – Schedule, Medium – Performance, Medium – Cost
Difficulty of Mitigation	Medium

5.7.1 Description

During the utility benchmark interviews both [redacted] and [redacted] touched on the importance of change management during the journey to Auto-FLISR. Oracle indirectly raised the subject via the conversation around the high number of system customizations to adapt to the operators' legacy process, rather than having them adapt to the functionality of the selected system. This is a common concern voiced by software providers.

And it should be noted that the challenge of change management is not simply resistance to something new. [redacted] gives the example of field trouble-shooters replacing a fuse with what they had in their vehicle rather than the prescribed sized fuse. This is done with the good intent of speedily returning customers to service but without a change in process to report this to the operator or to update a system of record, the operator or automated system is not working with correct operational data knowledge. This was a key discover for [redacted] as when running FLISR, particularly Auto-FLISR, the model accuracy of protective devices like fuse size will be likely to have a larger impact on determining the expected system behavior during a switching event.

[redacted] highlighted that field crews wanted confidence that when Auto-FLISR was offline and that no automated operation would take place while they are working on equipment. Field crews had little prior exposure to automated switching and so engagement was important. Giving the field crews this confidence was a vital aspect of acceptance for Auto-FLISR at [redacted]

For Auto-FLISR implementation, there are several areas of change management identified based on conversations with Oracle and peer utilities:

- Operational procedure (control room, field, and communications with [redacted]).
- Field device commissioning and maintenance.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Protection coordination.
- Network model update.

These areas involve a diverse range of staff, many of whom may not have direct interaction with the Auto-FLISR solution and so may not fully appreciate the objectives served by the process changes.

The timeline of change management activities might be impacted by operation seasonality. THESL should consider any potential storm season or wildfire season when FLISR events are more frequent for rolling out the process changes.

While the importance of training was identified by both [redacted] and [redacted] [redacted] provided insight as to aspects of their training approach which have either impacted their Auto-FLISR deployment or been impacted by deployment issues.

As a critical component of change management activities, training was also highlighted for operators, field crews, engineering groups, and technology staff during the peer utilities interview.

[redacted] deployed a thorough change management process and engaged key personnel as varios stages of the Auto-FLISR project, they choose a just-in-time (JIT) training process. Under this model the operators are trained on the system shortly prior to the planned use of the system so that training can be fresh and reinforced by actual use of the system. As operator training has to be scheduled in line with the operator work schedules the planning and coordination for the training has an amount of complexity.

As a point of reference [redacted] advised that their operator training time was between eight and 16 hours of training per operator, but it took six weeks to cover all operators due to the operator shift schedule. [redacted] also noted the importance of training operators on a stable system.

[redacted] was able to successfully execute their JIT training plan based on the intended platform go-live date. Unfortunately, prior to go-live a system error was determine which resulted in a three-month delay to the go-live date. This resulted in [redacted] needing to establish a new JIT training approach around the new go-live date.

Compounding the issue of repeated training is the fact the user training is an operation and maintenance (O&M) cost and not a capital cost. [redacted] identified that consequently the delay of the go-live has been and impact on both capital and O&M costs.

[redacted] also noted that they had four minor operational incidents post go-live and that three of these involved an operator executing controls either in parallel with FLISR or restarting a process on an old event. These incidents resulted in additional training.

5.7.2 Likelihood and Impact

The likelihood of the risk is considered as medium for the following reasons:

- The specific process changes and design documentations for future state Auto-FLISR operation are yet to be determined.
- While a dedicated change management team exists for the NMS upgrade project, there is currently no dedicated change management team specifically focused on Auto-FLISR implementation.
- Given that THESL is a unionized organization, the suggested changes might pose greater challenges during implementation.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

The impact of the risk is considered as medium in the schedule, cost and performance category for the following reasons:

- Process changes generally requires additional work during design phase and additional training time before system goes live, which may result in overall schedule delays if not adequately planned.
- The efficiency and execution of the future process will directly impact the performance of Auto-FLISR, both of which are contingent on successful change management and acceptance.
- It is commonly the case that user training for a new technology is an O&M cost. Such costs should be planned for in the deployment costs and allowance should be made for pre-deployment/JIT type training and post-deployment training.

5.7.3 Mitigation

Place importance on change management – Both [redacted] and [redacted] placed importance on change management and had communication materials developed to share with different stakeholder groups. [redacted] established a Change Manager as a fully budgeted role in support of both ADMS and Auto-FLISR projects. This role led development of the migration strategy and communications plan, conducted extensive stakeholder engagement and message testing. She even identified whether the messaging was becoming too extensive and thereby losing the interest of its target audience.

A potentially good practice of change management also rewards participation. Such an example is [redacted] involving operators and their supervisors during Auto-FLISR UAT and then promoted them as super-users to be on the forefront of managing upcoming process and technology changes as result of Auto-FLISR implementation.

Change management activities should be designed to support the transition throughout the entire FLISR implementation phases, not only for the Auto-FLISR deployment. The implementation stages are discussed in more detail in section 5.11 below.

Focus on training the process and technology – Training is an important pre-requisite to going live with the new system. Assuming that user acceptance testing (UAT) is the final test before go-live, operator JIT training should be scheduled in close coordination with the scheduled UAT completion. An influential set of operators should be involved in platform pilots and design, trained early and involved in the performance of UAT. This allows these operators to become system super-users and system advocates post-deployment.

The difficulty of mitigation is regarded as medium since the main action items focus on business process improvement and management.

5.7.4 Key Recommendations

- Establish a change management lead.
- Create respected solution champions.
- Deploy consistent stakeholder engagement.
- Highlight safe operations as a foundation of trust.
- Leverage Manual FLISR pilot to engage controllers and to help influence change acceptance.
- Establish appropriate O&M funding for comprehensive training.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Develop training specific to various roles: operators, field crews, engineering, and technology support.
- Provide just-in-time training.
- Use training to establish influential super-users.
- Reduce complexity of operational process to support improved training success.
- Adopt a phased approach to roll out different change management activities.

5.8 Operational Safety

Likelihood	Medium
Impact	High – Safety, High – Performance
Difficulty of Mitigation	Medium

5.8.1 Description

A key consideration for the use of an automated system for operating switches on any electric grid is to have well understood parameters for such operation, the ability to determine when automated control is taking place and to be able to override that control should it be so required. It is of importance that there is confidence that field crews or others will not be placed in danger of an automated system operating a switch when it is not expected to do so.

It was a common theme from [redacted] and [redacted] that only one entity can be in control of a device at any one time, whether that be an operator or Auto-FLISR. Both utilities spoke to the need to ensure the system clearly showed the status of control and the operator procedures have a clear step to put Auto-FLISR in Off mode when field protection is required. These requirements had two direct impacts for [redacted] and [redacted] the need for system change from their vendor and very focused training of operators in this regard. Both have focused on ensuring that the system status is clearly identified in the user interface, and [redacted] is considering a coded control to block switching of any device with a tag applied.

As noted above, field crews wanted assurance that no automated operation would take place while they were working on equipment in the field. While some switches have a manual device to override remote operation the preference should be for formal process to disable Auto-FLISR control via the operator.

In the system context the potential for automatic actions misinformed by a model not yet updated and the potential for operators to lose situational awareness if Auto-FLISR changes the system without the operator's knowledge were key points of focus. The importance of accurate and updated GIS data was also raised in this context.

5.8.2 Likelihood and Impact

The likelihood of the risk is considered as medium for the following reasons:

- The current state analysis (manual FLISR pilot phase) has not revealed any significant gaps on operational safety, but safety-related process changes and documentations for Auto-FLISR are yet to be determined.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Compared with some other peer utilities interviewed, THESL lacks prior experience in working with distribution automation projects or decentralized FLISR. This lack of experience could limit THESL's understanding of operational safety practices in the context of grid automation.

The impact of the risk is considered as high in the safety and performance category for the following reasons:

- Operational safety holds paramount importance in the utility safety portfolio.
- Developing robust operating procedures to ensure operational safety will have a direct impact on the performance of Auto-FLISR, benefiting both operators and field crews.

5.8.3 Mitigation

Focus changes on safety – [redacted] made disabling (turning off) Auto-FLISR for conditions such as hotline hold offs and de-energized work permit key aspects of their Auto-FLISR pilot and updated work processes, but also took the opportunity to re-emphasize the performance of the usual steps for upstream protection. [redacted] stressed "If we are following all of our existing rules, FLISR cannot hurt us."

Consider all aspects of how work might change – As an additional item PGE identified that the use of the term "FLISR" during verbal communication to the field proved problematic as it was often heard as "phase." [redacted] have focused on the use of clear language and avoidance of acronyms in the context of communication between operators and field crews in the context of FLISR operation.

Considering the information from the peer utilities mentioned above, the difficulty of mitigations is estimated to be of medium level and within project team's control.

5.8.4 Key Recommendations

- Introduce a work step for field crews and operators to make sure Auto-FLISR is in Off mode.
- Focus on operational safety during the future state process design.
- Reinforce clear language and three-way communication practices between operators and field crews.
- Establish training scenarios where operator disables Auto-FLISR for field work protection.

5.9 Cyber Security

Likelihood	Medium
Impact	High – Cost, Medium – Performance, Medium – Schedule
Difficulty of Mitigation	Medium

5.9.1 Description

The Oracle team have confirmed that they do not see any change in the cyber profile for the NMS platform upgrade from version 2.3 to 2.6. In general terms it is normally the case that the expectation is that a newer version of a software should be more secure than a prior version, but Oracle did not explicitly confirm this.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

A key aspect of THESL's move to Auto-FLISR will be that the Oracle NMS platform, as part of its upgrade from NMS 2.3 to NMS 2.6, will be deployed in the higher security SCADA control zone, rather than being accessible from corporate environment as is currently the case. This is an important requirement and will result in the platform being at a higher level of system protection than may currently be the case. This is a positive outcome for security of the new platform.

The move to the more secure environment can be expected to result in deployment complexity, solution cost increases, and changes to system maintenance approaches which will require new procedures, and which may result in additional support costs.

All hardware and software being deployed in the higher secure environment can be expected to require specific screening for any introduction of rogue elements and once these hardware and software components are deployed, they are protected by increased levels of cyber and physical protection. Such protection can introduce software gateways, known as firewalls, which can add to system integration complexity and can, in certain cases, impact transaction latency.

Additionally, system support staff may either need additional training and approval to work with a system in a secure environment and/or need to be escorted to enable access to the system.

It is also noted that THESL intends to deploy the NMS 2.6 platform on a high-availability basis which if a new approach for THESL may provide more complexity to the platform build, but will, at the least, require that the alternate instance be also in a secure and presumably physically different location.

5.9.2 Likelihood and Impact

The likelihood of the risk is considered as medium for the following reason:

- Apart from establishing the existing SCADA System in the secure zone, THESL possesses relatively limited experience in constructing a higher security SCADA control zone. In comparison, some other peer utilities have gained more similar experience during their previous endeavors, such as building a transmission Energy Management System.

It is expected that the impacts of the deployment to the secure zone will be expected in the context of the project schedule (medium) and costs (high). To the same extent transaction latency should be understood and tested in the context of expected security transitions, which also impacts the performance of the NMS / Auto-FLISR (medium).

5.9.3 Mitigation

The upgrade of the NMS platform is foundational to the deployment of Auto-FLISR, and it is warranted that any platform controlling devices be in a secure zone. The move to the secure zone should not be avoided.

Prepare support personnel for new secure environment – THESL has an existing SCADA System in the secure zone and as such has established procedures and processes for the management of systems in the secure zone, and the associated training of staff. THESL should determine whether the existing staff should take responsibility for the management of aspects such as hardware installation and system patching or whether the existing NMS support staff are suitably trained to follow the discipline associated with the more secure environment.

Plan for the increased complexity of secure environment – The protocols of the more secure environment should be integrated into the planning for the deployment and management of the NMS platform in the context of control functions such as required by Auto-FLISR. As the protocols are known the deployment of

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

equipment to the secure environment any additional implementation considerations and associated costs should be able to be identified and properly integrated to the NMS upgrade planning.

Considering all the factors mentioned above, the overall difficulty of mitigating this risk is considered as medium and falls within the control of the project team.

5.9.4 Key Recommendations

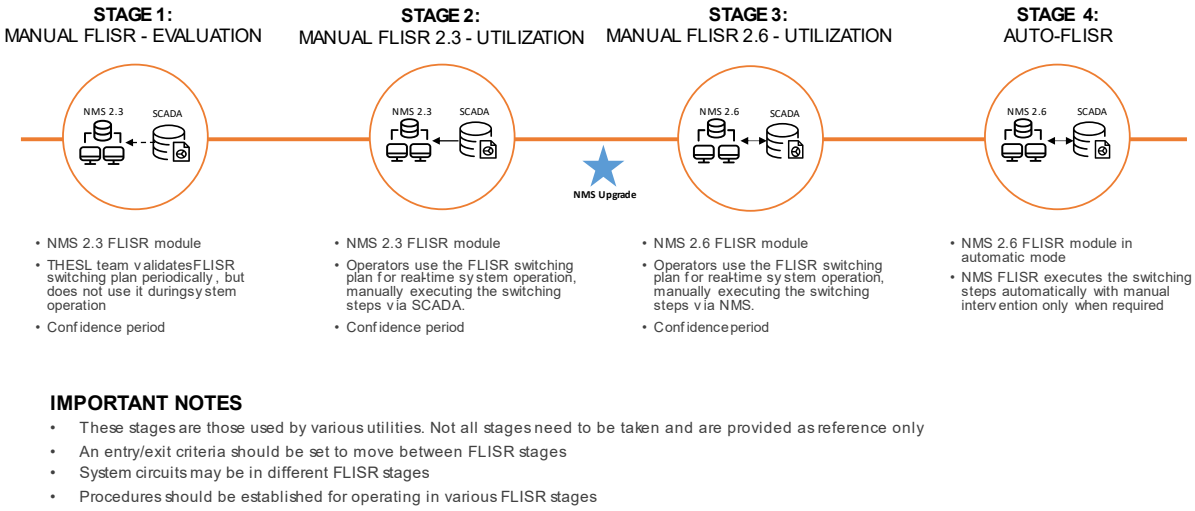
- Design system for secure transit as part of system performance architecture.
- Allow time and budget for a highly secure environment deployment.
- Leverage resources with expertise in working in a highly secure environment.

5.10 Auto-FLISR Deployment Strategy

Likelihood	Medium
Impact	Medium – Schedule, Medium – Performance
Difficulty of Mitigation	Medium

5.10.1 Description

Auto-FLISR is a multi-year journey for which each utility will need to develop a deployment and transition strategy based field technology (controllable switches) deployment and process readiness. For [redacted]E, they went live with Auto-FLISR at a sub-set of circuits in 2019 but it was not until 2022 that [redacted]E deployed Auto-FLISR on systemwide basis. [redacted] identified that this approach as allowing [redacted] to better understand their system behavior under their recently upgraded DMS. In comparison, [redacted] operated their FLISR scheme in auto mode for some time before later reverting to manual mode to validate and improve their distribution model. The consensus from utilities with Auto-FLISR experience is that the actual deployment has taken longer than was originally planned, particularly in the context of stabilizing system operations with automation. Not surprisingly, the efficiency of troubleshooting, finding edge cases, and tuning the system tends to improve over time as the operations and IT staff gain more experience about the product and the root causes of the issues.



During the deployment of Auto-FLISR operators, field crews and technology staff will have to adapt to circuits operating in different stages of Auto-FLISR deployment and transition. Stages can be expected to include manual stages where either NMS FLISR outputs are validated after the event or where the NMS output is used by operators to action switching, advisory or semi-automatic stage where NMS provides the switching solution but only executes after an operator approval, and then Auto-FLISR where the NMS system will execute independent of the operator. It should be noted that the manual stages can be used prior to NMS integration with SCADA control whereas the advisory/semi-automatic and full automatic mode require SCADA control. THESL anticipates that manual stages will be evaluated using first NMS 2.3 and then using NMS 2.6 and that the confidence gained from these manual stages will negate the need at THESL to go to the advisory/semi-automatic stage.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Currently THESL anticipates two pilots: a manual FLISR pilot (two substations) and an Auto-FLISR pilot (selected substations to be determined). It is worth noting that during each pilot phase, the system will need to operate in a hybrid mode in terms of global NMS FLISR settings.

These various modes of operation across the system until such time as Auto-FLISR is fully deployed as an operational norm will introduce additional complexity for control center operators, field crews, and technology staff. The complexity and need for clear process should not be under-estimated.

The Auto-FLISR transition stages expected at THESL are as follows. Note control of network devices from the NMS platform can only take place once SCADA control has been established.

5.10.2 Likelihood and Impact

The likelihood of the risk is considered as medium for the following reasons:

- The detailed Auto-FLISR rollout plan is yet to be finalized and is subject to change depending on THESL's operational confidence level.
- The process change during the transition phase (pilot phase) is not fully established.

The impact of the risk is considered as medium in the schedule and performance category for the following reason:

- Failing to implement a practical and effective rollout plan may lead to premature activation of Auto-FLISR, resulting in subpar system performance or even system failure, leading to the deactivation of Auto-FLISR.

5.10.3 Mitigation

Ensure situational awareness – Change management and training will play an important role to ensure all stakeholders are well informed as to the status of the FLISR deployment and to understand exactly what is in operation on which circuits, particularly in the context of those circuits that operate in a different FLISR mode compared to the majority, which is more extreme at the beginning and end of the Auto-FLISR deployment journey. Visual ques on displays can help operators identify pilot circuits.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Move swiftly yet deliberately – These risks can be mitigated by more quickly moving through or, should confidence allow, avoiding intermediate steps such as advisory/semi-automatic phases. This will involve ensuring that lessons learned from early deployments and associated remediation of issues are deployed across the enterprise.

Taking into account all the factors mentioned above, the overall difficulty of mitigating this risk is considered as medium and falls within the control of the project team.

5.10.4 Key Recommendations

- Establish transition stage education as part of change management and training.
- Seek to minimize time in transition stages.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

6 Areas for Further Consideration

The following are areas which TRC believes warrant further consideration and investigation due to there potential impact on the success of the Auto-FLISR deployment and operation at THESL.

6.1 [redacted] Controls

As noted earlier in this document, [redacted] was identified during the THESL discovery discussions as a key relationship for THESL in the context of the Auto-FLISR journey. It was identified that there is considerable device switching coordination required between THESL and [redacted] with as many as 30 percent of substation breakers owned and operated by [redacted] in Toronto's horseshoe area.

[redacted] was contacted for an interview which they agreed to for June 30, 2023.

TRC was advised that senior level discussions are underway between THESL and [redacted] as to how THESL may operate the [redacted] breakers. In the roadmap documentation provided to TRC, identification is made of a technical working group process which will progress to technical implementation and testing. In the roadmap document the implementation of the [redacted] breaker control is completed in a timing to allow for input to the configuration of SCADA control from NMS.

The [redacted] breaker control introduces complexity that should be specifically scoped as part of the Auto-FLISR rollout planning process. [redacted] breaker control drives the number of stations THESL will first go live with. If THESL do not get operating control from [redacted] breaker (not a preferred option), other alternative solutions such as installing a recloser outside the station for every feeder will need to be put on the table.

6.2 Procedure Governance

As with any major operating or technology change it is expected that there will be various changes to procedures. It is also to be expected that the changes will result in overall benefits to the operations of the business.

In order to measure a benefit, it is normal to establish a benchmark from which to measure the subsequent improvement or benefit. In the context of a solution such as Auto-FLISR the focus for improvement measurement tends to start with customer impacting outcomes such as SAIFI and SAIDI. Efficiency measures such as time of crew arriving at the correct fault location are tracked as an operational benefit.

What can be more challenging is the recognition of benefits which may not be tracked to the same degree of specificity, or which may have subjective elements to them. These are also the areas which have the potential provide disagreement during the change management process. There will be debate during the discussion of change to procedures as to the effectiveness of the existing and the new procedures, and this becomes particularly complex when new service expectations are being set.

When entering into these conversations it is important to have a view of the effectiveness of the current procedures. The effectiveness of the procedures can be impacted by various aspects of which the following are examples:

- Clarity of purpose.
- Management of updates.
- Accessibility.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

- Training.
- Compliance monitoring.

Apart from providing valuable input for future procedure design and training, the rigor applied to procedure governance will set the foundation for the change management process during and subsequent to the transition to Auto-FLISR.

It is also worth noting that the expansion of activity at the grid edge, with various DERs potentially exporting energy, operational procedures and external compliance requirements are likely to increase in complexity during the period of the transition to Auto-FLISR.

6.3 Staffing and Skills

The progression to a technology such as Auto-FLISR is an example of a move from a previously manual process to a more automated process, where there is greater reliance on technology to conduct operations previously managed by employees.

The introduction of automated processed into the workplace can have many impacts on the operations of the business and key amongst these is the ability of staff to be able to understand the processes of the technology and to effectively manage it to the best outcomes of the business.

Staff roles will in many cases change from performing operations to monitoring a technology performing operations. This can be expected to require staff to learn new skills and potentially require the targeting of new hires with an aptitude for the management of the technology being deployed.

As the NMS platform transitions to a critical operational system, it can also be expected that the staff responsible for the performance of the platform, including system integrations and data governance will need to be re-trained in the context of managing mission critical systems and the disciplines associated with this.

Currently applied staff capability and development approaches for staff in these key areas may need to be reviewed and adjusted to align with future operational needs and expectations.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Appendix A: Potential Costs

The journey to Auto-FLISR at THESL will involve various cost elements and feedback from [redacted] and [redacted] suggests that these be generally considered in the context of whether they are field/operational costs or technology related costs.

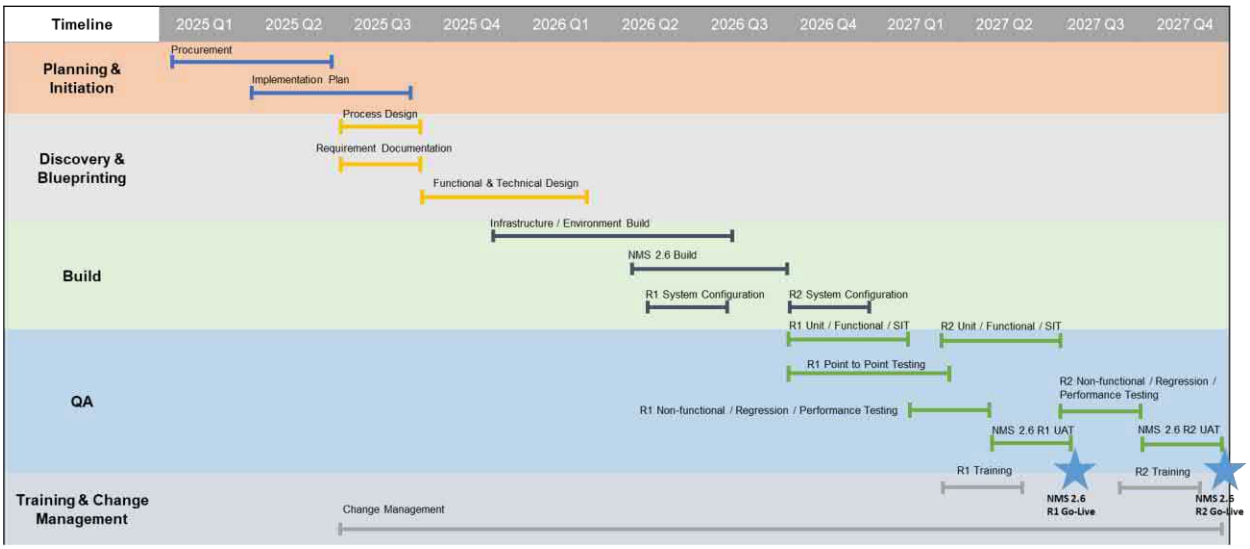
Also of consideration is capital costs as compared to O&M costs.

[redacted] particularly made the observation that while the technology costs were a significant investment, they were not of the scale of the costs involved to deploy newer and additional communicating switches and the overall communication solution. With an indicative cost of $100,000 per recloser the installed field costs can scale quite extensively. [redacted] and [redacted] spoke to the cost of substation relay upgrades that were required and that these projects quite often led to work more extensive than purely a relay replacement. It is noted that the field devices provide benefit beyond the Auto-FLISR capability.

In the context of a typical information technology project it can be expected that what may be considered typical for the upgrade of a system such as Oracle NMS will be increased by the need to build the upgraded solution in the higher security environment with a high availability architecture.

It is the case with such technology projects that it is not the costs of the particular software or hardware that drives the costs but rather the internal and external labour and services required to conduct the implementation effort over the period of several years.

These internal and external labour and services costs can be expected to be increased above an expected level based on Oracle's advice to the increased complexity of the NMS upgrade due to the high level of customization. Leveraging native configuration of the NMS 2.6 platform will be expected to mitigate such cost increases.



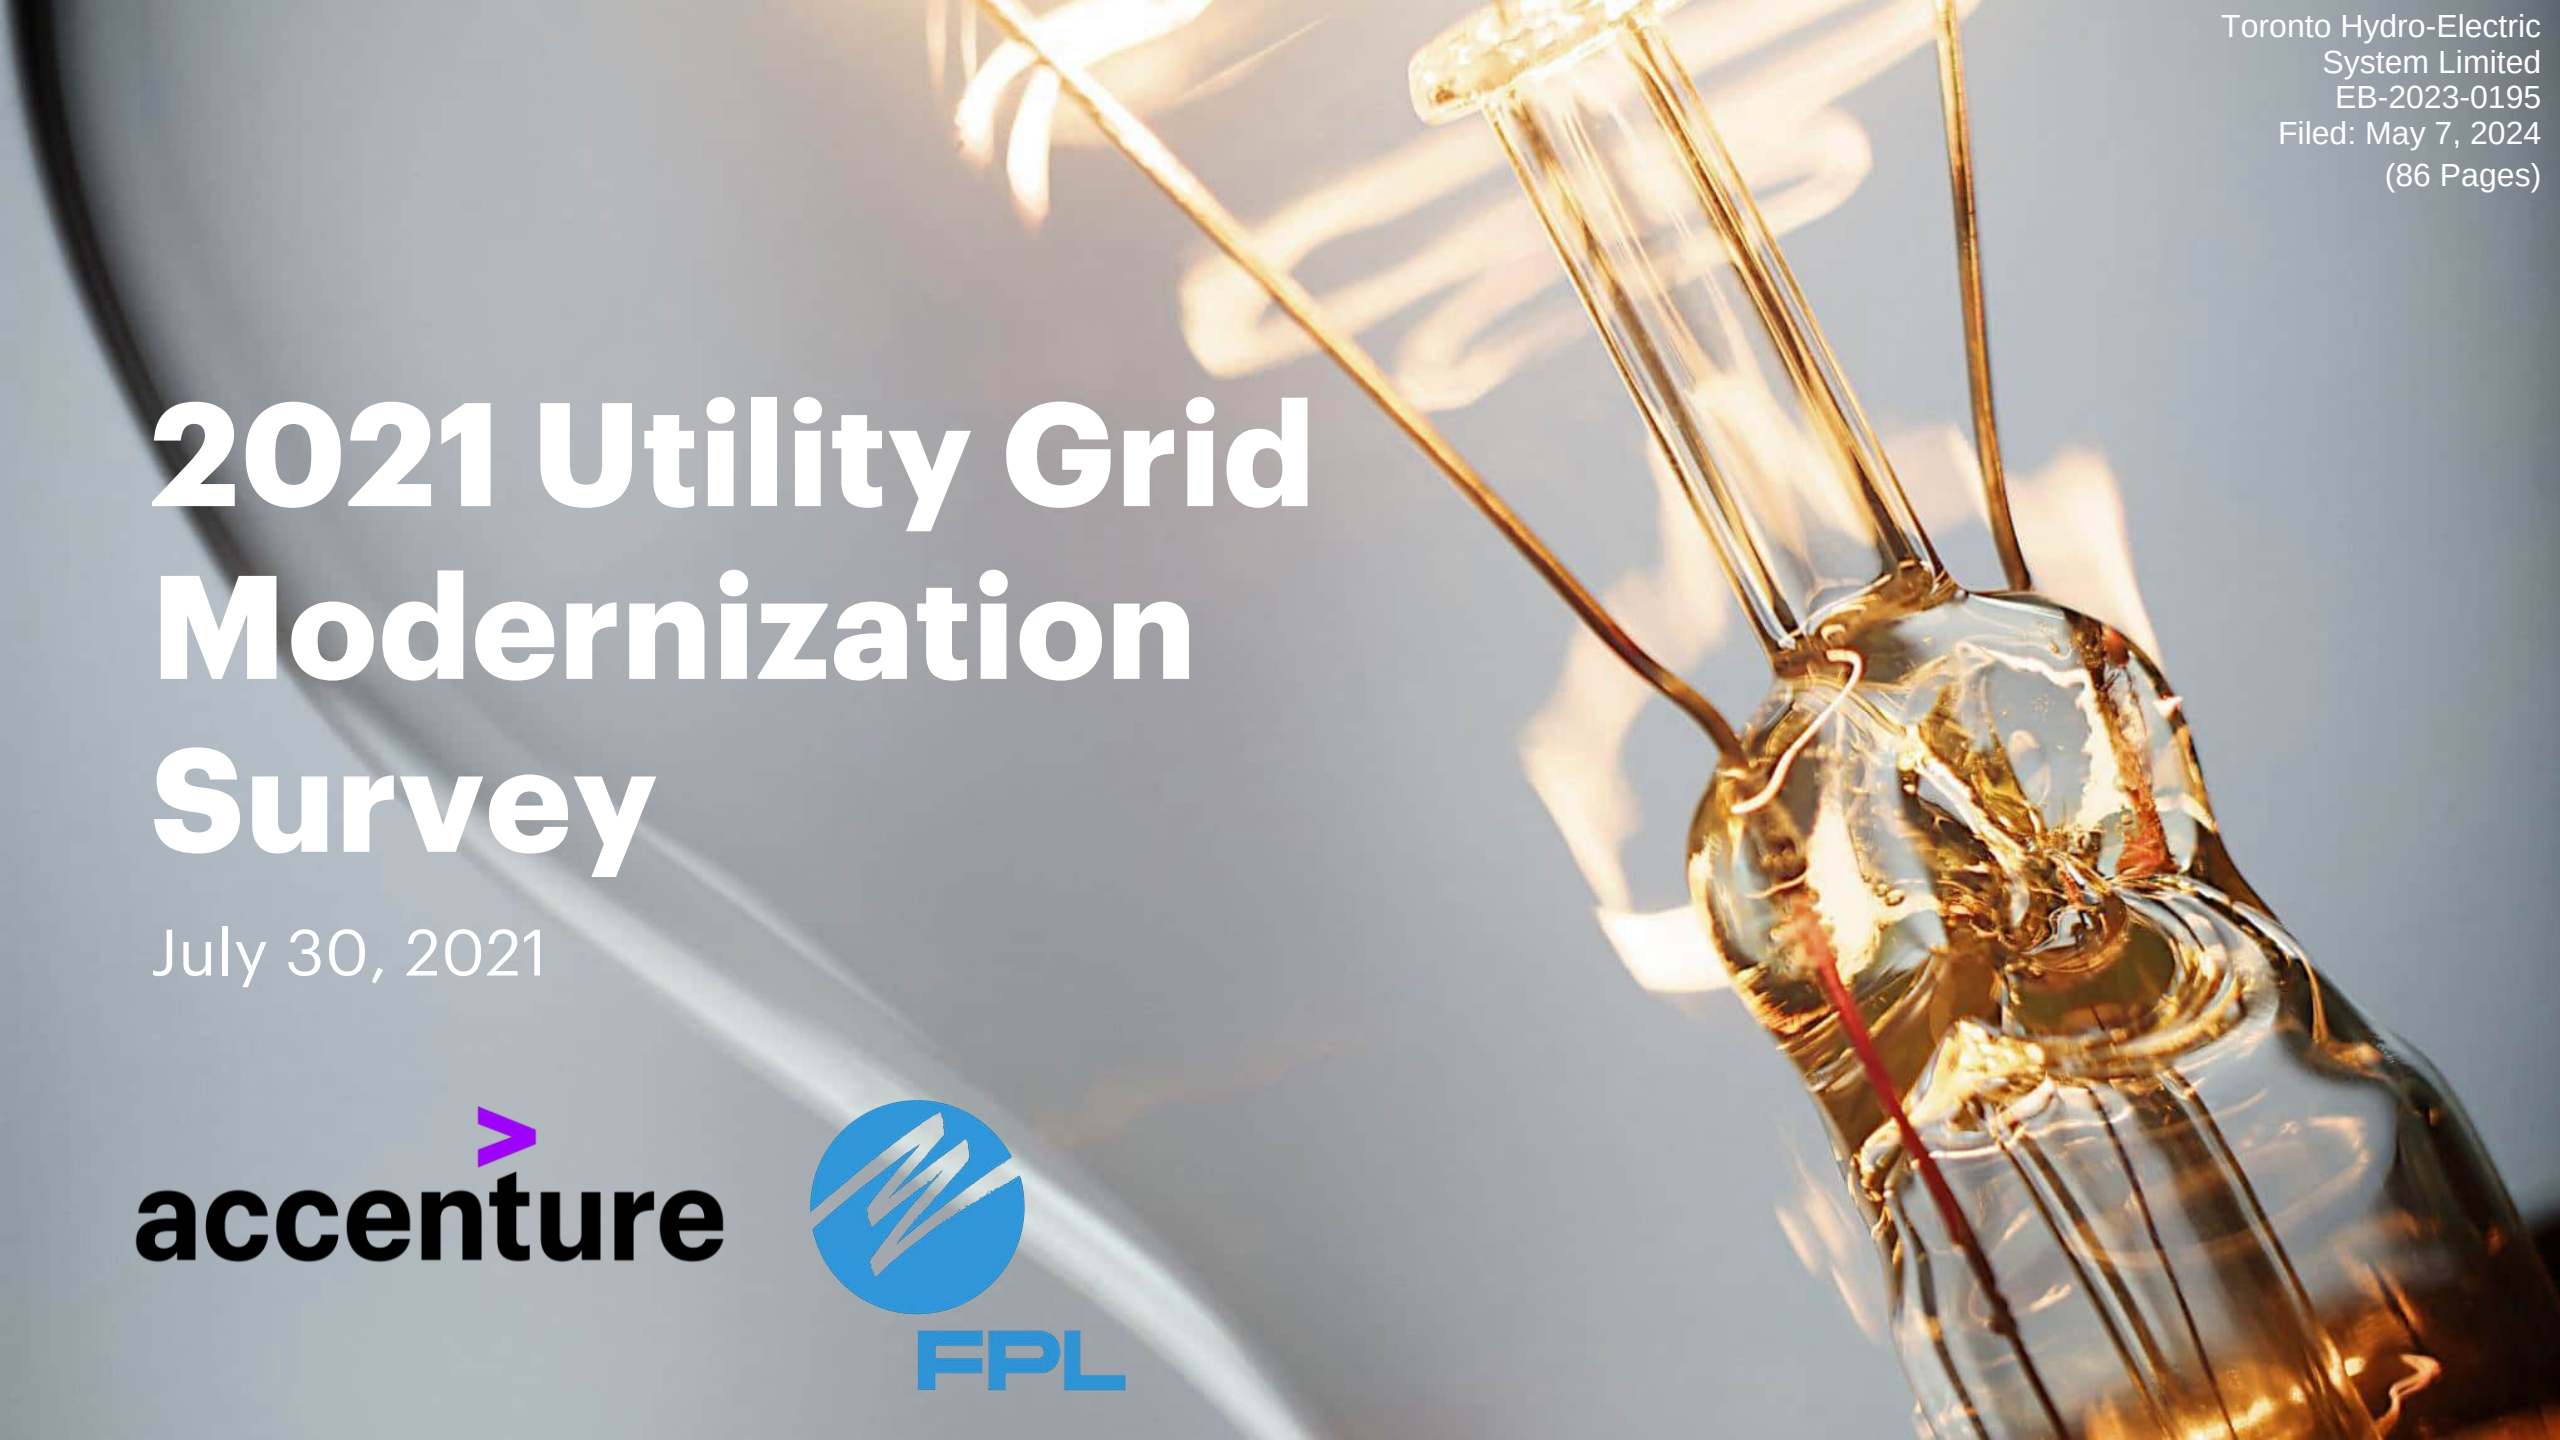
While the capital costs will inevitably be more significant than those of O&M, the planning for available O&M for user training is a vital component which should be planned. The better the users of a system are trained to use the system the more effective the use of that system will be. This is an important investment in support of the overall project investment.

[redacted] and [redacted] were not able to provide the specific costs identified as a discrete Auto-FLISR project as costs were allocated/shared to various operational objectives.

This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Appendix B: NMS Upgrade Indicative Activities

The following graph lists the main activities for NMS upgrade. The activity date and duration are indicative. Note that R1 activities focus on the NMS core functions including SCADA outbound control, while the R2 activities focus on Auto-FLISR related functions.



This document contains confidential information of TRC and is subject to the restrictions described in the confidentiality page.

Executive Summary

The electric distribution grid is undergoing a massive transformation. This is being driven by innumerable factors including, but not limited to: aging infrastructure, extreme weather events, and shifting electricity supply and demand models. Given the extent of the challenge, there are many stakeholder groups involved in the grid transformation process including public agencies, industry, and consumers. However, utilities will be at the forefront of this change. They must lead the charge and guide the actions that need to be taken to reimagine and develop the electric distribution system of the future. Given the complexity of the undertaking and the various operating models and regulations facing utilities, there isn't one clearly defined course of action.

To help utilities understand the current grid modernization maturity landscape, FPL and Accenture developed this benchmark study. We asked our survey respondents to provide us insight into their capabilities surrounding numerous key grid modernization topics. We supplemented those findings with secondary research and further analyses. Through this process, we created a benchmark reference that respondent utilities can use to understand their respective grid modernization maturity and opportunities for growth.

There are four key considerations that utilities can take away from this study:

1. Utilities are recognizing the importance of grid modernization and have well developed grid modernization strategies which are impacting their future investment planning activities.
2. Many respondents' extreme weather response and control center procedures have not seen much growth in the wake of the modernizing grid. Given the successful integration of new operational technology (e.g., OMS, AMI), utilities can leverage analytics to make better use of the data received from these technologies.
3. While most respondents acknowledged the increased deployment and presence of DERs, many of them are still in early developing stages regarding strategizing and enabling capabilities.
4. New workforce technologies (e.g., drones, AI/ML, AR/VR) are rapidly becoming integrated into distribution operations.

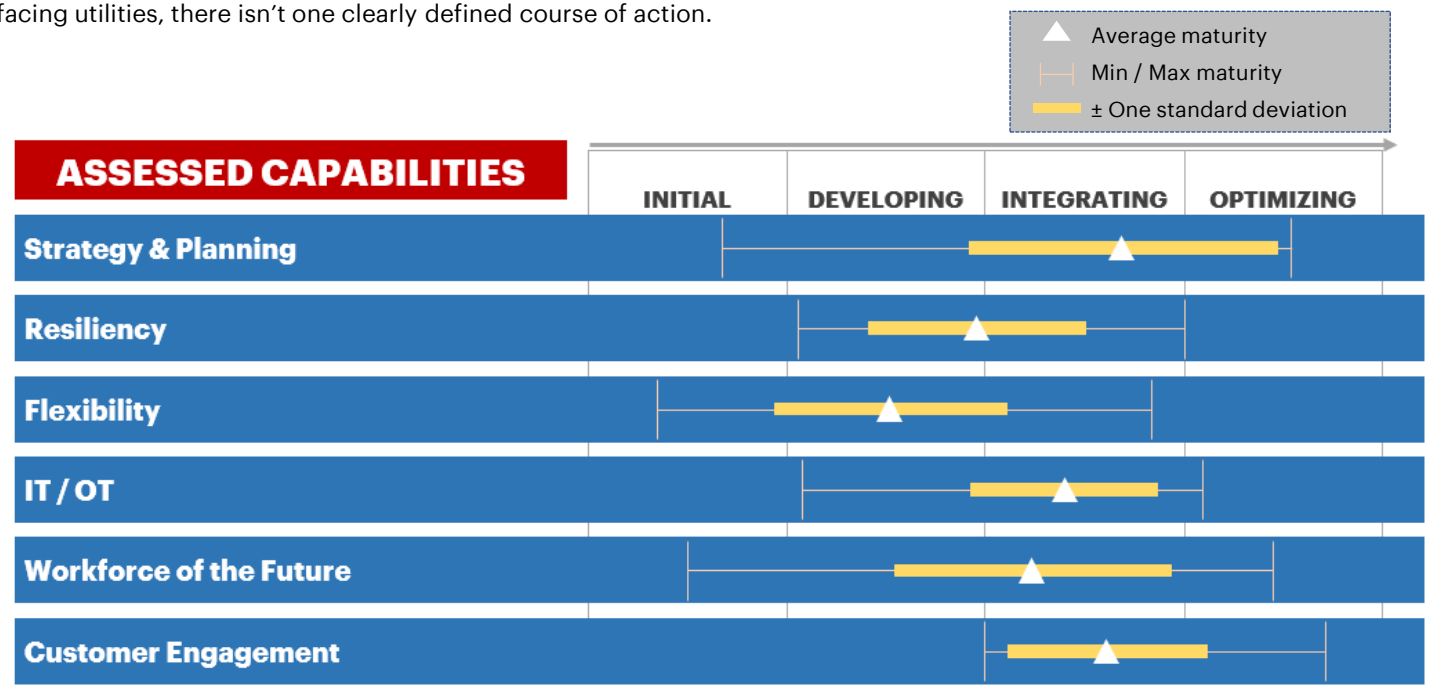

Figure 1. Average maturity per capability

Grid Modernization Overview

accenture FPL

Introduction

The 20th century developed North American grid is showing its age. A significant proportion of many distribution systems were built in the 1960s to 1980s and are nearing the end of their technical lives. One 2015 report from the U.S. Department of Energy concluded that 70% of power transformers are 25 years of age or older[1]. While this serves as a testament to the engineering ingenuity that developed the grid infrastructure, a massive overhaul is still required.

While the most apparent solution may be to just replace the old poles and wires, the reality is not as simple. One 2017 study estimated that the cost to replace the entire U.S. distribution infrastructure could be close to $1.8 trillion[2]. However, even putting aside the cost, the status quo is no longer sustainable.

Extreme weather events that contributed to the 2018 California wildfires and 2021 Texas Power Crisis not only highlighted the vulnerabilities in the existing grid infrastructure but demonstrated the urgency for more resilient systems. The combination of increasing supply of renewable energy resources and increased demand in the form of electrification and electric vehicle proliferation brings new flexibility requirements and a need for a more decentralized grid architecture.

While these challenges appear to be insurmountable obstacles, there are powerful new digital tools that can be leveraged to modernize and develop a “smart grid”. Cutting edge advances in technology, equipment, controls, and communication offer new grid operating capabilities and, more importantly, the ability to transform traditional decision-making mindsets.

$1.8T

Estimated cost to replace the U.S. distribution infrastructure

A modernized grid is long overdue and utilities can use the challenges of today to reimagine the future of the electric distribution system.

accenture FPL

Current day events are highlighting the need for grid modernization and projections on emerging trends point towards a need for prompt action.

Extreme weather events are increasing in number and only expected to become more destructive
Changes in climate patterns have had significant impacts across the grid. The most notable of these are the events that have caused damage to distribution infrastructure or been caused by failing infrastructure. A 2021 report found that there has been a 67% increase in weather-related power outages since 2000 in the United States[3]. Similarly, higher temperatures lead to both increased consumer demand and decreased generation plant efficiencies seen in the increasing number of rolling blackouts across many parts of the US.

Increased proliferation of variable renewable energy sources will create instability if left unaddressed
Global installations of renewable energy are projected to grow at a CAGR of 7.6% between 2021 to reach 3,812 GW by 2026 and DERs are estimated to compose ~10% of the renewable energy mix[4]. 31 US states currently have renewable portfolio standards, further requiring utility responses. While many utilities have been responding with utility scale storage and renewable generation, this shift also has impact on distribution systems. Renewables can create unforeseen impacts on voltage profiles, reverse power flows, and create difficulties in determining the source of network problems.

Exponential growth in electric vehicles adoption and electrification are increasing demand requirements
In North America, electric vehicles are expected to grow at a CAGR of 31% between 2021 – 2026[5]. This rapid increase has the potential to cause significant strain on the grid during peak load periods with one study projecting a 38% in US electricity demand solely due to EVs[6]. Increasing electrification trends in other industries is also contributing to an increase in demand requirements.

Recent cyberattacks on critical infrastructure are only part of a growing trend
The 2015 Ukraine power grid cyberattack is the first known successful cyberattack on the power grid. Not only did hackers compromise and damage information technology systems, but they also seized control of SCADA systems and were able to remotely shutoff substations. The 2021 Colonial Pipeline ransomware cyberattack prompted a pipeline shutoffs that created fuel shortage incidents. The utility industry is recognizing that these are not isolated incidents and that malign actors are increasing their focus on the power grid. A recent survey of global utility professionals found that 54% expect a cyberattack on critical infrastructure in the next 12 months[7].

67%

increase in weather-related power outages since 2000 in the United States

31%

projected growth in CAGR between 2021-2026 in the North American EV market

54%

accenture FPL

Massive investments are needed to maintain a resilient and efficient grid that can deliver low-carbon electricity and meet customer demands. North American public agencies have recognized this imminent need and have taken actions at both federal and local jurisdiction levels.

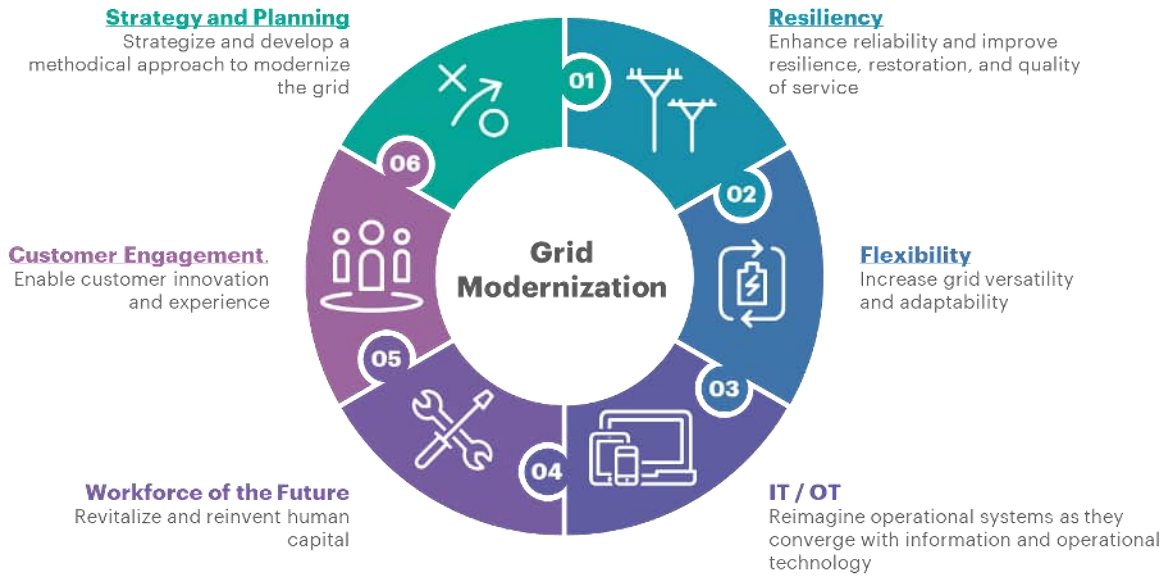
Survey Introduction

accenture FPL

Survey Introduction

Given the difficulties in even defining the term "grid modernization", it has proven even more challenging to assess the progress distribution utilities have been making in transforming the grid and incorporating new best practices. There is no standard, broadly accepted definition or scope of grid modernization. Different operating companies are subject to different regulations and operating situations, affecting their capabilities and priorities in grid innovations. However, in order for utilities to identify performance gaps and learn from each others' successes, there needs to be a mutual understanding of the key capabilities that will drive change in the industry.

The 2021 grid modernization benchmarking survey consists of 57 questions and assesses electric distribution utilities' maturities across a series of grid and utility modernization topics. Figure 2 denotes the six capabilities of grid modernization which directed the benchmark's survey. It is important to note that the survey is specifically targeted towards distribution utilities and does not ask any questions related to their transmission infrastructure or any generation capabilities. While these are very important areas of discussion, the distribution specific analysis was conducted for a more targeted discussion.



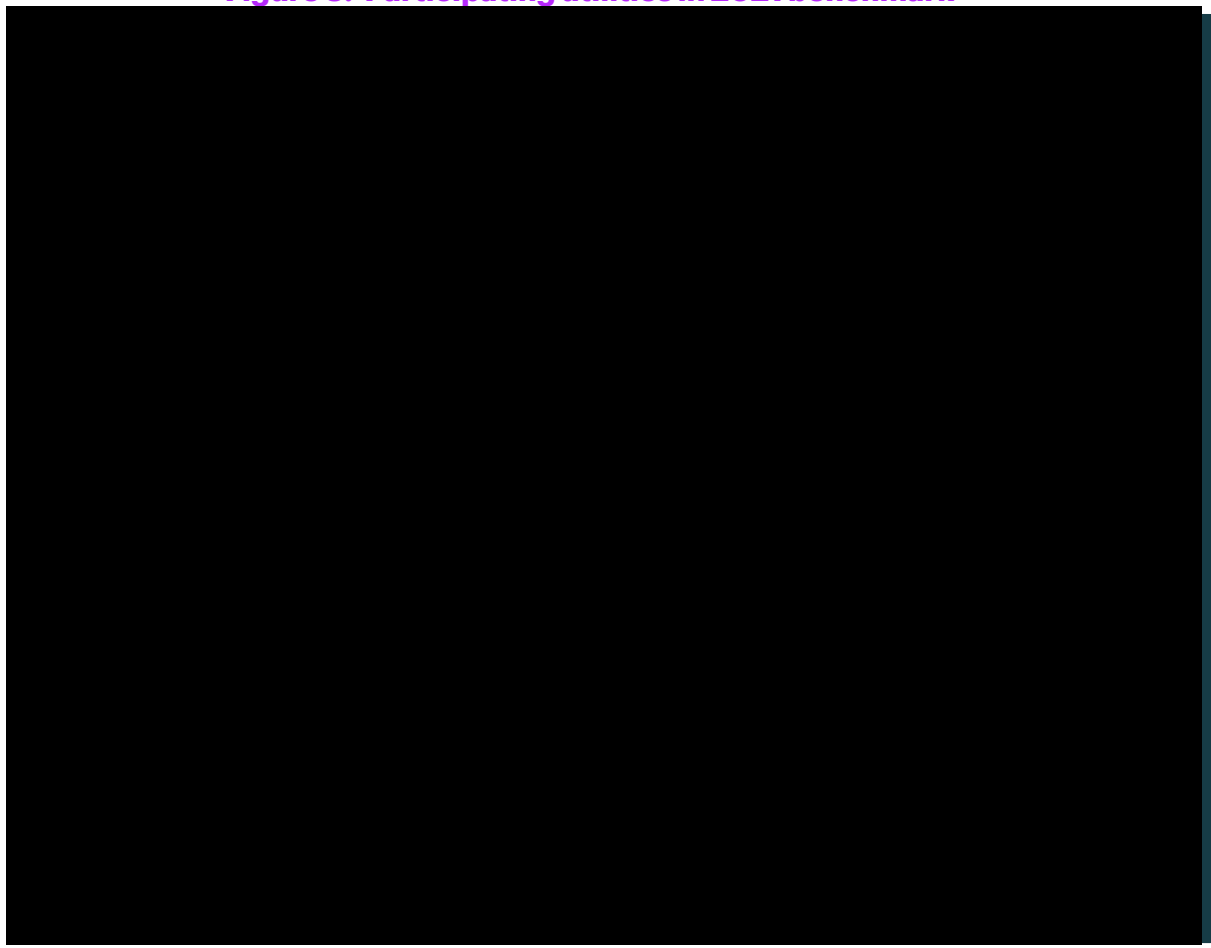
Key drivers behind the survey include:

1. How mature are utilities in key grid modernization capabilities?
2. Where have there already been significant recent transformations?
3. What are the key areas of growth and performance improvement?

For each question, survey respondents were asked to select from a multiple-choice list the descriptor which best described their maturity or abilities regarding a certain topic. Response options were compiled by industry experts and aimed at capturing the wide spectrum of grid capabilities. Respondents with multiple sub-entities were asked to either fill out separate responses per operating company or select the option that best described the average capabilities across the different entities. Similarly, entities with both North American and international operating companies were asked to describe the capabilities of their North American entities.

Each question was weighted equally towards the total results and were predicated solely on the direct responses from participants. The questions and response options were geared to be as agnostic as possible to regulatory jurisdictions; however, it should be noted that survey responses may be tied directly to jurisdictional restrictions or requirements outside of the utility's control.

Figure 2. Grid Mod Capabilities



The six capability categories are the following:

- Strategy and Planning
- Resiliency
- Flexibility
- IT / OT
- Workforce of the Future
- Customer Engagement

Survey Participants

21 North American utilities participated in the 2021 survey spanning the United States and Canada. The respondents, largely consisting of large investor-owned utilities, covered 23 jurisdictions and represented over 50 million customers. Figure 3 contains the full list of surveyed utilities.

Strategy & Planning – Introduction

The concept of making improvements to the power grid is not a new one. Distribution utilities have always worked to continuously enhance their grid infrastructure. However, this has historically taken place in the form of disparate and disjointed initiatives. Grid modernization is elevating that concept to drastic new levels but with these increased challenges comes the importance of increased strategy and planning. The drivers behind grid modernization are too wide-spread, from increased variable generation to extreme weather, to be dealt with individually and require dedicated strategies and planning in order to arrive at success.

Arguably, the greatest strategic driver behind grid modernization is the increased penetration of distributed energy resources (DERs), largely in the form of renewables. Since 2008, local and state commitments have led to a near-doubling of renewable energy generation in the United States[8]. For utilities, these regulatory requirements translate to faster than usual investment timelines and accommodation of more distributed resources. However, in the face of these new requirements, regulators are still looking for utilities to demonstrate value from grid modernization investments, apart from societal benefits, to make sure that their ratepayers are being treated fairly.

Doing so will require the formation of new markets and models to properly obtain the value from these new assets—a massive shift from the transactional nature of the current distribution utility business model. Examples of such new models include using non-wires solutions (e.g. energy storage) as T&D investment deferral and grid service providers, DER aggregation for virtual power plants (VPPs), and renewables integration.

One of the most innovative models is the transformation from a purely asset driven business model to one that incorporates the increasing responsibilities of a distribution system operator (DSO). The expansion of the DSO role to include market-based procurement and operation of DERs creates a wide slew of opportunities for utilities, many of which are already playing key DSO roles. The incorporation of new functionalities as distribution grid operators, market operators, or DER operations represent a significant transformation for utilities would be an evolutionary leap.

The regulator will play a pivotal role in that journey and any type of DSO vision will require a strong supporting regulatory model that incentivizes the new investments. While the DSO model will not be appropriate for all types of distribution utilities, there are applicable aspects, irrespective of industry structure or regulatory model, that can be leveraged to optimize the value of DERs.

Strategy & Planning – Benchmark Results

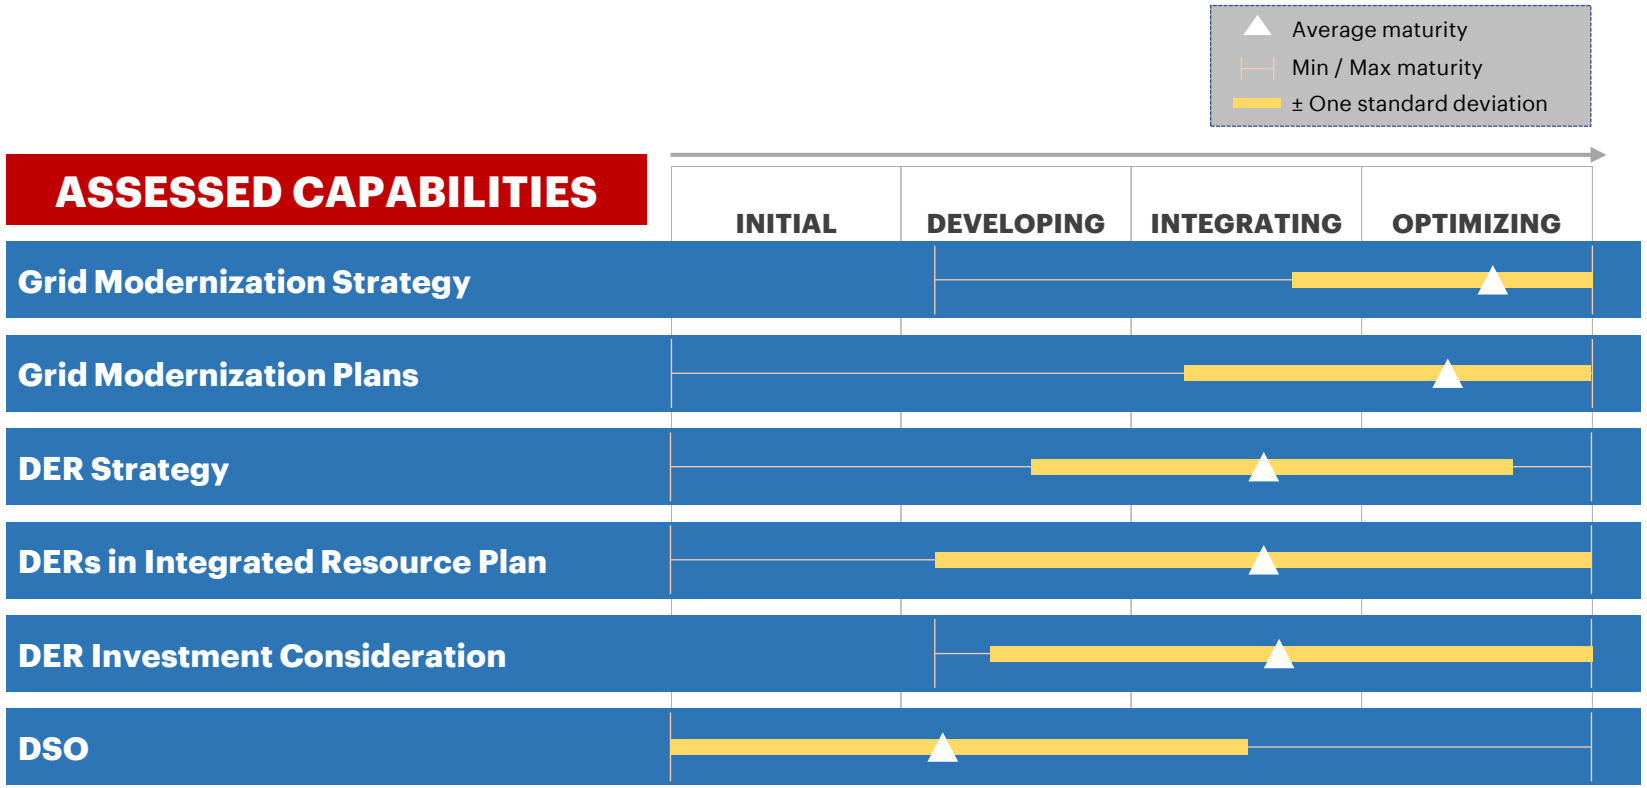

Figure 4. Strategy & Planning capabilities benchmark results

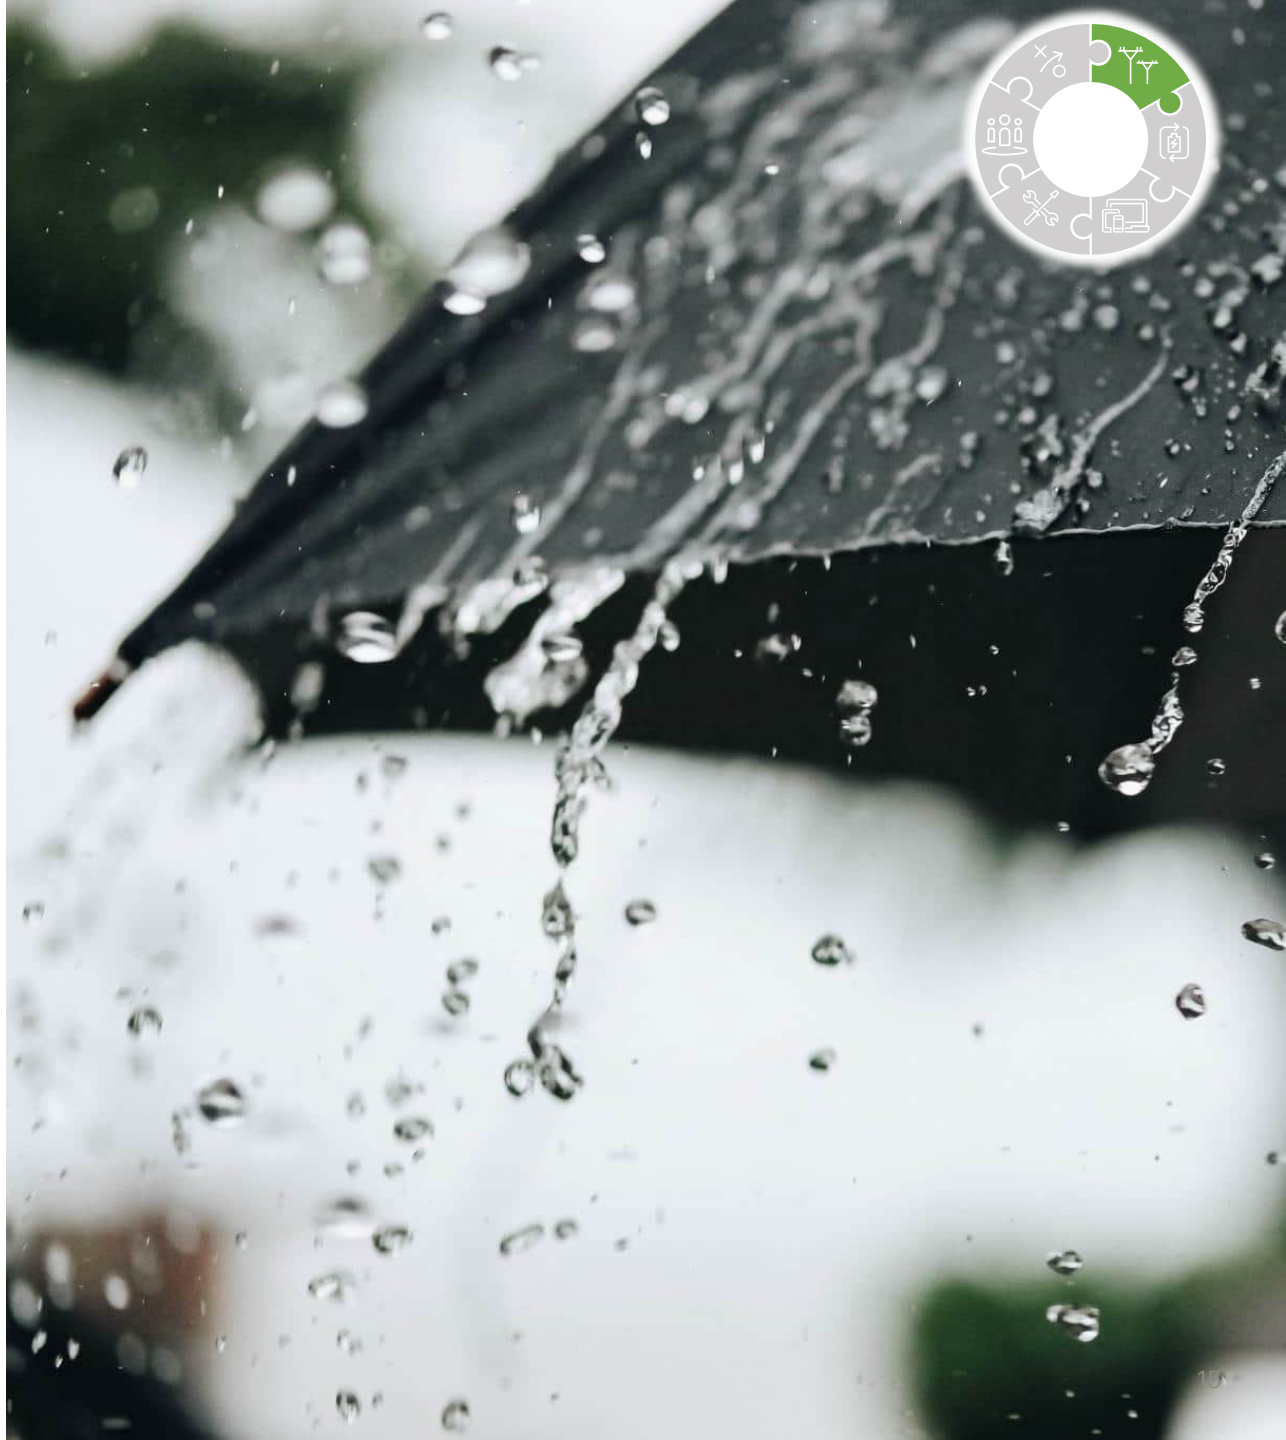
OVERALL ANALYSIS – KEY CONSIDERATIONS

- Grid modernization strategies and plans have been largely defined and are being executed upon. These plans, projects, and associated investment figures are also being included in discussions with regulators.
    - **86% of surveyed utilities** have developed grid modernization strategies and begun implementation
- Utilities are developing strategies to tackle the increased penetration of DERs; however, there is a wide maturity spread in both strategy integration and execution capabilities
    - **33% of surveyed utilities are in early stages of DER strategy development** and do not have a formal strategy in place
- DER forecasts are becoming increasingly included into integrated resource plans either through jurisdictional requirements or utility initiatives
- Utilities are more regularly considering DERs as replacements or deferral opportunities for traditional grid investments. This presents an opportunities for new DER vendors who may be more incentivized to pursue grid facing services compared to current solely customer centric business models.
- There has been minimal interest and few conversations had with regulators on a potential DSO model thus very little actions have been taken. This observation warrants a further examination into the current gaps and obstacles that are impeding utilities' interests or abilities in assuming DSO responsibilities.

**Refer to Appendix for full breakdown of responses*

Resiliency – Introduction

Reliability, the ability to bounce back from individual system failure events, has been measured and managed throughout the decades. However, resilience and the ability to manage high-impact events, has yet to reach that level of maturity especially in the face of extreme weather events. A recent survey of North American utility executives showed that ~87% of respondents stated that extreme weather events severity and duration has increased in their locations over the past 10 years and 92% of respondents expected these type of events to increase or worsen over the next 10 years[9].



Currently, there is no standardized nor broadly accepted definition of resilience in the utility industry. Utilities don't have one; neither do regulators. Thus, the responsibilities will fall on utilities to take the lead and develop a roadmap to resilience that encompasses other key stakeholders (i.e., regulators, customers).

This overall shift from tactical to strategic will require a rebuilding of scenario planning and ensuring risk mitigation is a valued capability that is integrated across the enterprise. This occurs from assessing current risk capabilities, modeling possible scenarios, and then translating those scenarios into risk mitigation plans. The objective, of course, being an optimally hardened network that delivers the appropriate value to customers who will inevitably see increased costs from resilience initiatives.

These high–impact complex scenarios will also require an accelerated approach to digital solution adoption in order to deliver on resilience strategies. One of the key opportunities for digital solutions is damage assessment. Damage assessment drives the recovery process after any disaster and dictates the resources required, where you put them, and where to focus these efforts. Increased asset visibility and analytical tools such as Artificial Intelligence (AI) and Machine Learning (ML) can transform the foundation of how utilities view, manage, and maintain their system. Technology is not limited to pro-active decision making and can be used to inform restoration strategies using real-time geographic and weather data to inform priorities and improve communications with customers.

The shift towards digital comes with increased risk of cyber threats. The 2021 Colonial Pipeline cyberattack that halted all of the pipeline's operations demonstrated the extreme events facing the grid are not limited to natural forces. With a 160% year-on-year increase in ransomware events in 2020, there is an increased focus on mitigating potential cyber risks across both IT and OT environments[10]. These challenges facing utilities aren't going away anytime soon and a range of solutions and will be needed for a resilient future.

accenture FPL

Resiliency – Benchmark Results

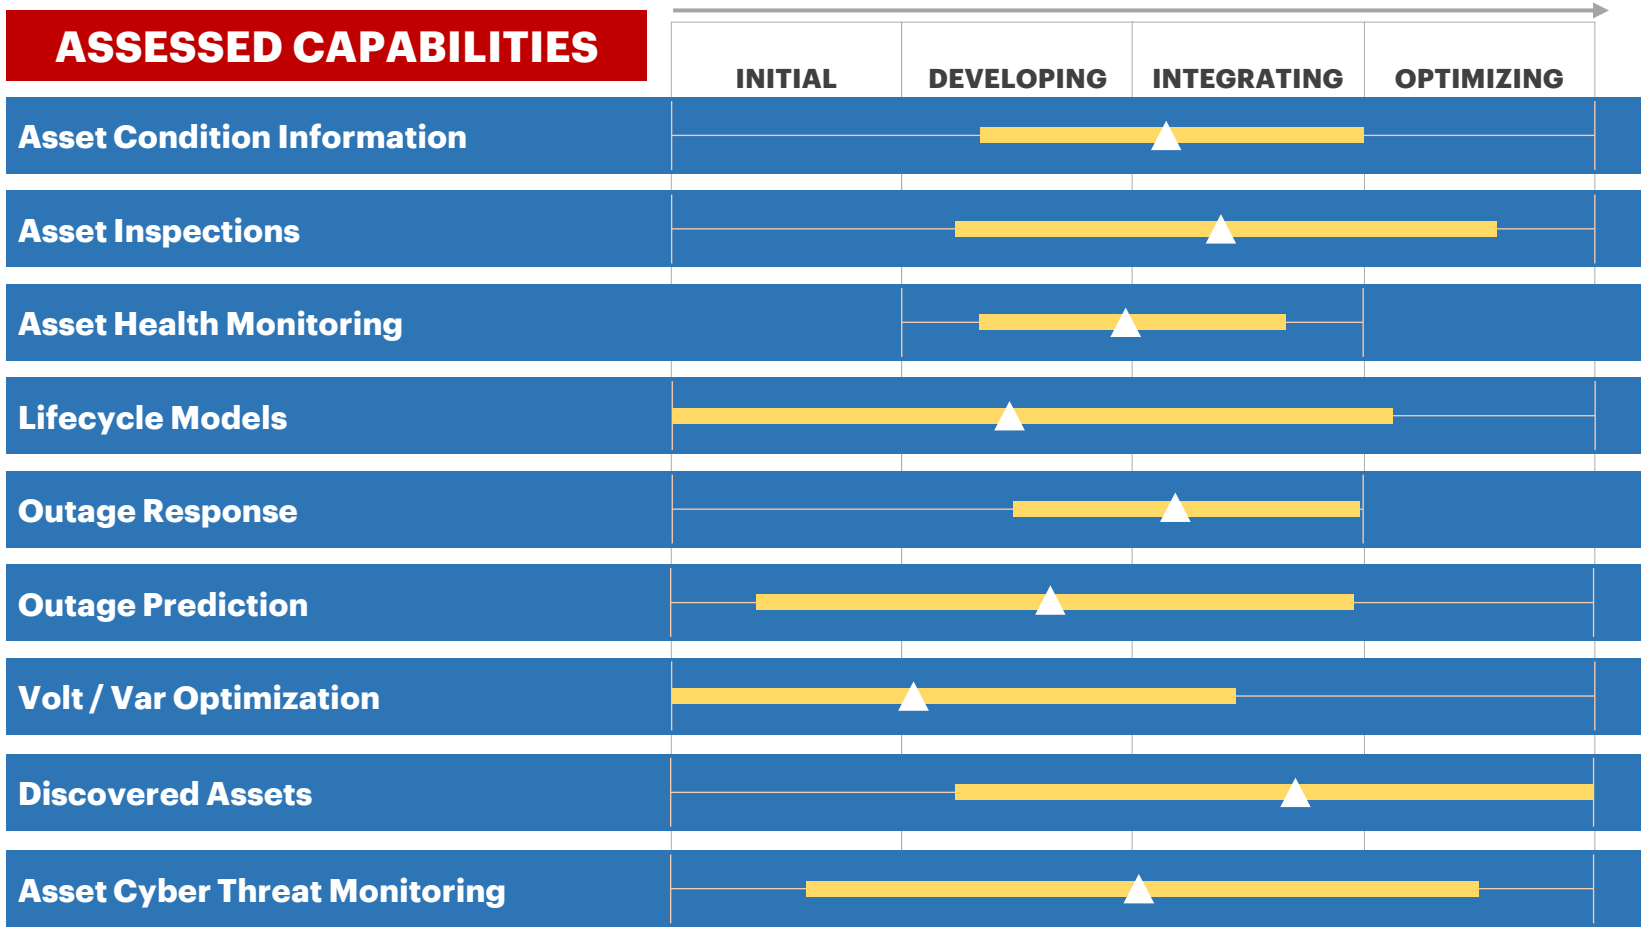


Figure 5. Resiliency capabilities benchmark results

OVERALL ANALYSIS – KEY CONSIDERATIONS

- Asset health analytics, while still heavily subject-matter-expertise influenced, are trending towards increased use of company and industry data.
- While the majority of respondents stated that they used traditional run-to-failure or field inputs to make asset repairs or replacements, many utilities also employ data-driven lifecycle models.
  - **19% of utilities stated using predictive lifecycle models that use real-time data to proactively call for action**
- There was a **wide variance in maturity regarding outage prediction,** from respondents stating that they are not pursuing any outage prediction to those with systems in place, including predictive modeling, to detect disturbances correlated to outages.
- Volt / Var Optimization (VVO) deployment, while still in initial stages at many utilities, has gained noteworthy traction as 33% of respondents stated having the technology on over half of their distribution feeders.
- There was a **wide variance in maturity demonstrated regarding asset cyber threat monitoring** from respondents stating that they lacked any OT threat monitoring capabilities to those having real-time centralized monitoring via a security operations center (SOC).

**Refer to Appendix for full breakdown of responses*

Flexibility – Introduction

Flexibility is generally defined as the grid's ability to manage variability and volatility to balance electricity supply and demand. The increased penetration from renewable variable energy sources such as solar and wind have led to increasing grid instability and is aggravated further by distributed energy resources, especially rooftop solar PV. Developing greater system flexibility is not only required to manage these new supply and demand patterns but is also one of the most cost-effective approaches to build resilience.

There are several points along the electricity supply chain where distribution utilities can take action to inject flexibility. At the point of demand, tools such as behind-the-meter energy storage, demand response, and smart charging can be leveraged to smooth the variability from distributed generation and electric vehicle (EV) charging. At a larger distribution system level, self-islanding solutions can be used to reduce demand and grid dependency. Microgrid solutions are an example of tools utilities can use to develop both flexibility and resilience in the face of extreme events. A recent survey of utility executives found that 93% of respondents agreed that self-islanding solutions will be a major contributor to improved resilience. Lastly, at a large point of supply are utility-scale renewable generation, grid-scale storage, and vehicle-to-grid (V2G) solution options.

Energy storage, largely in the form of batteries, is one of the solution options that appears across multiple points of scale. While there is continued debate on the efficacy of grid-scale versus distributed energy system solutions, storage assets provide a unique level of versatility that allow them to pull from multiple value pools. Storage assets can be used to increase renewable penetration while also being deployed as T&D system assets to address grid inefficiencies or localized pockets of congestion that would otherwise require costly infrastructure investments.

Similarly, electric vehicles and related assets are having a transformative effect on the network of the future. Current projections expect a CAGR of 31% for the North American EV market during the forecast period of 2021 – 2026. A recent Accenture report estimates the total U.S. eMobility market to have a $700 billion worth by 2040, with $100 billion being attributed to the value of home and public charging stations[11]. Leading utilities will not only be able to develop commercial partnerships to address home and public charging investments but also leverage EVs to deliver grid flexibility. The Accenture report estimates that the value potential of this grid flexibility in the U.S to be $30 billion.

Flexibility – Benchmark Results

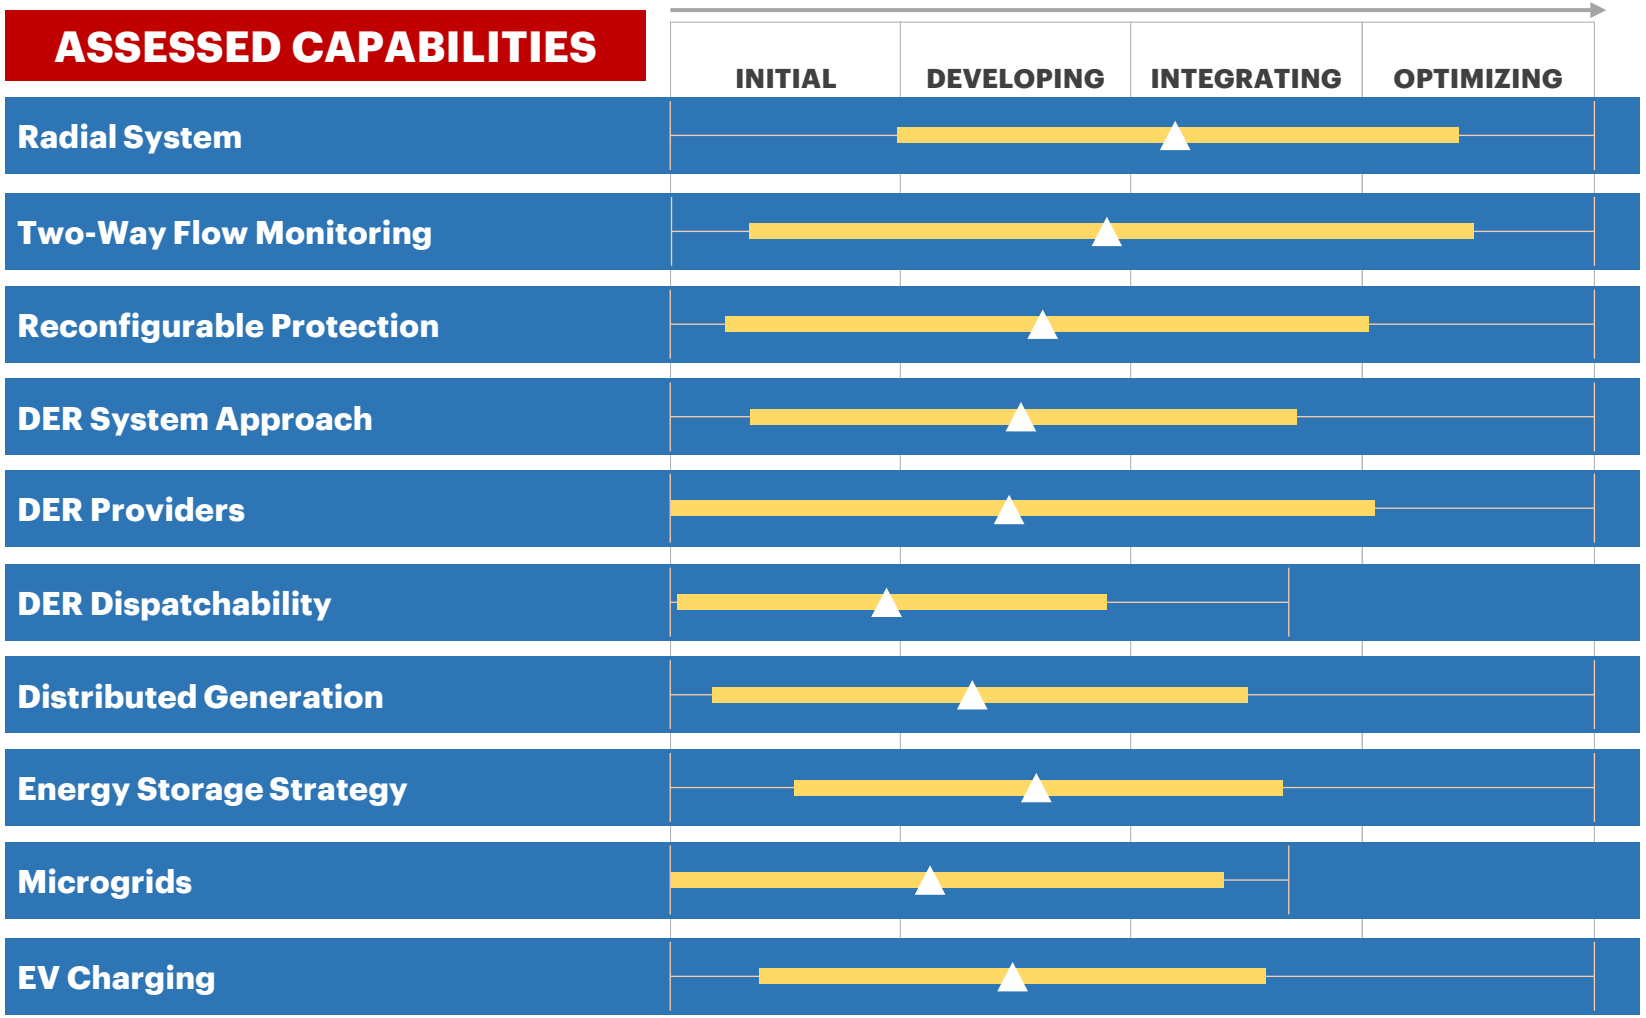

Figure 6. Flexibility capabilities benchmark results

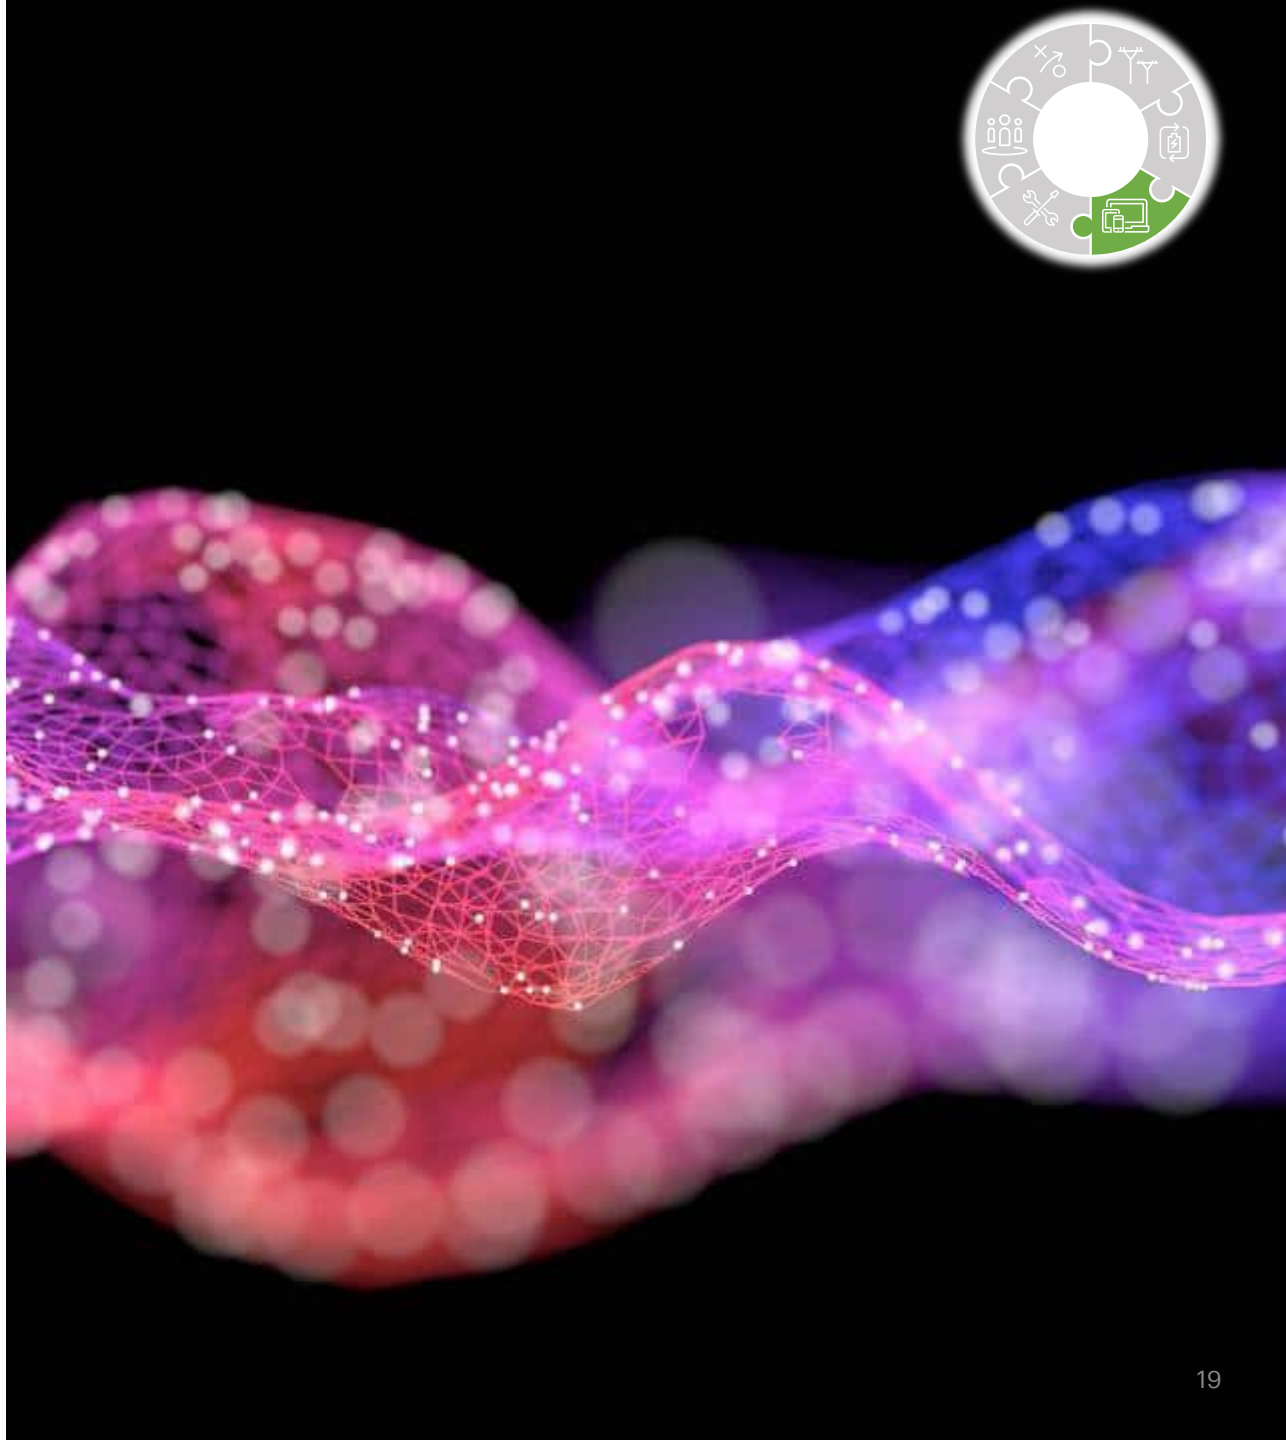
OVERALL ANALYSIS – KEY CONSIDERATIONS

- **Two-way flow monitoring**, a key component of monitoring distributed generation, has been enabled at 66% of surveyed utilities; however, only **33% of respondents have the ability to see real-time asset status.**
- Approximately 50% of respondents are in an early developing stage regarding system capacity/system protection strategies for increased DER penetrating, while 28% have operationalized their approach and implemented alternate protection schemes.
- Reconfigurable protection research has begun at many utilities but only **33% of respondents have implemented the capability either partially or throughout their service territory .**
- Distribution Management Systems (DMS) for DER dispatchability is in early consideration as **only 14% of respondents have begun any capability piloting.**
- While half of the respondents stated having no operationalized microgrids, 38% responded having microgrids that can be islanded and operated without centralized generation in pilot environments.
- The majority of respondents stated owning EV charging stations or having organizational provider partnerships; however, there was notable variance in the utilities' abilities to monitor or manage the charging station's usage.

**Refer to Appendix for full breakdown of responses*

IT / OT – Introduction



Arguably, the greatest driver of the modernized grid is the introduction and influx of digital grid solutions. Solutions include new cloud capabilities, 5G, edge computing, IOT, and automated sectionalizing devices to name a few. These solutions have applications across multiple utility ecosystems and will serve as enablers of other grid resilience and flexibility transformations.

Traditionally, most utilities have had their information technology (IT) and operational technology (OT) operate in completely different domains. IT capabilities were primarily focused on customer services (e.g. billing, desktop support) and internal functions (e.g. HR, communications). OT solutions were limited in scope to software systems that operated, managed, and reported grid technologies (e.g. SCADA, DMS, GIS).

However, with new technology solutions comes increased data and the increased needs for an integrated technology infrastructure that can scale with these new demands. Advanced Metering Infrastructure (AMI), the combination of smart meters, communication protocols and data management systems, is a prime example of a technology solution demanding this transformation. While smart meters were originally deployed for ease of billing capabilities, progressive utilities began are realizing that they could use the granular data from smart meters can be used with other data systems for advanced use cases such as outage isolation and voltage monitoring. This advanced use case of disparate databases and advanced analytics requires the integration of IT and OT capabilities to provide a solid and reliable foundation.

One of the key opportunities for advanced IT/OT is in the control room. Many utility control centers continue to be heavily dependent on human operators looking at multiple screens of data and reactively solving real-time problems with little to no context. However, the new challenges from extreme weather events, variable generation, and cyber attacks have introduced significant complexity and a magnitude of threat that may not be addressable by a reactive approach. Integrated data systems and automated task flows are examples of tools that both improve operators' abilities to address issues and decrease the risks from manual errors.

Evolving IT and OT systems enable the breakdown of generational siloes and the decision-making capabilities required to bring enhanced reliability and flexibility to the grid.

IT / OT – Benchmark Results (1/2)

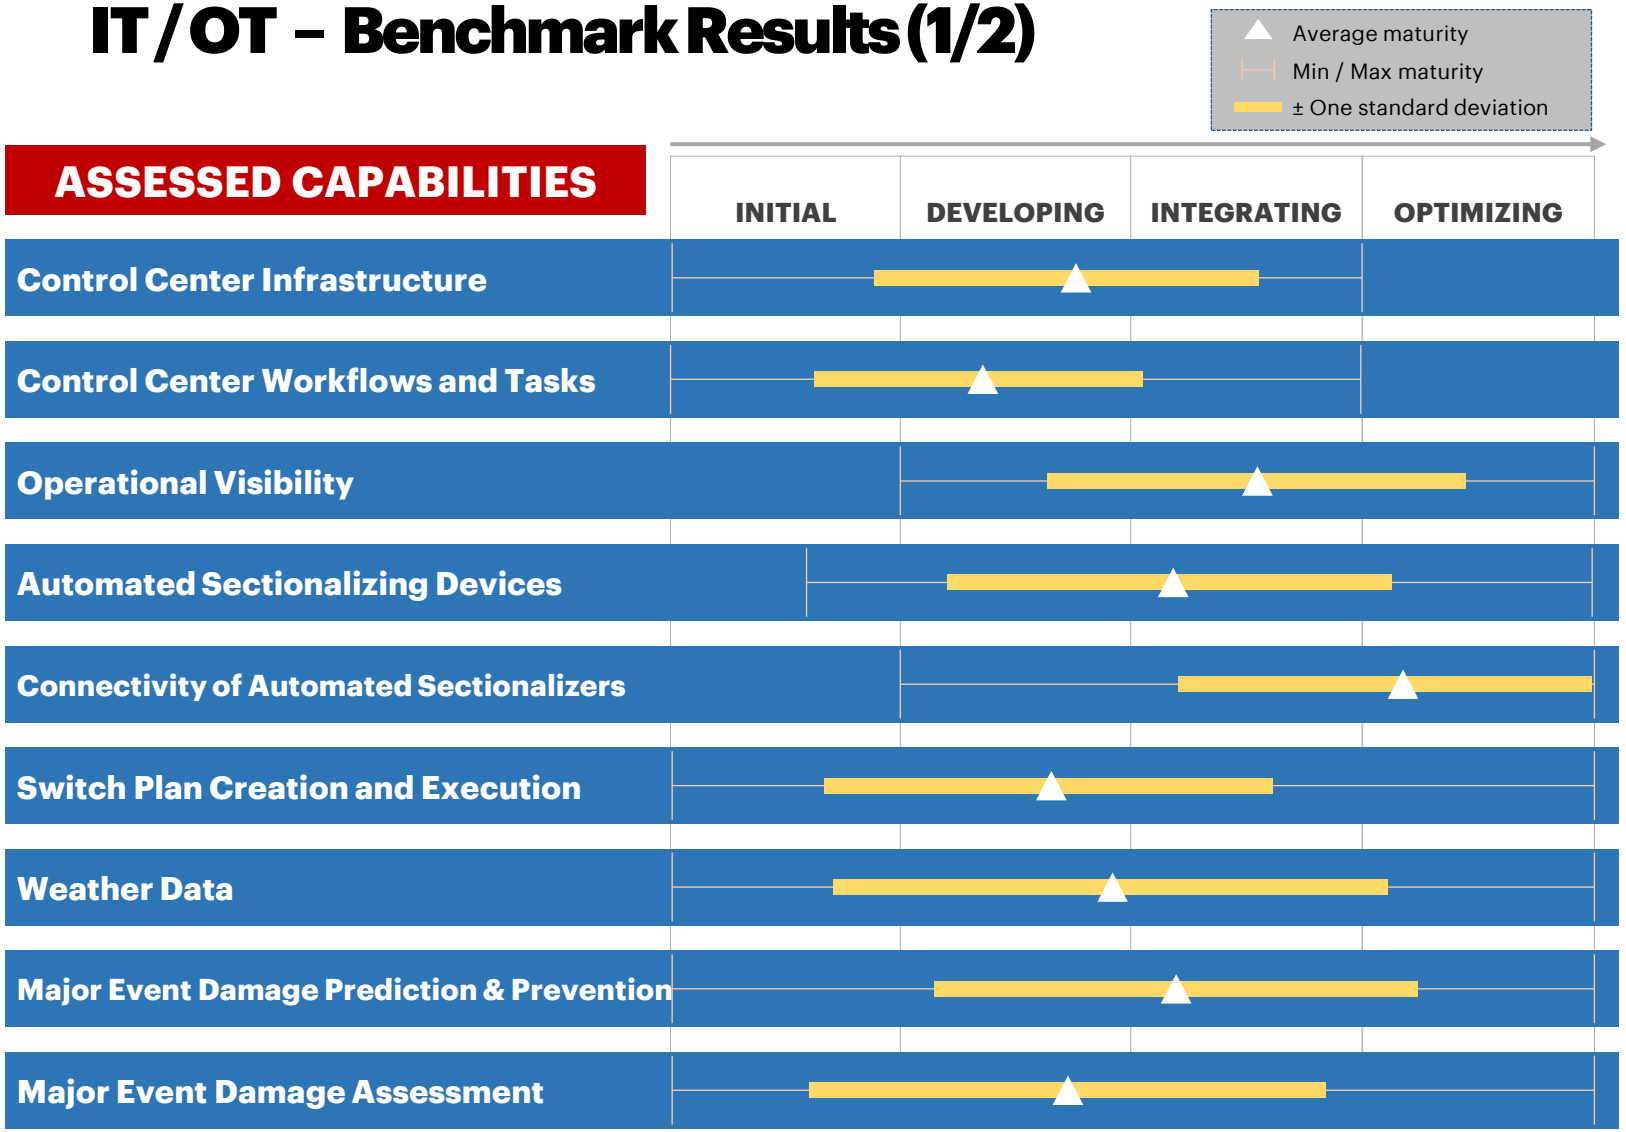


Figure 7. IT / OT capabilities benchmark results (1/2)

OVERALL ANALYSIS – KEY CONSIDERATIONS

- The majority of utility control centers have integrated data sources but workflows are still largely dictated by long-standing processes and are primarily focused on approval s and handoffs. Some utilities are beginning to look towards new technologies as **38% have started to experiment with using AI / ML in control center applications.**
- Automated sectionalizing devices have been well integrated in many utilities with a majority stating over 50% of their feeders had such operational technology.
- Many utilities, 52% of respondents, have recognized the potential of sectionalizers beyond reclosing activities and have devices provide telemetry and integrate data into operational models(e.g. ADMS)
- With the increased threats from extreme weather, many utilities are recognizing the importance of weather data. **43% of respondents stated using meteorology teams to perform sophisticated analyses (e.g. predictive modeling)** and a smaller portion stating that they had integrated real-time weather data into operations
- There are notable opportunities to integrate analytics into major event damage prediction and assessments with **71% of utilities responding that their damage prediction activities were limited to manual exercises.**
- Similarly, while the vast majority of utilities, 66%, stated that they used a combination of manual and digital tools post- major event to upload information into systems, the subsequent actions are driven by operator decision making. However a small portion, ~10%, stated using digital tools to feed systems that automatically recommend a course of action.

**Refer to Appendix for full breakdown of responses*

IT / OT – Benchmark Results (2/2)

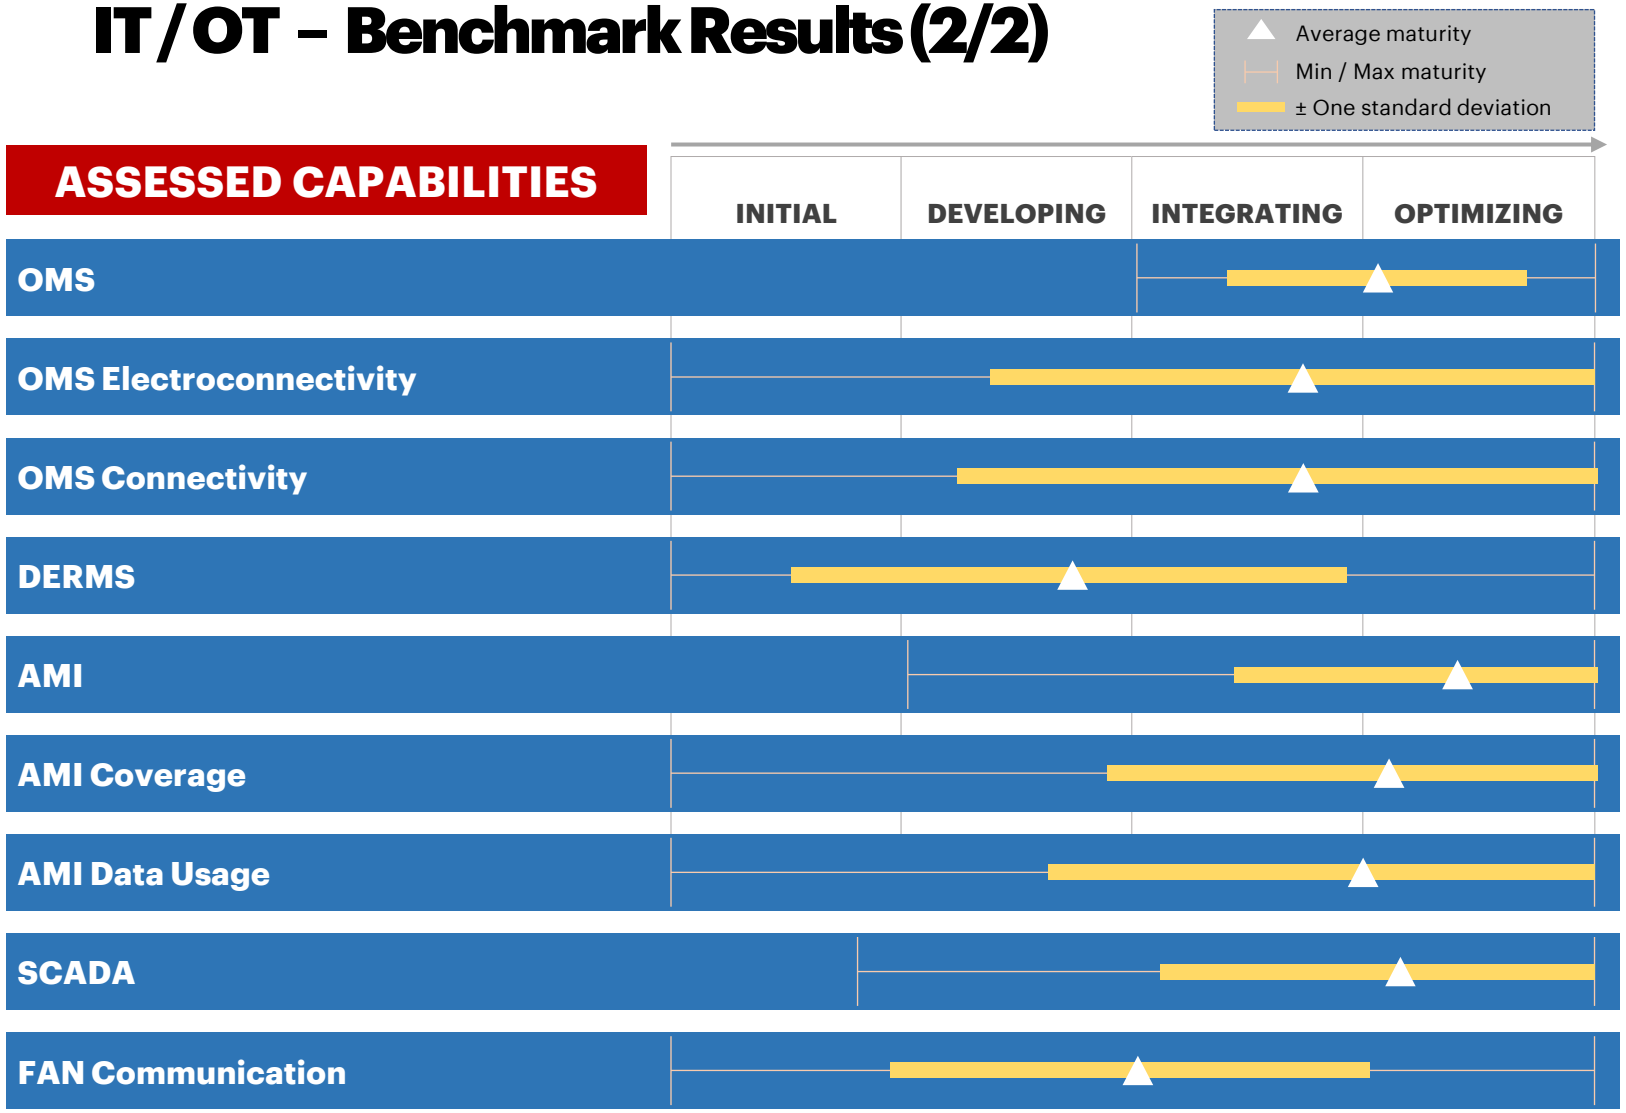

Figure 8. IT / OT capabilities benchmark results (2/2)

OVERALL ANALYSIS – KEY CONSIDERATIONS

- While all utilities stated having an outage management system (OMS), there is a wide variance within system maturity. The majority of utilities stated having elements of integration with other OT systems (e.g. GIS, ADMS), **only 24% could state that their systems were well integrated in that changes in integrated systems would be reflected real-time in OMS**. Similarly, the majority of respondent OMSs have electroconnectivity models but only **50% of models reflect dynamic, real-time status while the remaining are either static or had to be updated manually.**
- Utilities approaches and maturities regarding DERMS is quite varied. While **33% of utilities are only still having initial conversation on incorporating DERMS**, the remaining are evenly spread out the spectrum between having no DERMS initiative to fully operational systems.
- The vast majority of utilities have integrated AMI systems. While there is some variability in system maturity, **many utilities, 76% of respondents, are using AMI beyond standard customer operations** and leverage advanced intelligence capabilities such as outage management.
- While the majority of utilities continue to use the industry standard of 900 MHz Radio Mesh in their Field Area Network (FAN) communications, a small portion of utilities are leveraging more advanced communication networks such as high-speed wireless (14%) or fiber optic networks / LTE solutions (10%) that can better support new smart grid technologies.

*Refer to Appendix for full breakdown of responses

Workforce of the Future - Introduction

The COVID – 19 pandemic has highlighted the importance of utilities having a resilient workforce that can endure any type of event. However, utilities are currently facing an aging and retiring workforce with the US Department of Labor projecting that 50% of current energy utility workers will retire within the next ten years. Grid modernization has also introduced a need for a digital-savvy workforce that can develop and manage the technologies required for a future state smart grid.

One of the core approaches for creating a resilient workforce that can handle these challenges is the use of innovative technology to drive flexible plans and procedures. A digital organization can help capture the deep existing expertise of current employees and allow employees to focus on mission-critical tasks. A recent survey of utility employees found that only half of non-managerial employees believed that they were being utilized at their full potential.

Many activities within the industry require manual tasks and outdated tools that can now be automated with new technologies. Automated field work dispatch is an example of a technology that can allow dispatchers to automatically create and assign routine work thus allowing them to focus their efforts on the more challenging scenarios. More general technologies such as robotic process automation (RPA) can further reduce employees' busy work and allow them to concentrate on the challenges in evolving the grid rather than only do damage control on the status quo.

While operational efficiencies do allow employees to better use their time, new field technologies (e.g. drones, Augmented Reality (AR) / Virtual Reality (VR)) should be leveraged to better manage the grid. For example, drones can support overhead mileage inspections, maintenance jobs, and post major event damage assessments. Augmented reality solutions have been used to superimpose digital information on the real world, providing utility workers dynamic access to data and back-office systems. As grid infrastructure becomes more complicated with the introduction of smart devices, employees will need to instantly access more information in order to properly assess and maintain field assets.

Lastly, Artificial Intelligence (AI) and Machine Learning (ML), are some of the most disruptive new technologies that have seen proven success in many, if not all, grid modernization topics. However, successful use of AI and ML not only requires the right data science skills, but also the fostering of a digital savvy organization that can identify potential use cases and translate the results into appropriate actions.

accenture FPL

Workforce of the Future – Benchmark Results

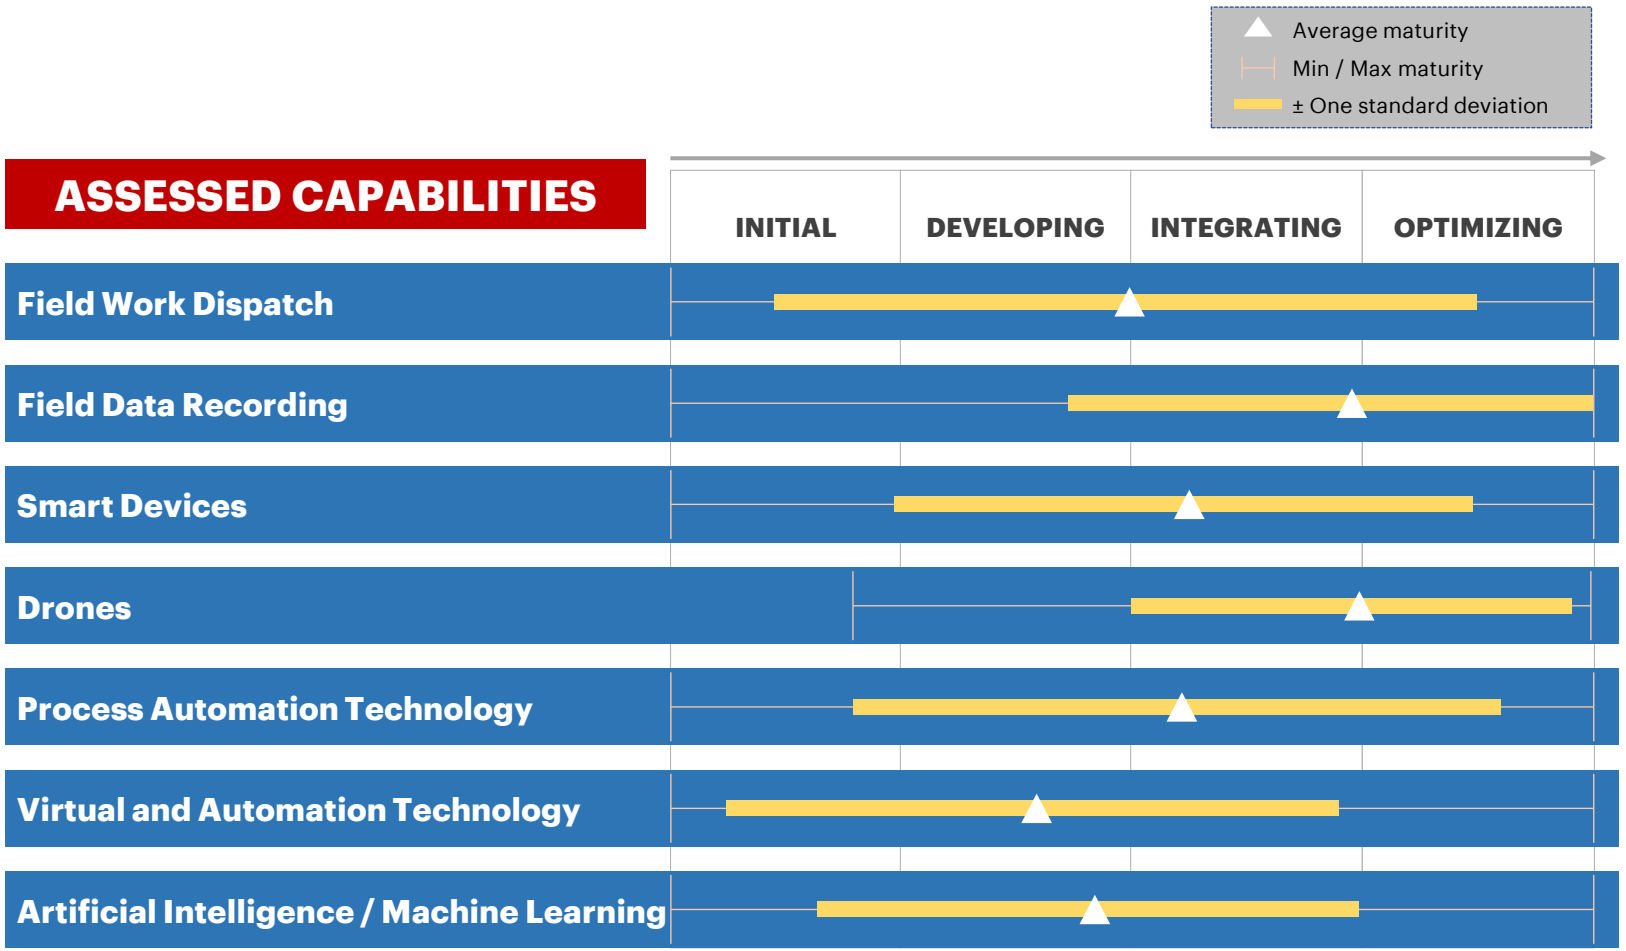

Figure 9. Workforce of the future capabilities benchmark results

OVERALL ANALYSIS – KEY CONSIDERATIONS

- Despite the predominant usage of centralized digital systems of records for initial work dispatch, not all respondents are able to accommodate real-time emergent work and require at least some degree of manual intervention
- Field devices have been widely integrated into most utilities' field operations with **~50% respondents stating that their devices were connected to their system of records and can be updated in real time**
- While not common in most surveyed utilities, smart devices have either been lightly integrated or piloted into field operations across many utilities
- **Over 70% of respondents** have begun conducting **feasibility studies or pilots for drones' usage**
- While most respondents stated having only an initial or developing approach to integrating VR / AR, **nearly 30%** have begun or fully completed at least one form of operational implementation
- A majority of respondents have integrated AI/ML within distribution operations, with **33% stating that they have employed data scientist resources or capabilities to implement AI/ML in identified use cases**

**Refer to Appendix for full breakdown of responses*

Customer Engagement – Introduction

Customer engagement has traditionally not been associated with grid design or modernization as the relationship is primarily transactional. However, while customers are playing a significant role in the current challenges facing utilities, they may also prove to be a solution driver.

Many customers are becoming more scrutinous of their relationship with their electricity providers as major grid events disrupt their normal lives. The 2018 California wildfires are a prime example of a significant incident that caused customers to pay attention to their utilities' infrastructure capabilities and re-evaluate their utility relationship. Though most of North America is served by regulated utilities, the public can have major influences on regulators favorability to utility decisions.

Customers have been a driving force behind many of the flexibility challenges facing the grid. DER penetration, which has caused concern for grid instability, is continuing to grow at steady rates. The more significant driver through is the rapid increase in electric vehicles. Though slightly hindered by the COVID-19 pandemic, the North American EV market is estimated to grow at a CAGR of 31% between 2021 and 2026. The subsequent increase in load will lead to massive instability if left unchecked.

However, customer engagement may also prove to be a solution to many of the aforementioned issues. In 2020 and 2021, customer responses to utility and grid operators' requests to reduce peak load during supply shortages prevented severe blackout scenarios. Behind the meter systems including microgrids, solar-plus-storage systems- and dispatchable energy loads provided much needed capacity during these incidents. While DER resource deployment is largely customer driven, the utility can play significant roles in enabling and encouraging customers to install these assets. Similarly, while EVs can pose potential threats to stability if left unchecked, utilities can engage customers to manage load profiles and use EVs as flexibility assets.

Utilities can also take more direct roles through demand response and energy efficiency programs. In a recent survey, more than half of customers indicated that they are interested in time-of-use tariffs, flexible tariffs, and demand response options post-COVID 19 pandemic to increase cost savings.

Customers are now more willing than ever to accept innovation and utilities can leverage this to bring them along in the grid modernization journey.

Customer Engagement – Benchmark Results

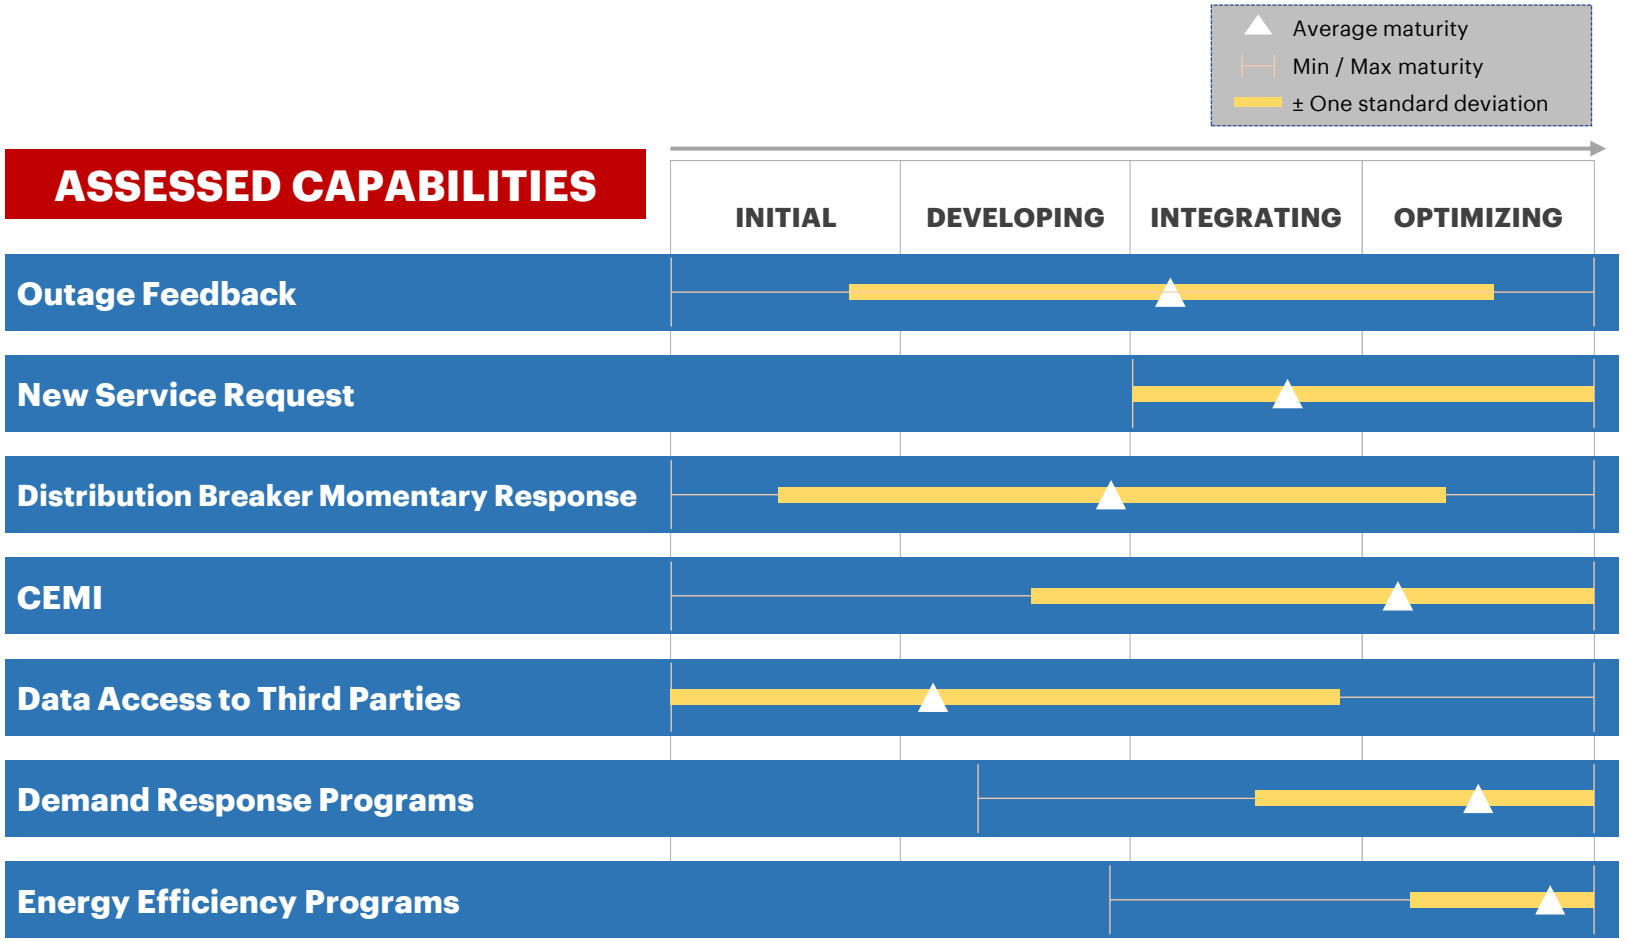

Figure 10. Customer engagement capabilities benchmark results

OVERALL ANALYSIS – KEY CONSIDERATIONS

- 57% of utilities stated that they leverage information from systems such as OMS or AMI to provide customers with an estimated time of restoration (ETR) with 24% reporting that they were able to provide additional real-time information (e.g. outage cause)
- The majority of utilities, ~90%, currently measure CEMI (customers experiencing multiple interruptions), with 66% of respondents reporting that they have required action thresholds and plans in place. Similarly, 76% of utilities currently measure MAIFI, with 24% reporting that they have required action thresholds.
- The vast majority of utilities stated having both behavioral and controlled demand response programs as well as energy efficiency programs.

**Refer to Appendix for full breakdown of responses*

Conclusion

accenture FPL

Conclusion

Our benchmark has shown that there has been a wide degree of maturity throughout the industry, but more and more utilities are recognizing the need for a transforming grid and the key role their sector will play in facilitating this change.

86% of the surveyed utilities have both developed and begun implementation of grid modernization strategies. This strategic acceptance of grid modernization is the first step to enabling change; however, execution progress must not be overlooked. Many utilities have completed key programs such as AMI but effectively using the results and data gathered from these new systems will be the more notable differentiator.

One of the promising results from the benchmark has been the maturity displayed in customer engagement programs. While these activities may not directly lead to a modernized grid, consumers will ultimately shape the future requirements for the grid and the importance of maintaining a healthy relationship cannot be overlooked.

The greatest growth opportunities found were with regards to flexibility. While certain regions may not face the urgency of addressing DERs due to current low penetration rates, utilities must develop the grid for future energy supply and demand patterns and look towards the shifting landscape of EVs and increasing electrification.

There has been notable maturity shown throughout the benchmark, but the survey has also indicated that there is much that utilities can learn from each other. Many respondents displayed high maturities in comparison to their peers in certain categories but then in other topics, would be significant less mature against those same peers. The electric distribution grid is one of the most complex feats of engineering ever undertaken. Successful reimagining of the grid will require knowledge-sharing and cooperation to develop a holistic vision that can be tailored to each utility's needs and desires.

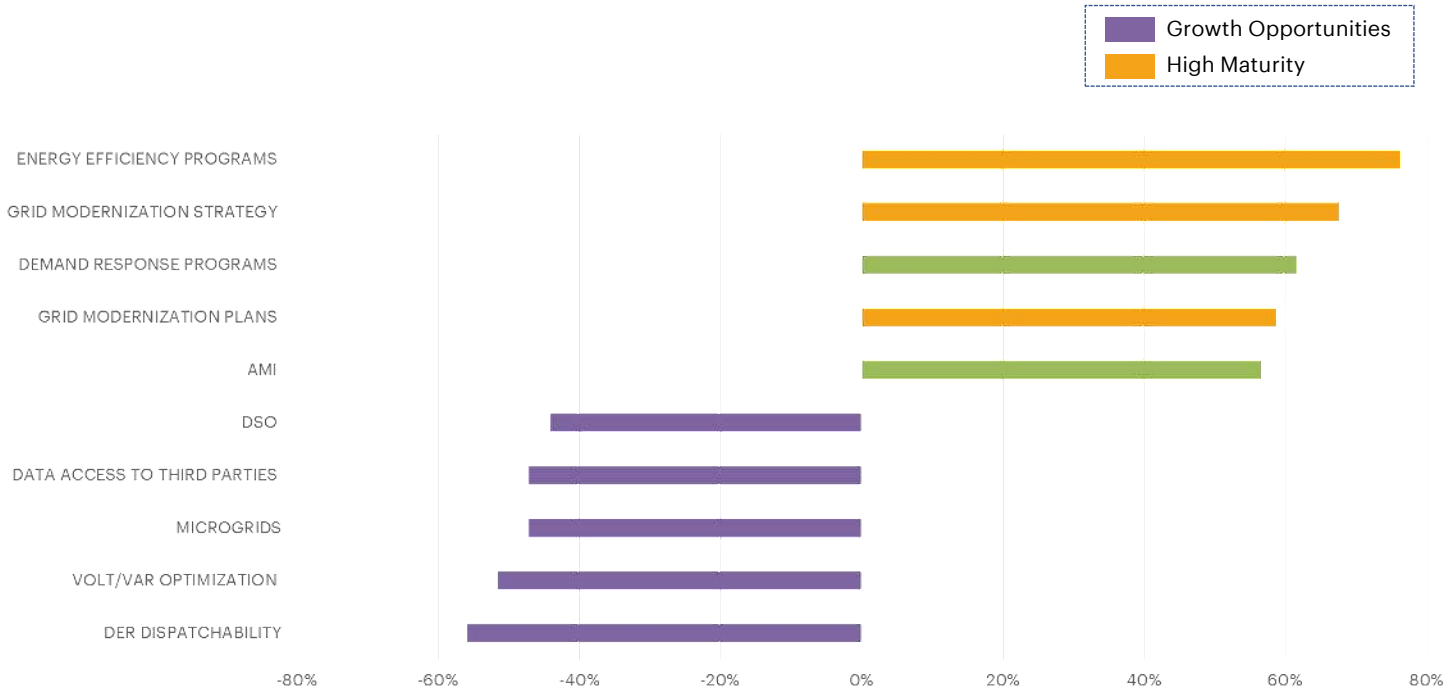

Figure 11. High maturity and growth opportunities compared to median results

Utilities are embracing the need for grid modernization but still have significant growth opportunities in critical execution

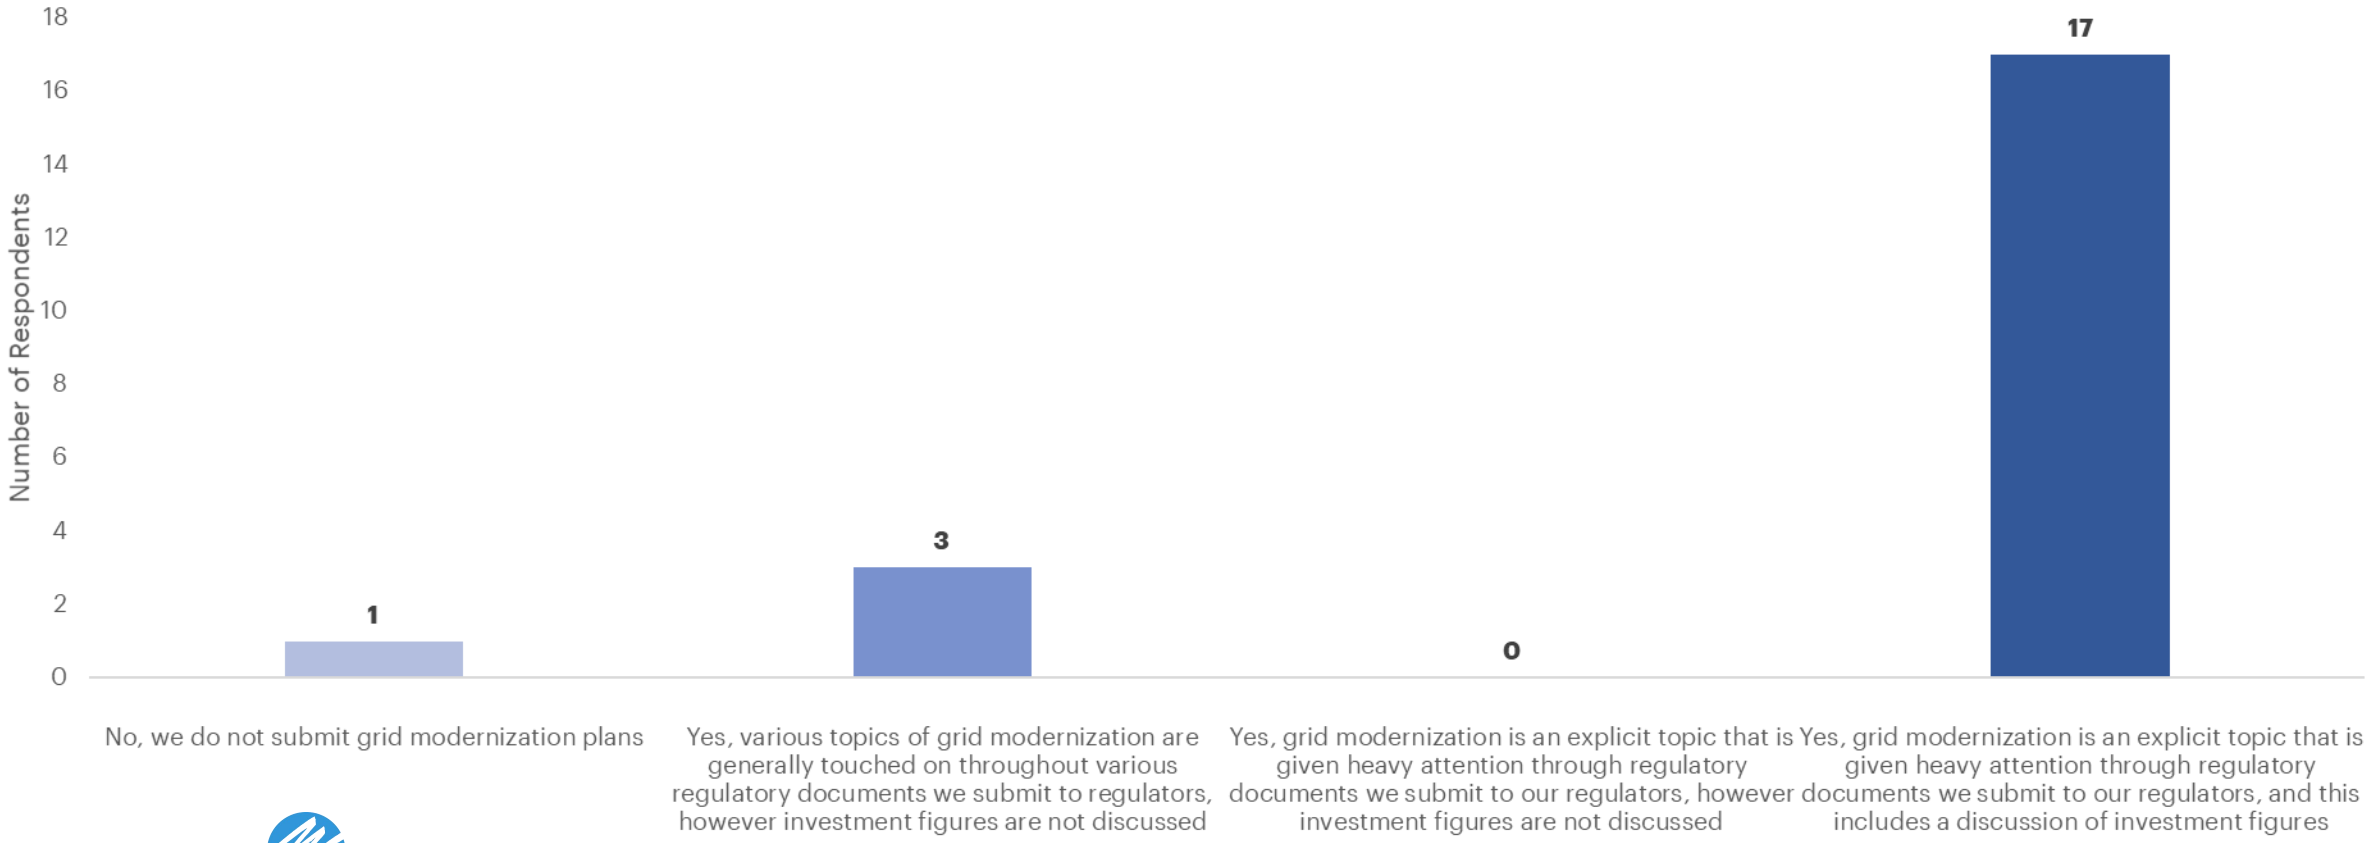
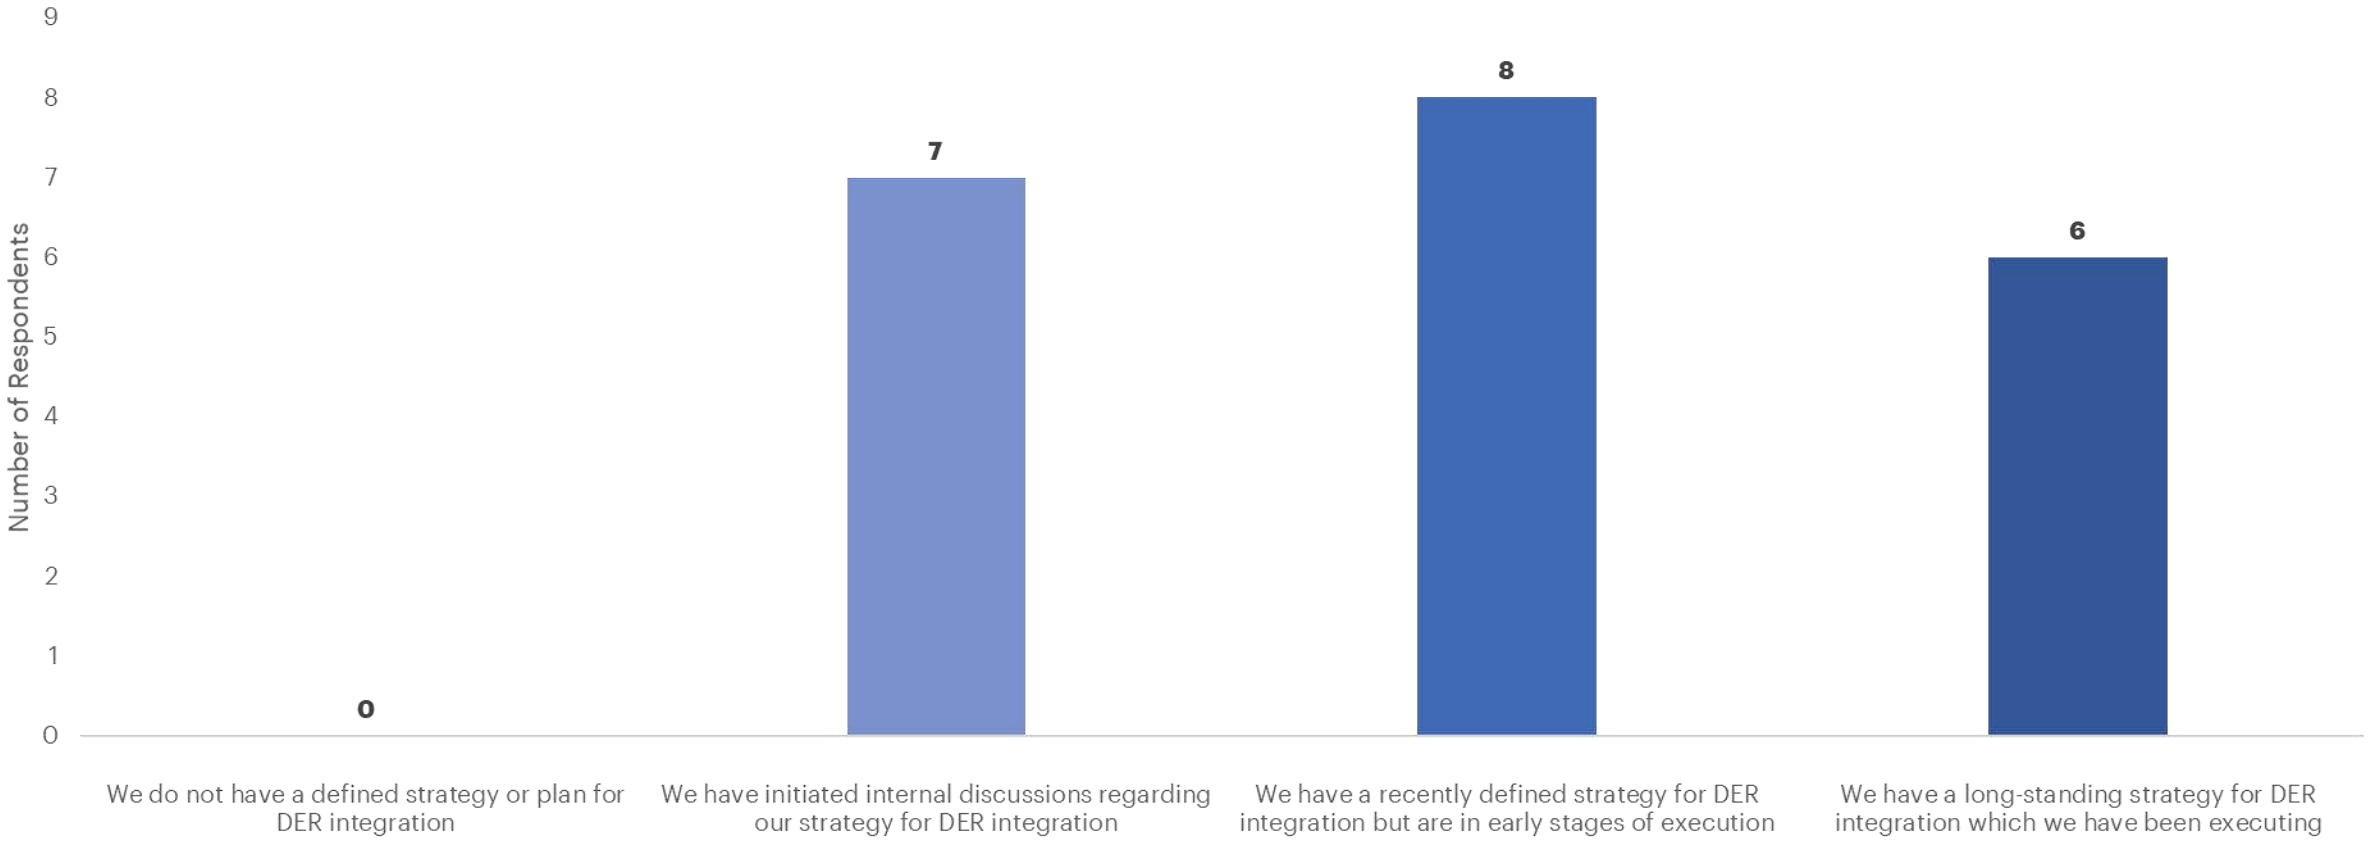
Appendix

accenture FPL



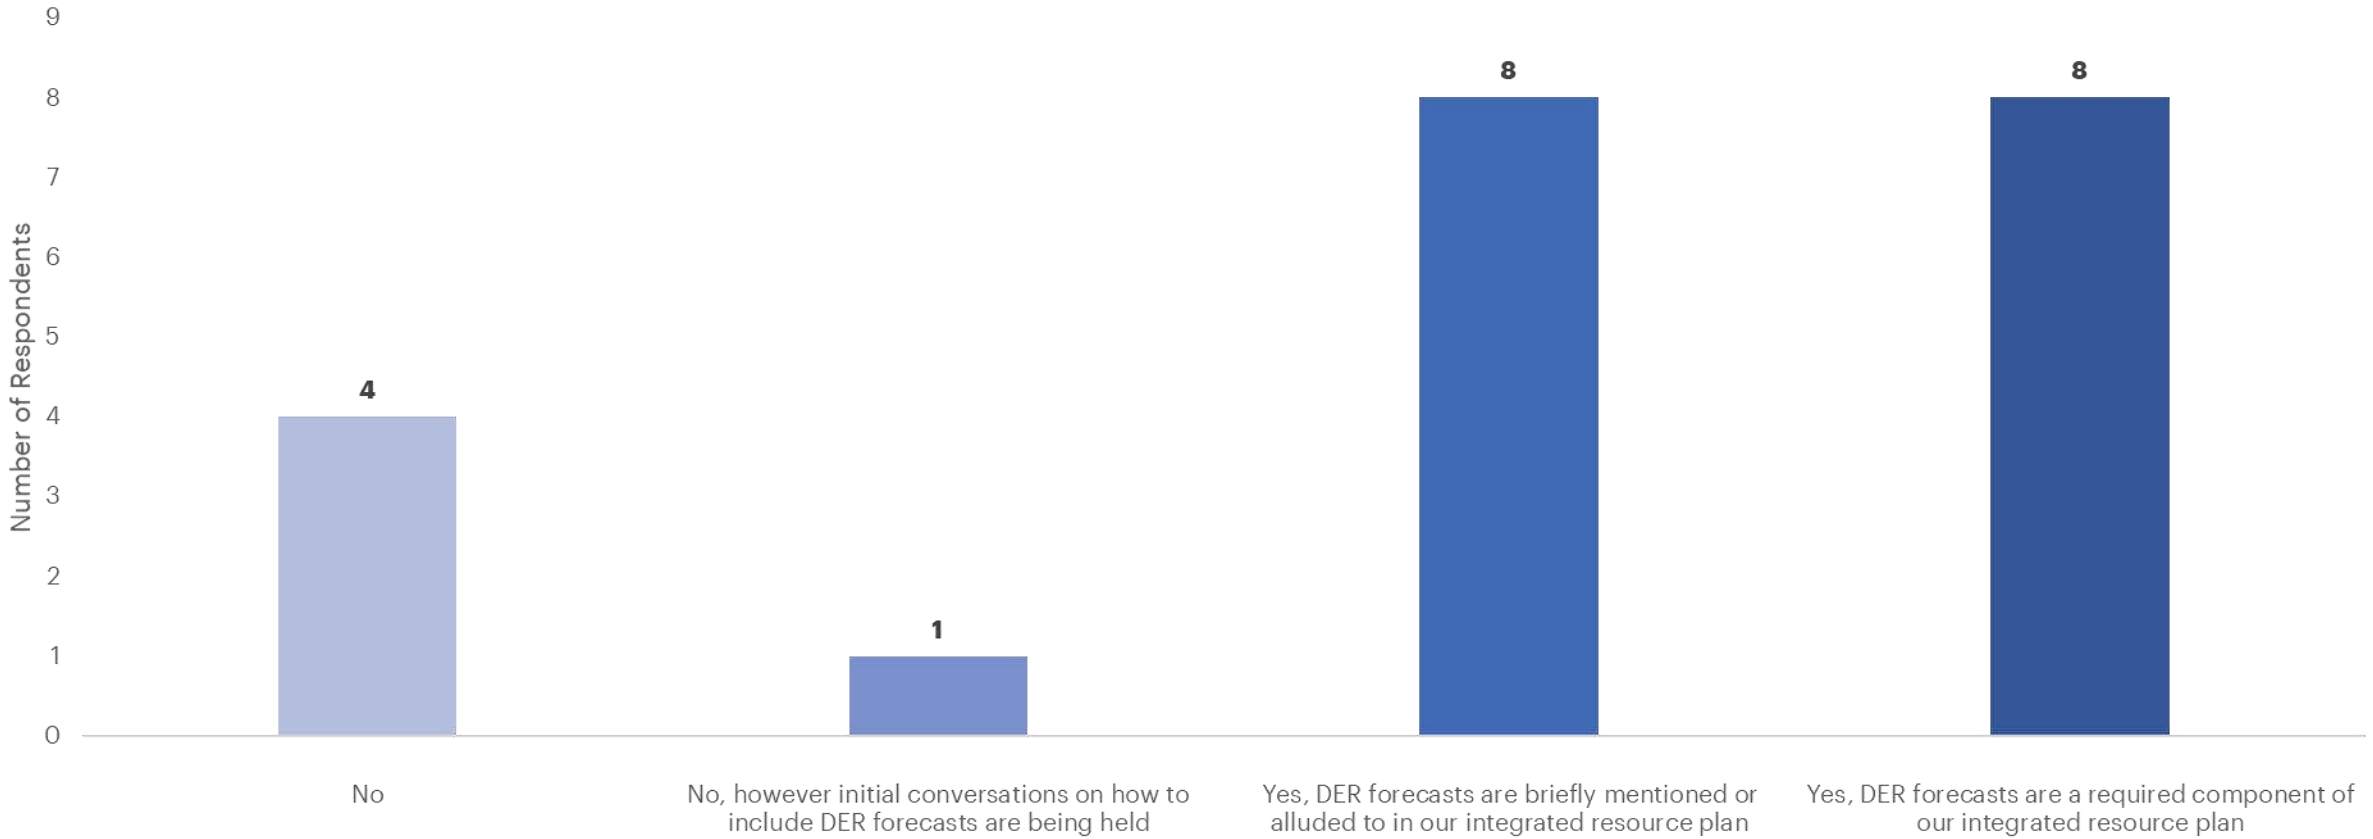
1.1) Grid Modernization Strategy

Question:	Have you developed a grid modernization strategy? NOTE: A grid modernization strategy would include items such as business objectives, a multi-year roadmap, budget, etc. dealing with a utility's plan to modernize its grid.



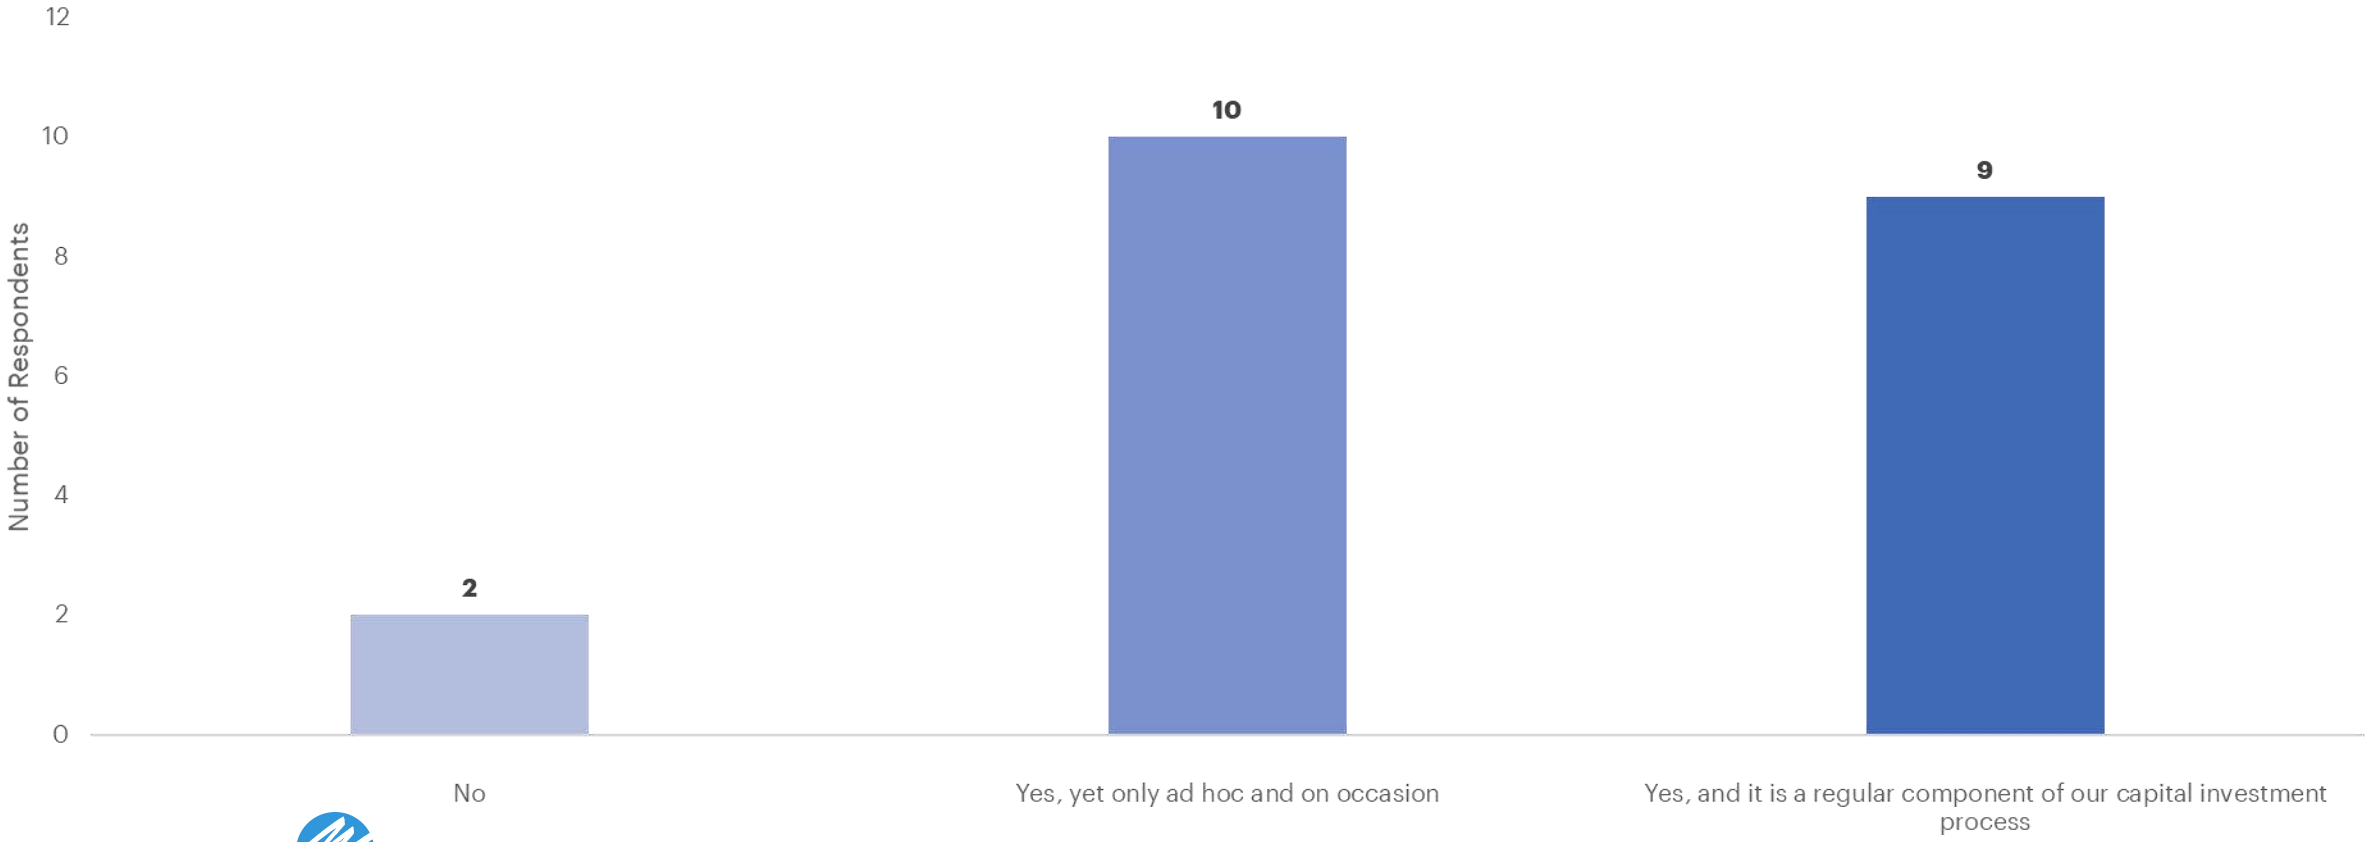
1.2) Grid Modernization Plans

Question:	Do you submit grid modernization plans to your state's public utilities regulator (despite whether such plans are required or not), and do those plans specify levels of investment for grid modernization programs? NOTE: Grid modernization plans can take the form of a resiliency plan, storm protection plan, or any such plan dedicated to outlining the advancement of the grid's modernization.



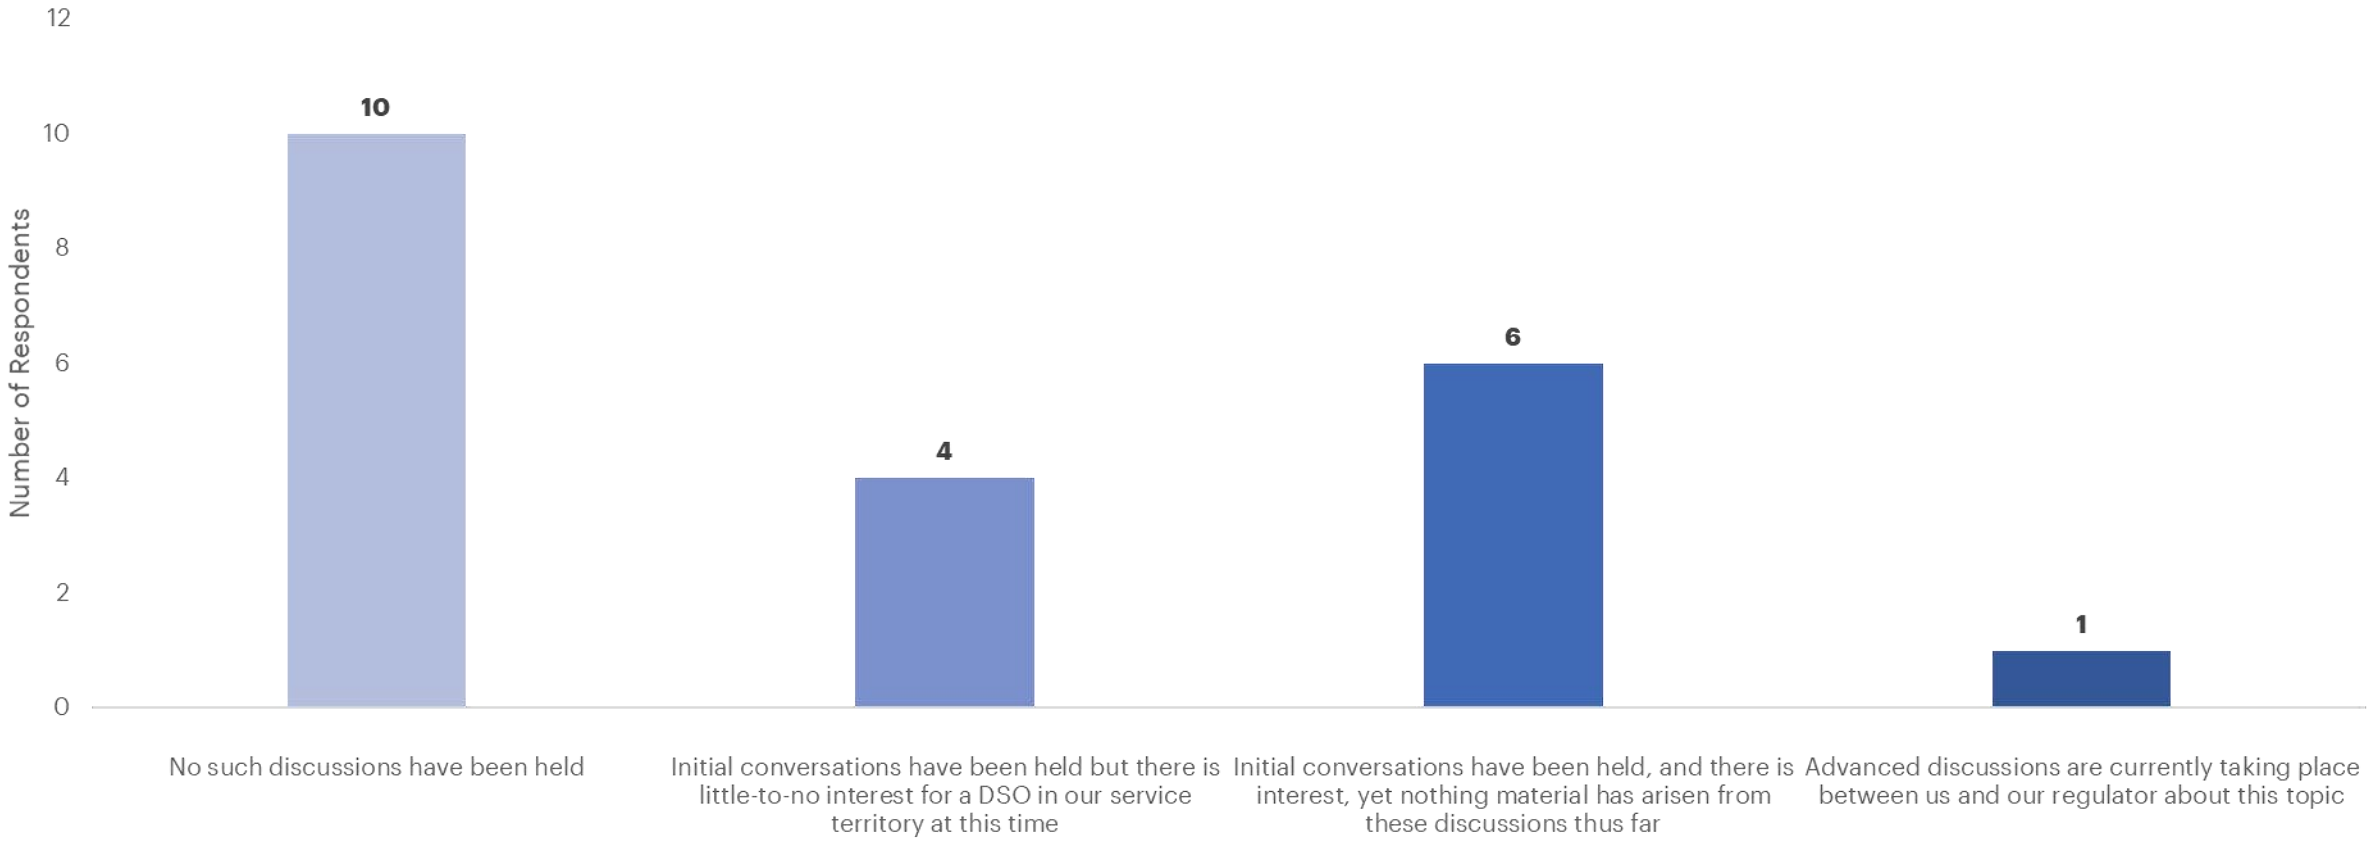
1.3) DER Strategy

Question:	Which of the following best describes the maturity of your strategy for integrating distributed energy resources (DERs)? NOTE: A DER is an electricity-producing/storing resource or controllable load device that is connected to the local distribution system, such as a solar panel or battery.



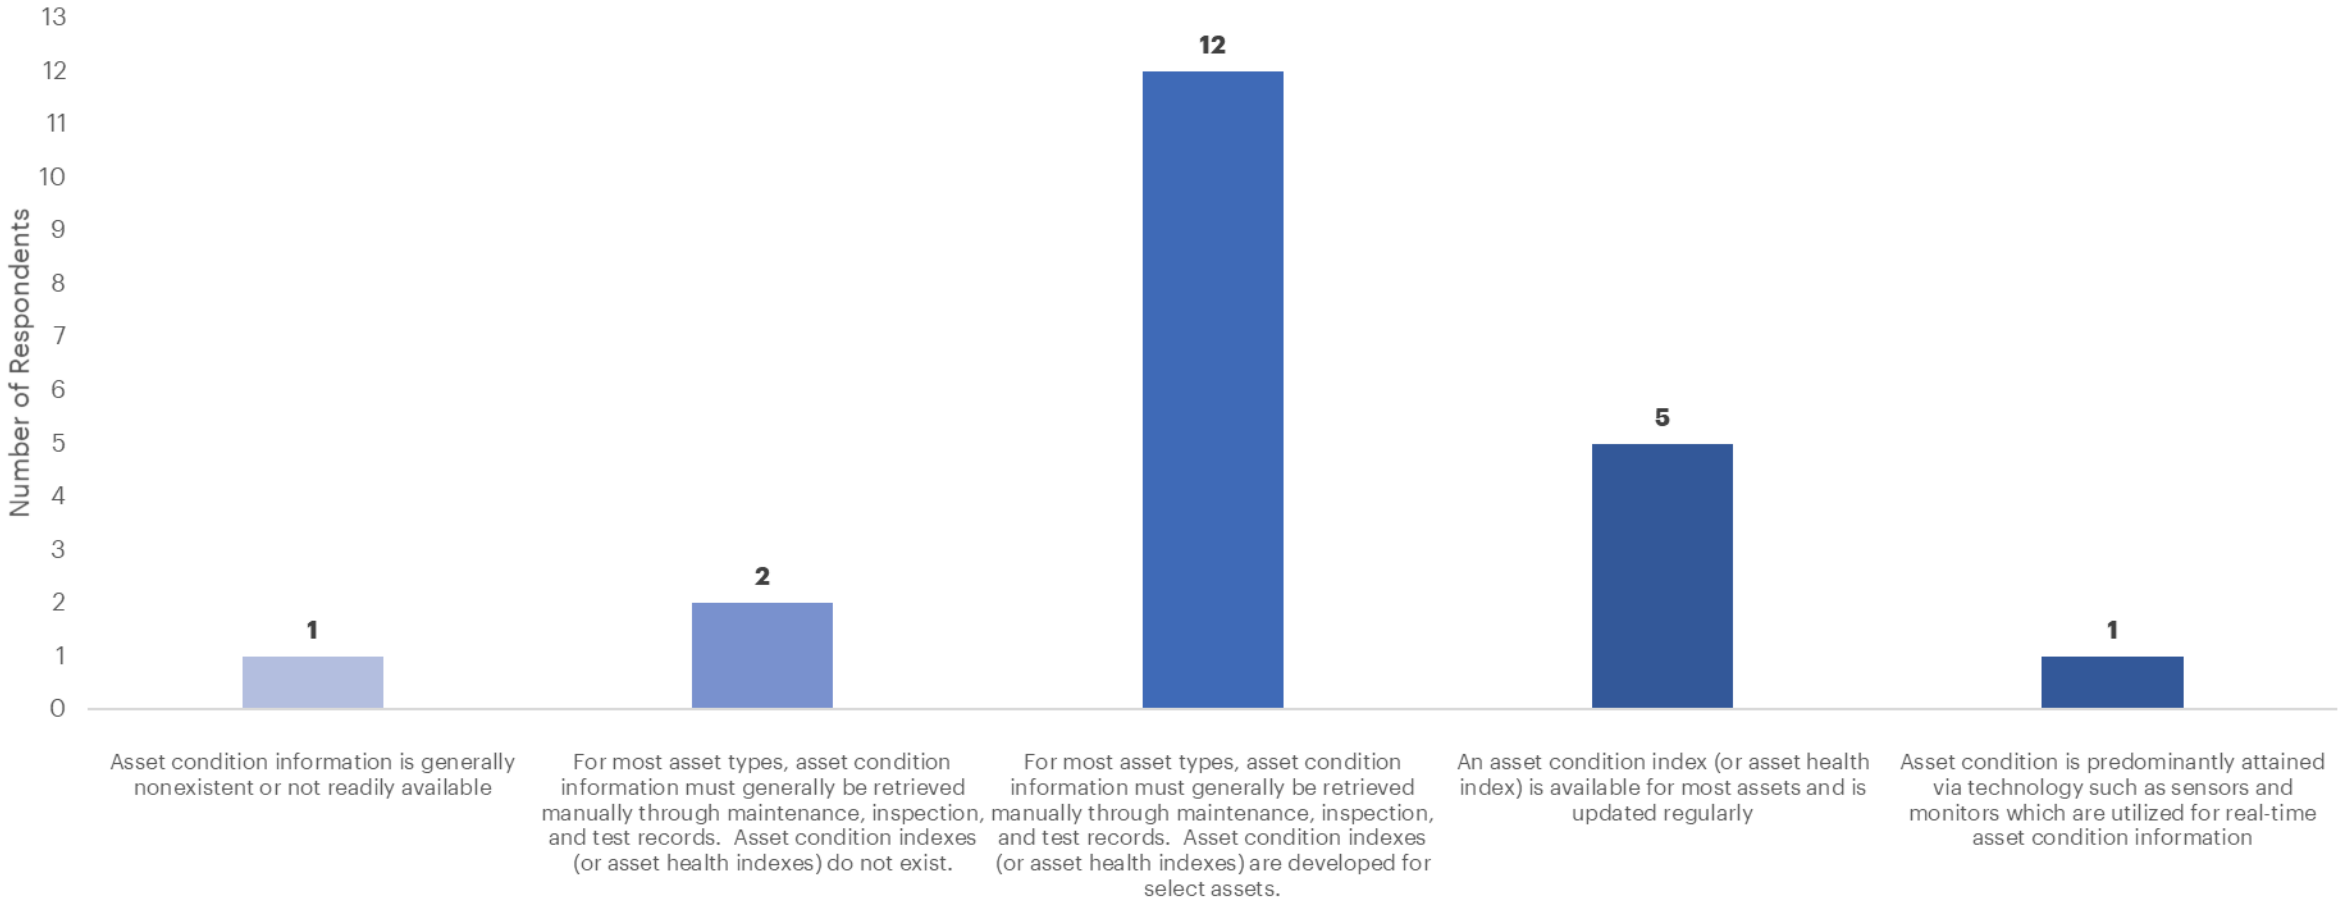
1.4) DERs In Integrated Resource Plan

Question:	Does your integrated resource plan include forecasts for anticipated DER penetration? NOTE: As a reminder, this question (along with the rest of the survey) is focused on distribution



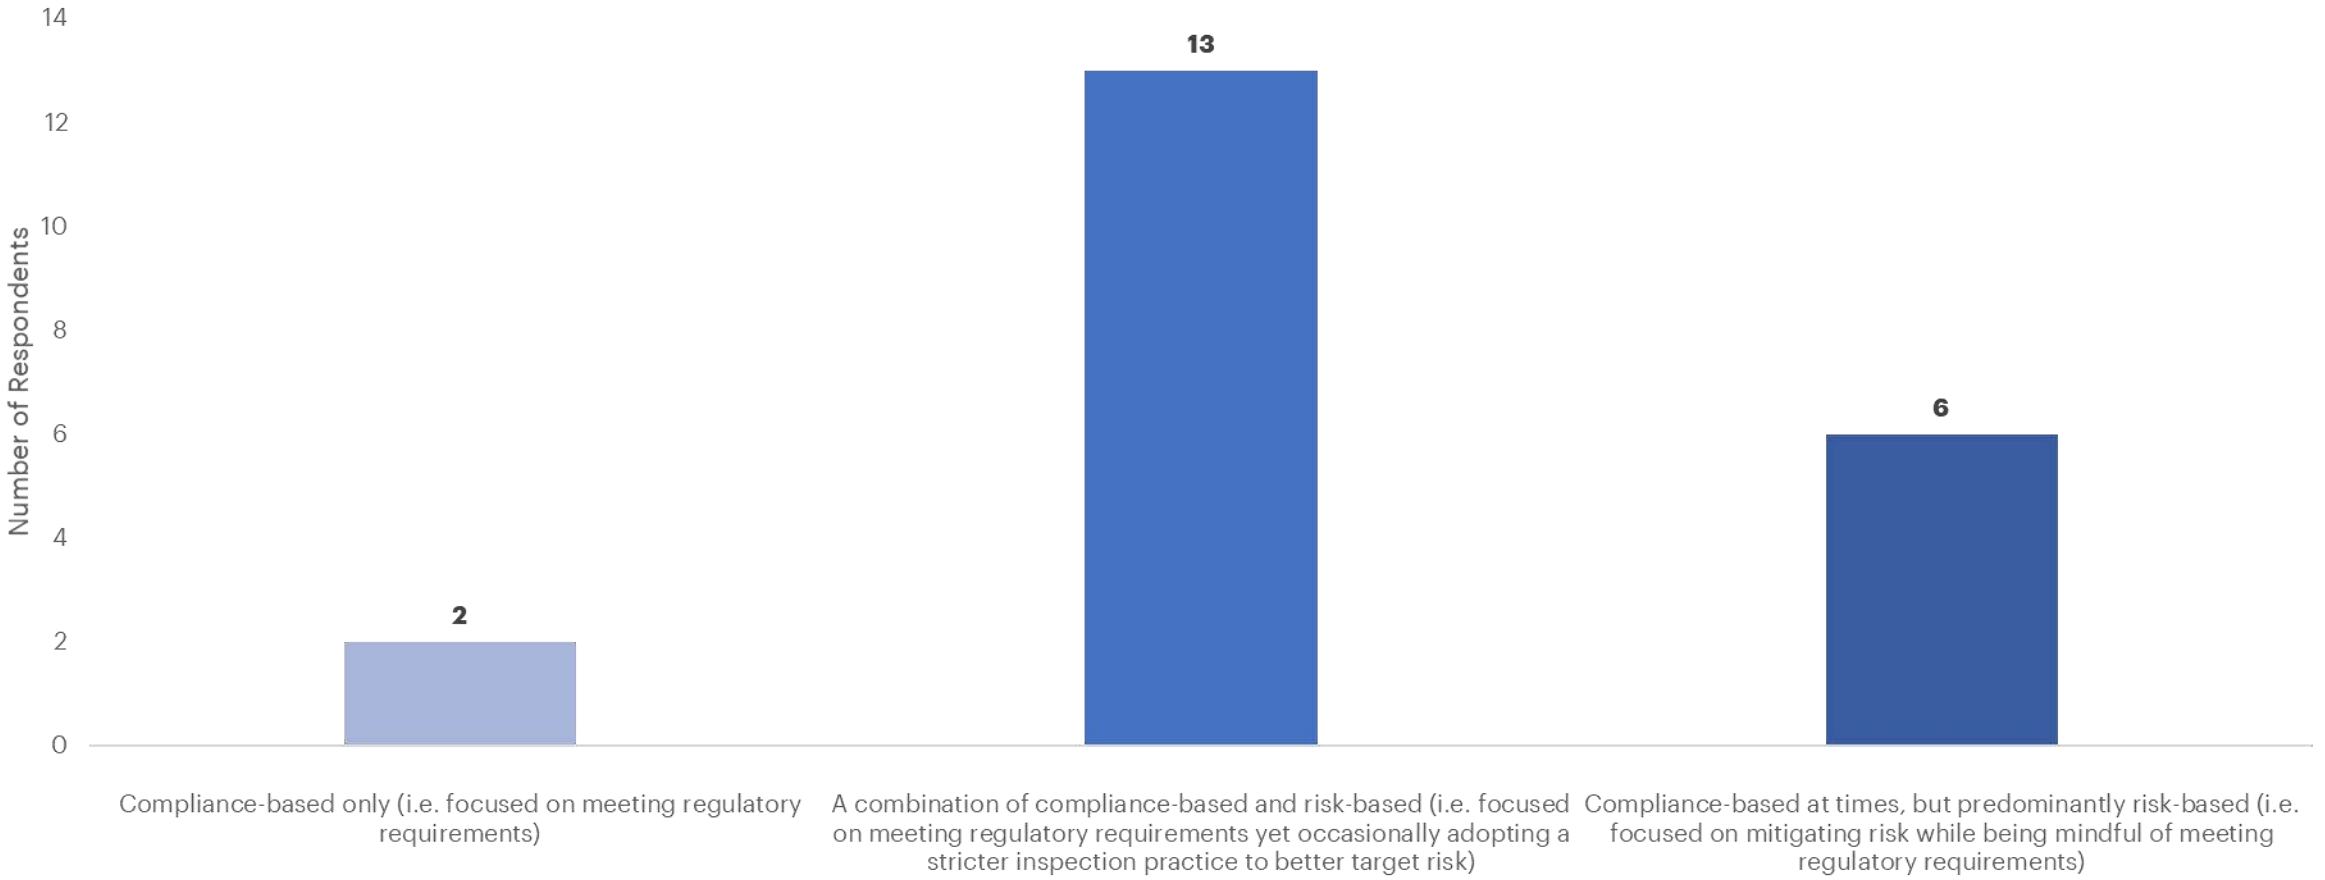
1.5) DER Investment Consideration

Question:	Does your capital investment process consider the deferral or replacement of traditional grid investments for the sake of distributed or other alternative investments? NOTE: An example of this would be assessing a location's load growth and considering DERs / energy storage / microgrids or other non-wires alternatives as an option alongside traditional distribution load growth projects



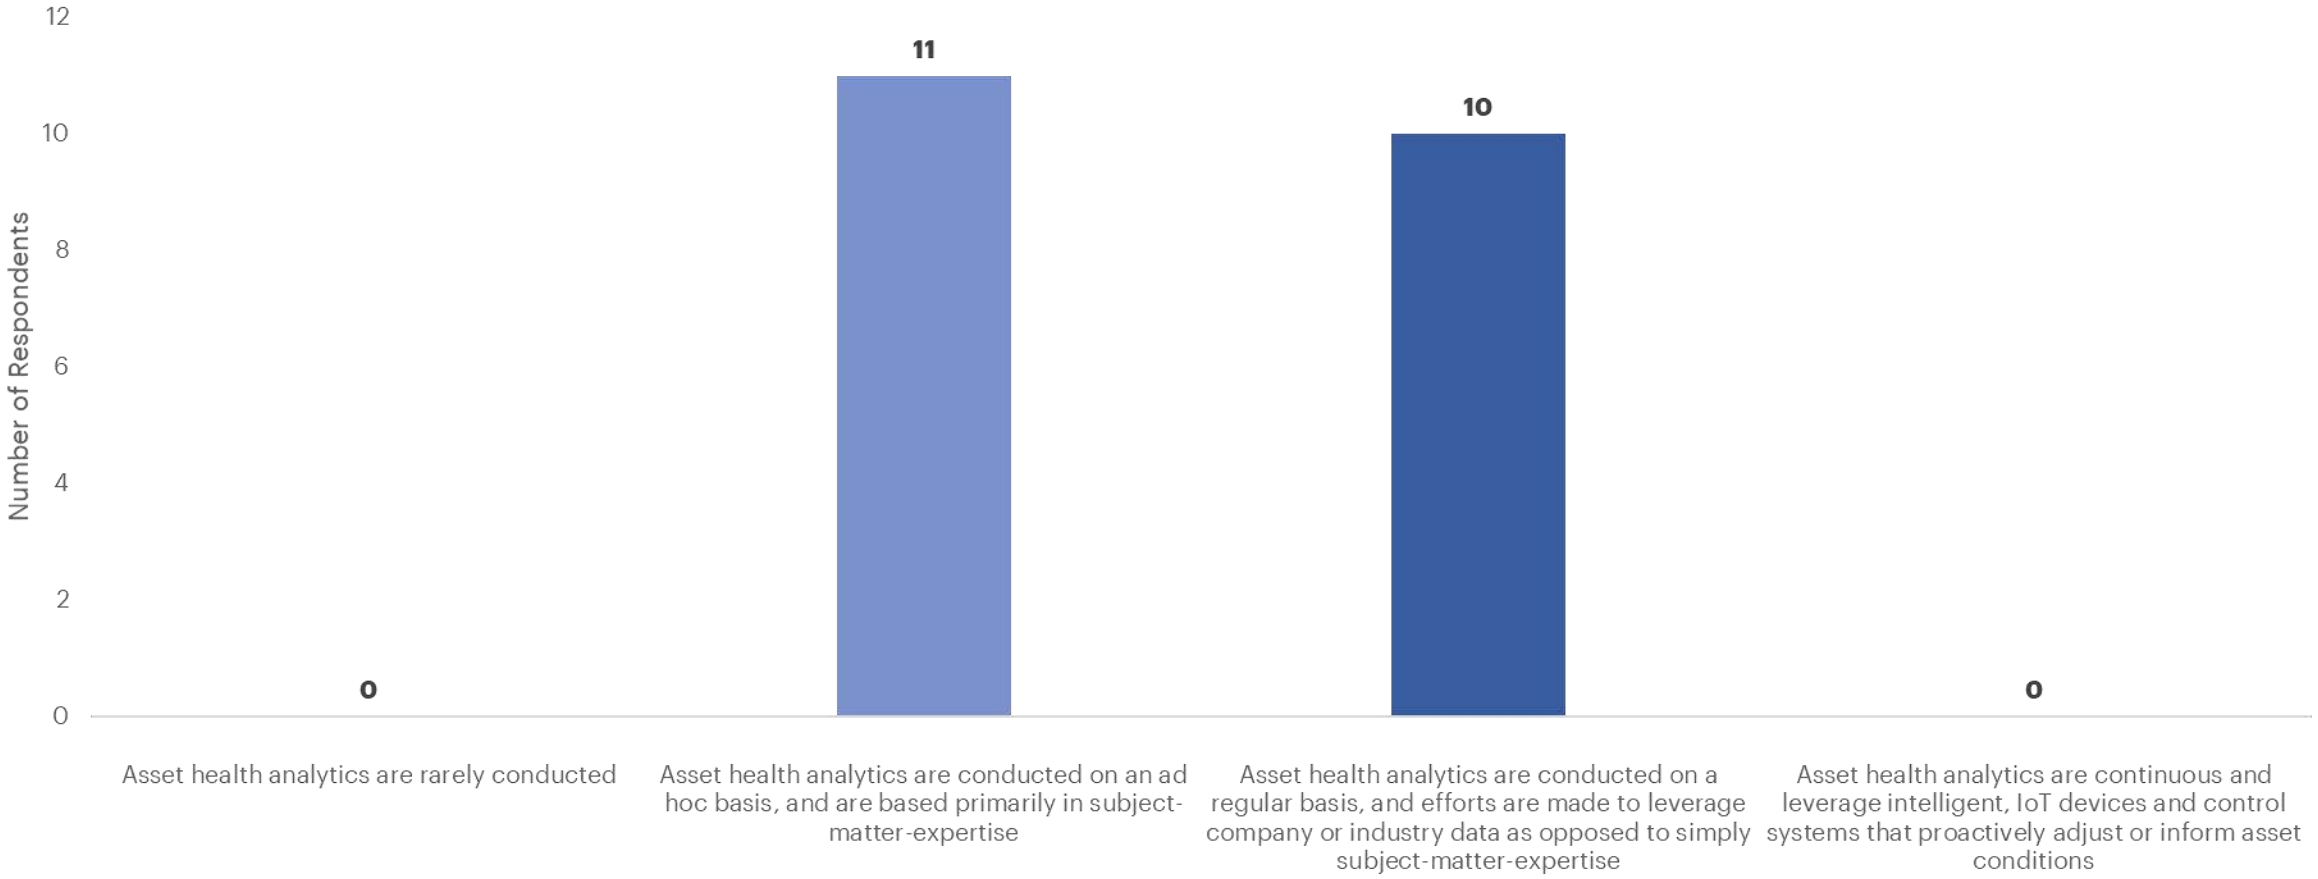
1.6) DSO

Question:	Have discussions been held between you and your regulator regarding the topic of transitioning your distribution line of business into the role of a Distribution System Operator (DSO) that facilitates the coordination of energy delivery similar to that of a Regional Transmission Operator (RTO)?



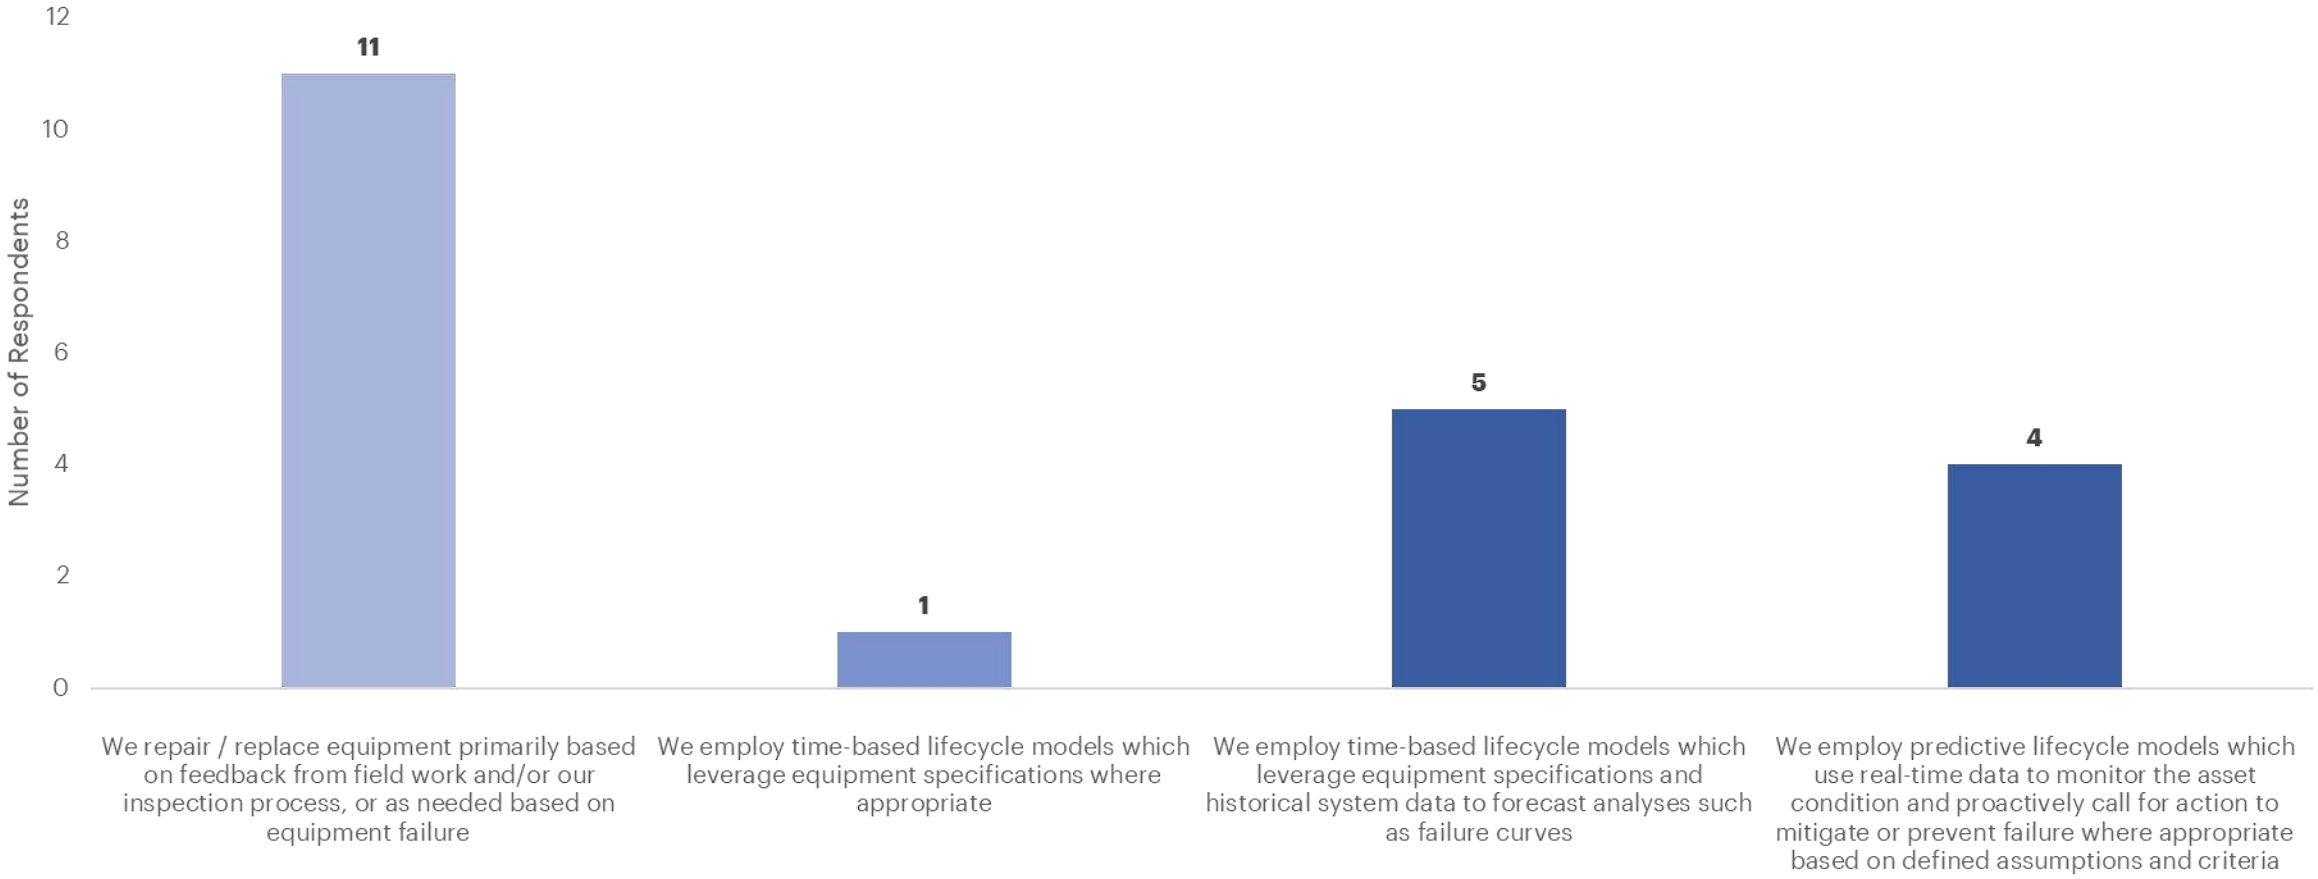
2.1) Asset Condition Information

Question:	Which of the following best describes your asset condition information? NOTE: This question is in reference to physical system assets.



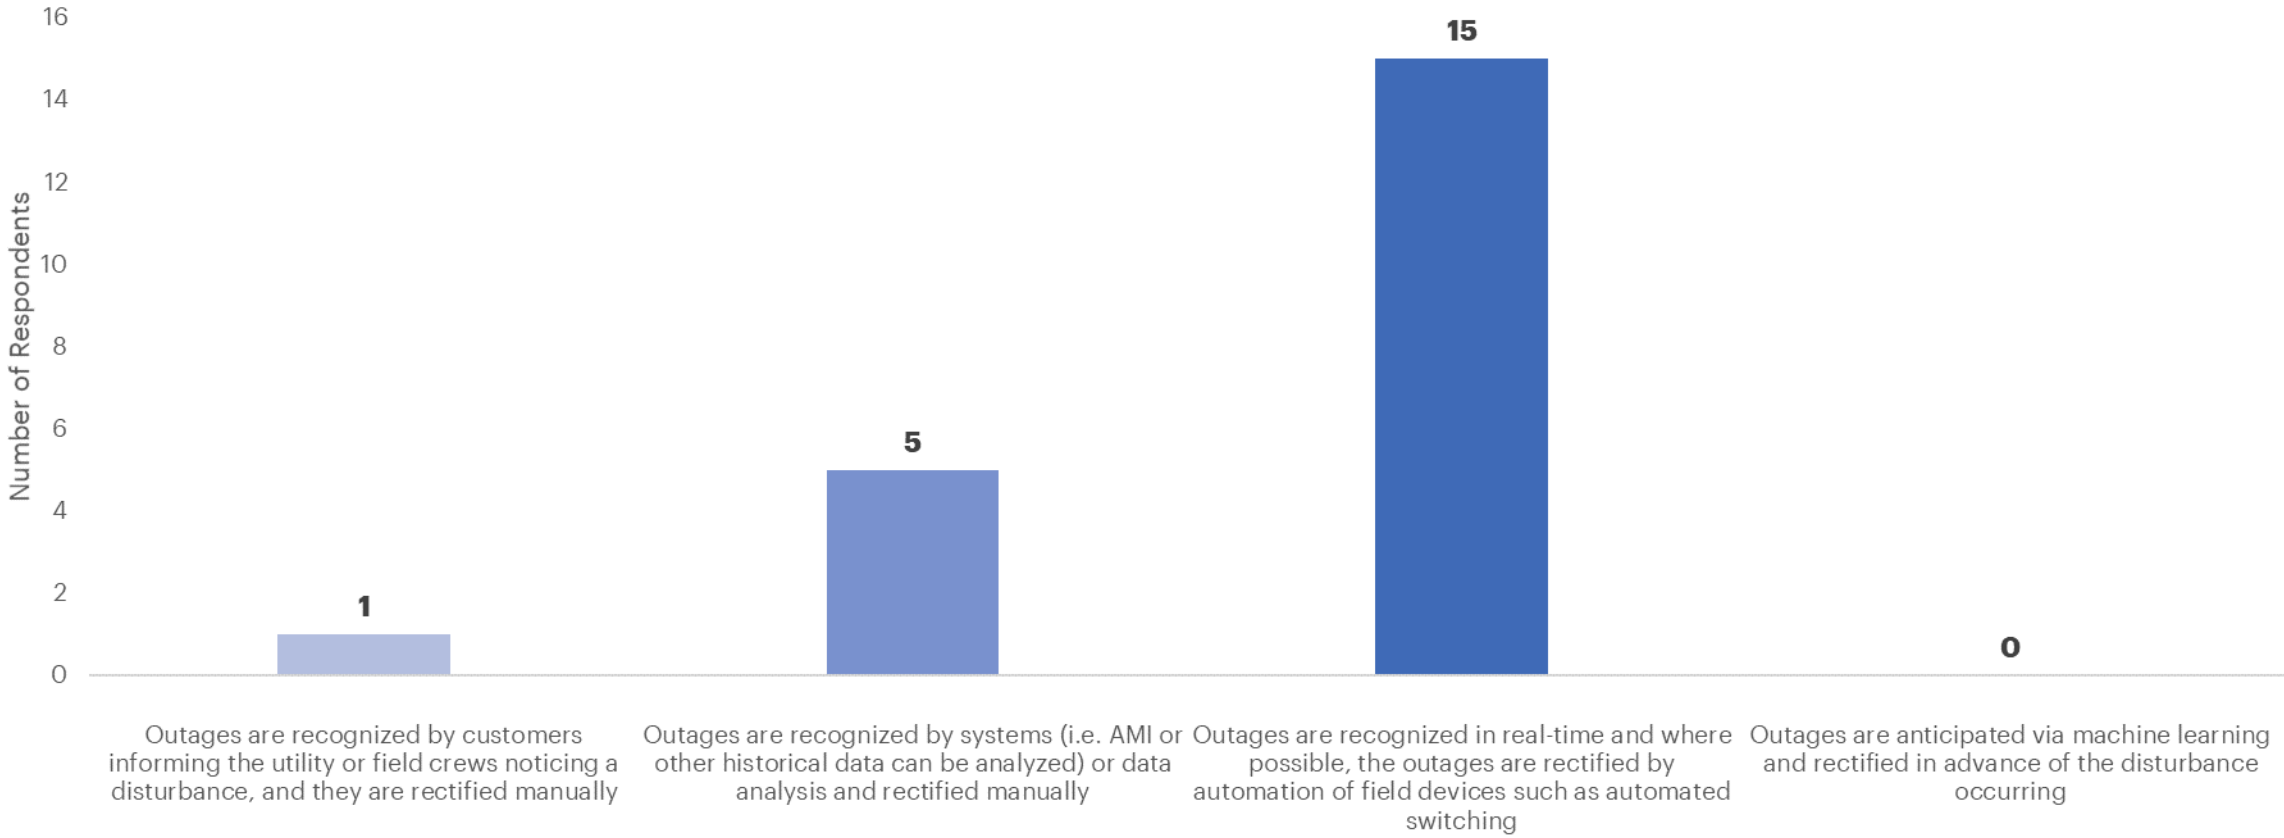
2.2) Asset Inspections

Question:	Which of the following best describes the inspection practices of your assets?



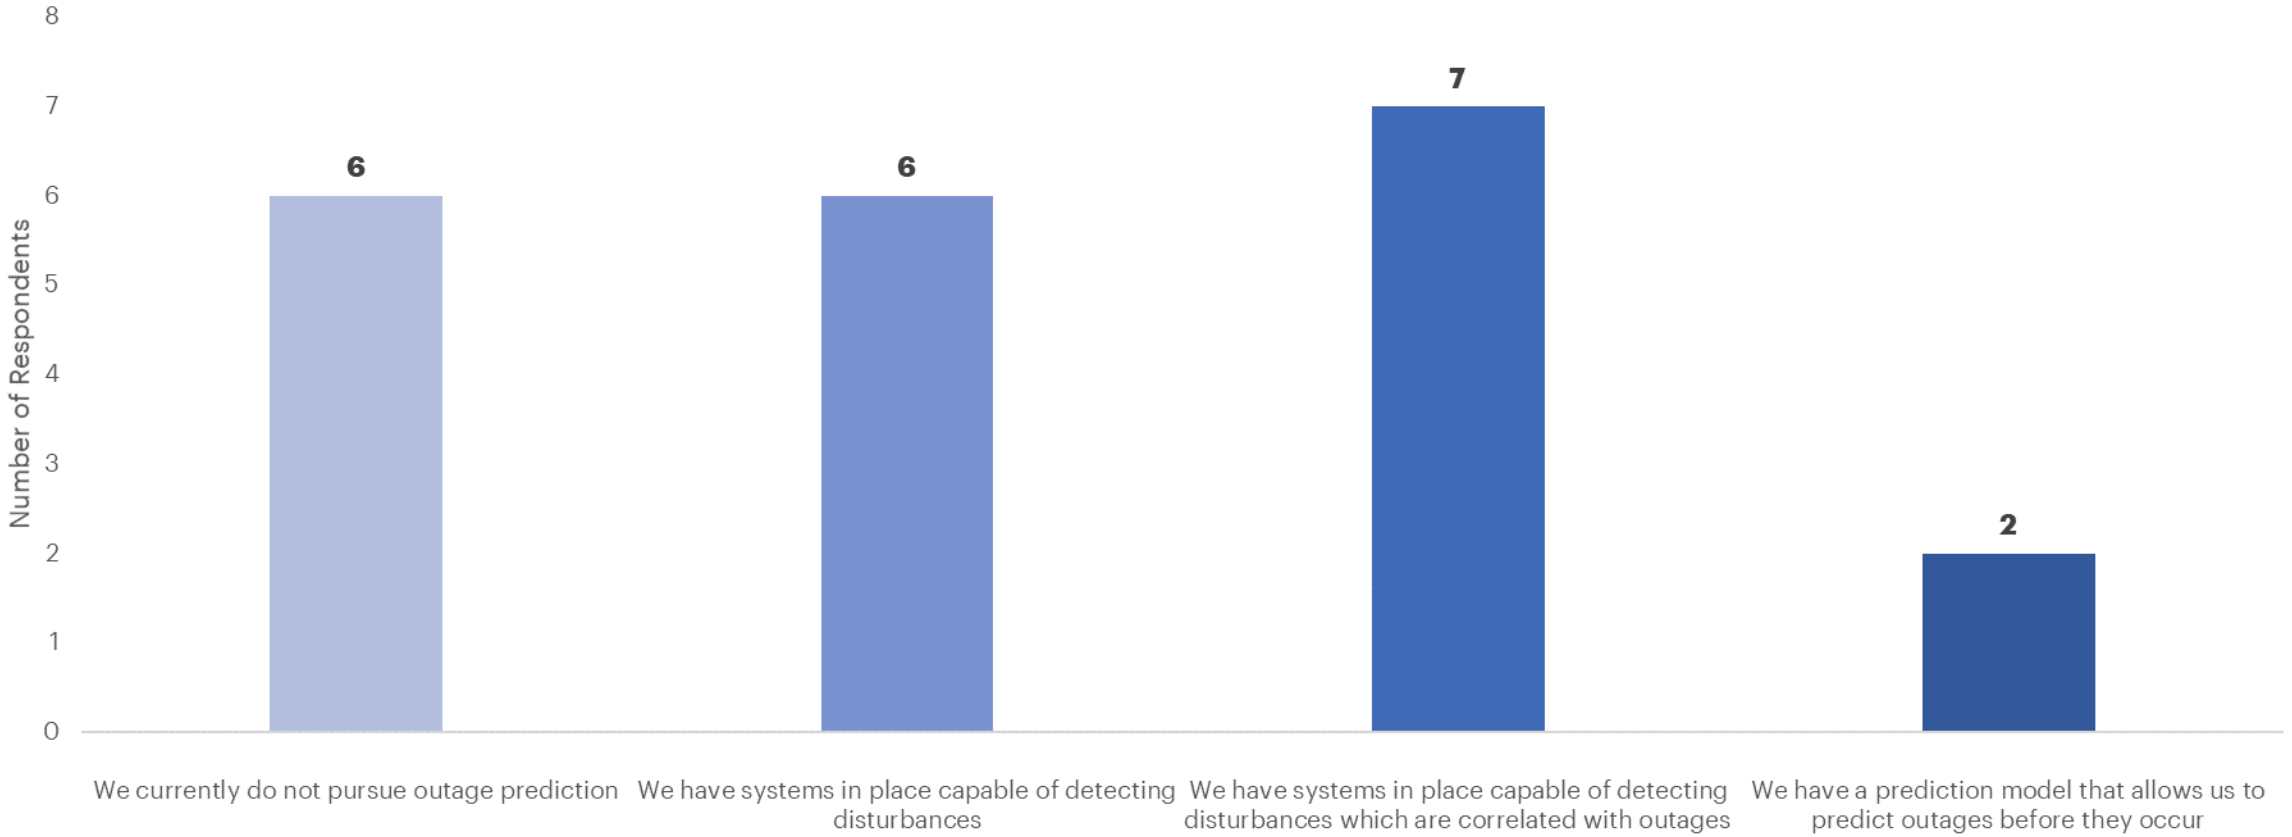
2.3) Asset Health Monitoring

Question:	Which of the following best describes your asset health monitoring?



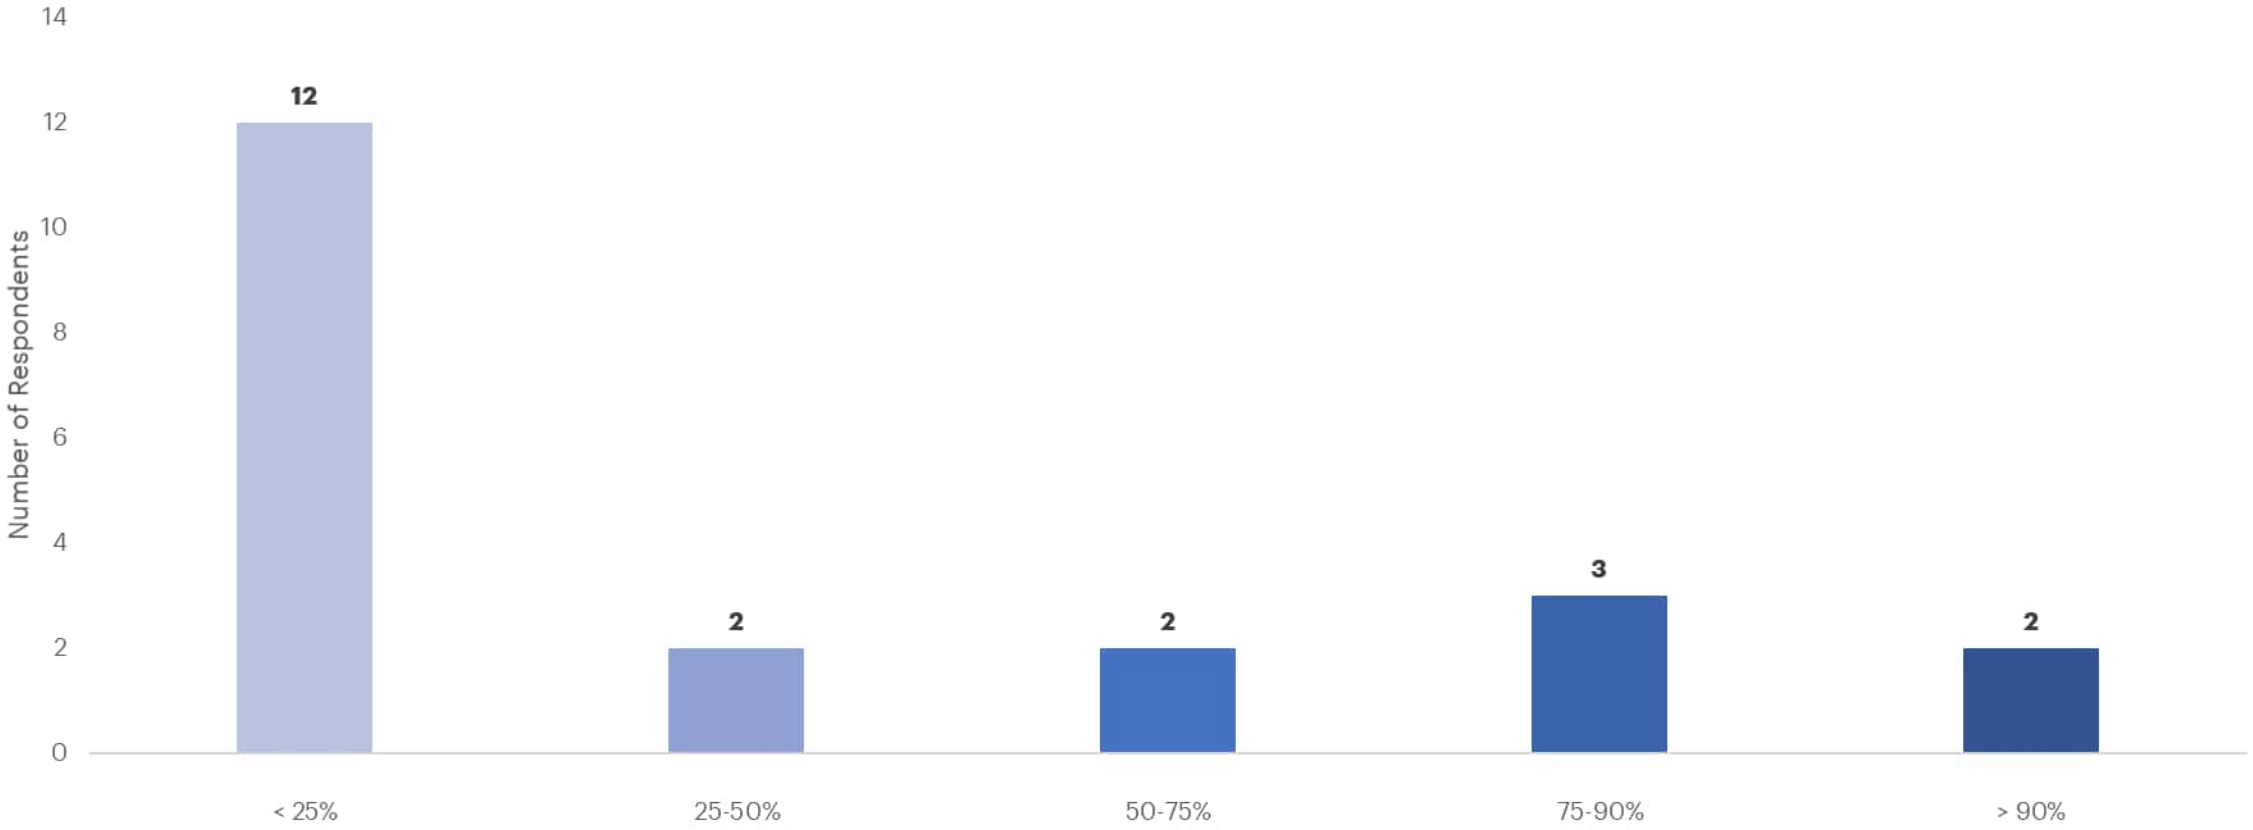
2.4) Lifecycle Models

Question:	Which of the following best describes how do you make repair / replace / run-to-failure decisions?



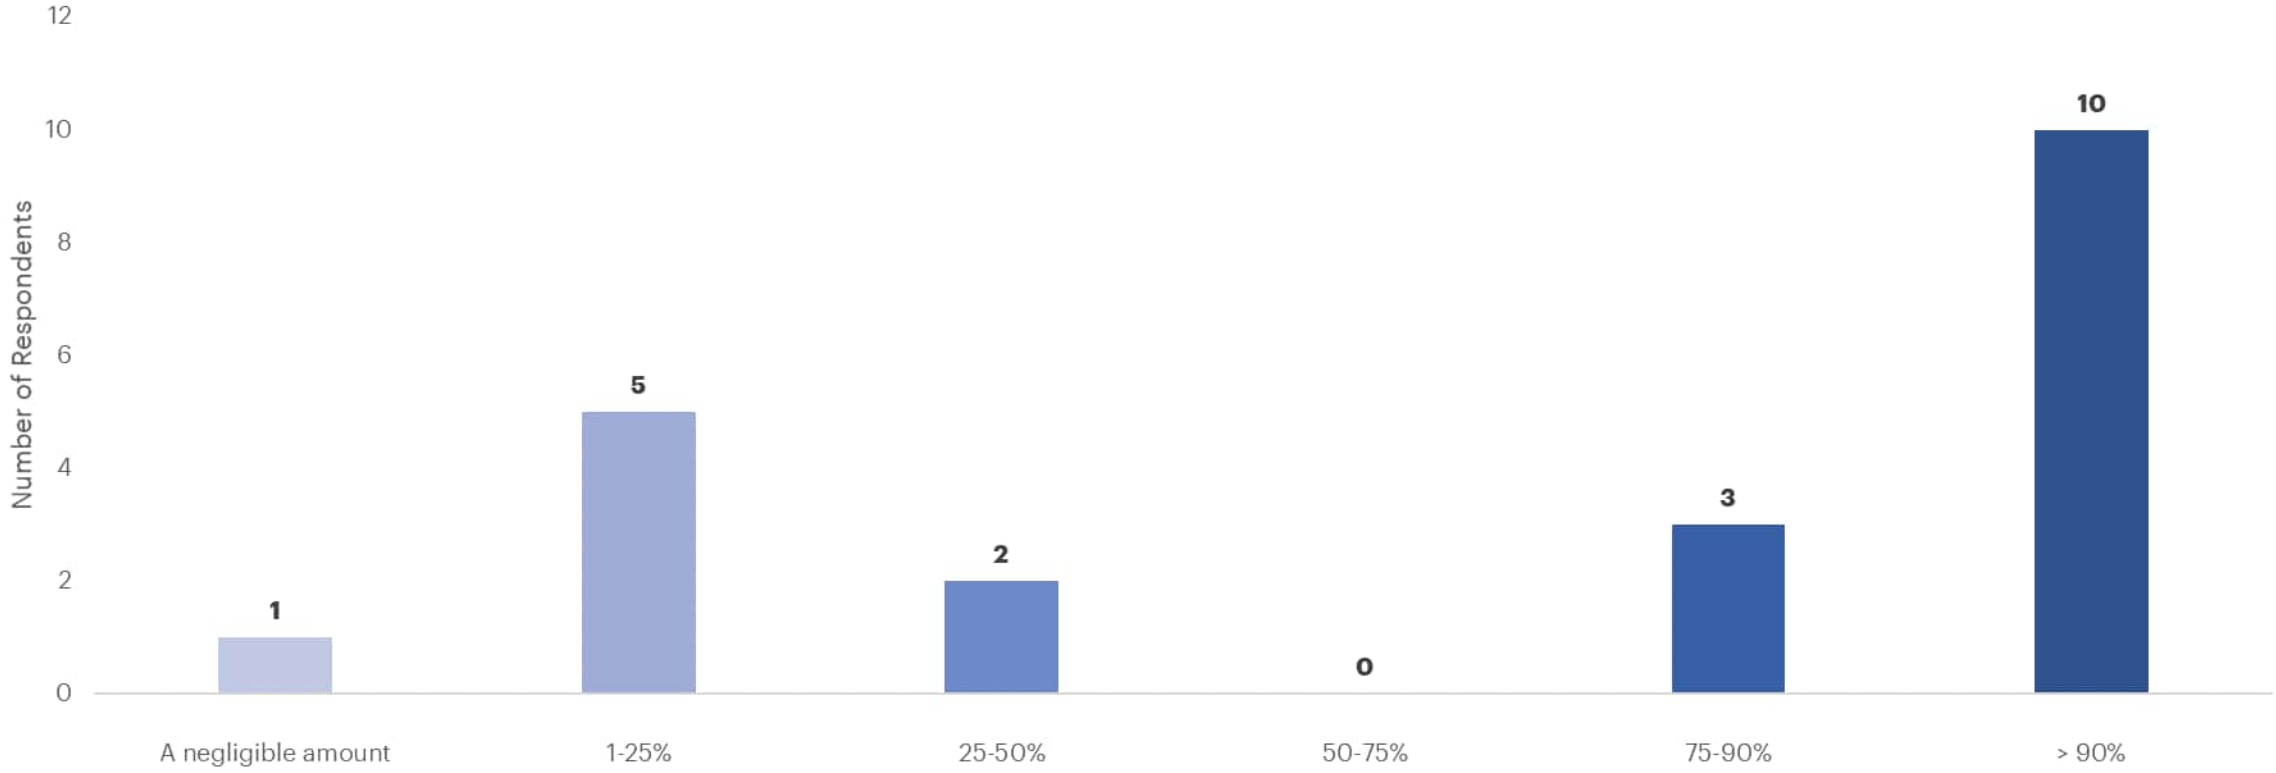
2.5) Outage Response

Question:	How is an outage recognized and rectified? Please select the option that best describes the highest level of practice at your utility. NOTE: Here, an "outage" is defined as a sustained system fault (not a momentary).



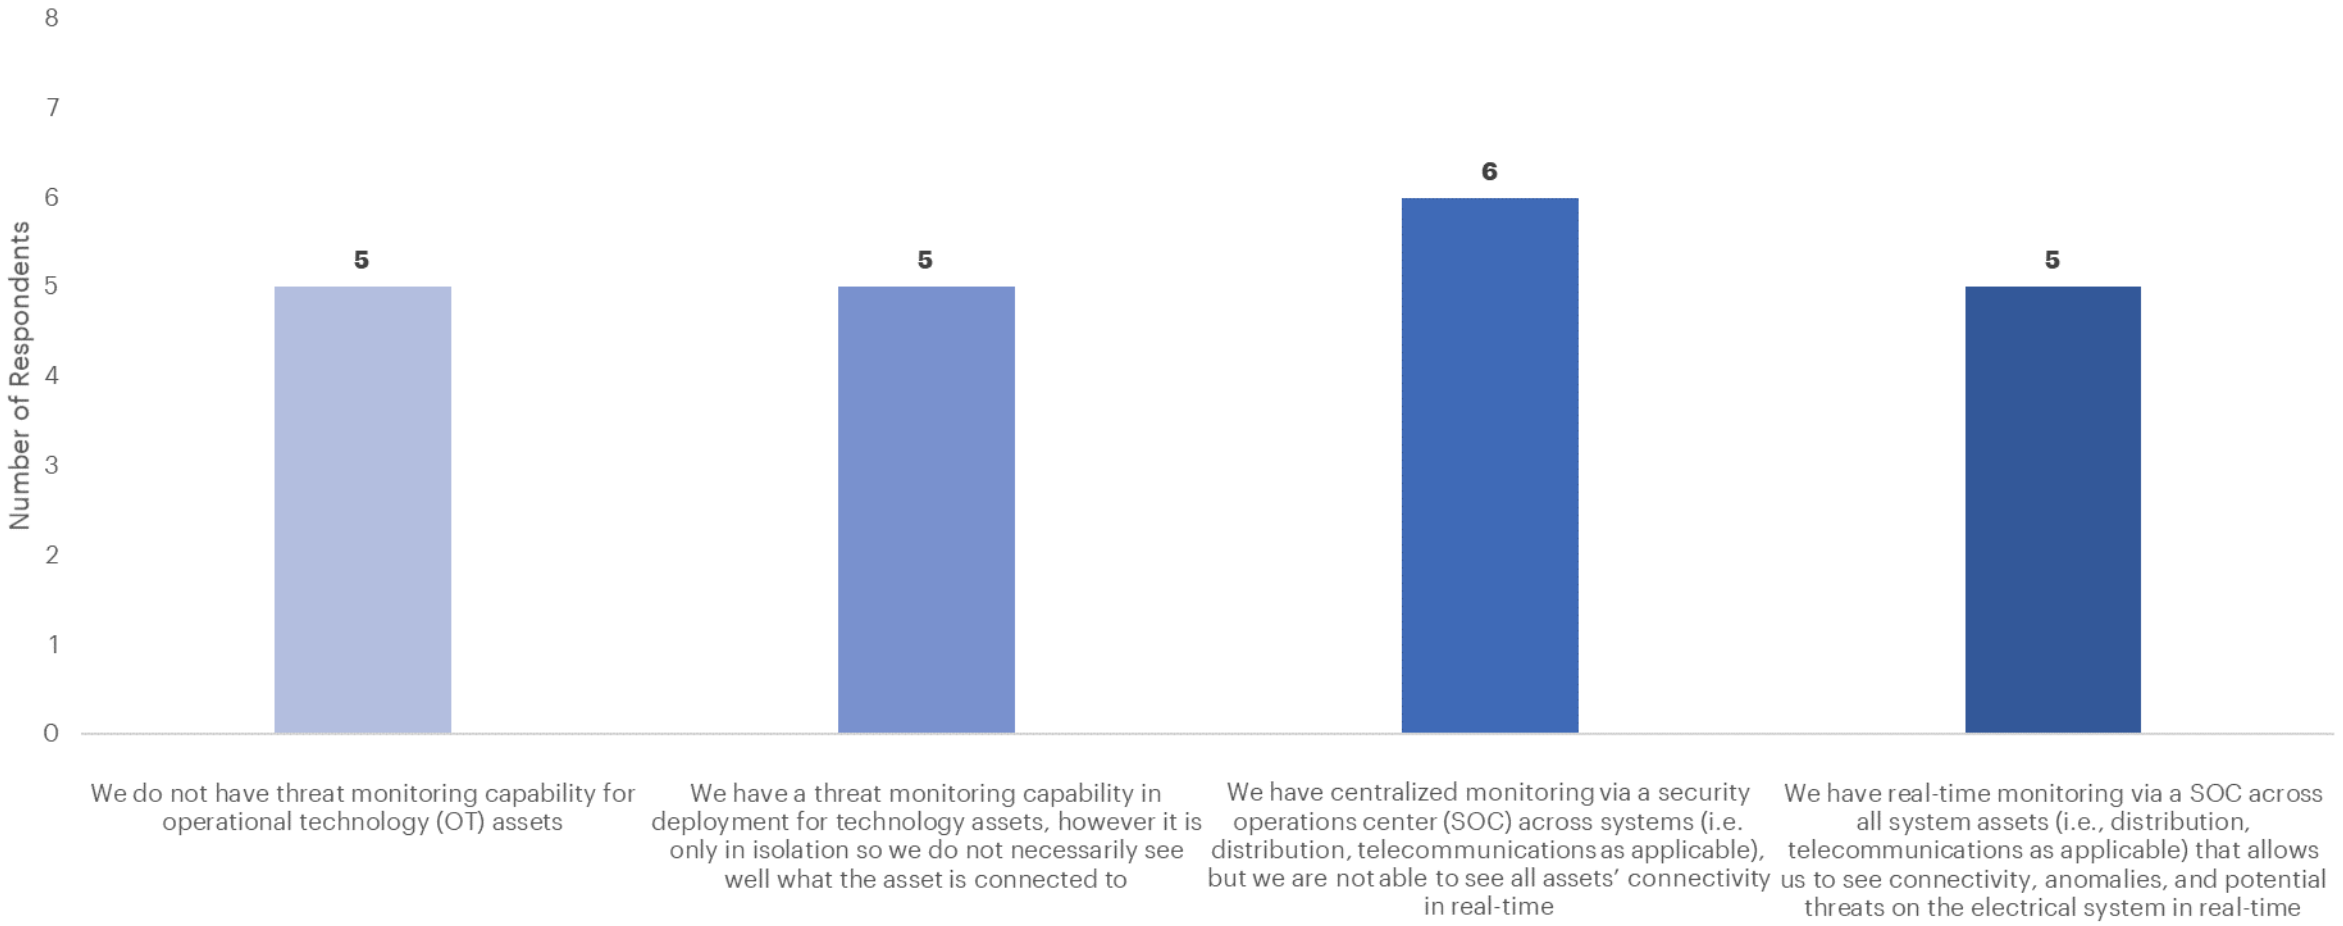
2.6) Outage Prediction

Question:	Which of the following best describes your capabilities regarding outage prediction? NOTE: Here, a “disturbance” is defined as an operational anomaly which does not trigger a protective device.



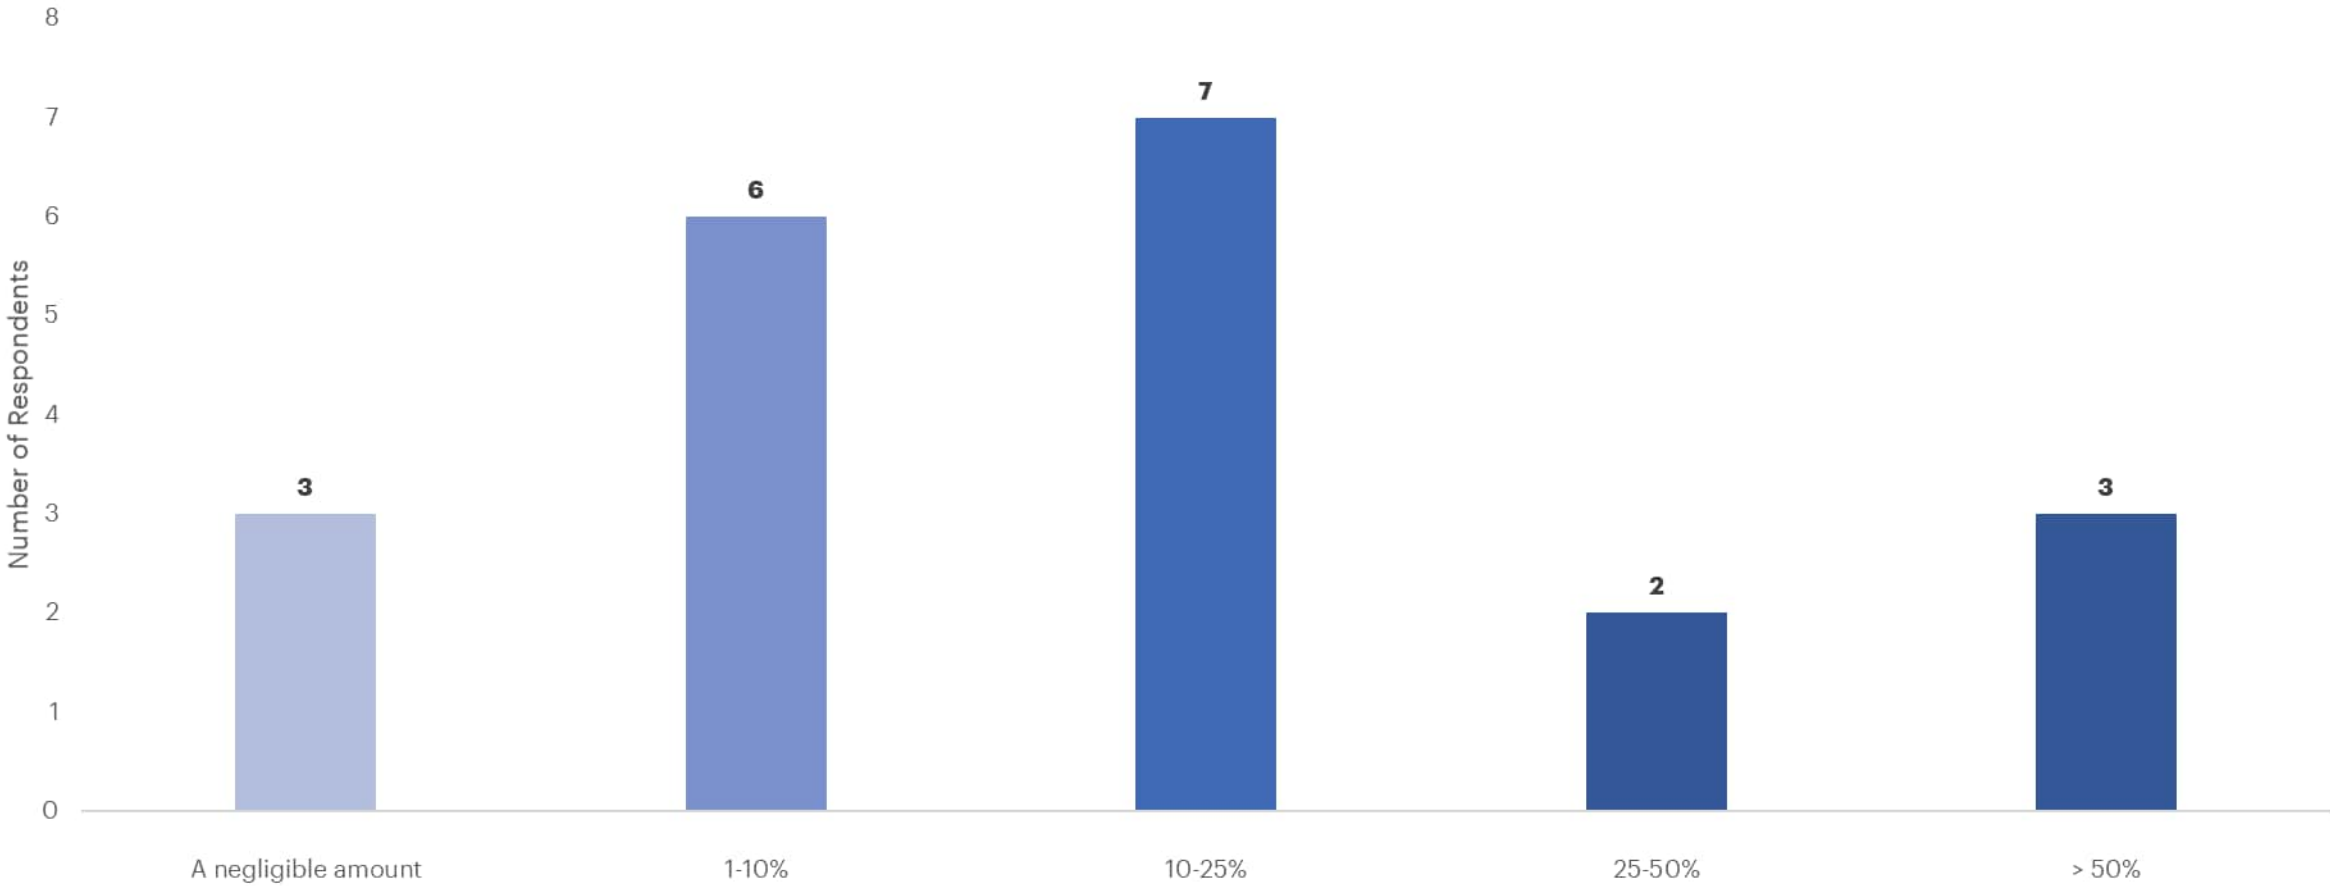
2.7) Volt / Var Optimization

Question:	What percentage of your feeders have integrated volt/var optimization (VVO) solutions? NOTE: Here, “integrated VVO” refers to a solution that optimizes both voltage and reactive power simultaneously using real time data.



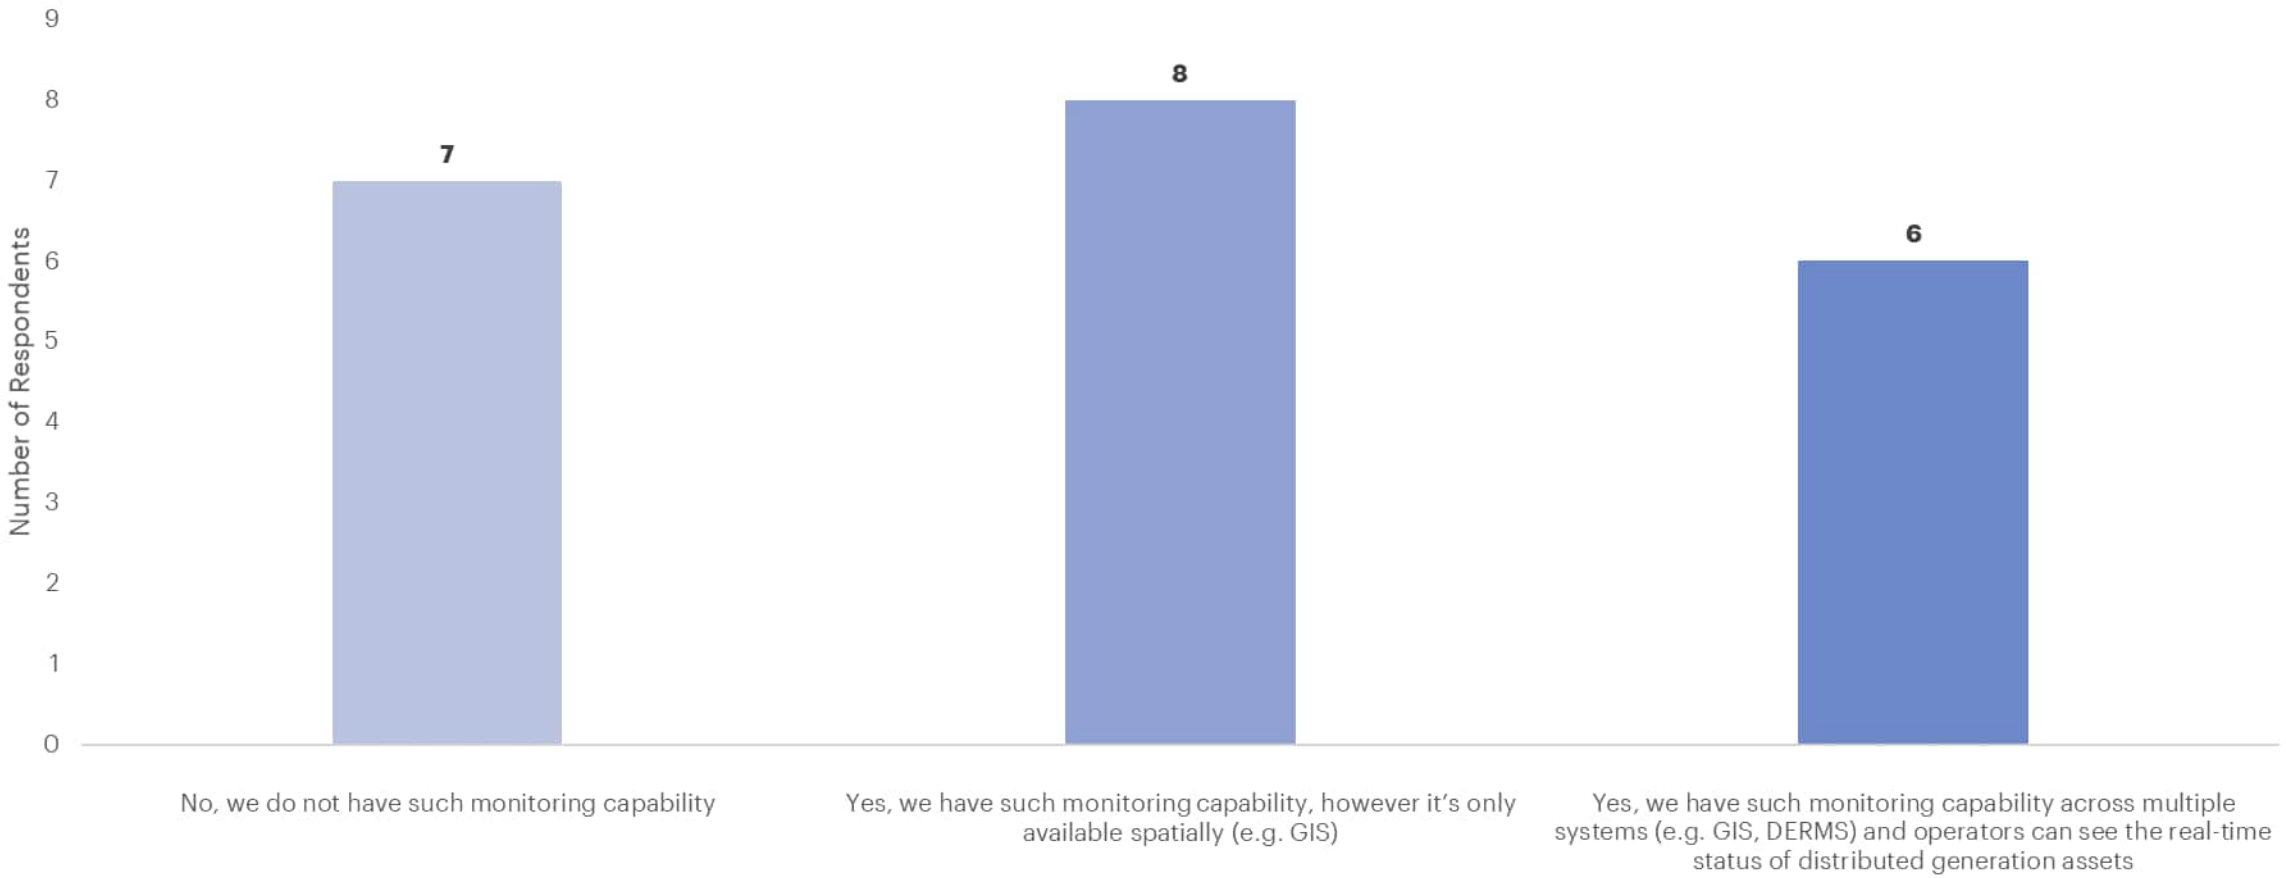
2.8) Discovered Assets

Question:	What percentage of your field technology assets are discovered? NOTE: Here, "discovered" implies that you have visibility into the asset from a threat intelligence perspective. As in, you have awareness of what the asset is and where it is.



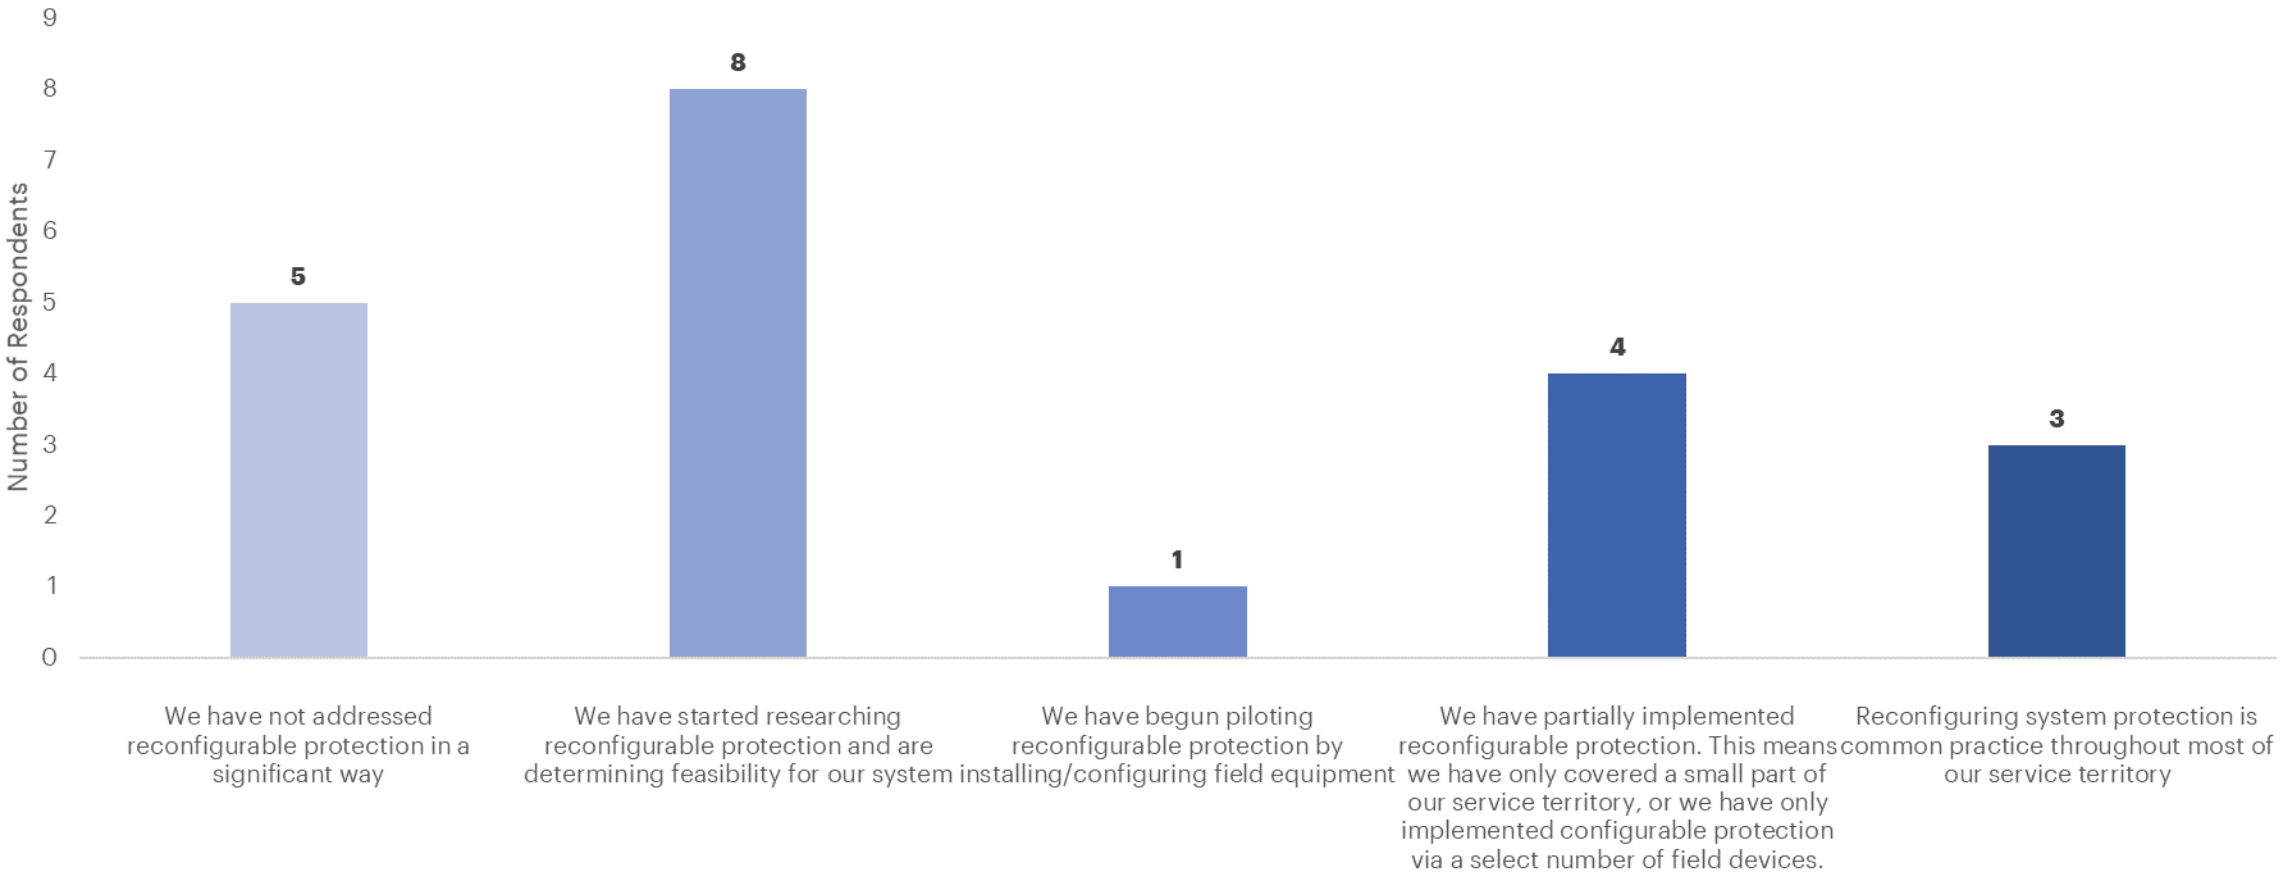
2.9) Asset Cyber Threat Monitoring

Question:	Which of the following best describes your capabilities regarding cyber threat monitoring of assets?



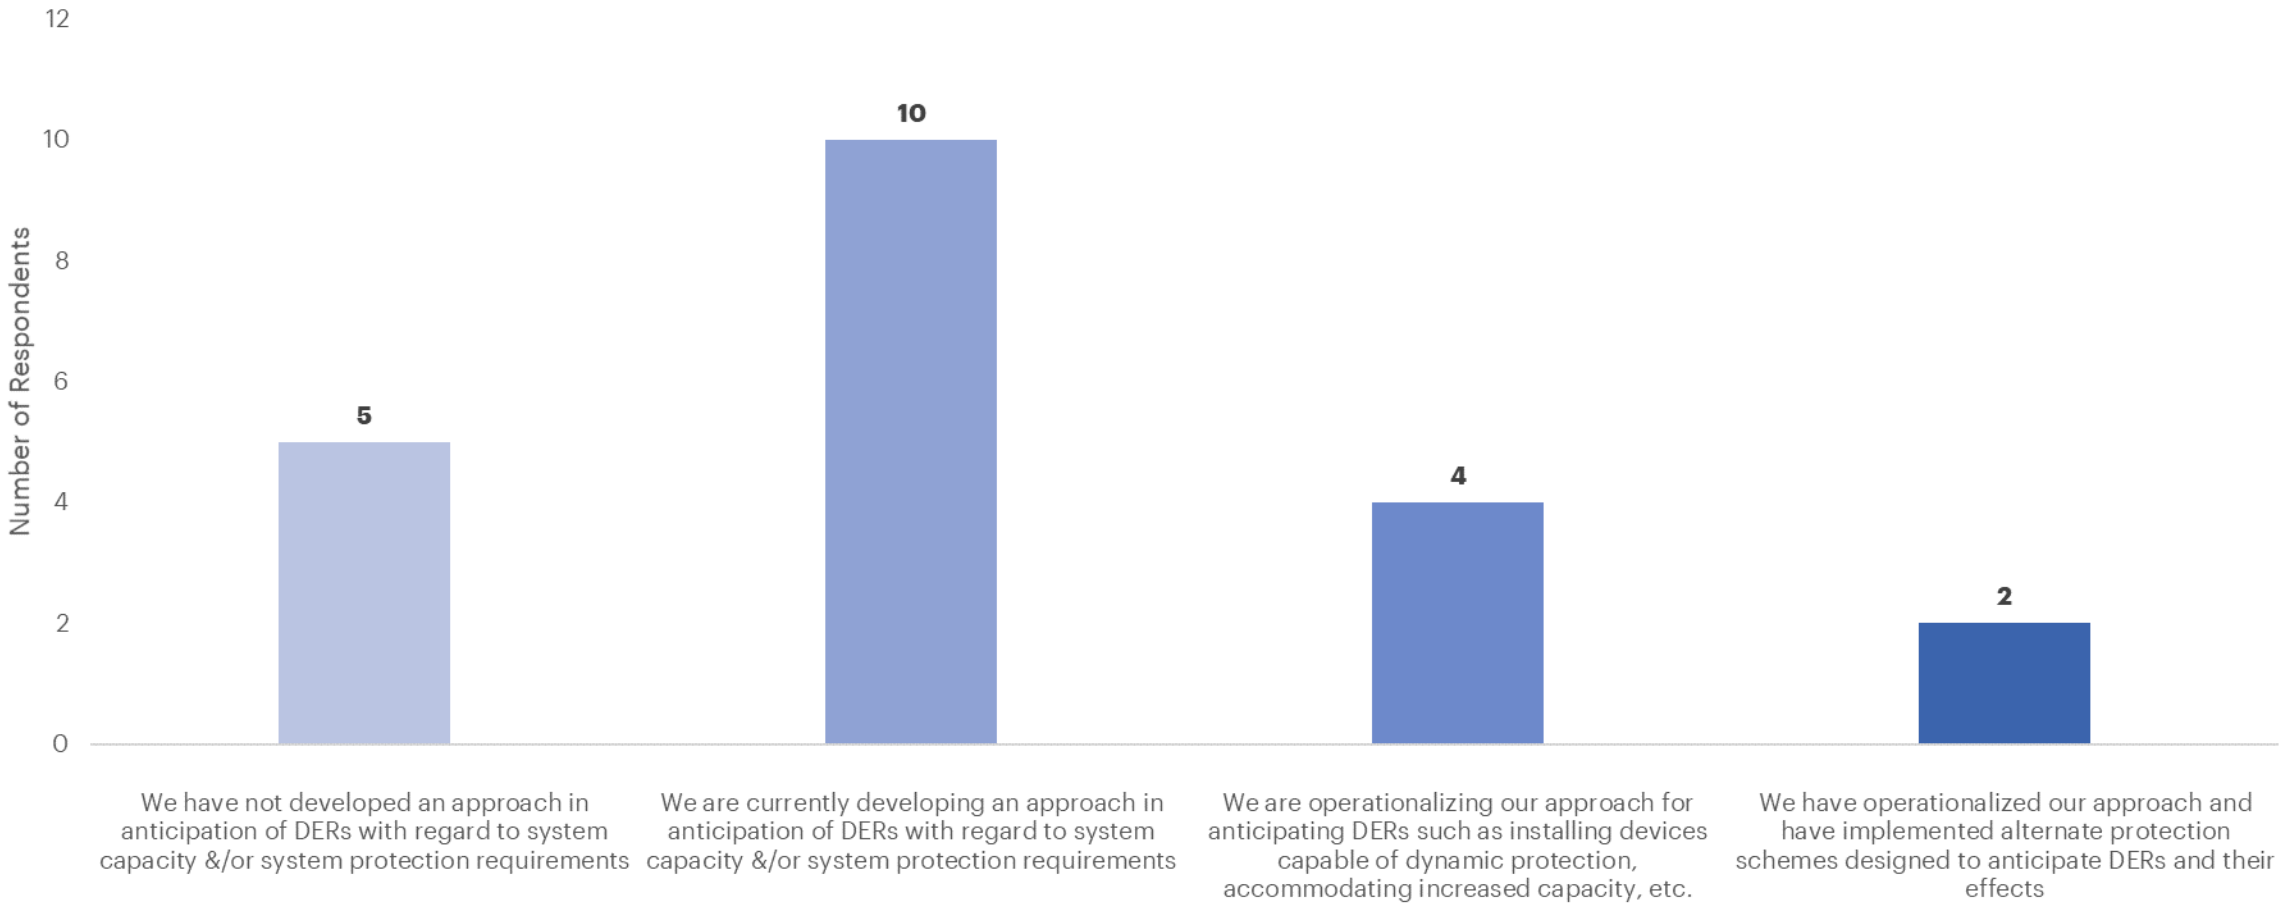
3.1) Radial System

Question:	What percentage of your customers are served by distribution backbone system that is radial (i.e., without capability of alternate feed)?



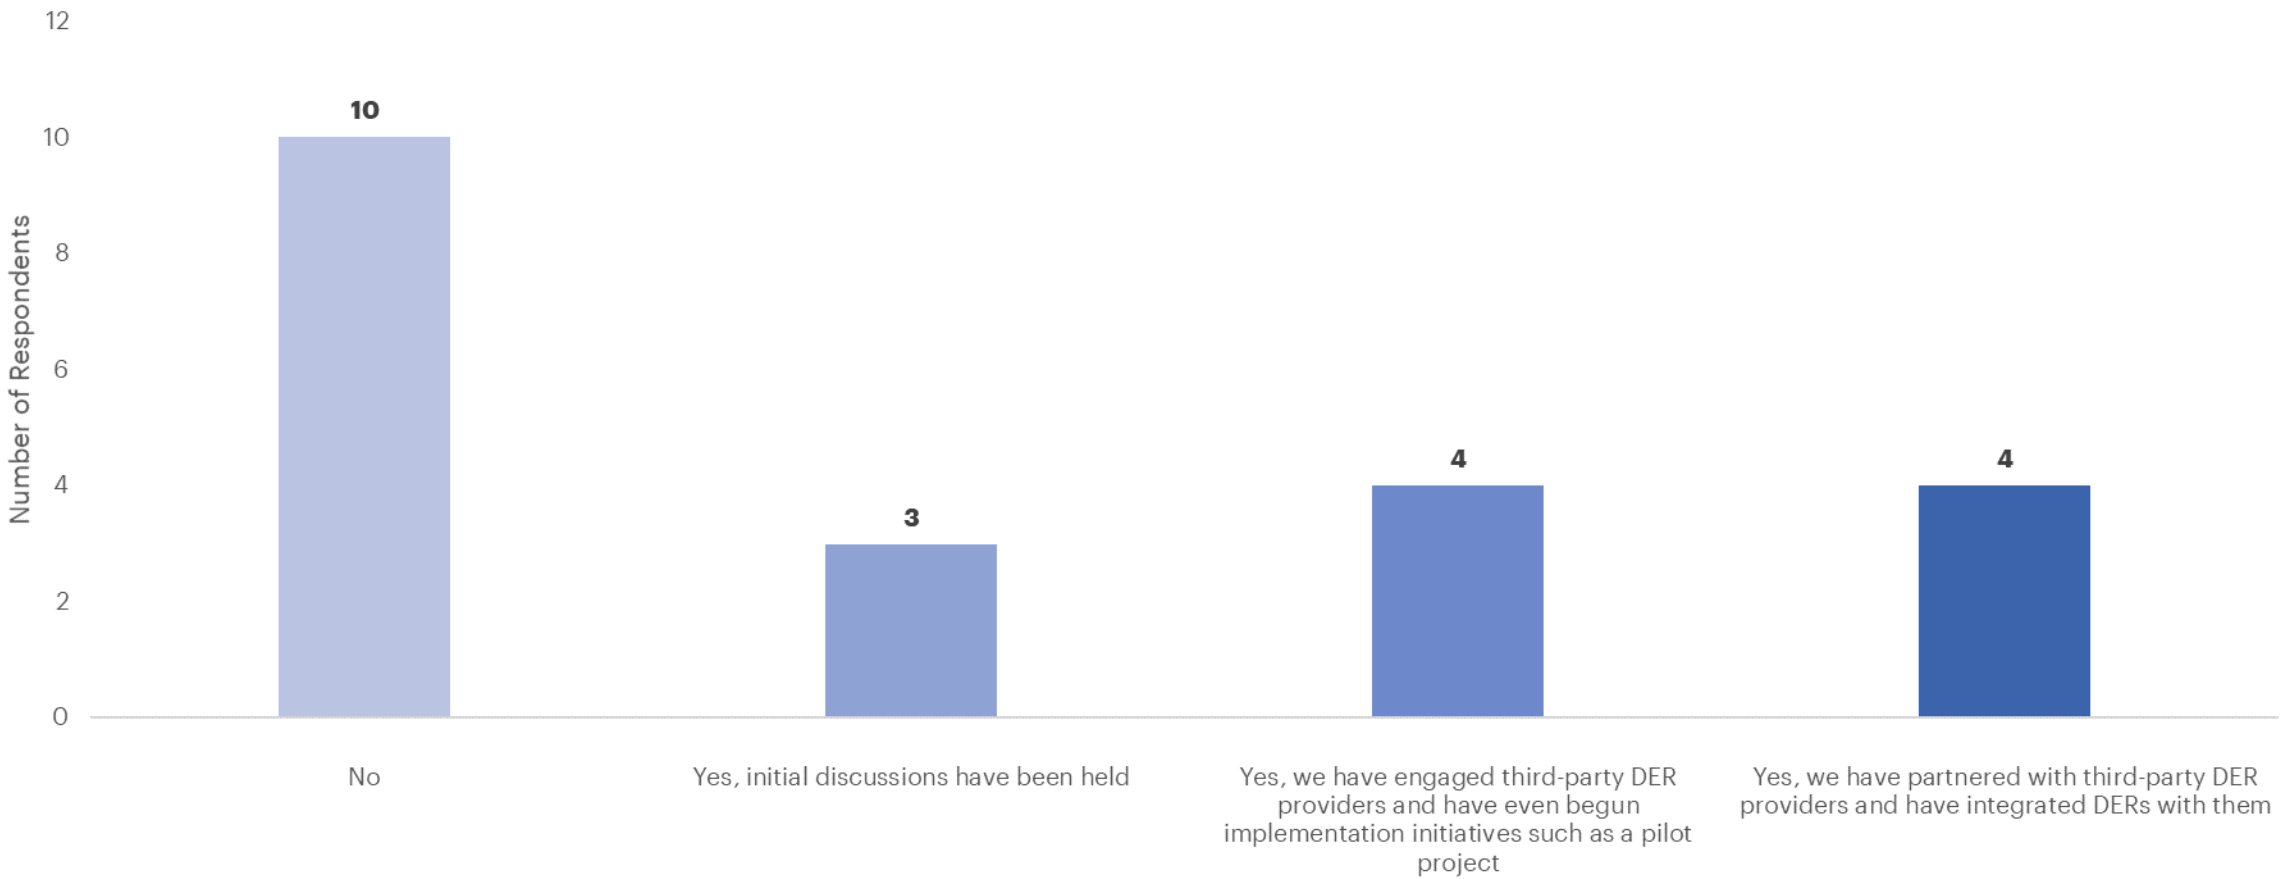
3.2) Two – Way Flow Monitoring

Question:	Do you have the monitoring capabilities that allow you to see distributed generation assets on your system?



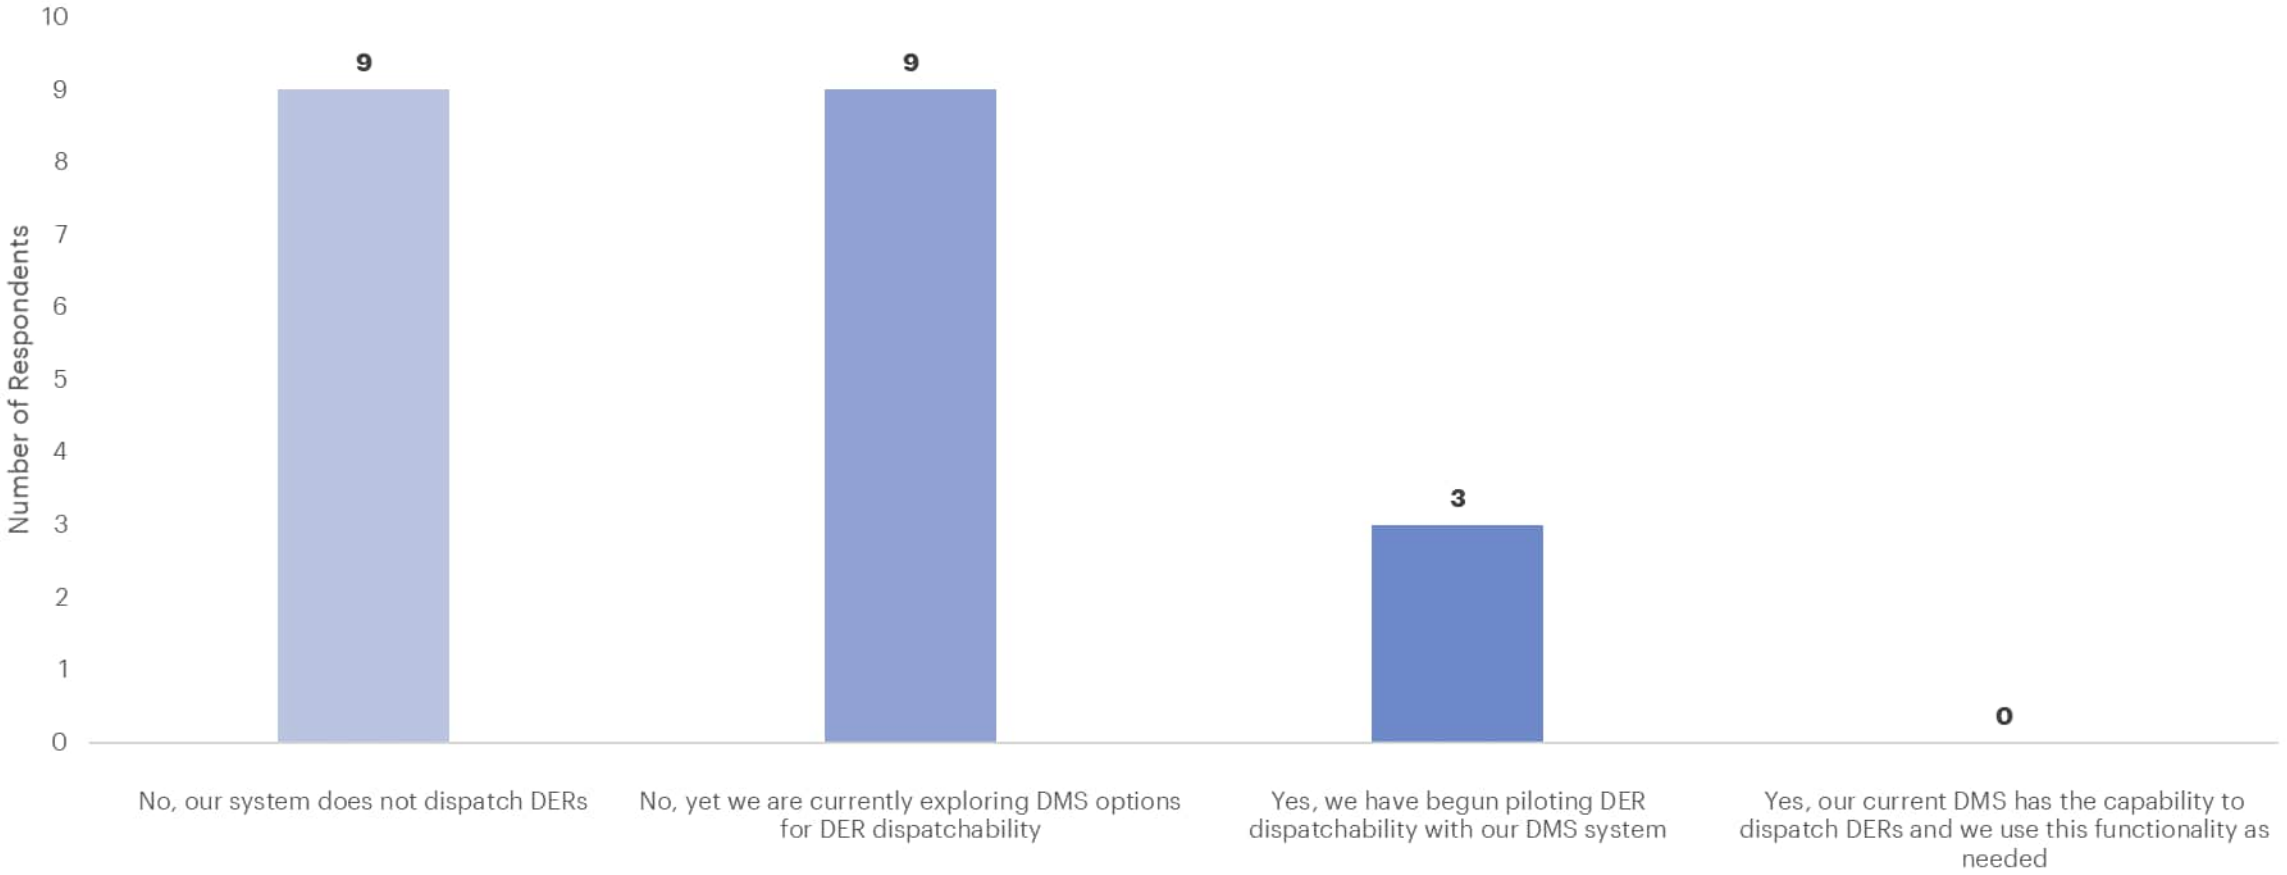
3.3) Reconfigurable Protection

Question:	Which of the following best describes your ability to reconfigure system protection as required given system dynamics?



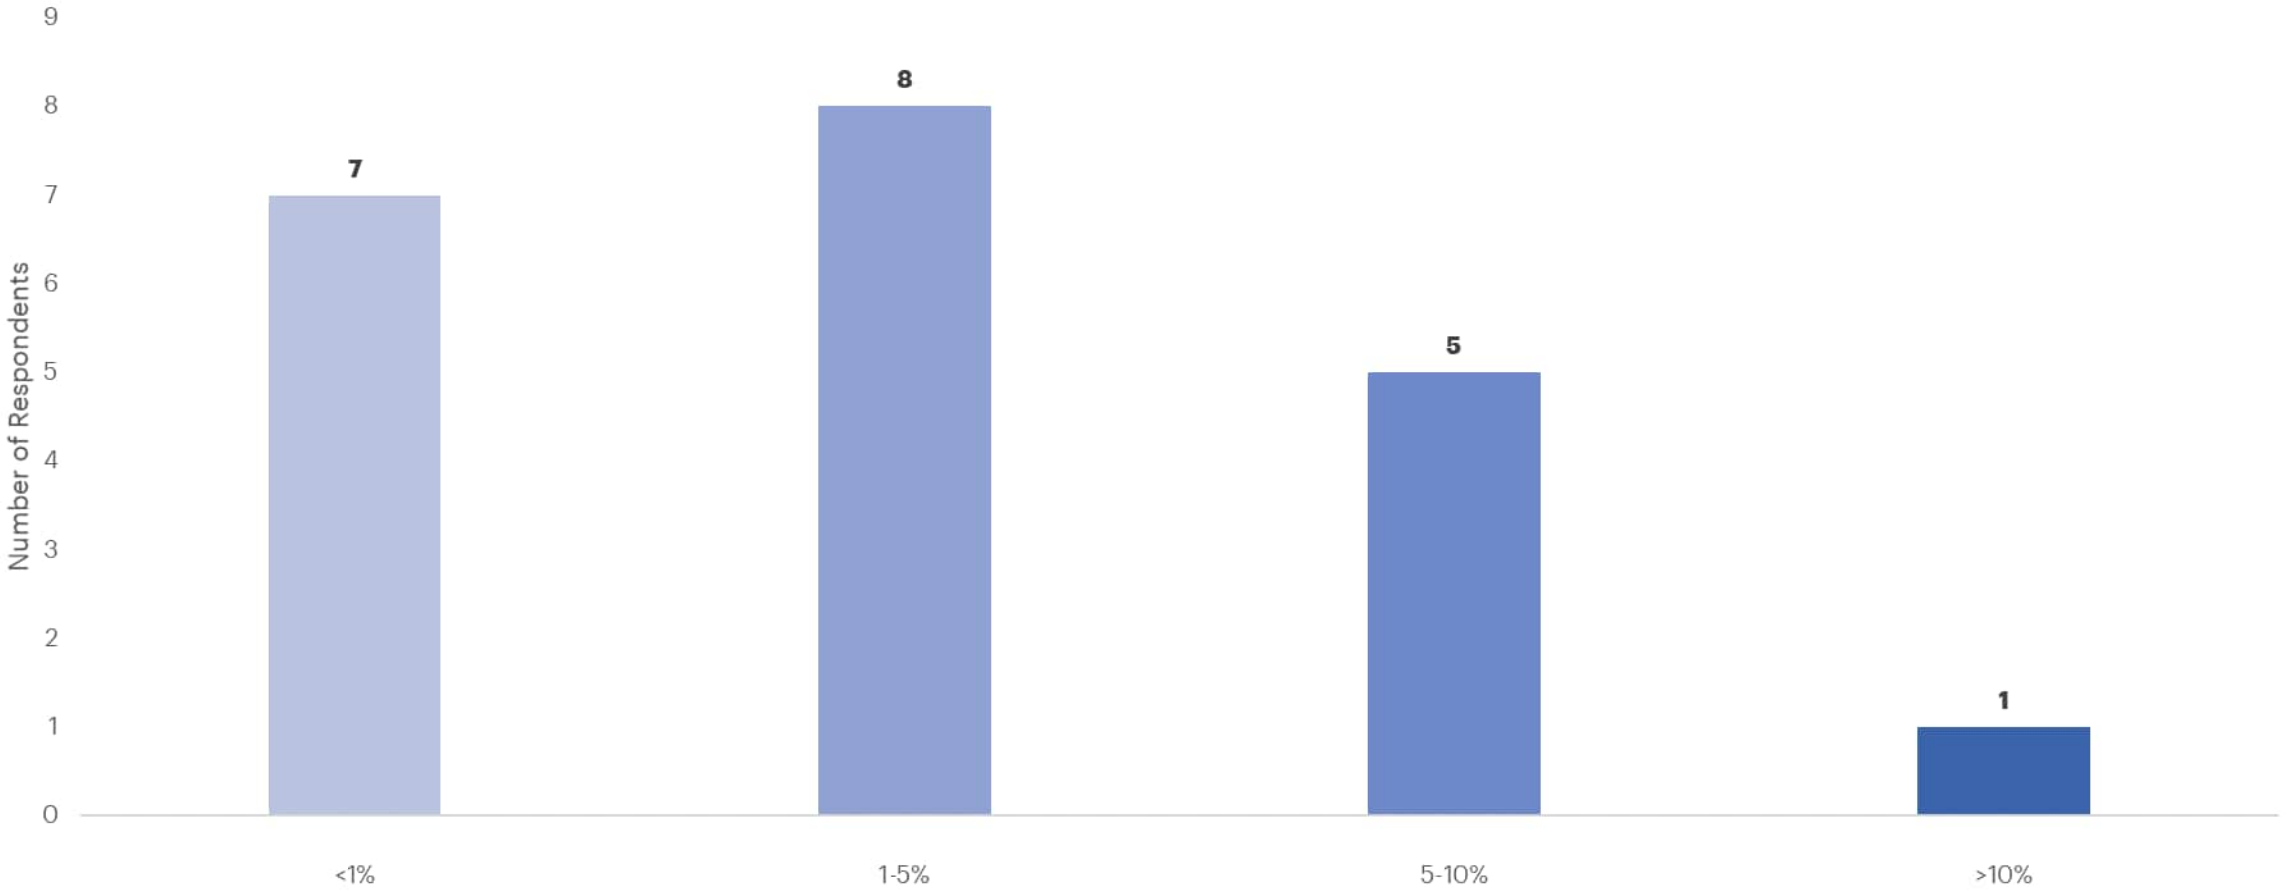
3.4) DER System Approach

Question:	Which of the following best describes your approach for anticipating changes to system capacity &/or system protection requirements due to increased DERs in your service territory?



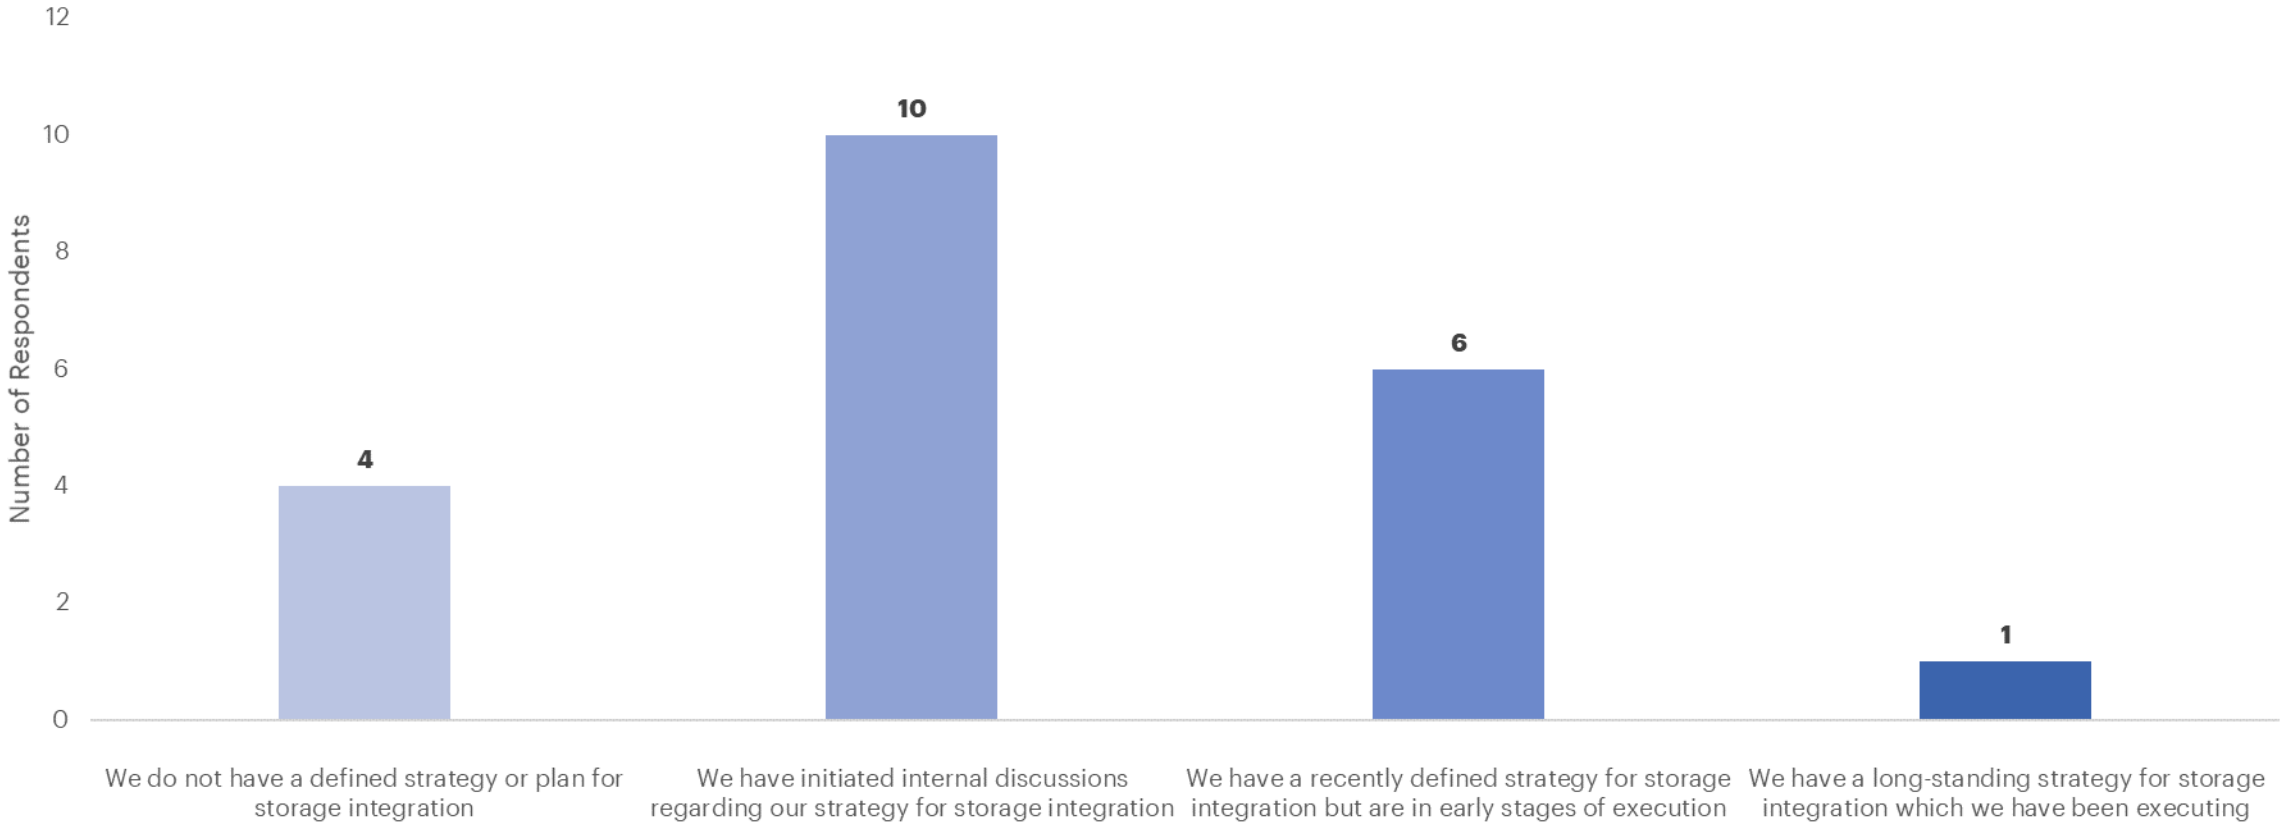
3.5) DER Providers

Question:	Are you partnering with third-party DER providers to integrate DERs in your distribution system?



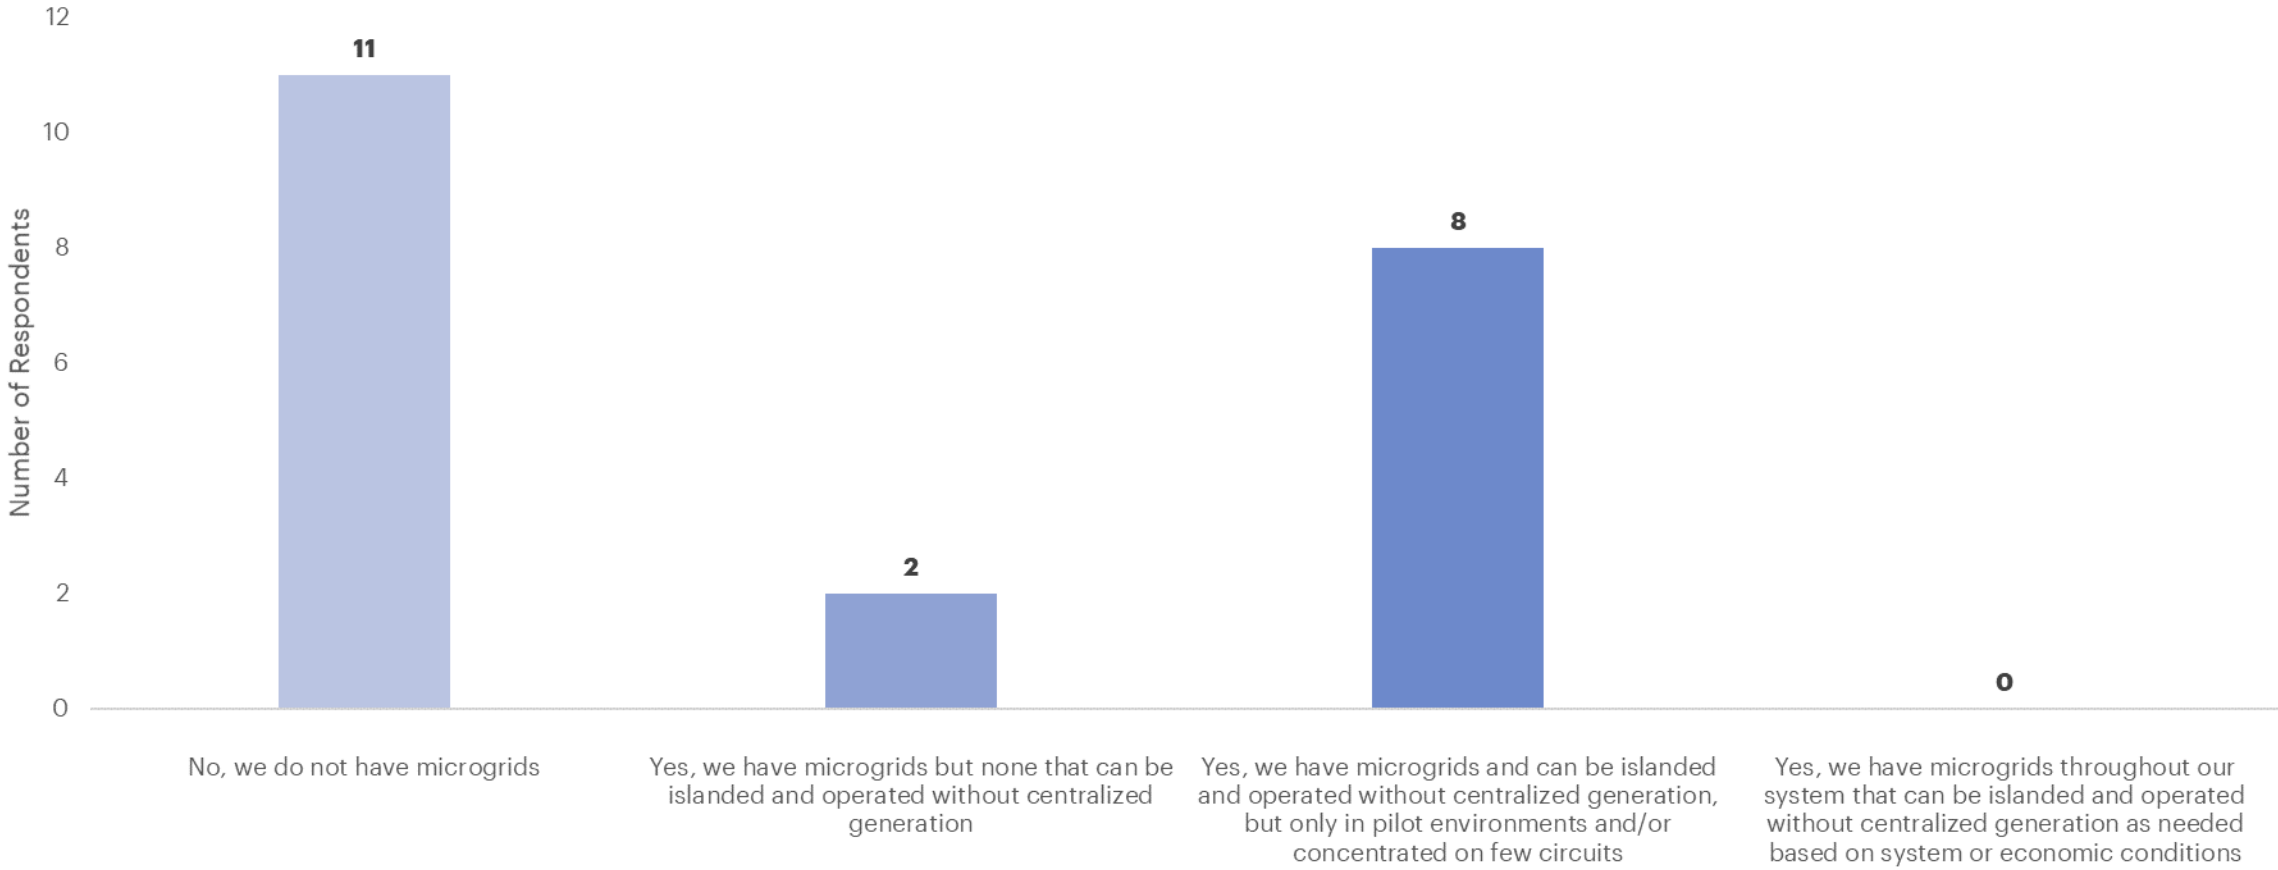
3.6) DER Dispatchability

Question:	Do you have a distribution management system (DMS) that allows for DER dispatchability?



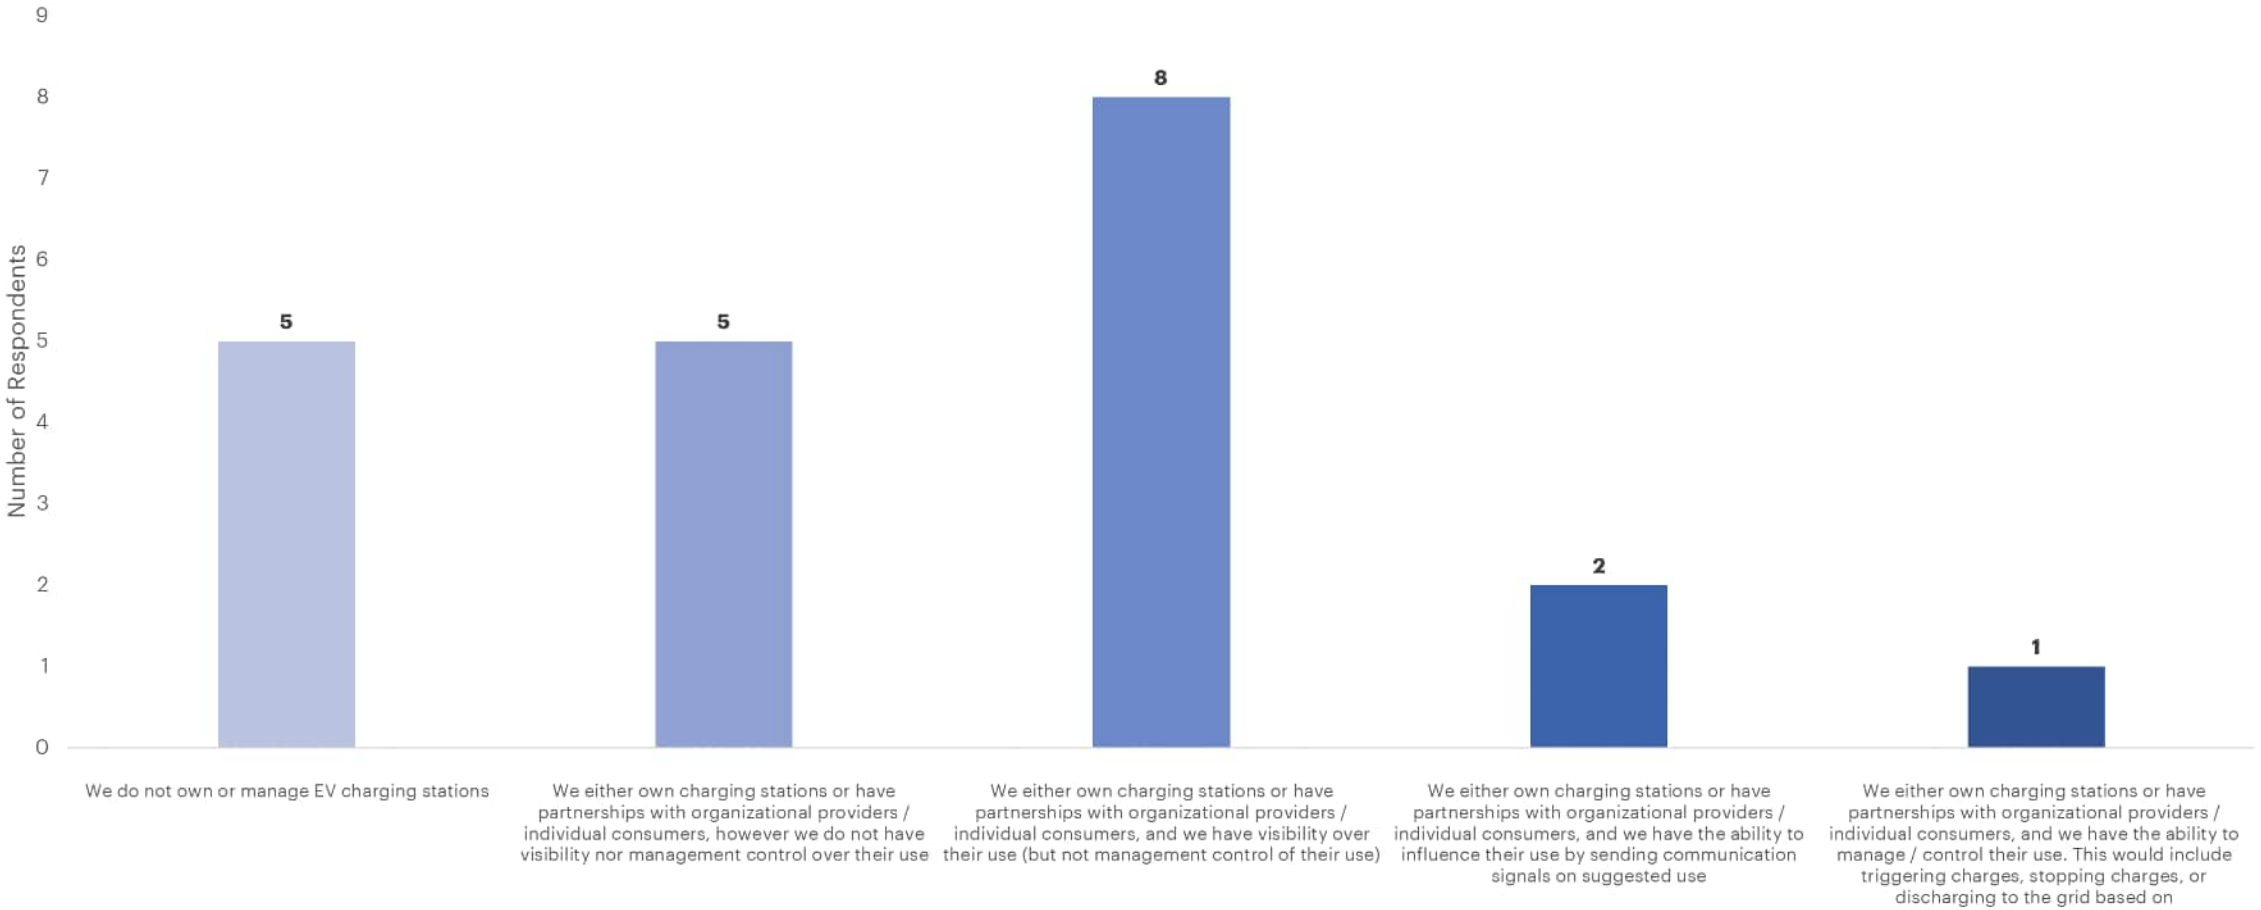
3.7) Distributed Generation

Question:	What % of your customers have customer-sited or directly connected distributed generation (e.g. solar, wind, fuel cells, etc.)?



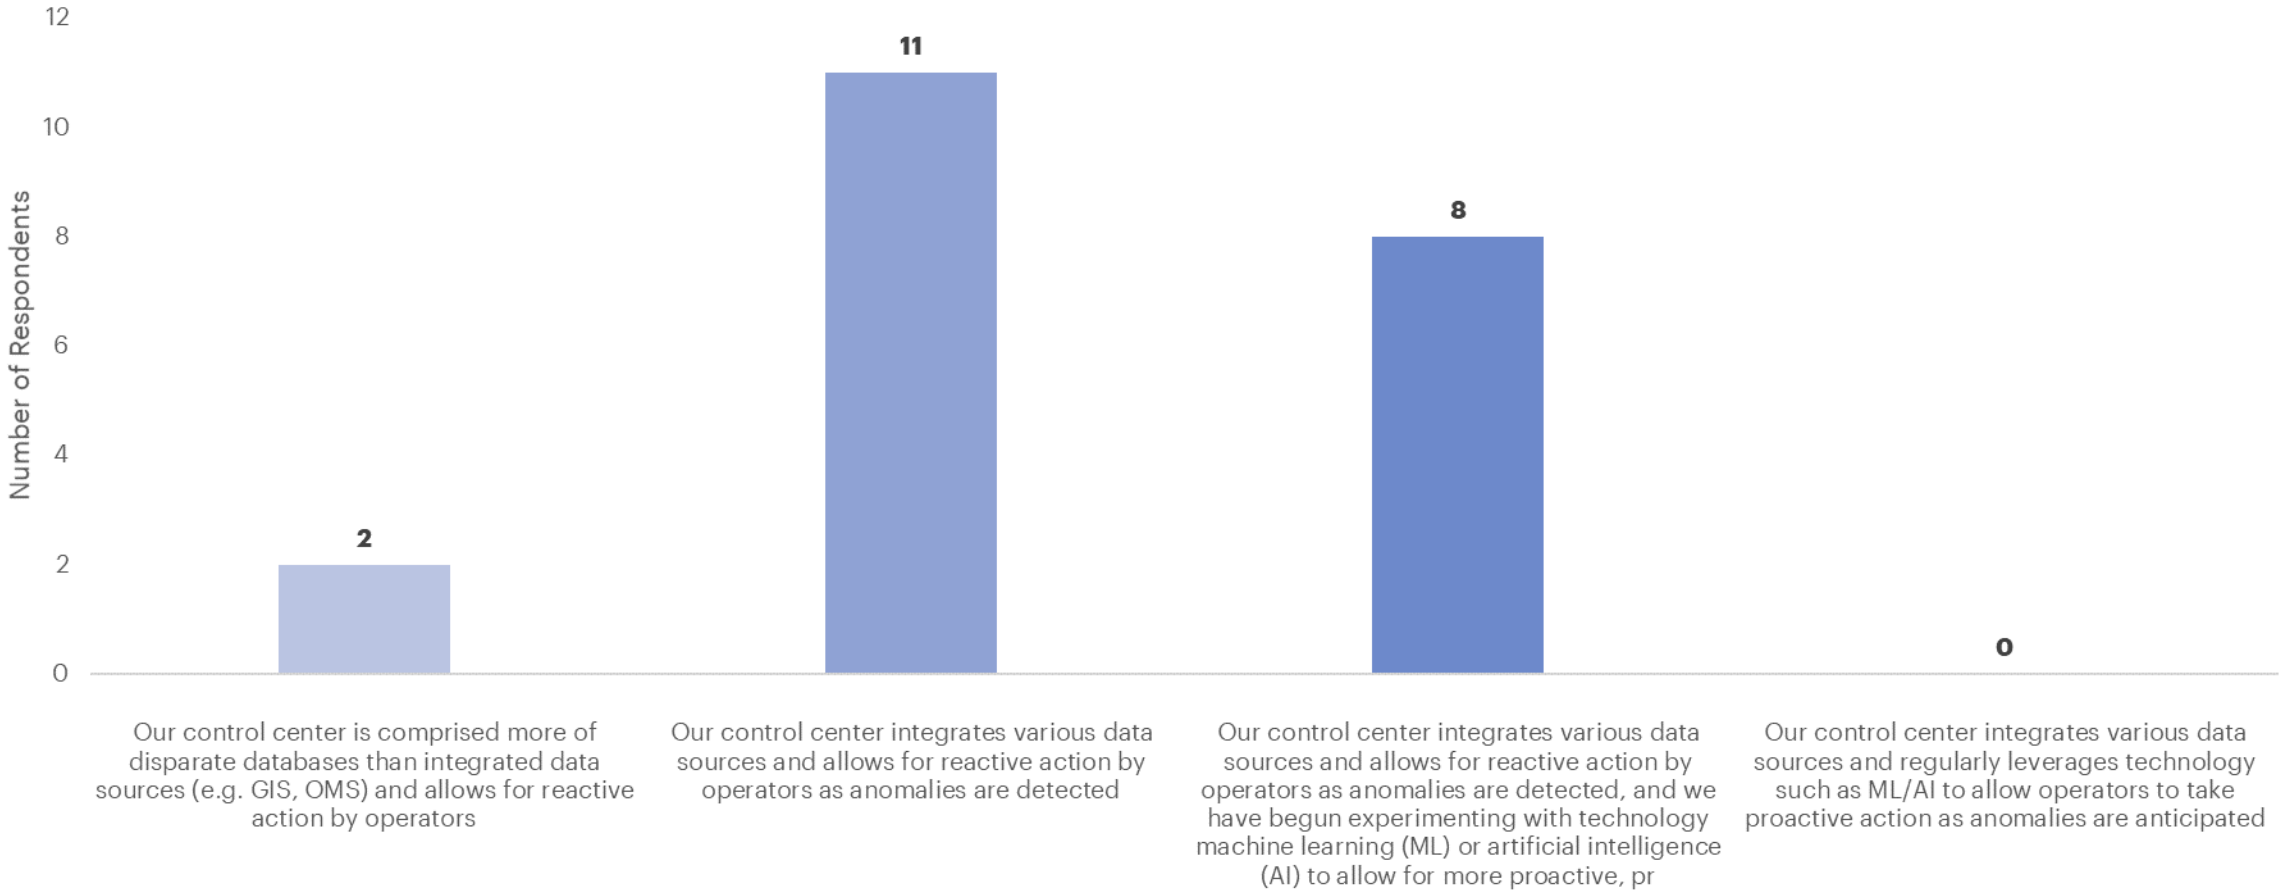
3.8) Energy Storage Strategy

Question:	Which of the following best describes the maturity of your utility's distribution level energy storage strategy? NOTE: This question refers to energy storage of your utility (not that of your customers). Examples of energy storage would include batteries (lithium ion or otherwise), fuel cells, etc.



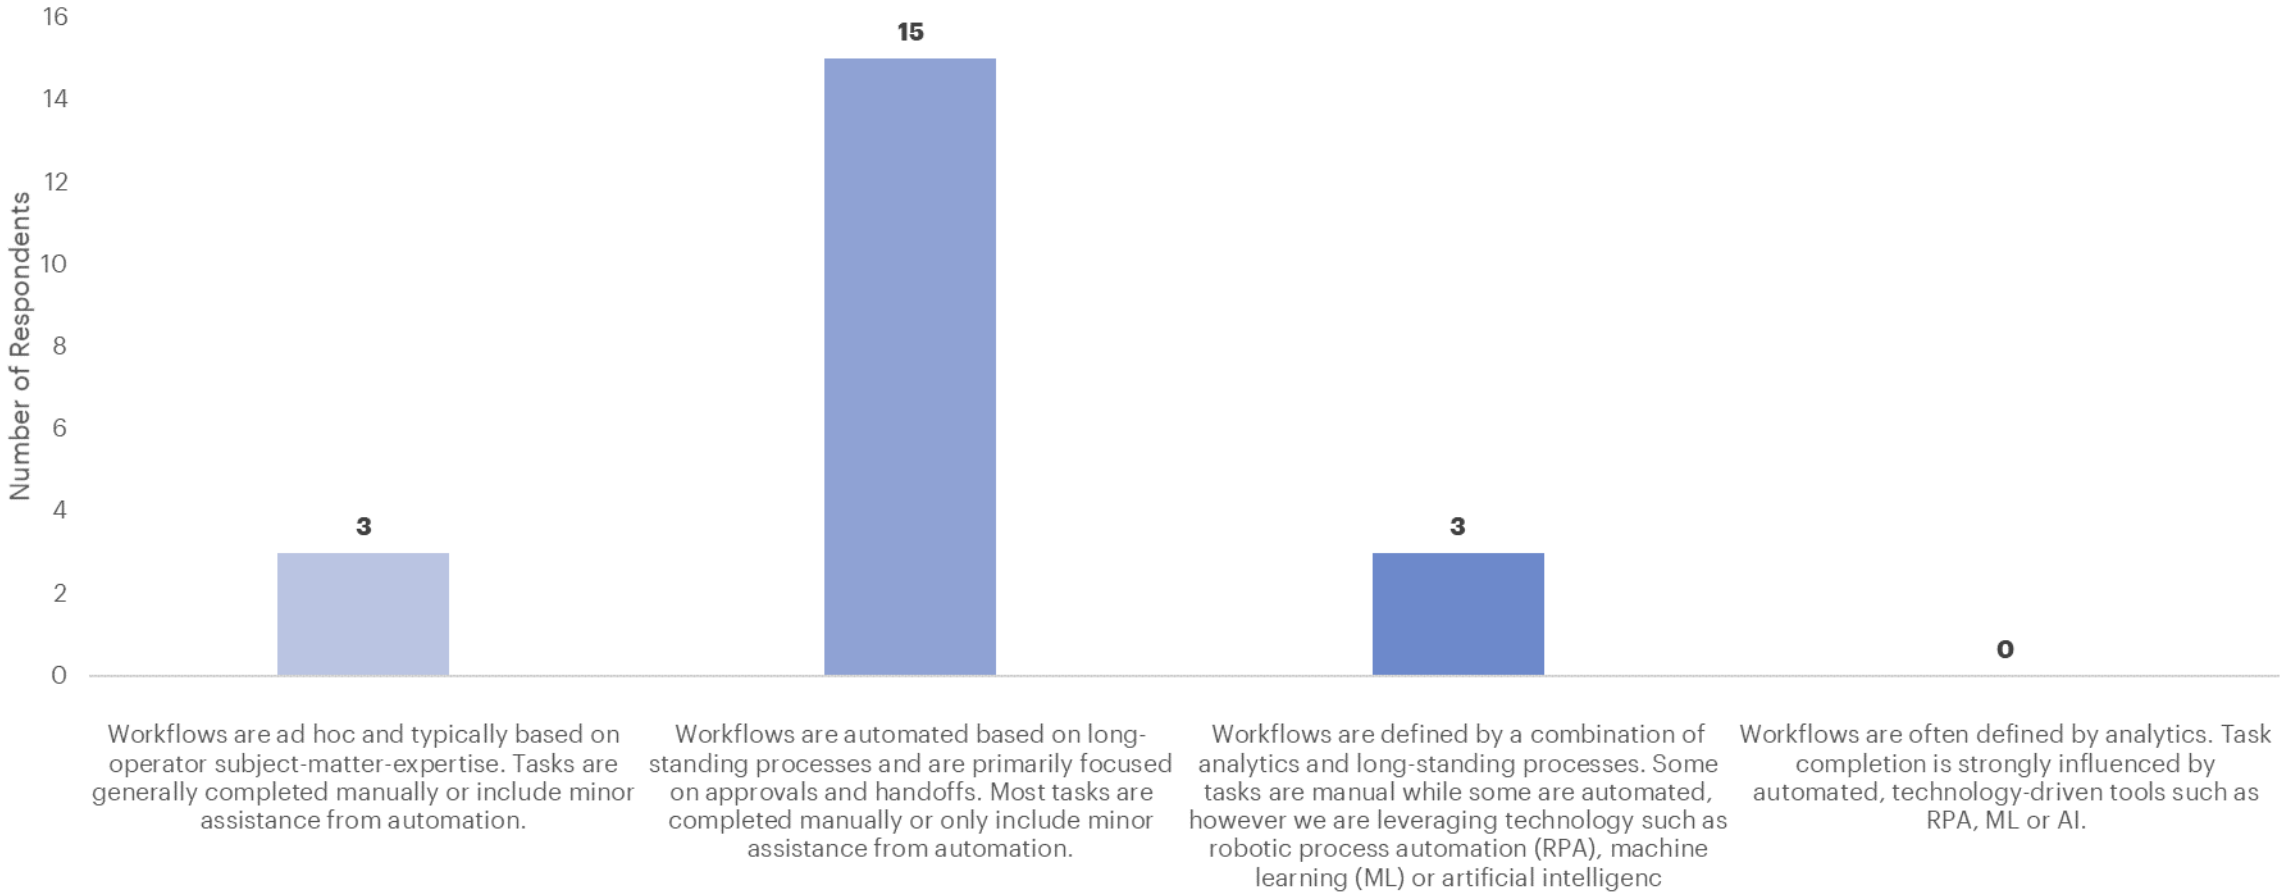
3.9) Microgrids

Question:	Do you have microgrids that can be islanded and operated without centralized generation? NOTE: This refers to microgrids which the utility controls, either by direct ownership or contract.



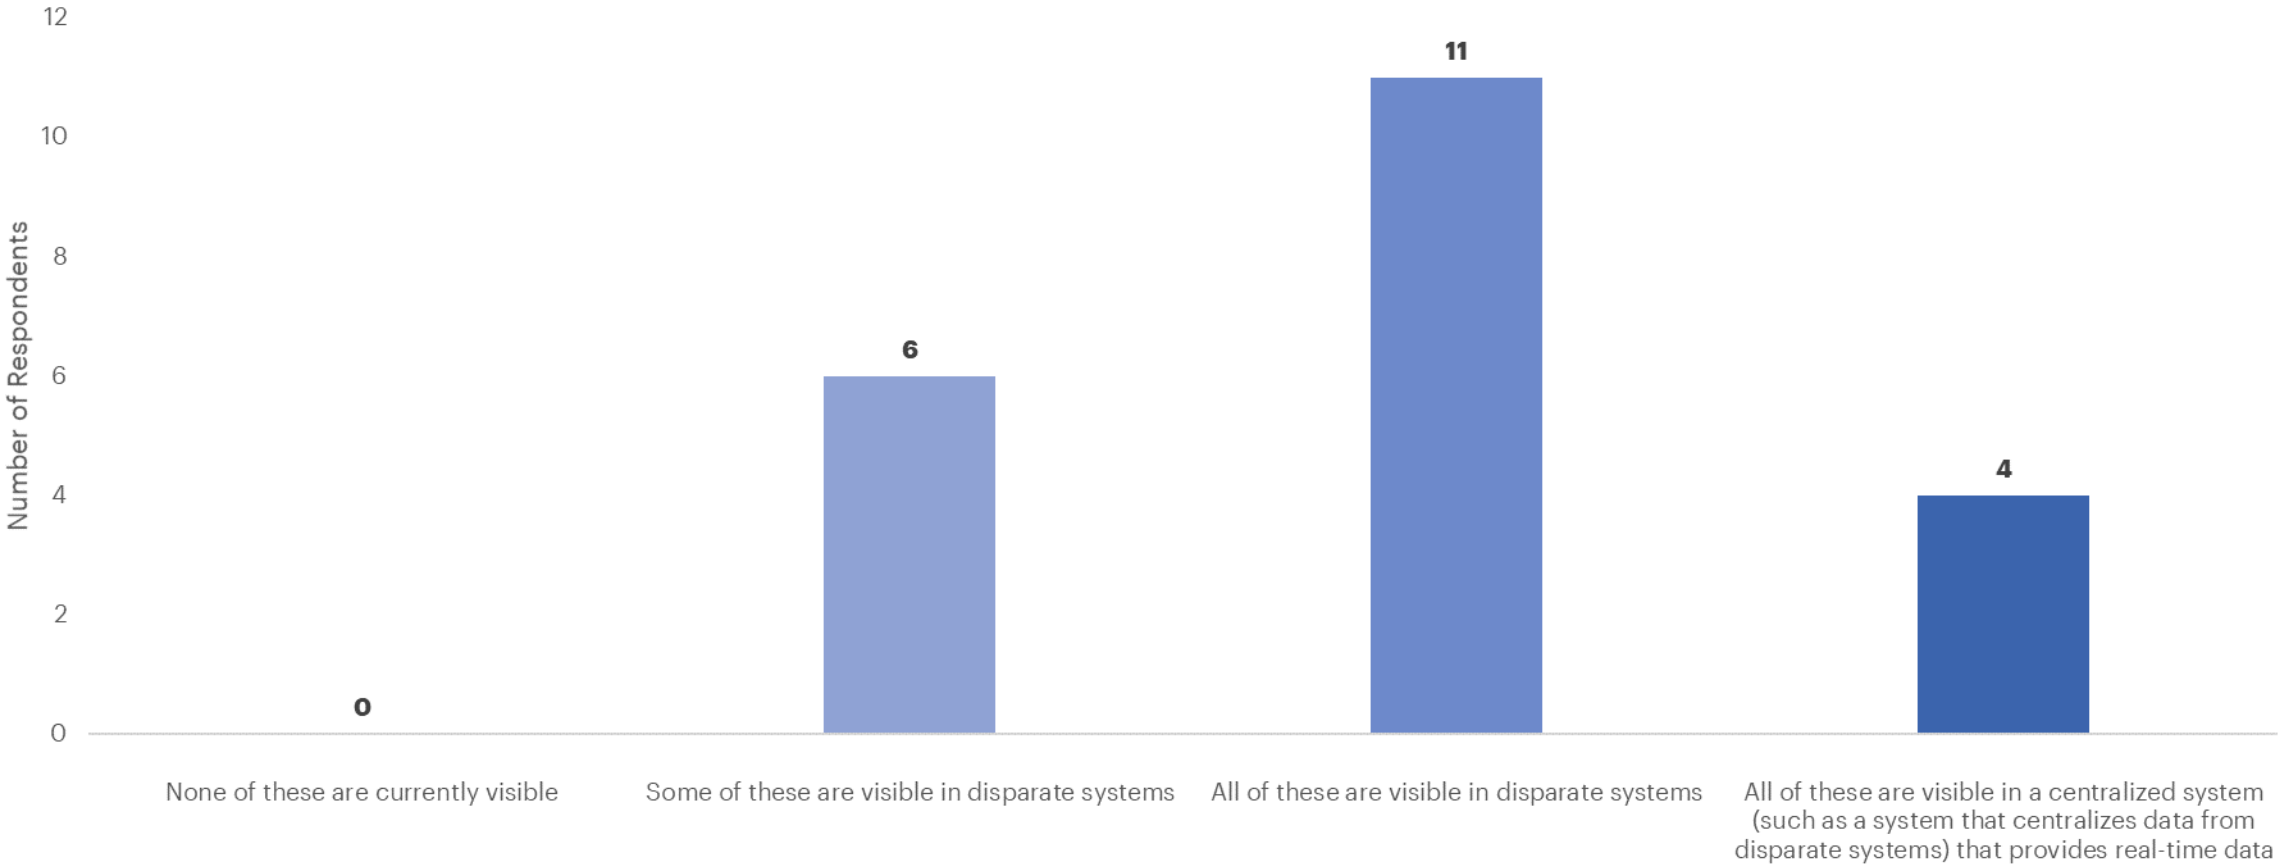
3.10) EV Charging

Question:	Which of the following best describes your electric vehicle (EV) charging capabilities?



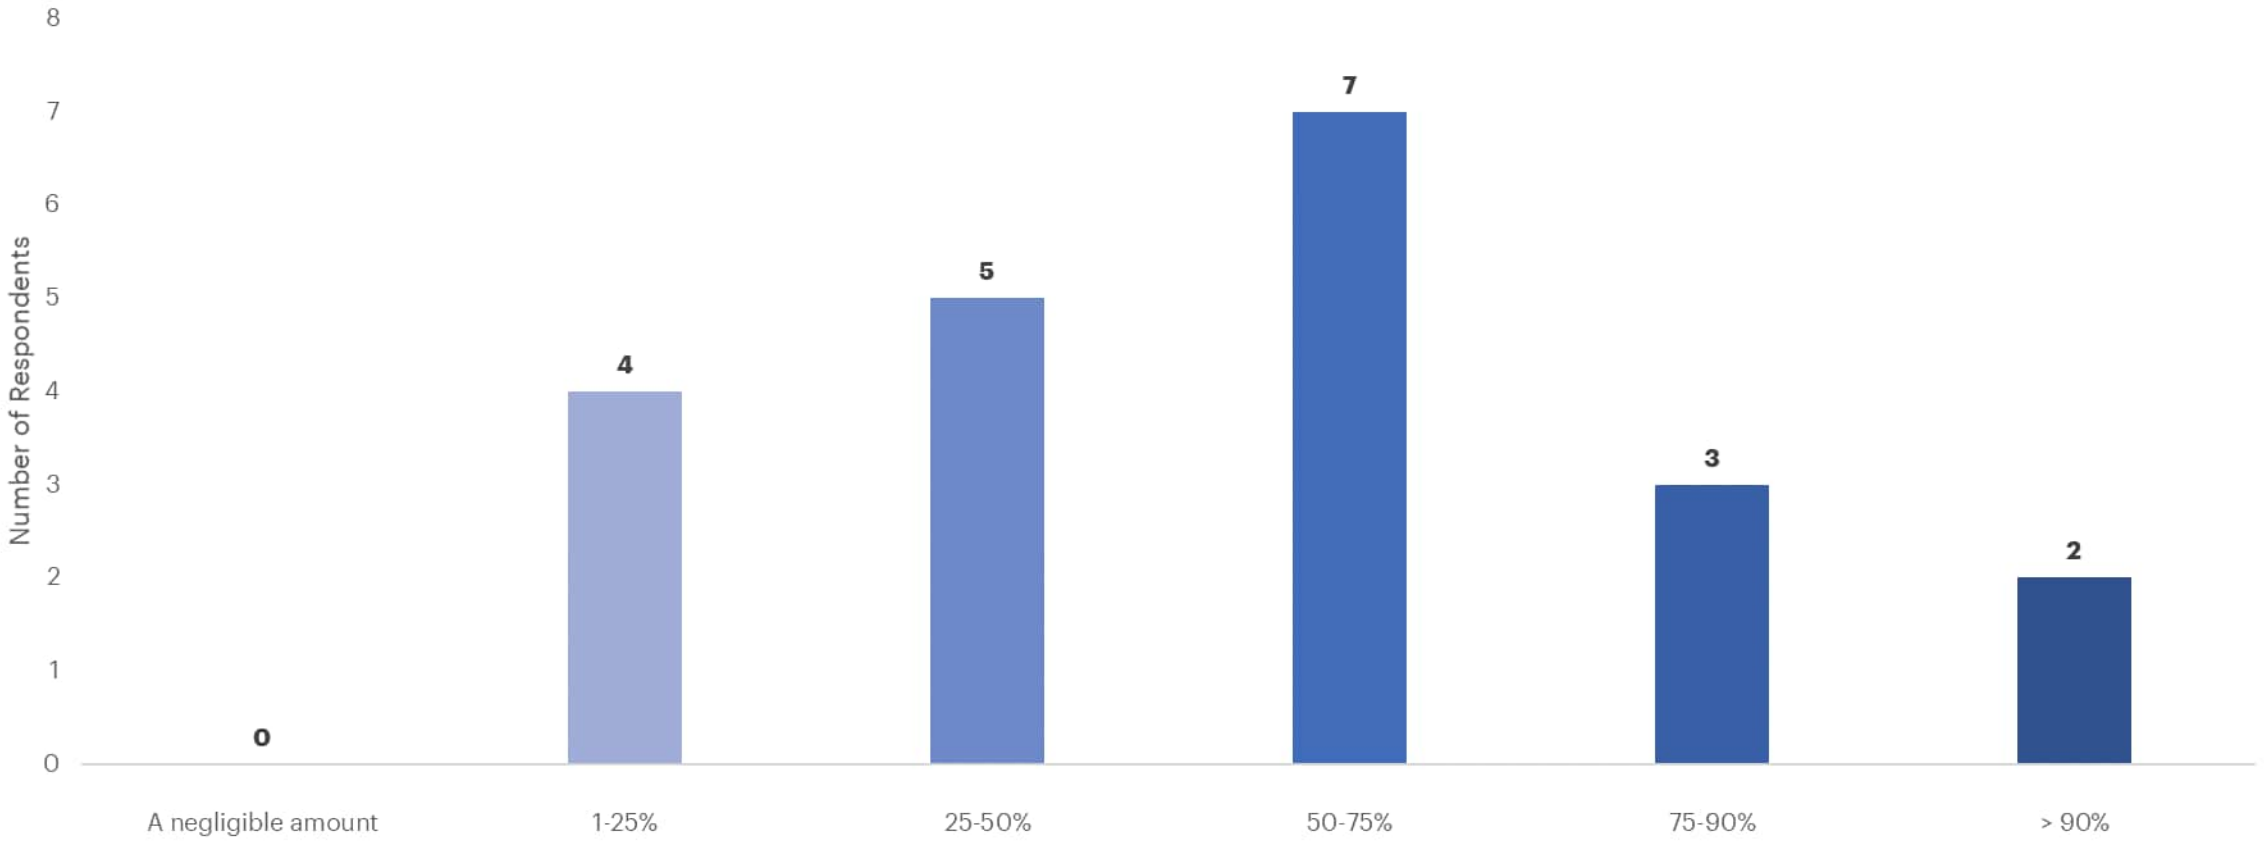
4.1) Control Center Infrastructure

Question:	Which of the following best describes the underlying infrastructure of your control center?



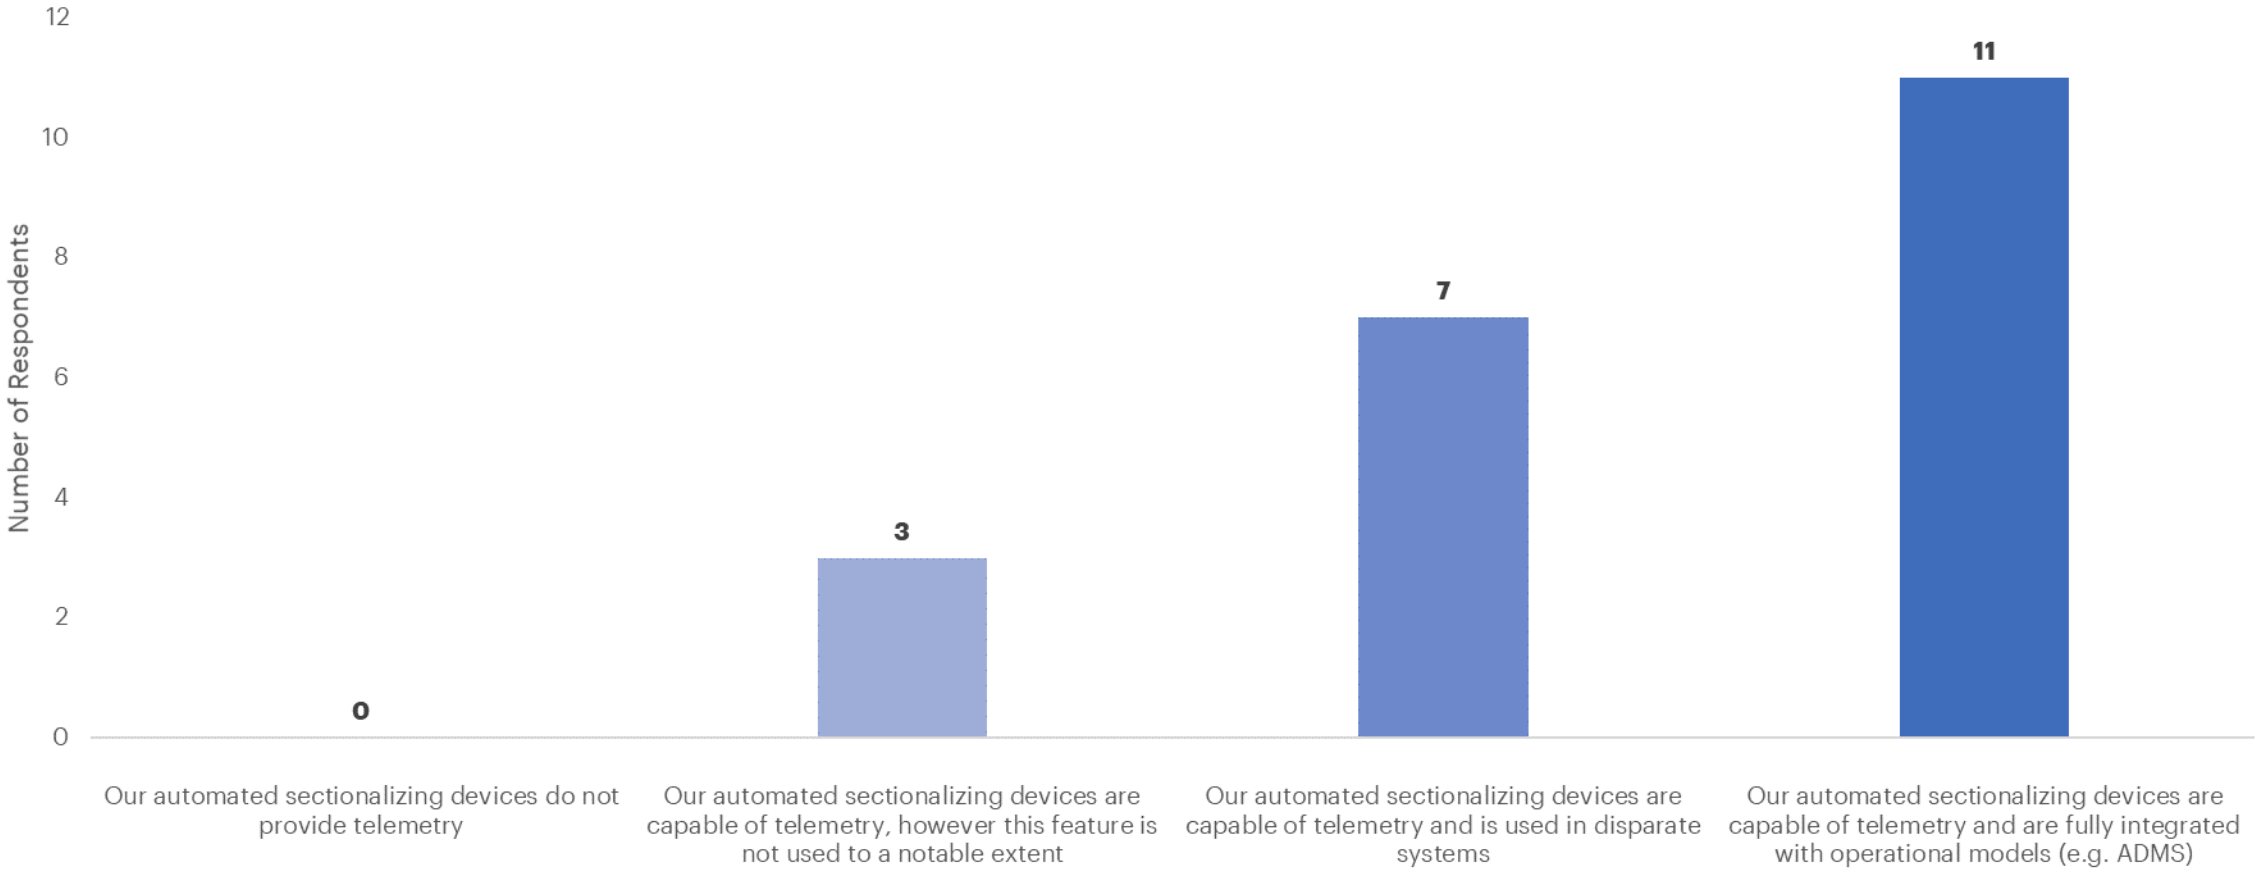
4.2) Control Center Workflows and Tasks

Question:	Which of the following best describes the workflows and tasks conducted in your control center?



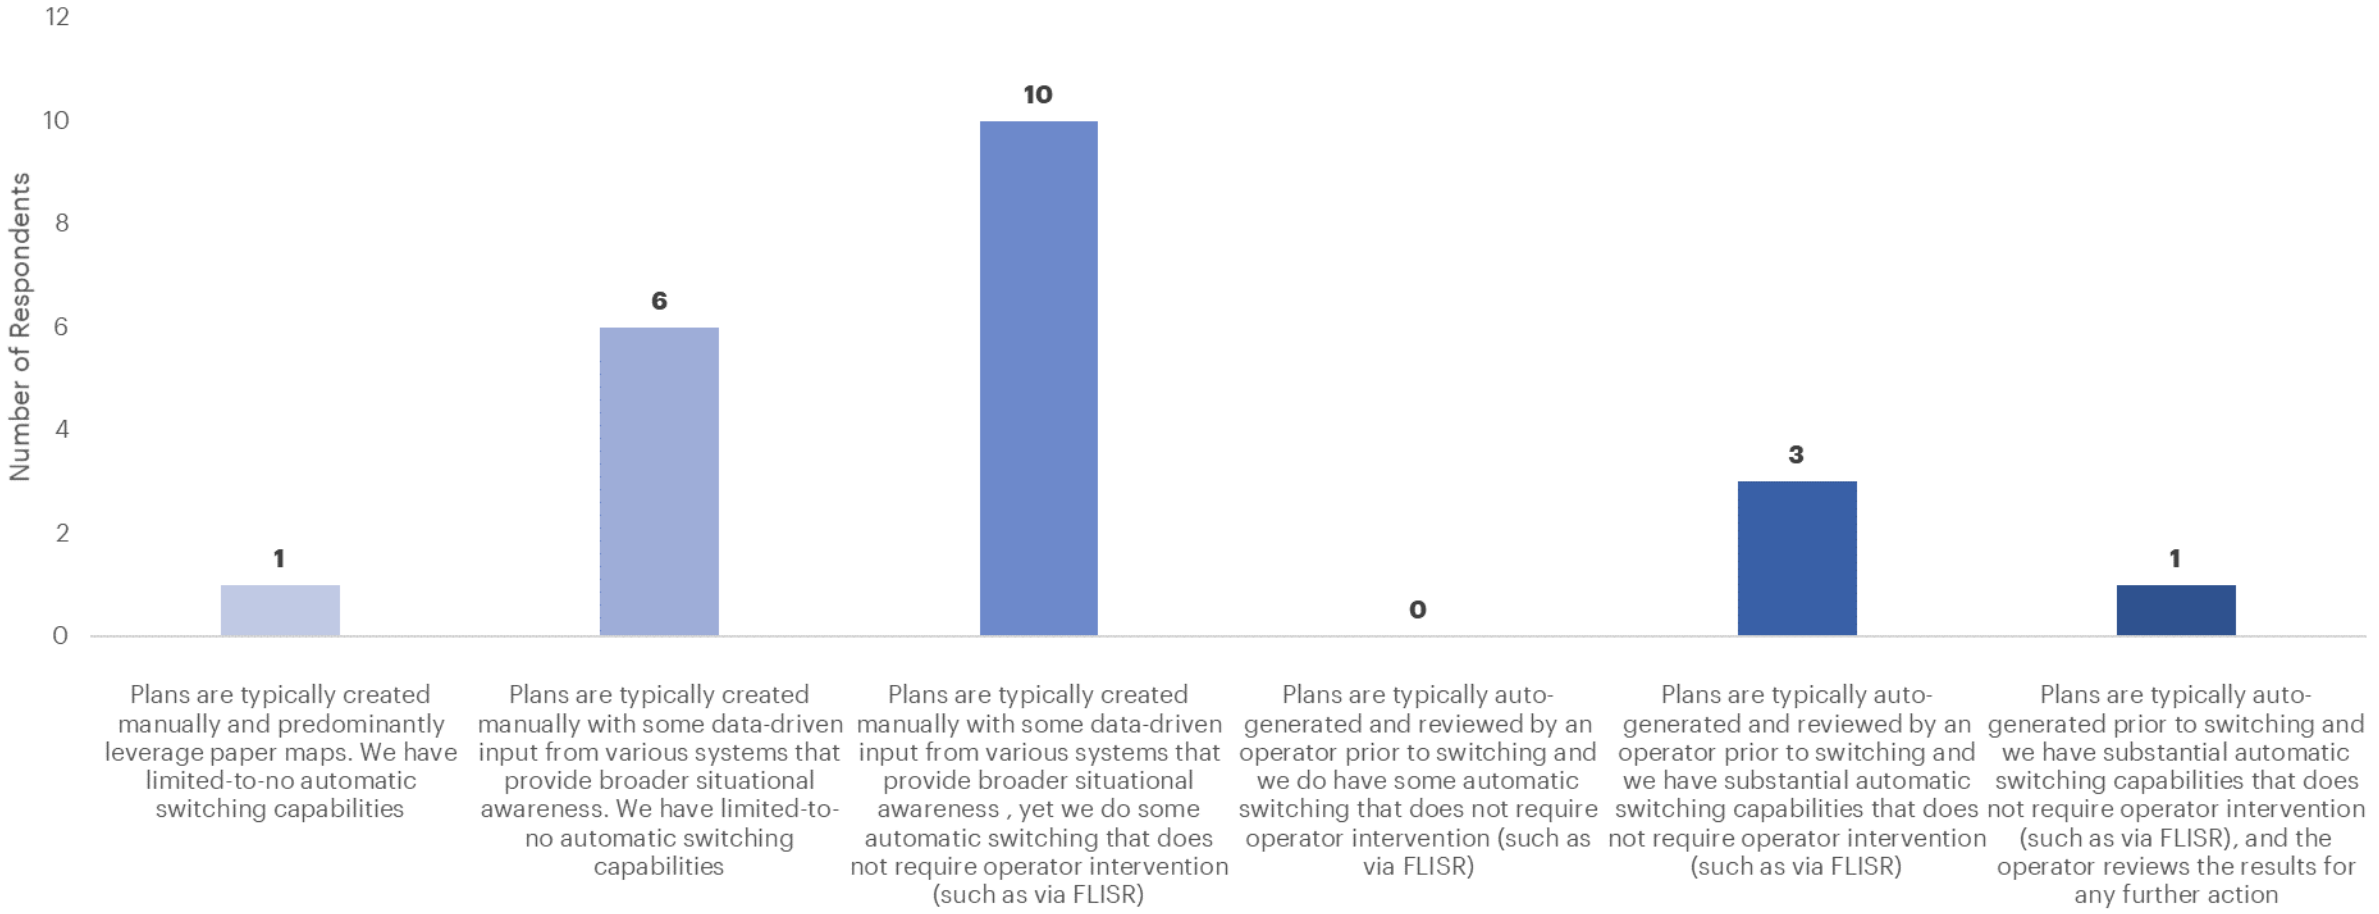
4.3) Operational Visibility

Question:	Which of the following best describes your visibility into operational activity such as customer energy usage, power flows, outages, and faults?



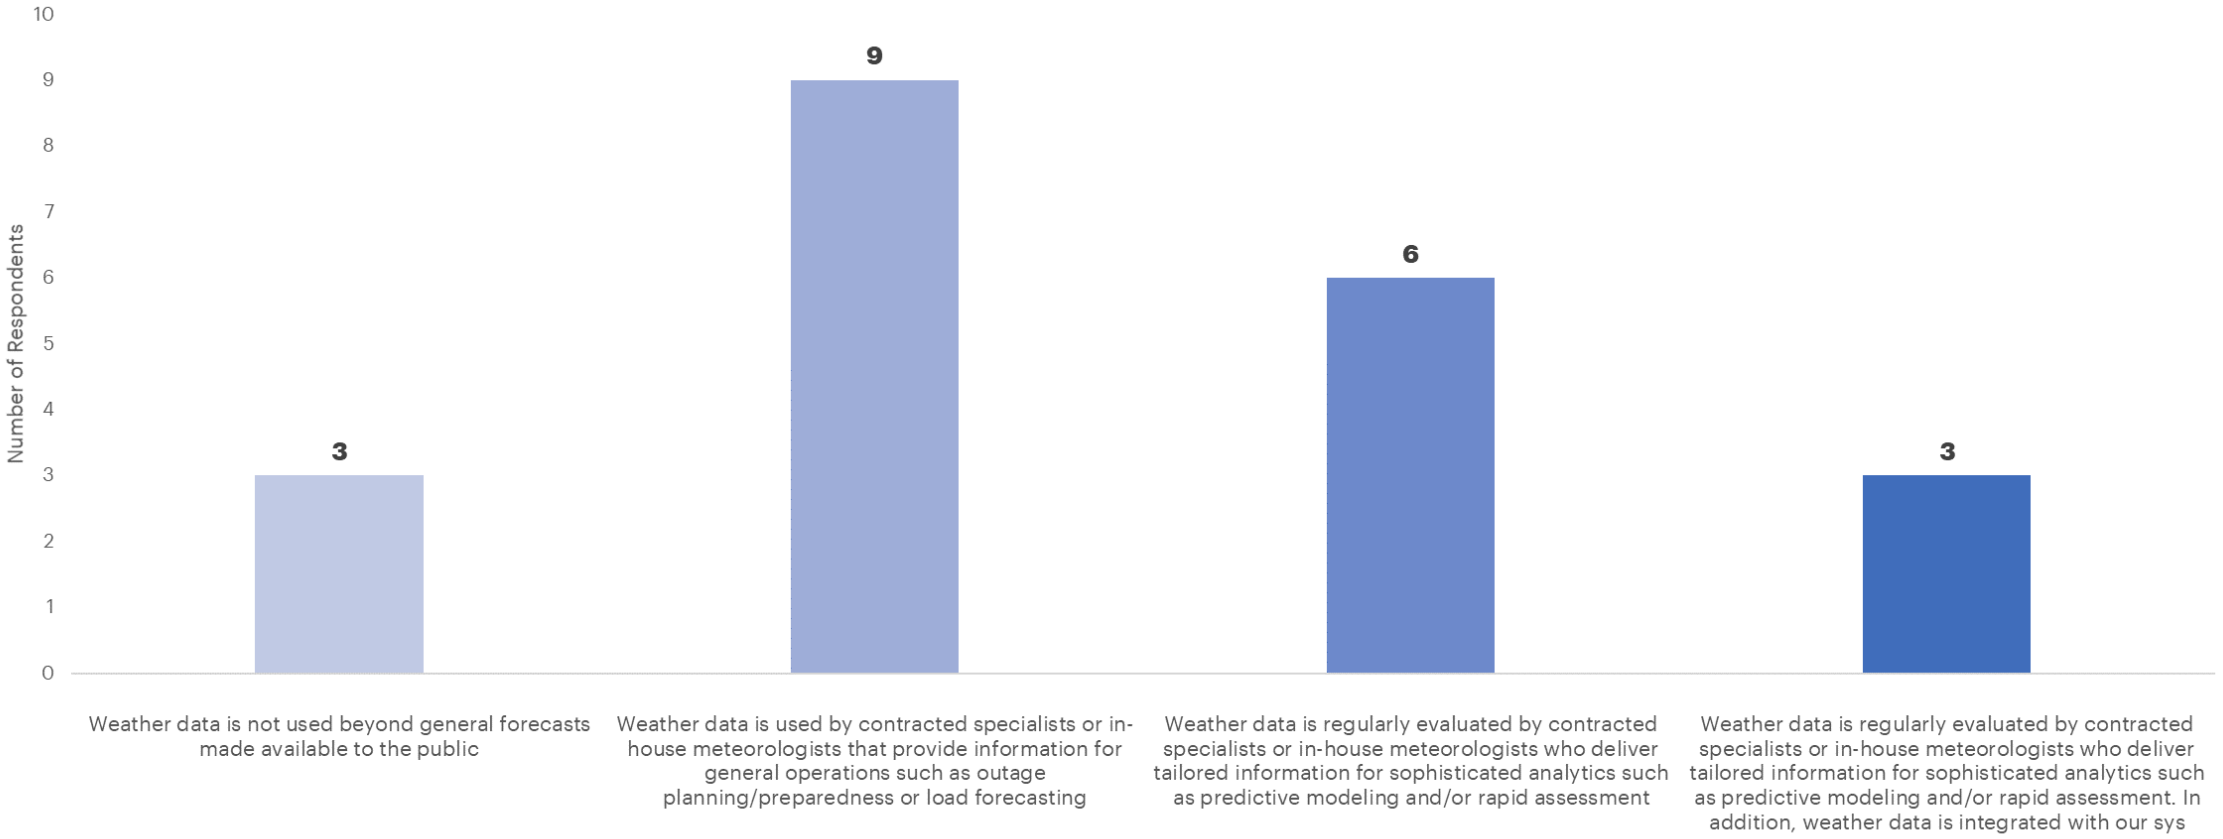
4.4) Automated Sectionalizing Devices

Question:	What percentage of your feeders have automated sectionalizing devices? NOTE: The entire feeder does not need to contain automated sectionalizing devices—partial coverage with automated sectionalizing devices suffices for this question.



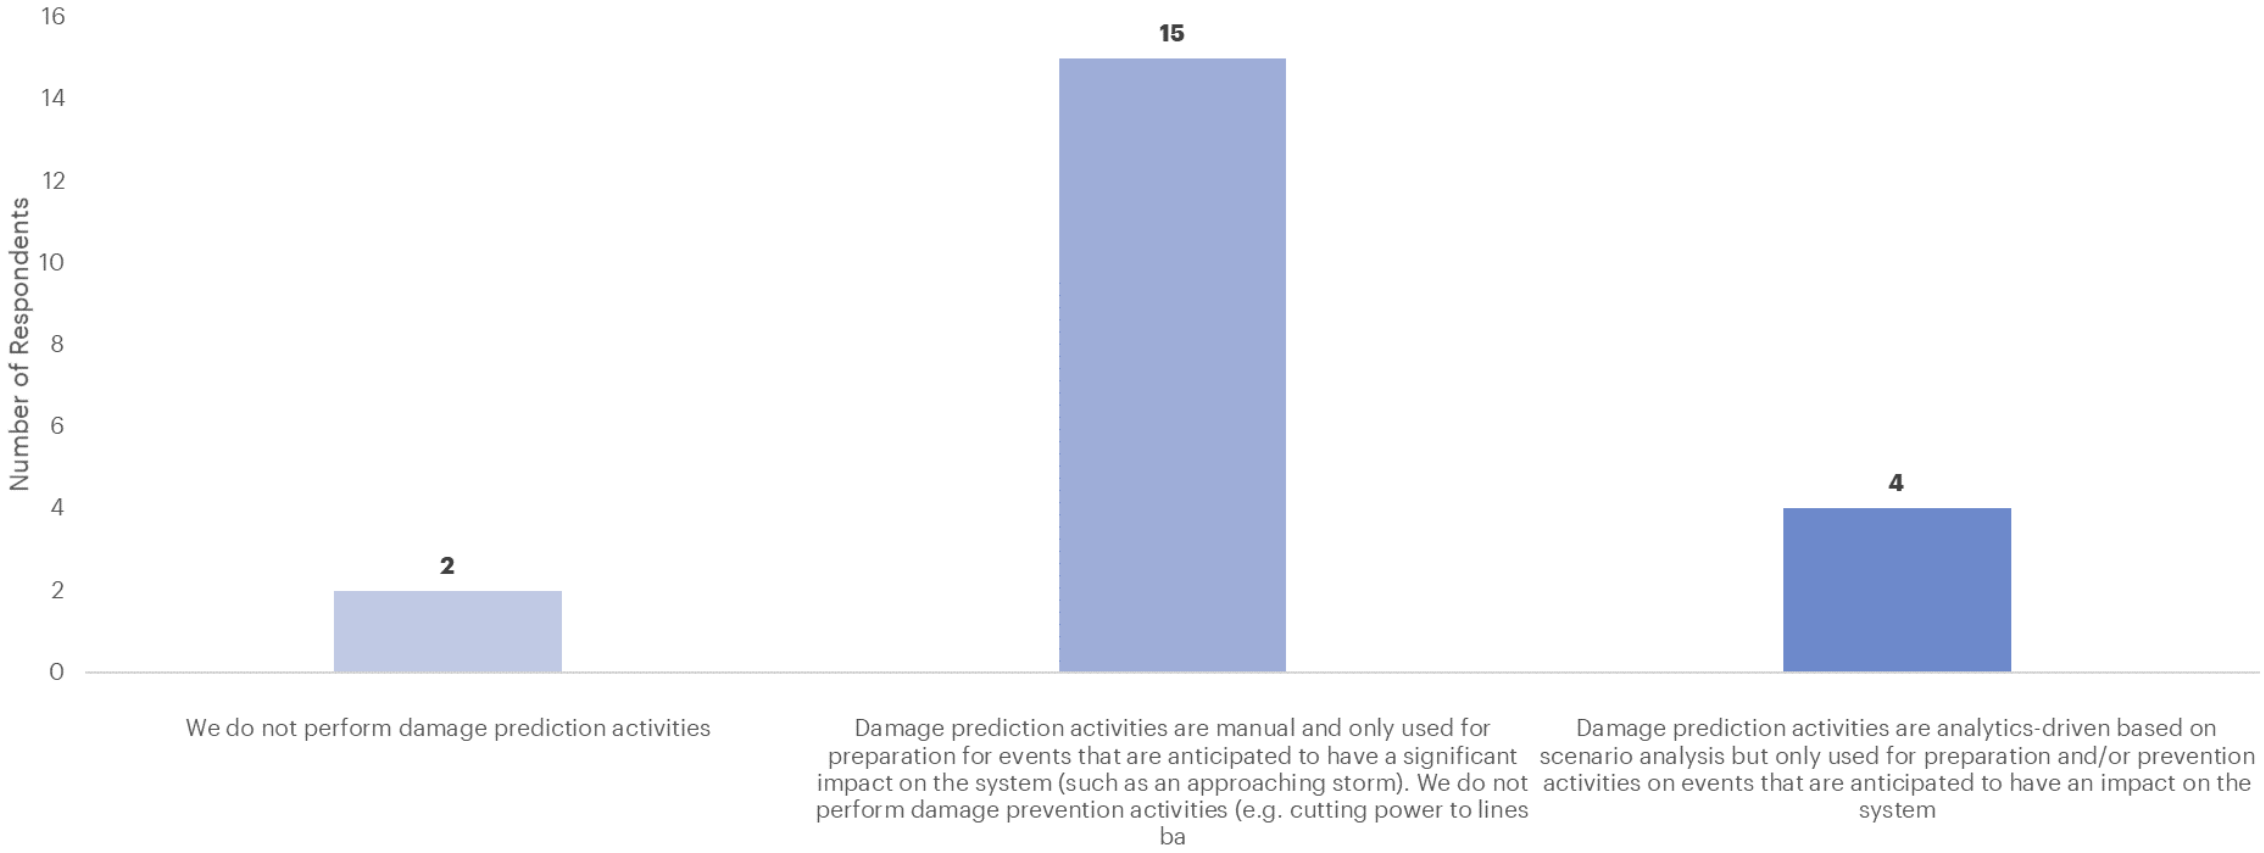
4.5) Connectivity of Automated Sectionalizing Devices

Question:	Which of the following best describes the connectivity and use of automated sectionalizing devices? NOTE: Below, “telemetry” refers to any measurement or status information gathered from the automated sectionalizing device.



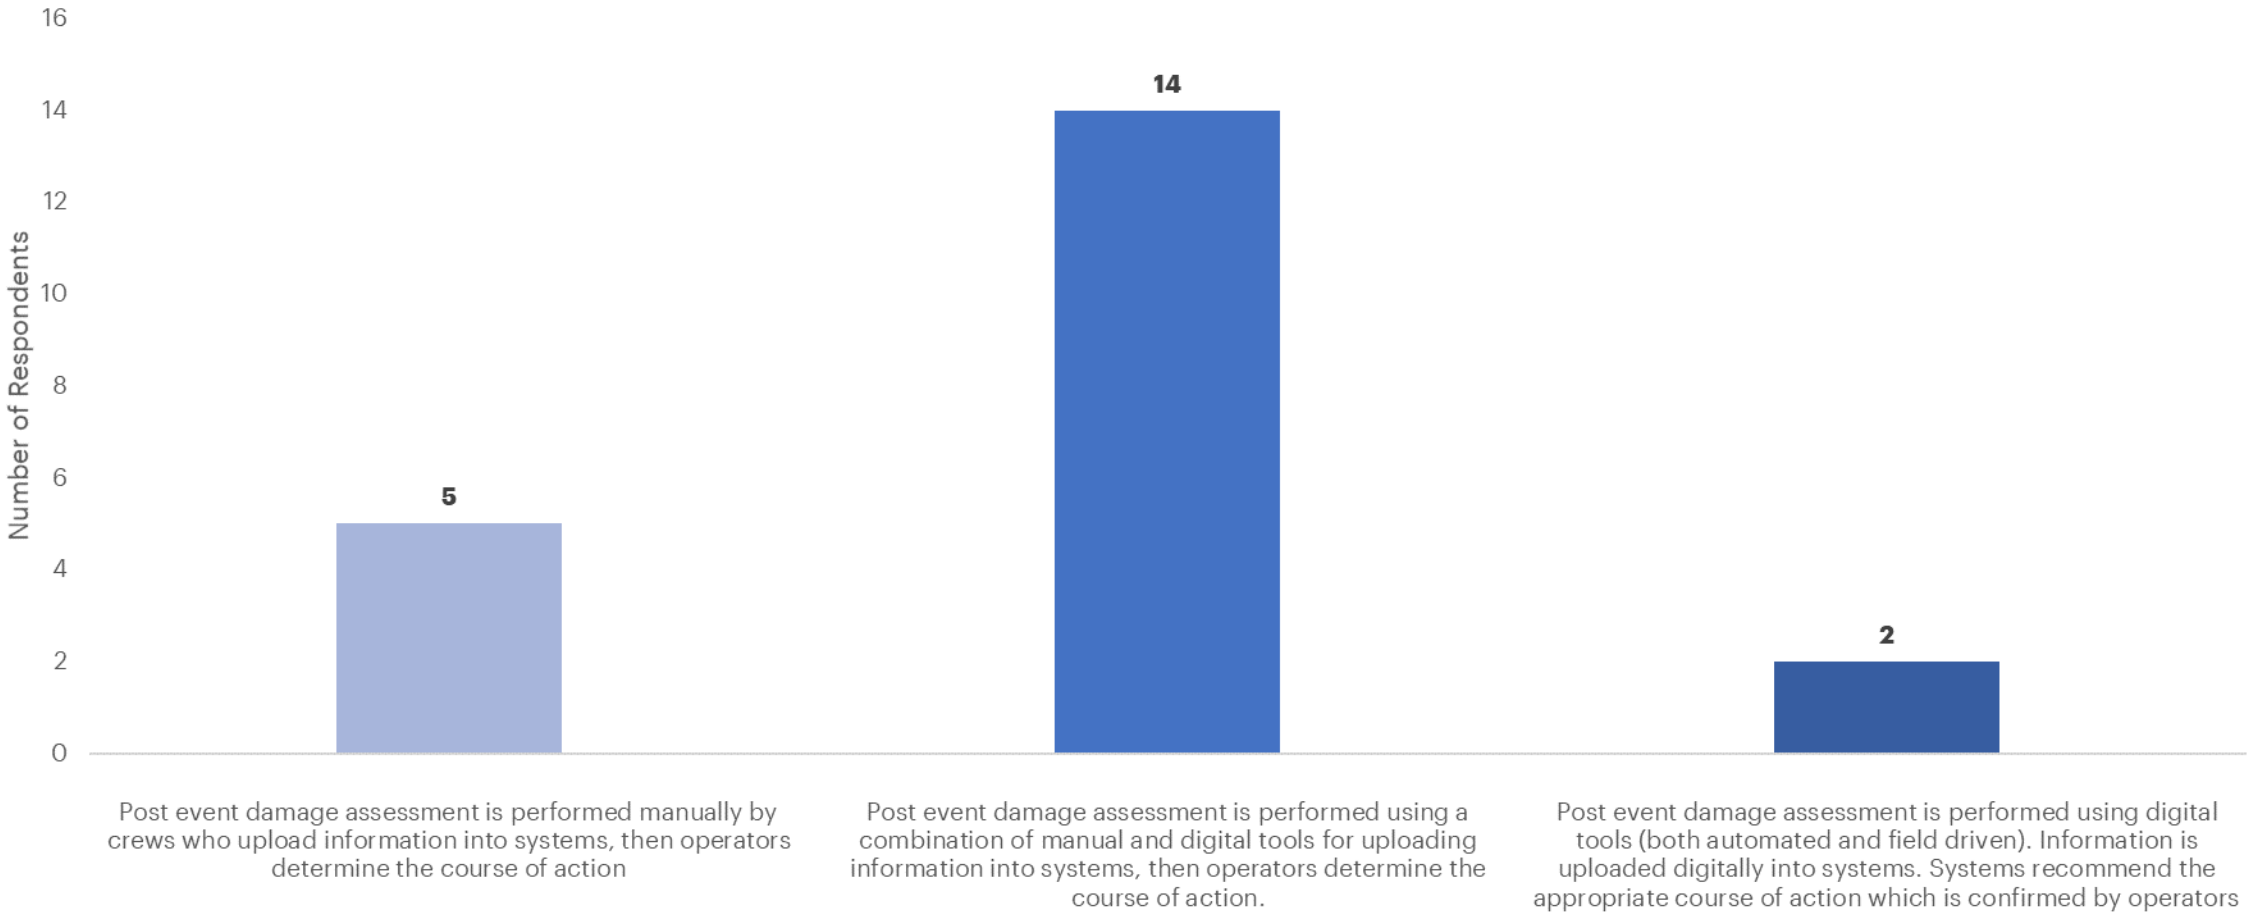
4.6) Switch Plan Creation & Execution

Question:	How are your switch plans created and executed for outage restoration?



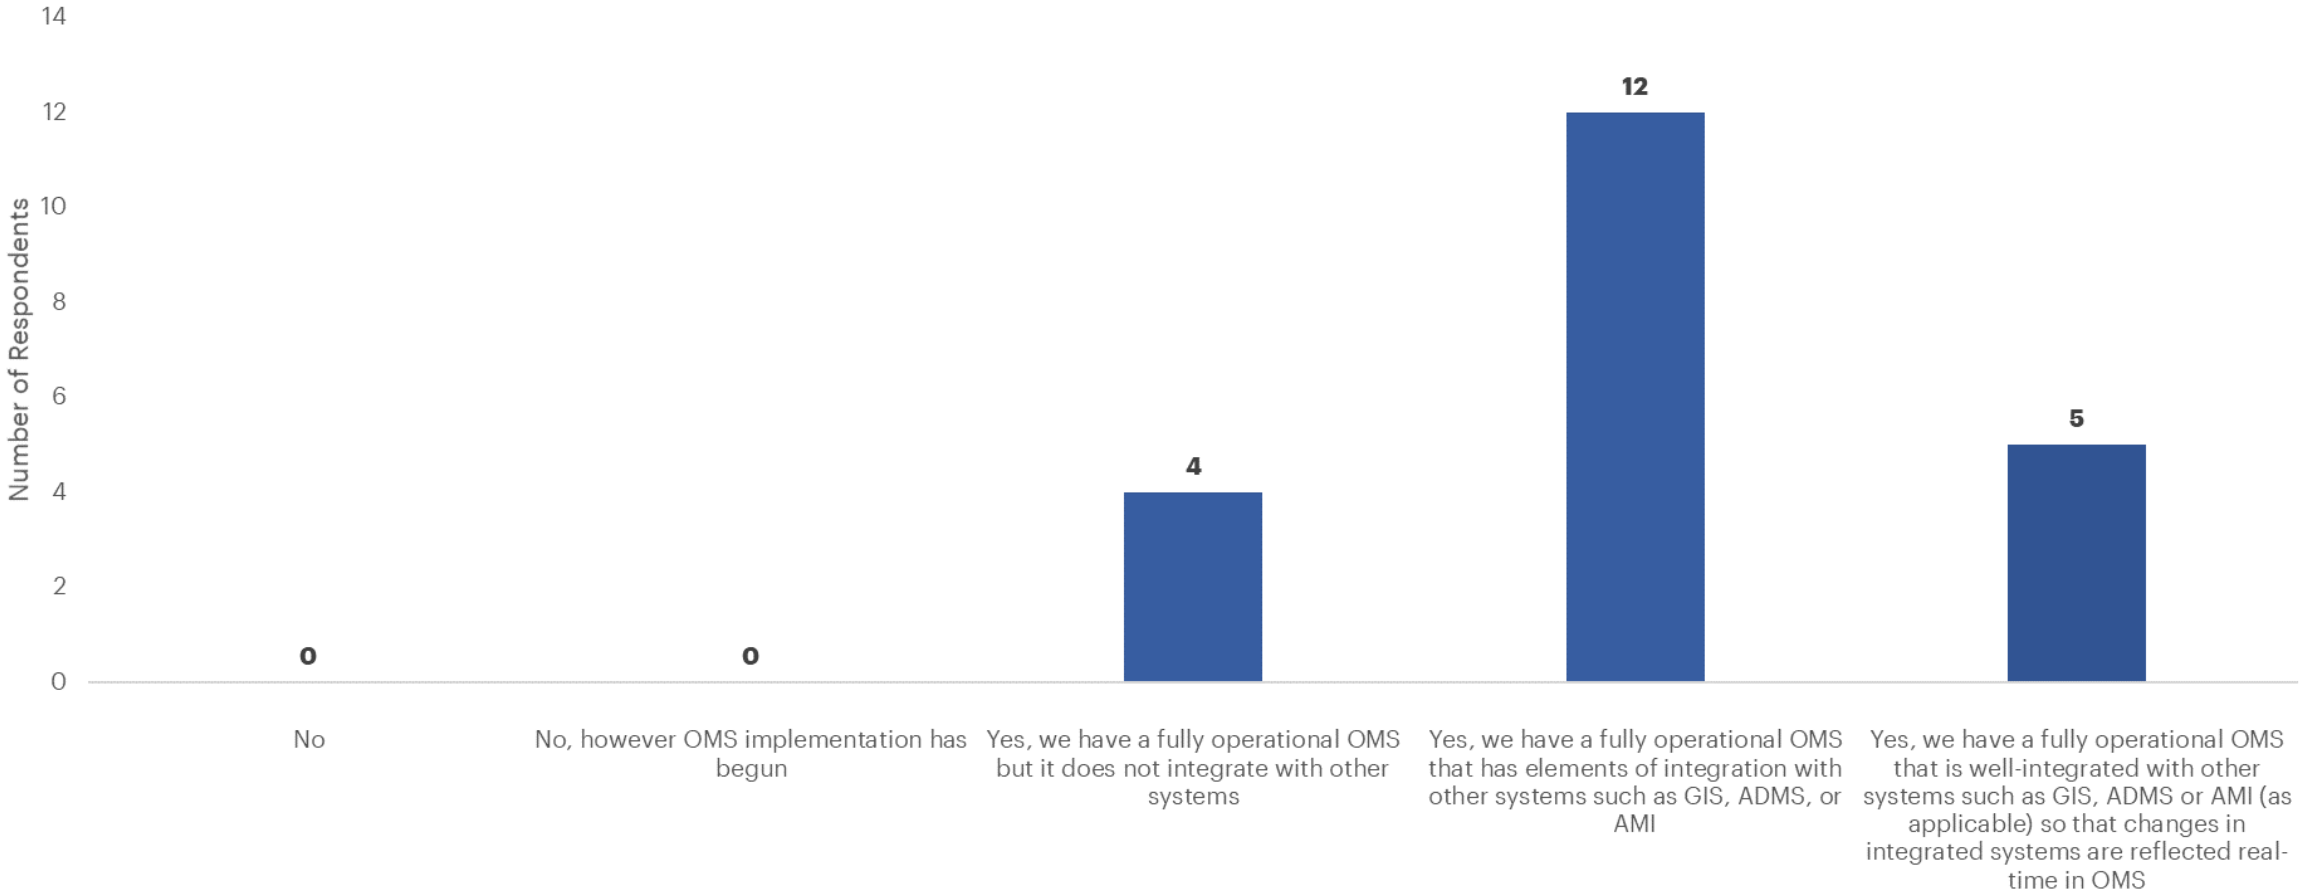
4.7) Weather Data

Question:	To what degree is weather data integrated into your operations (such as storm/wildfire preparations, damage prediction or damage assessment)?



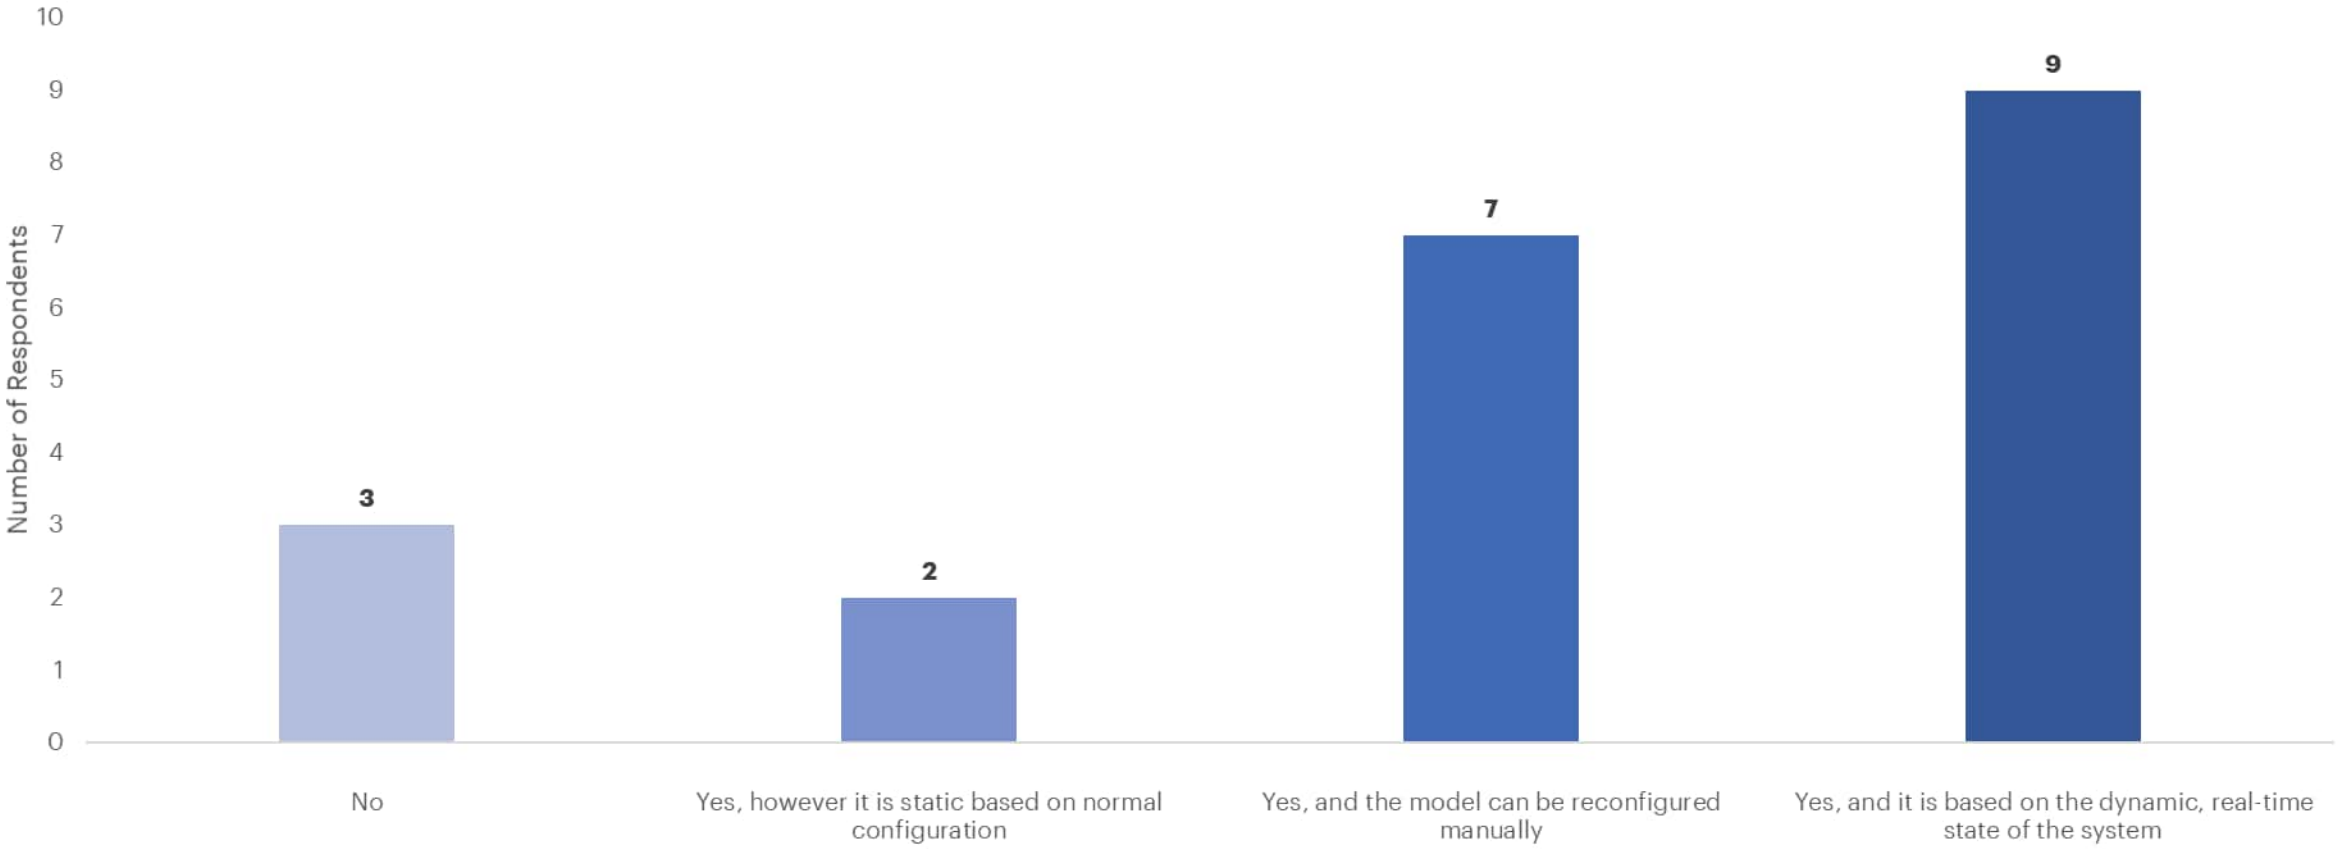
4.8) Major Event Damage Prediction and Prevention

Question:	Which of the following best describes your approach to damage prediction and prevention for major events?



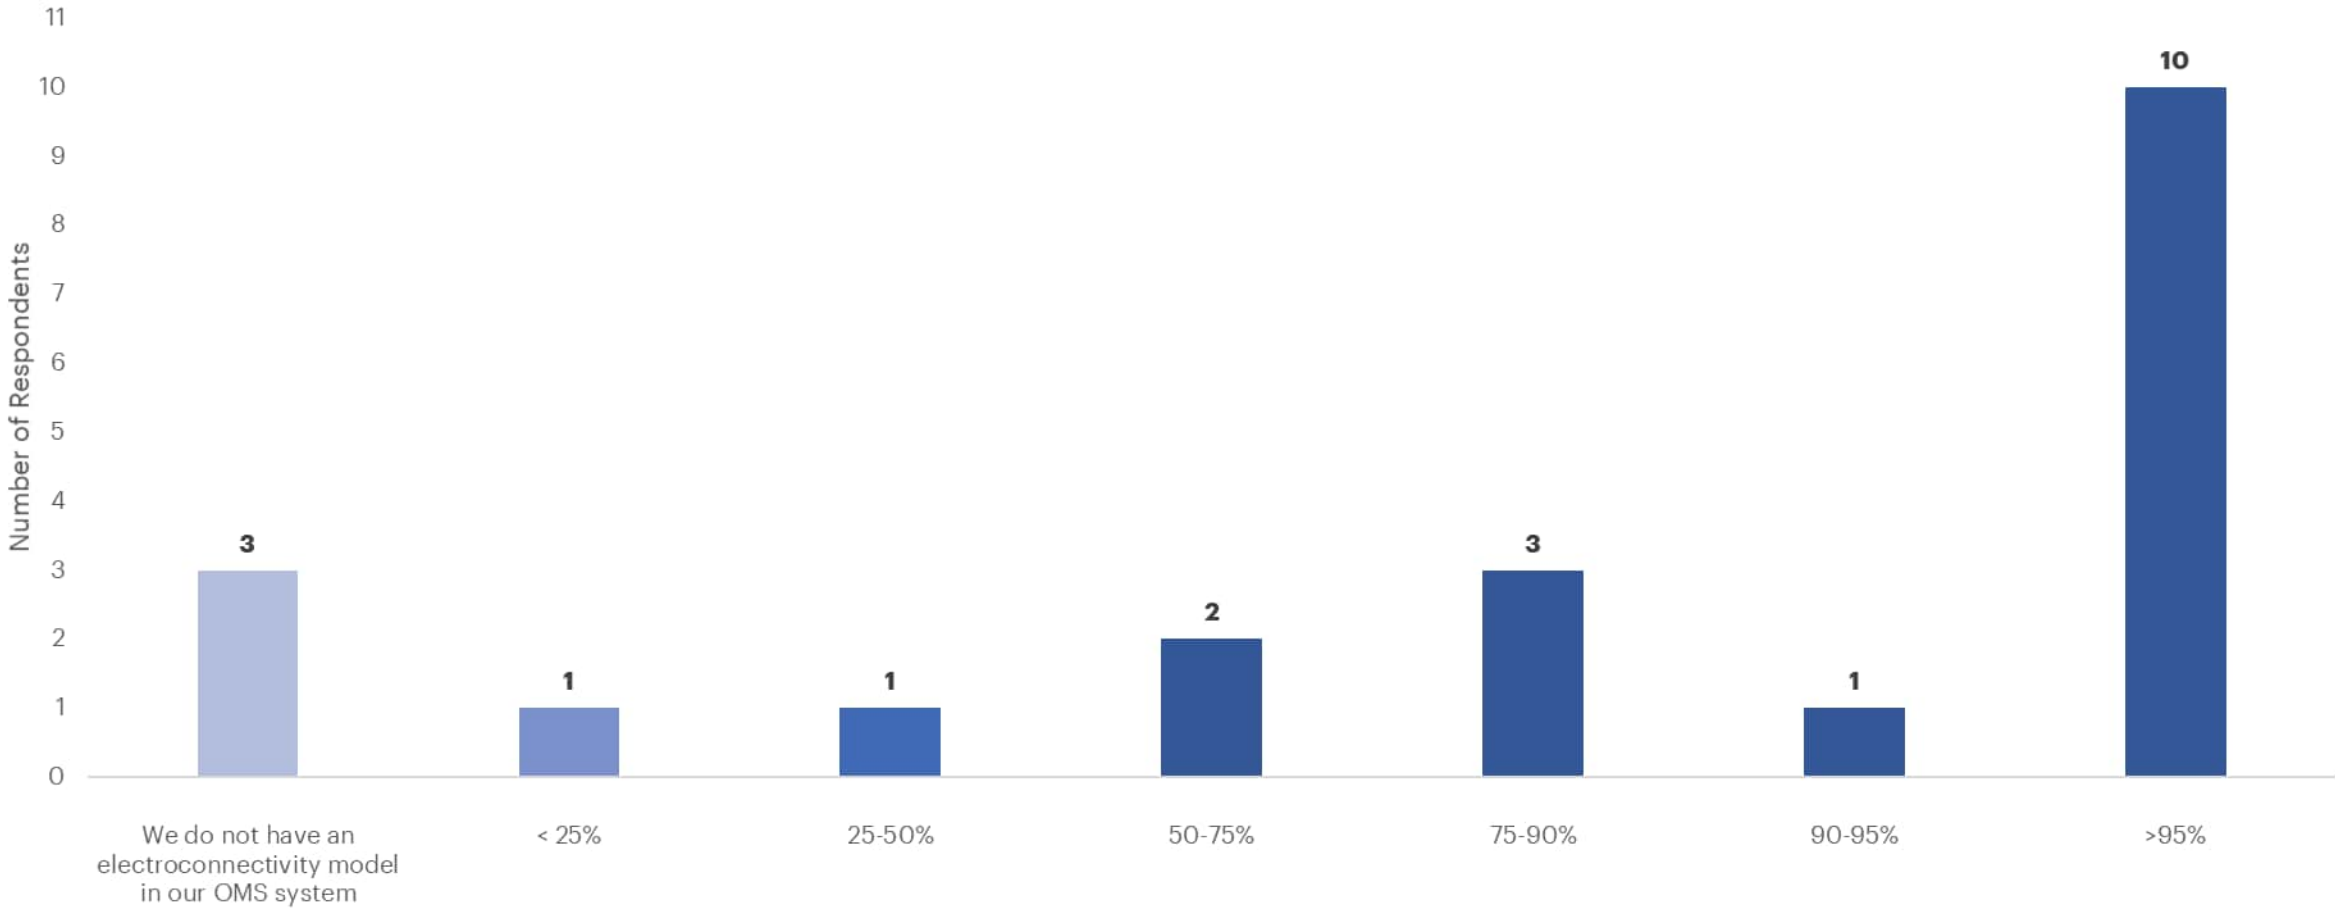
4.9) Major Event Damage Assessment

Question:	Which of the following best describes your damage assessment methods for major events?



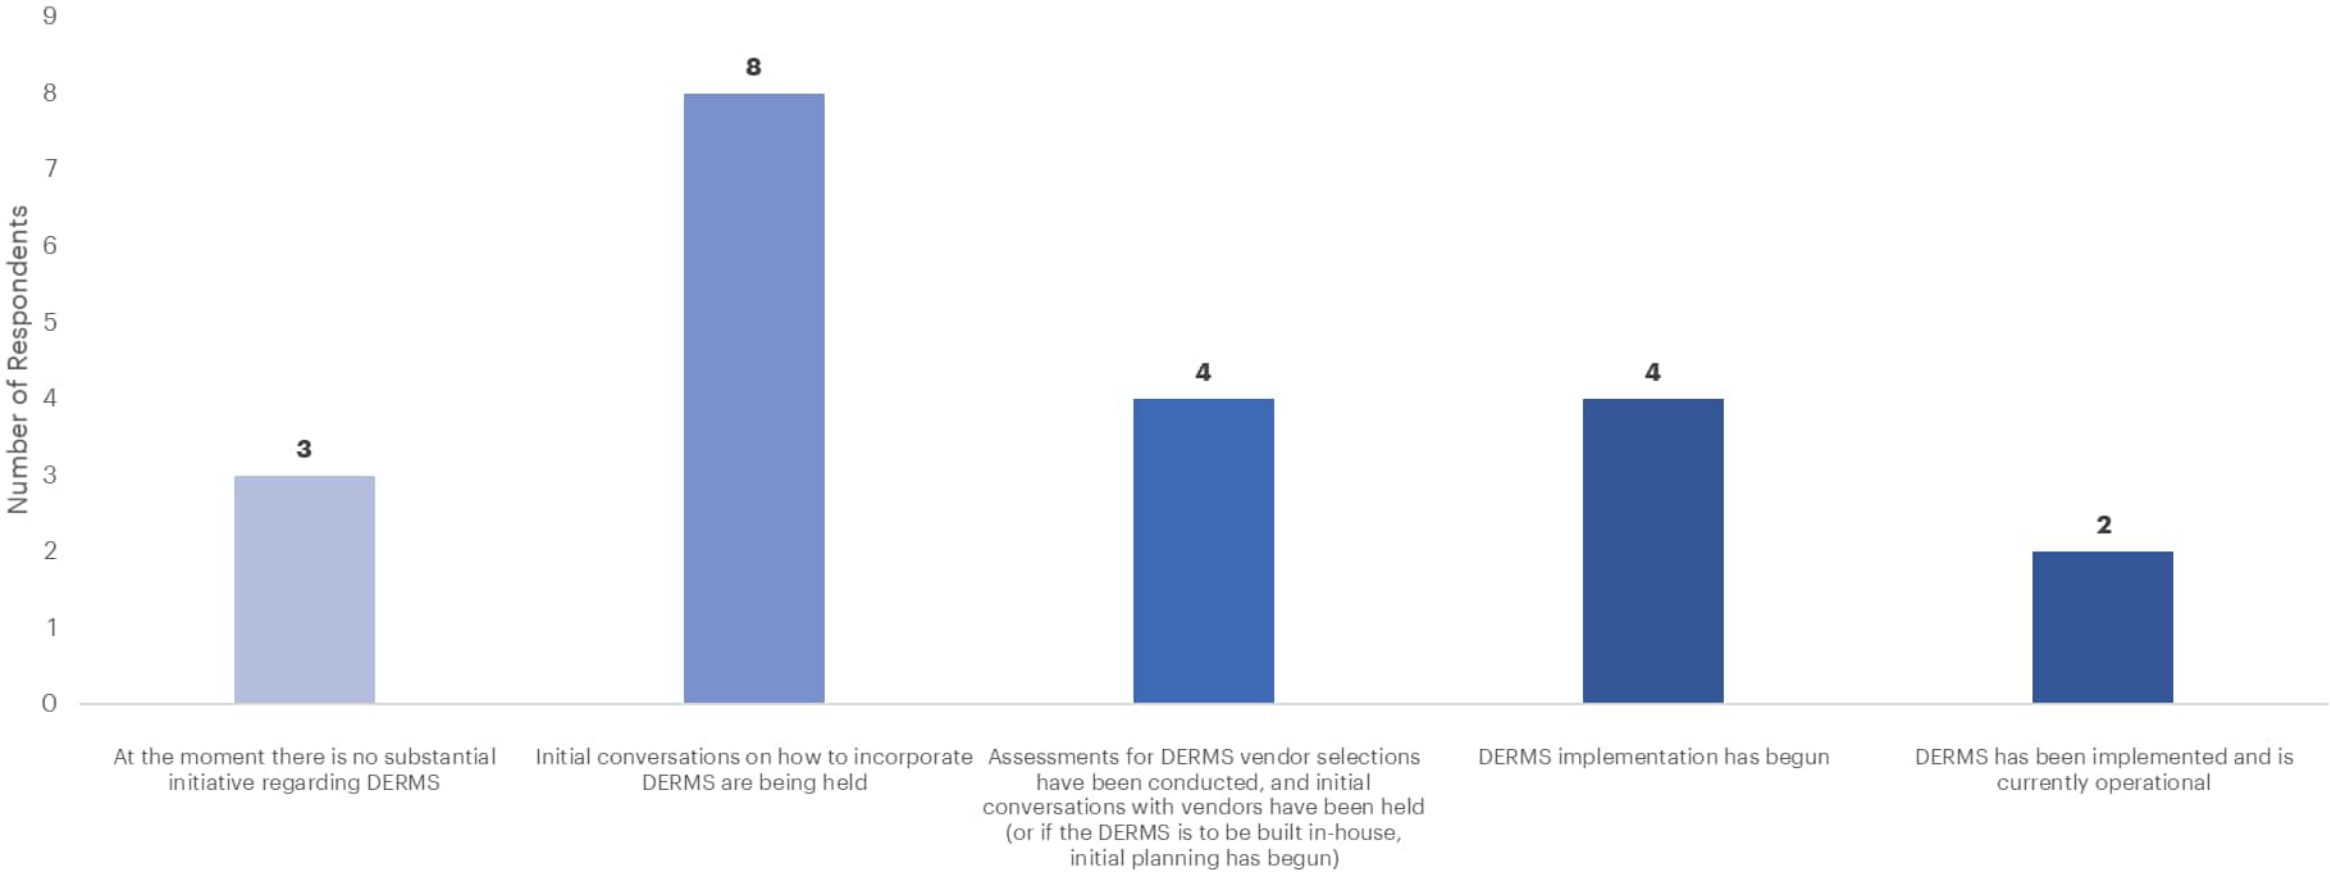
4.10) OMS

Question:	Do you have an outage management system (OMS)?



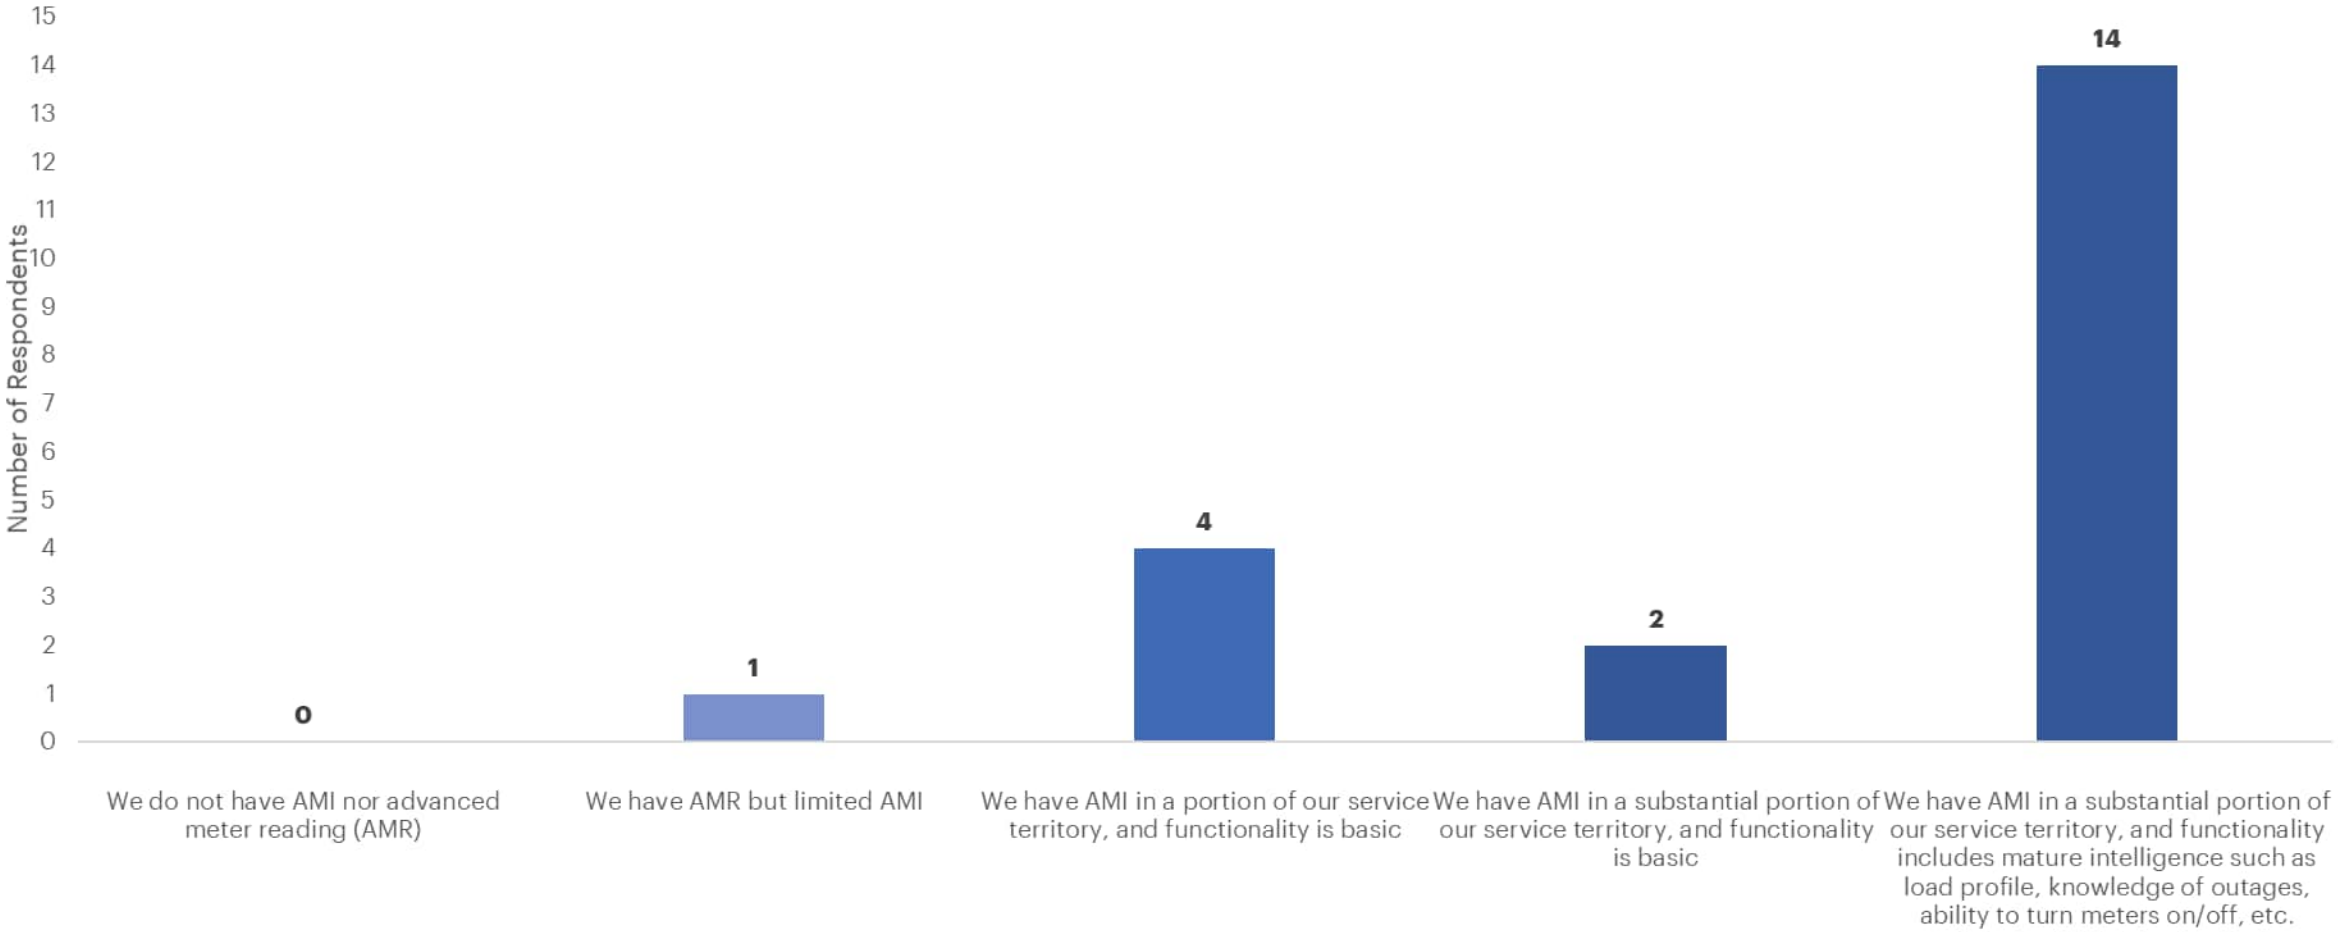
4.11) OMS Electroconnectivity

Question:	Does your OMS have an electroconnectivity model?



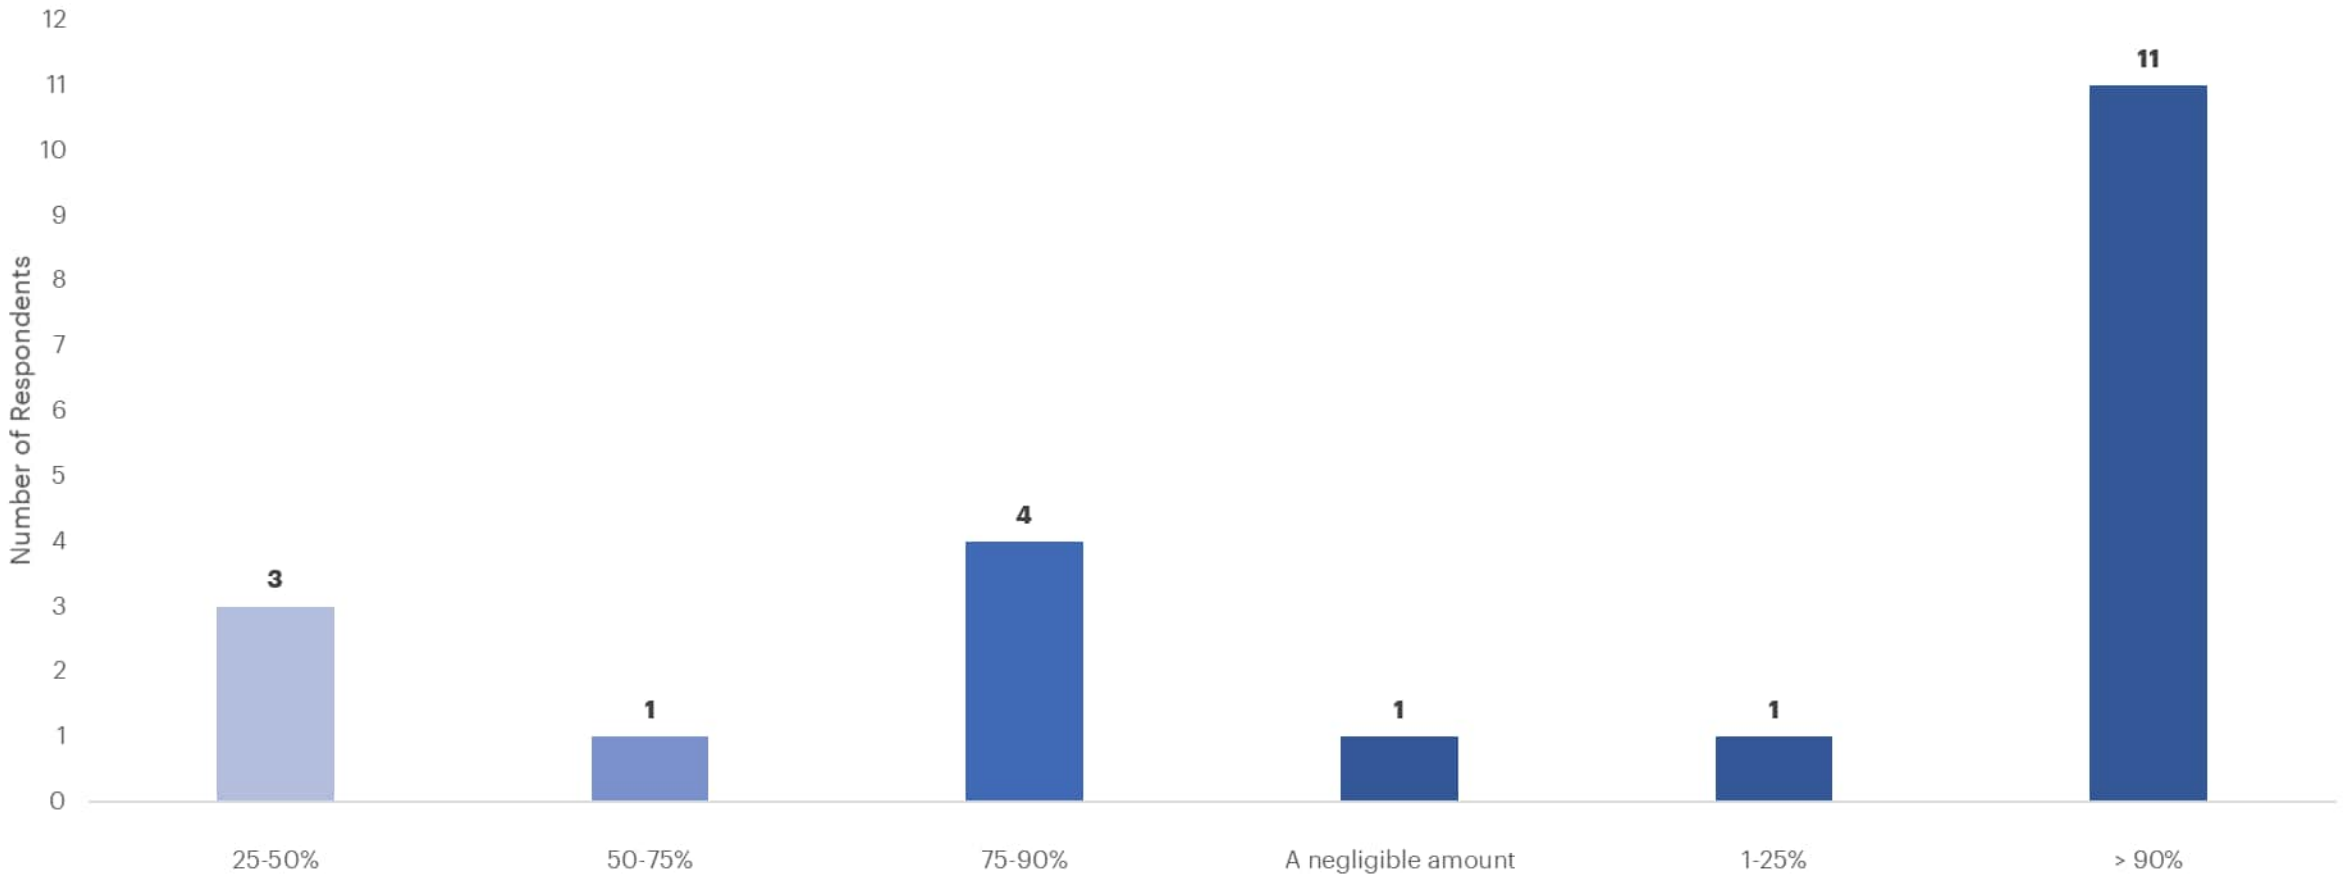
4.12) OMS Connectivity

Question:	How much of your system is modeled in your electroconnectivity model in your OMS system?



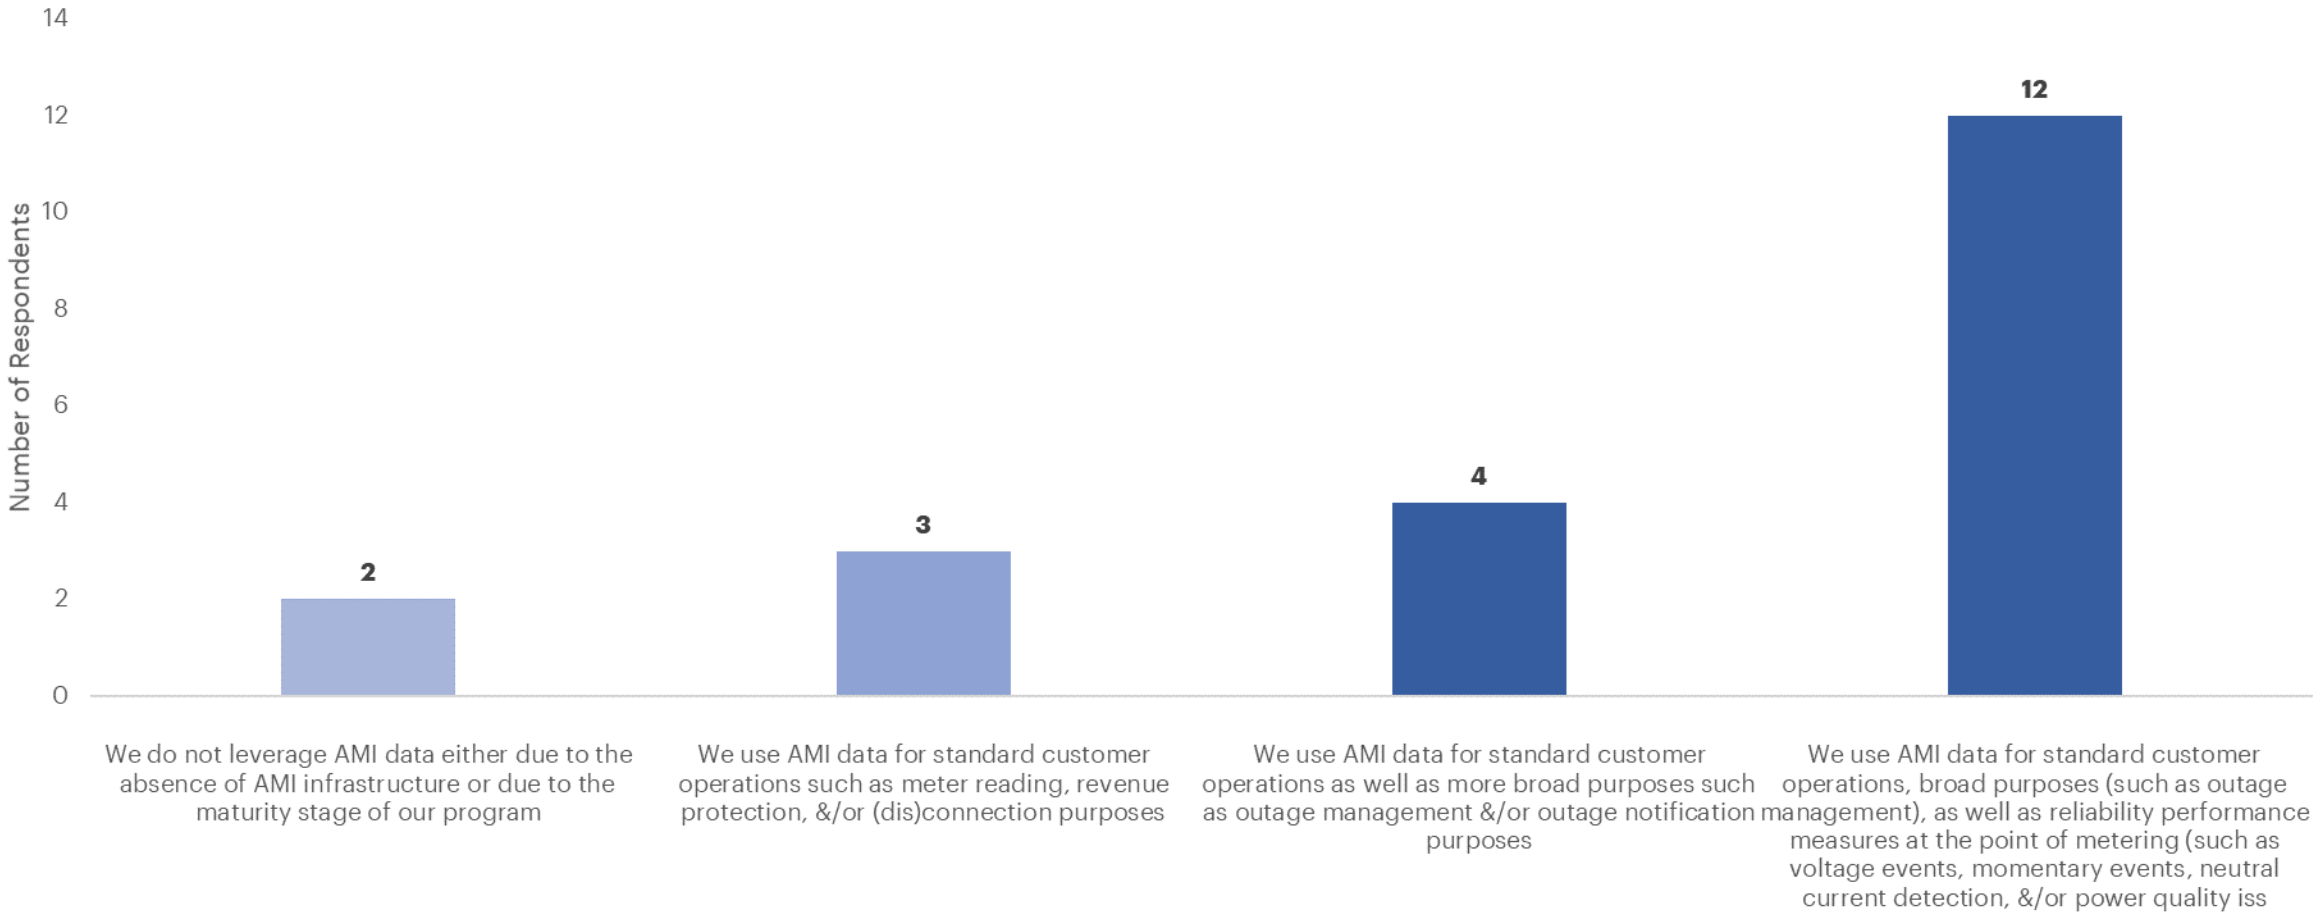
4.13) DERMS

Question:	Which of the following best describes your current state regarding a distributed energy resource management system (DERMS)? NOTE: This question does not necessarily refer to a unique DER management system, as some advanced distribution management systems (ADMSs) have features which address DER integration.



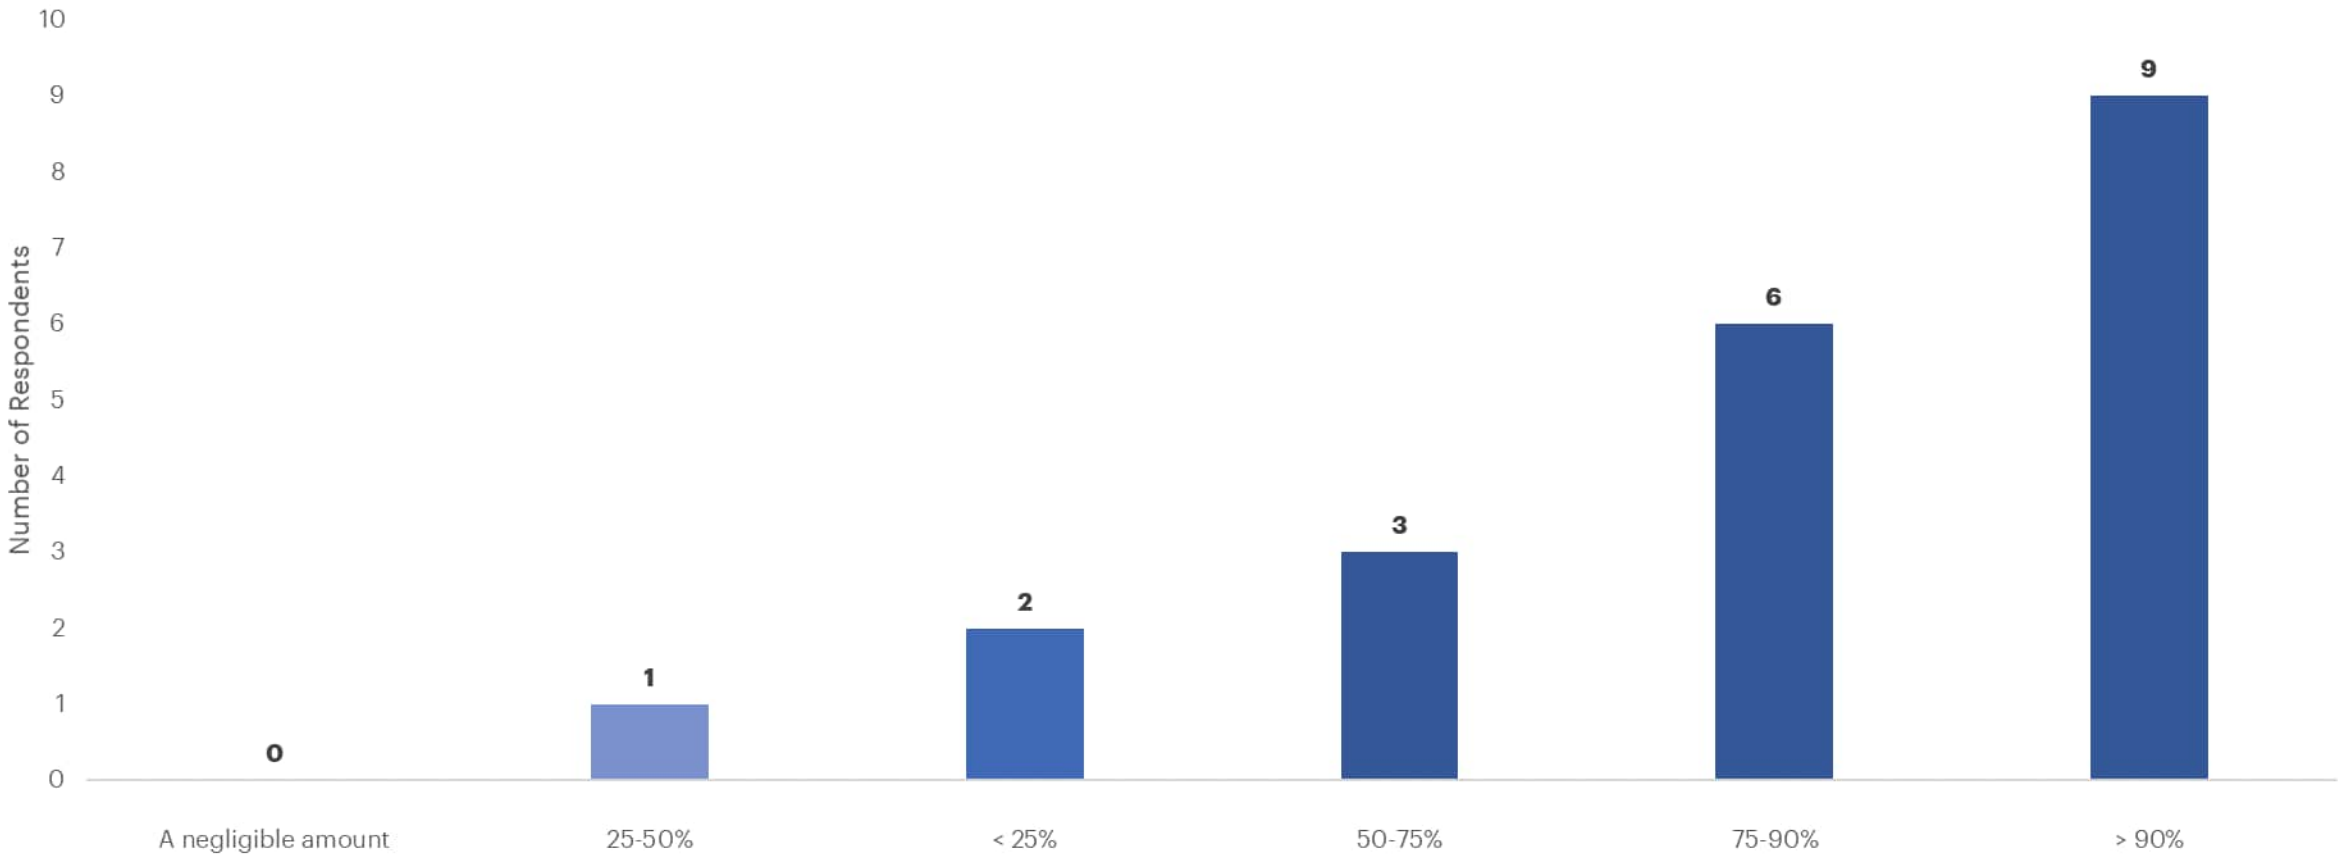
4.14) AMI

Question:	Which of the following best describes your advanced metering infrastructure (AMI)?



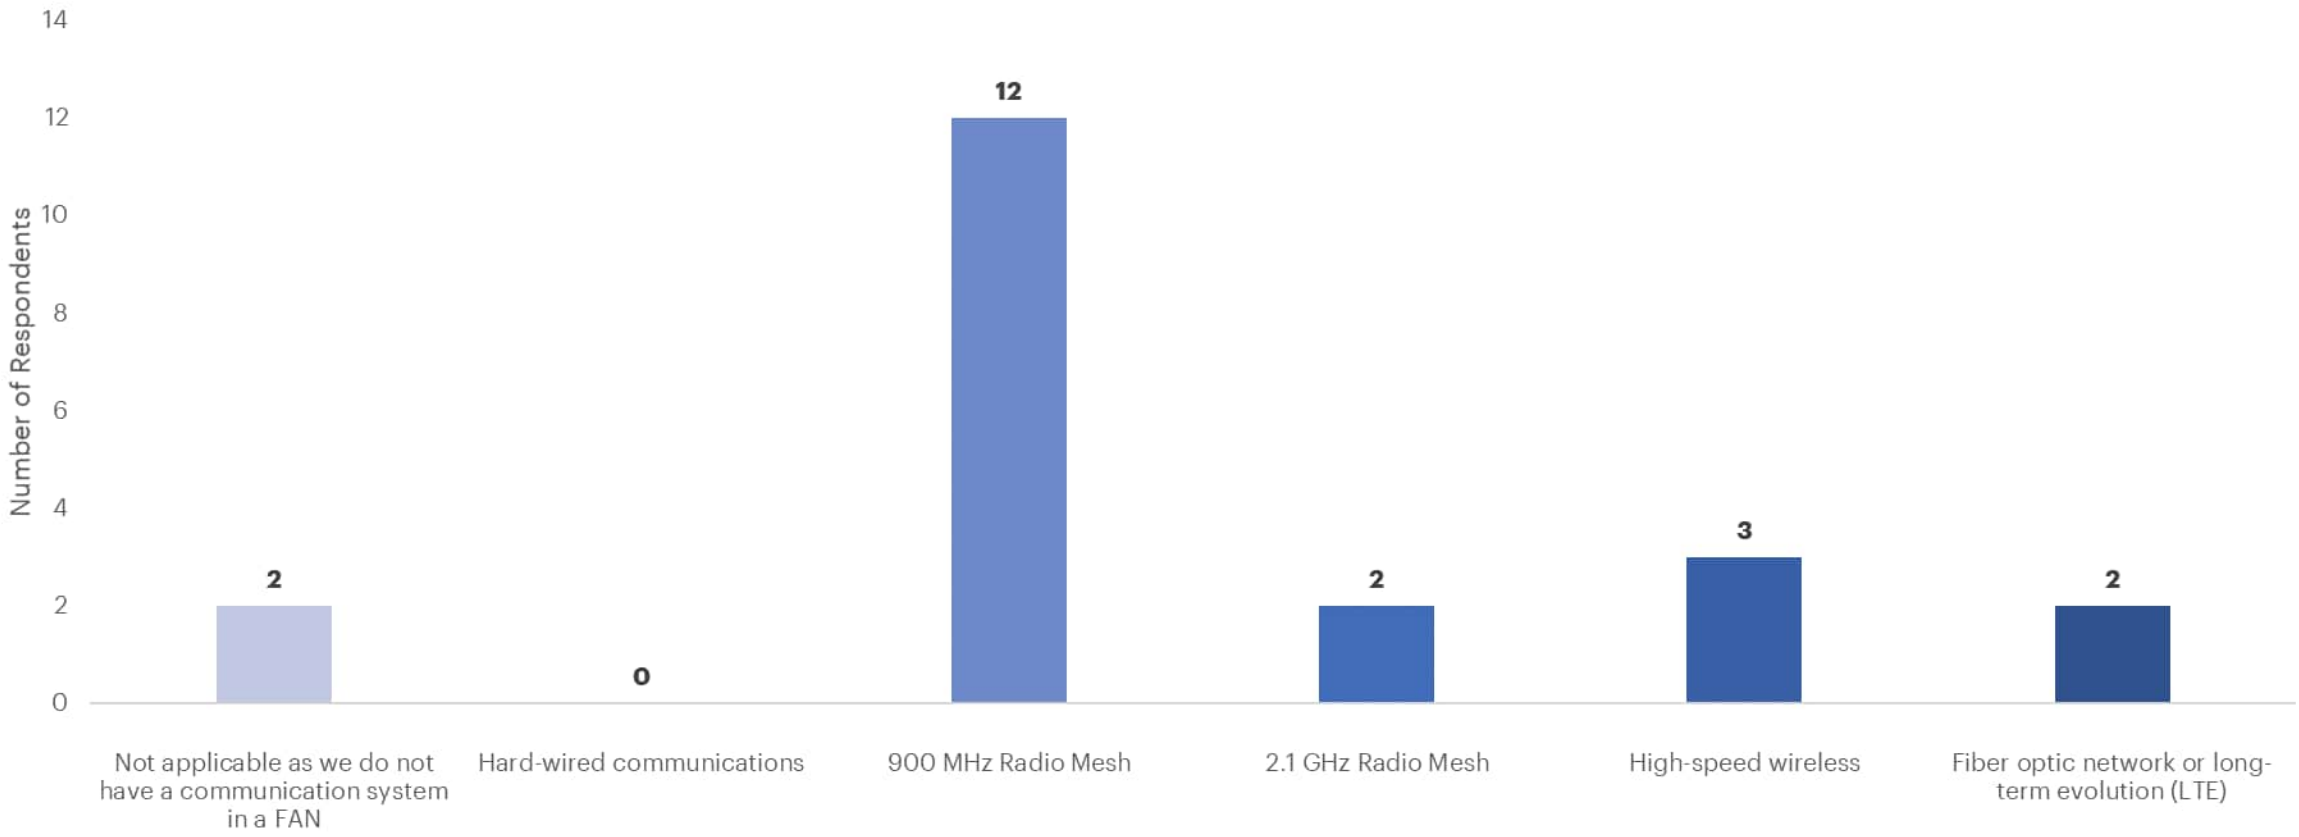
4.15) AMI Coverage

Question:	What percentage of your customer base is covered by AMI?



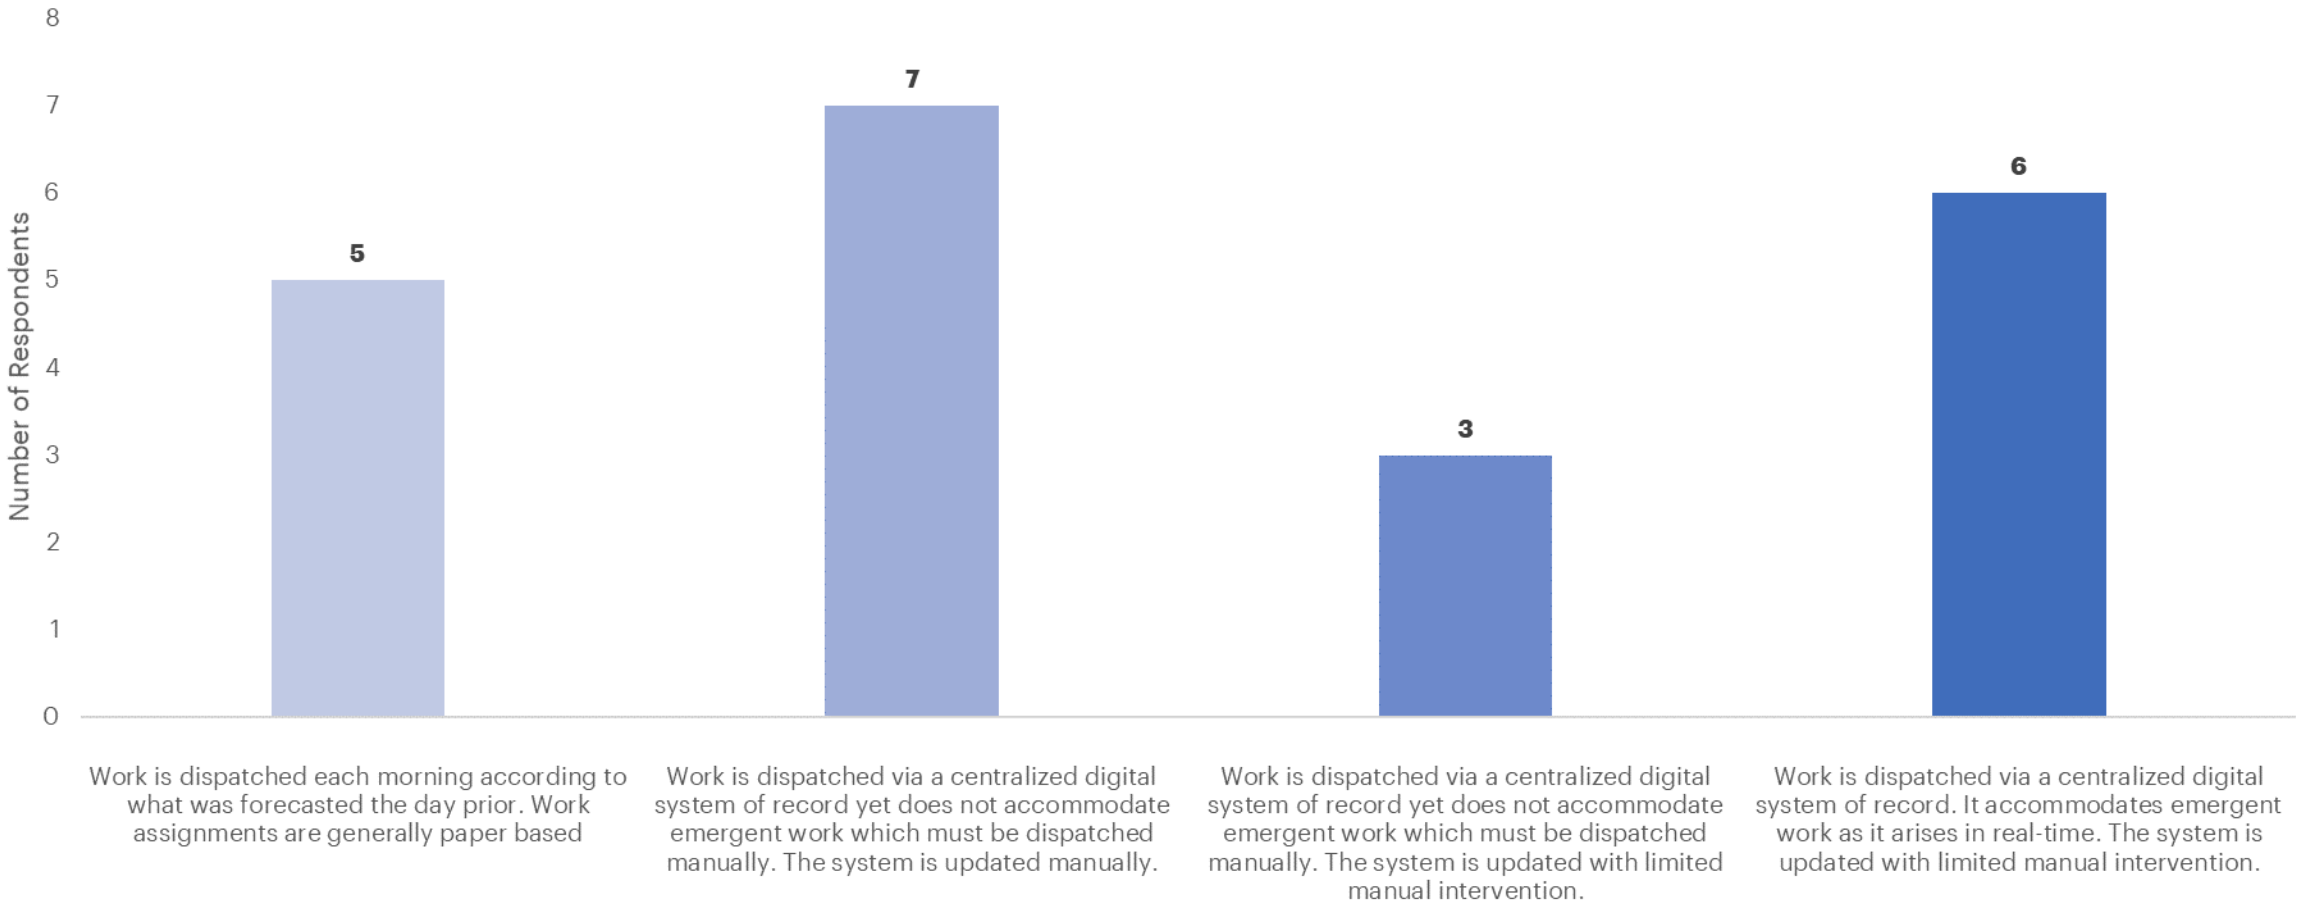
4.16) AMI Data Usage

Question:	Which of the following best describes usage of data and analytics from your AMI system?



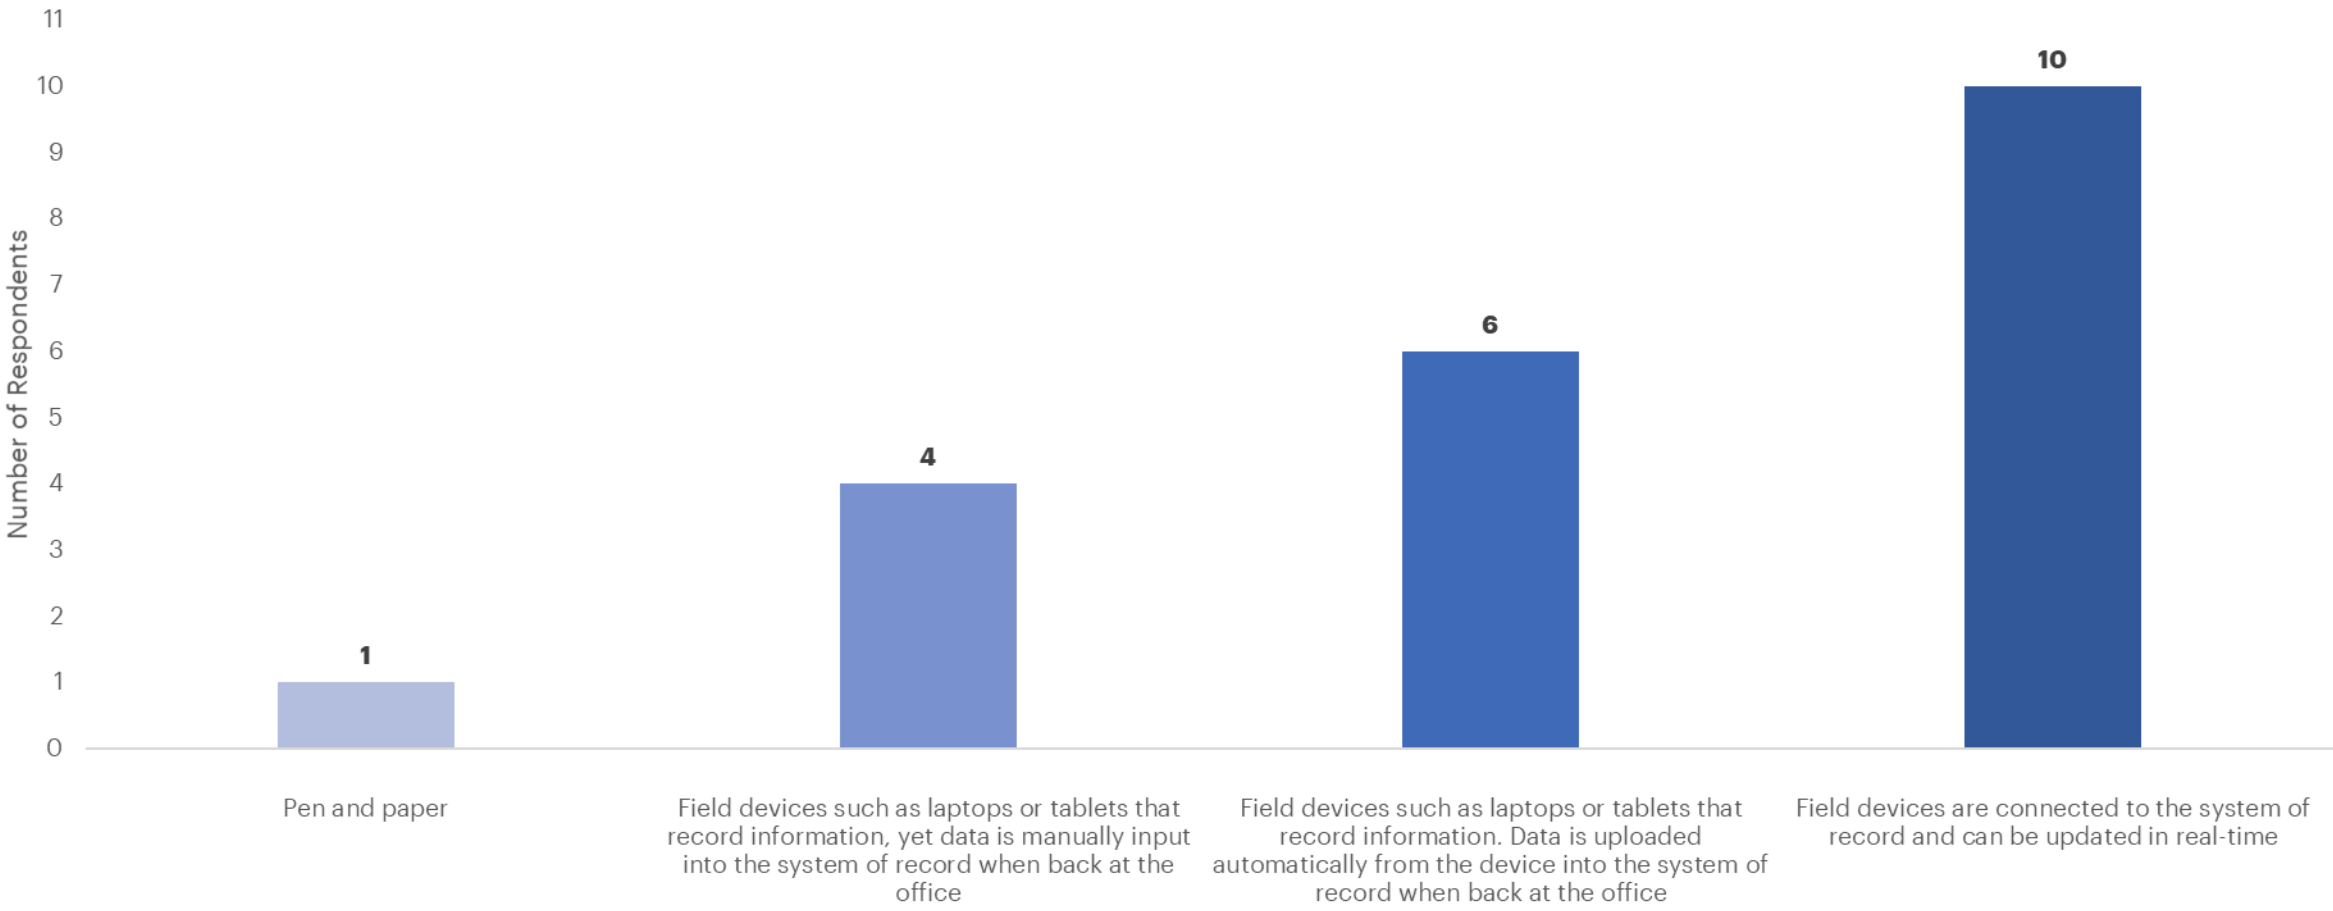
4.17) SCADA

Question:	What percentage of your substations that serve distribution are covered by SCADA? NOTE: Here, a substation that serves distribution is defined as having a distribution-level output voltage (approximately 12 to 25kV).



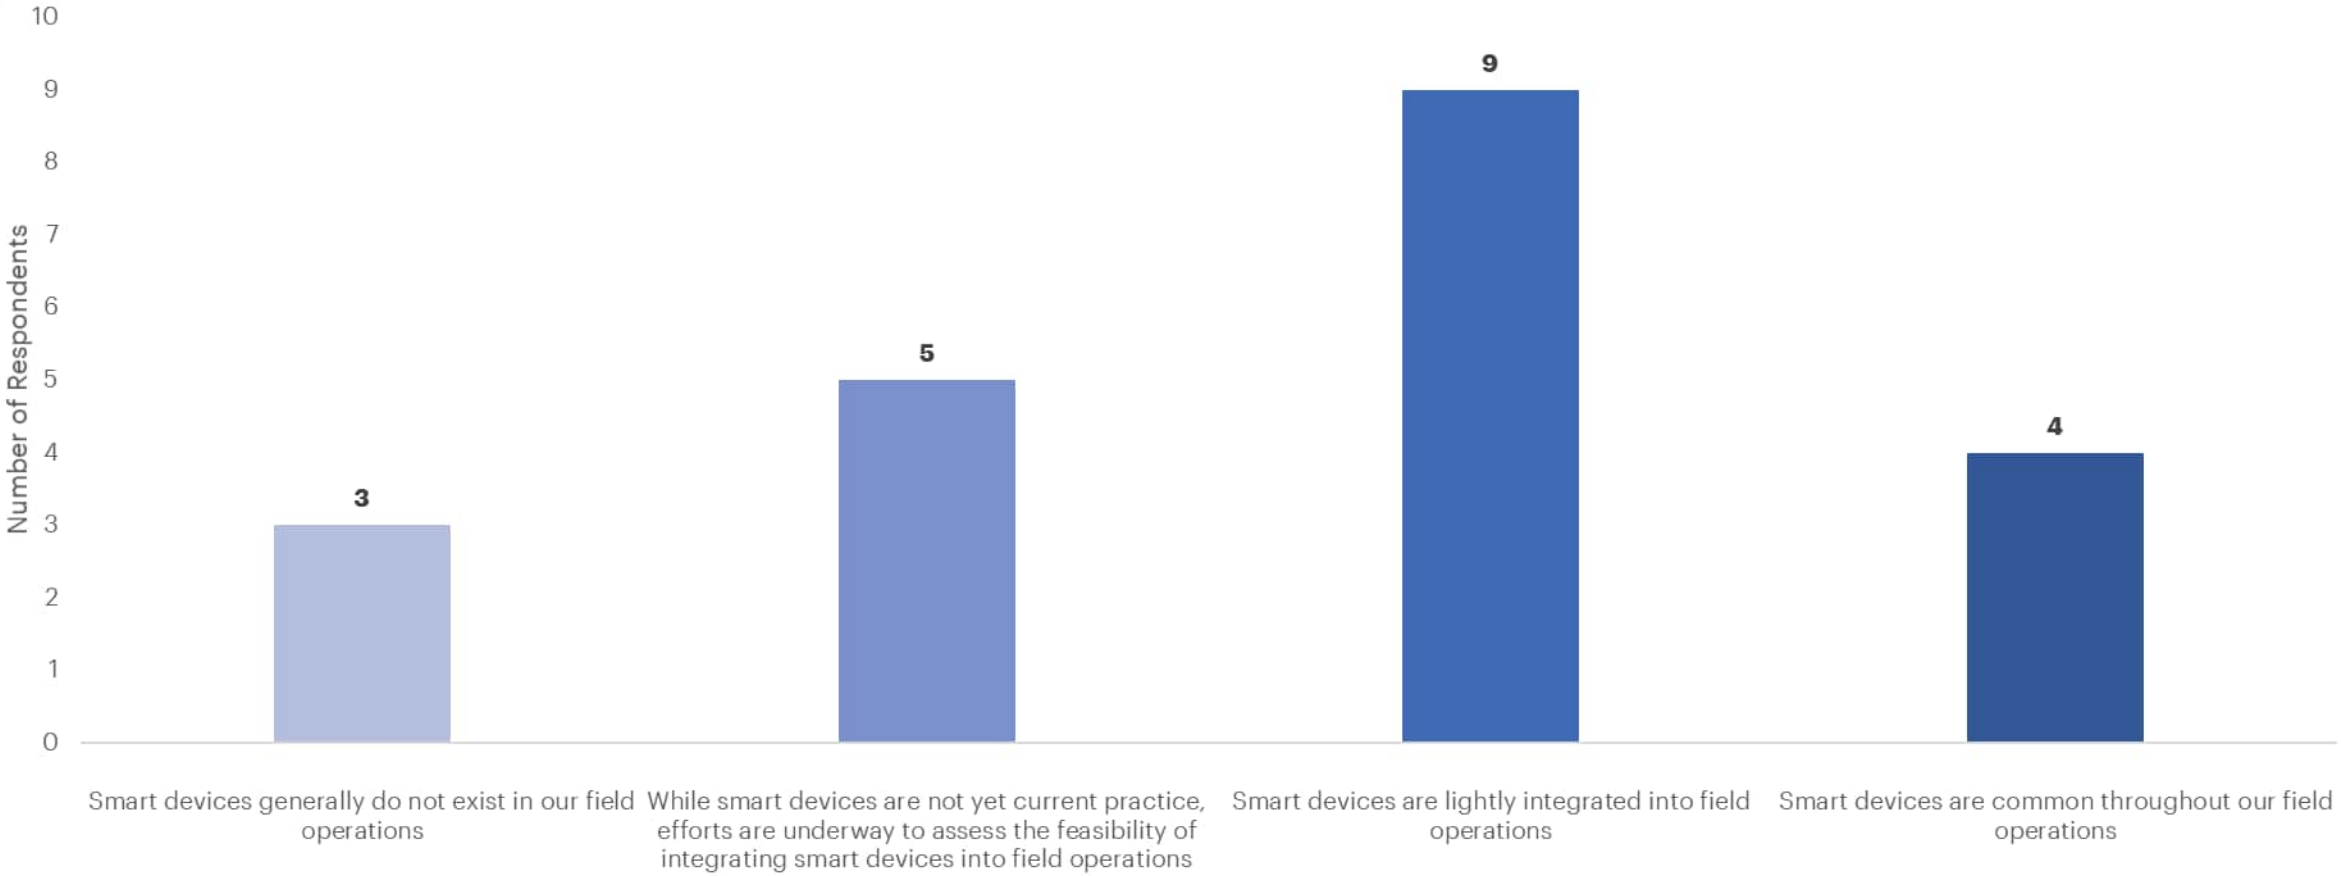
4.18) FAN Communication

Question:	What type of device-to-device communication system is most prominent in the field area network (FAN)?



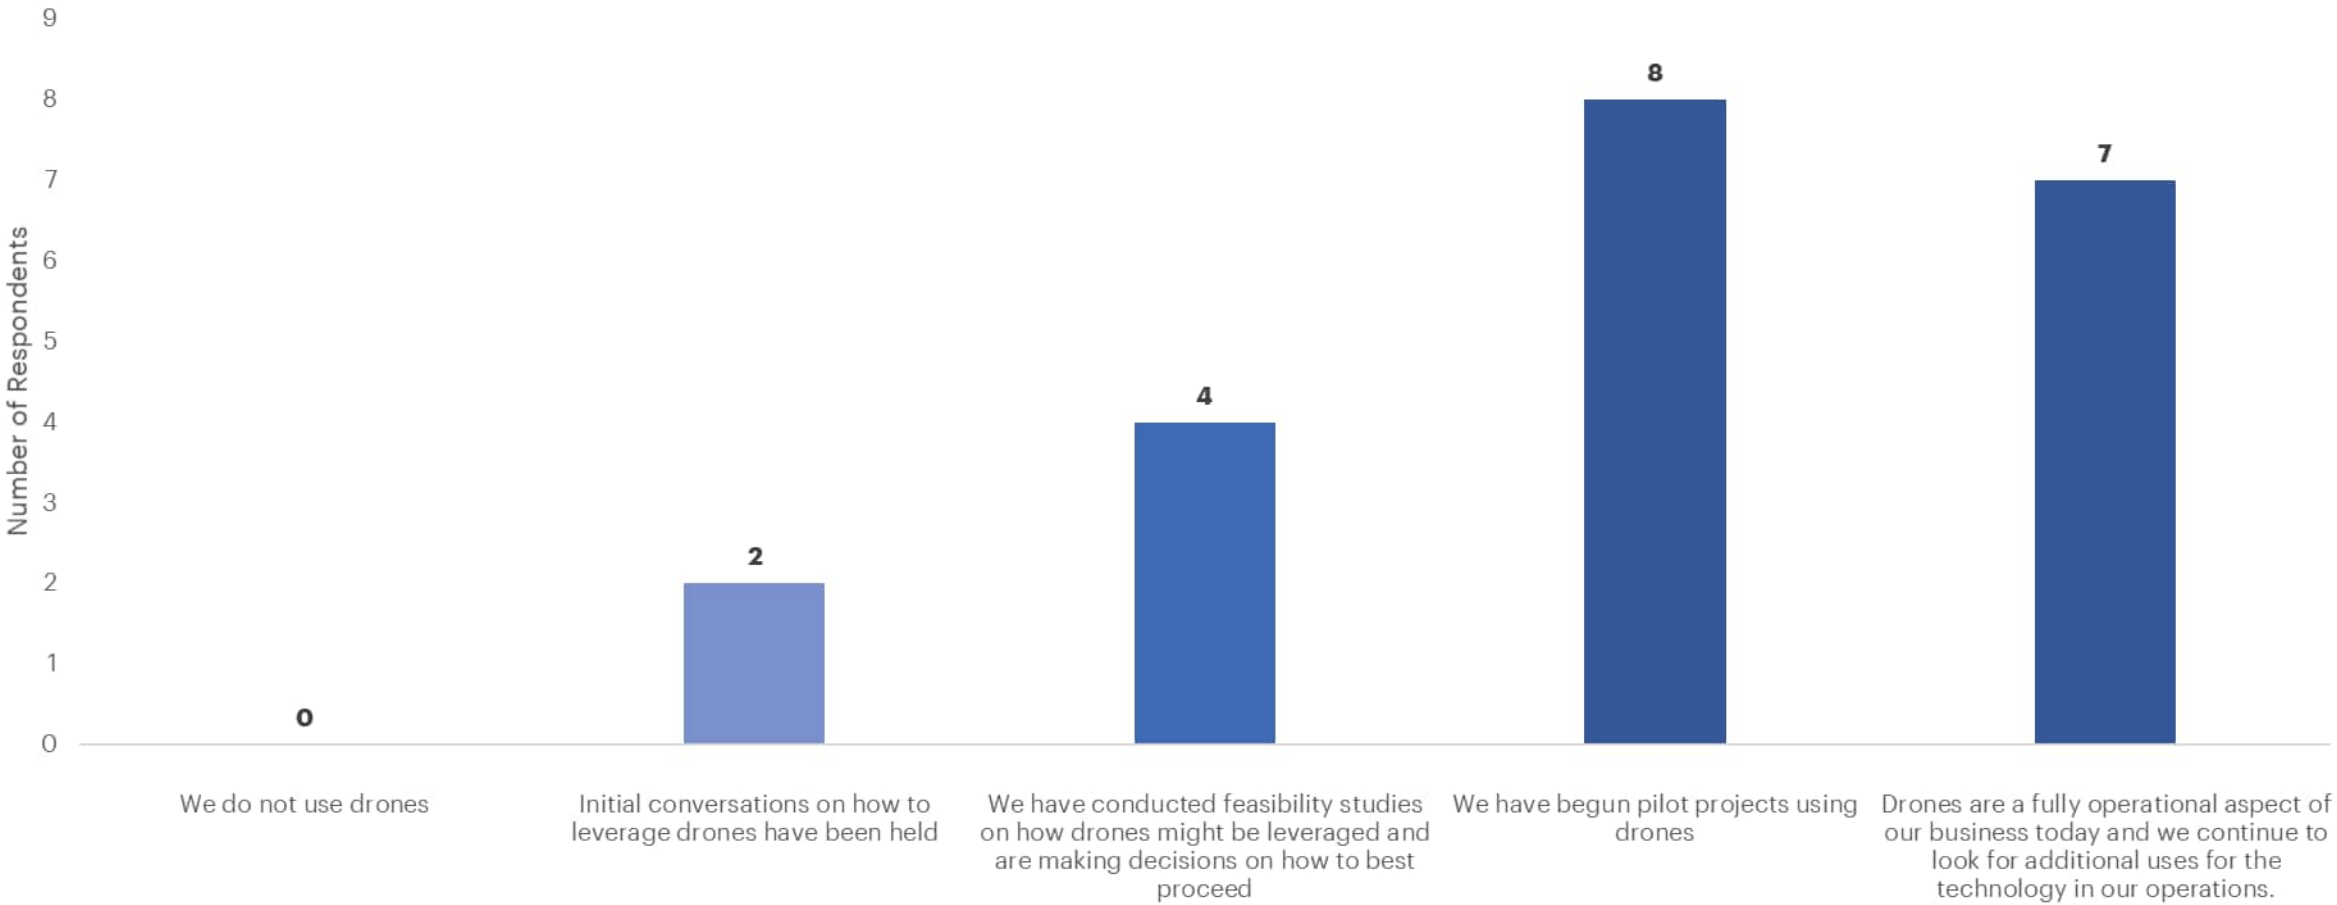
5.1) Field Work Dispatch

Question:	Which of the following best describes your field work assignment methods? NOTE: This is in reference to dispatch of your own employee workforce (as opposed to contractors) during blue sky days (as opposed to during restoration work).



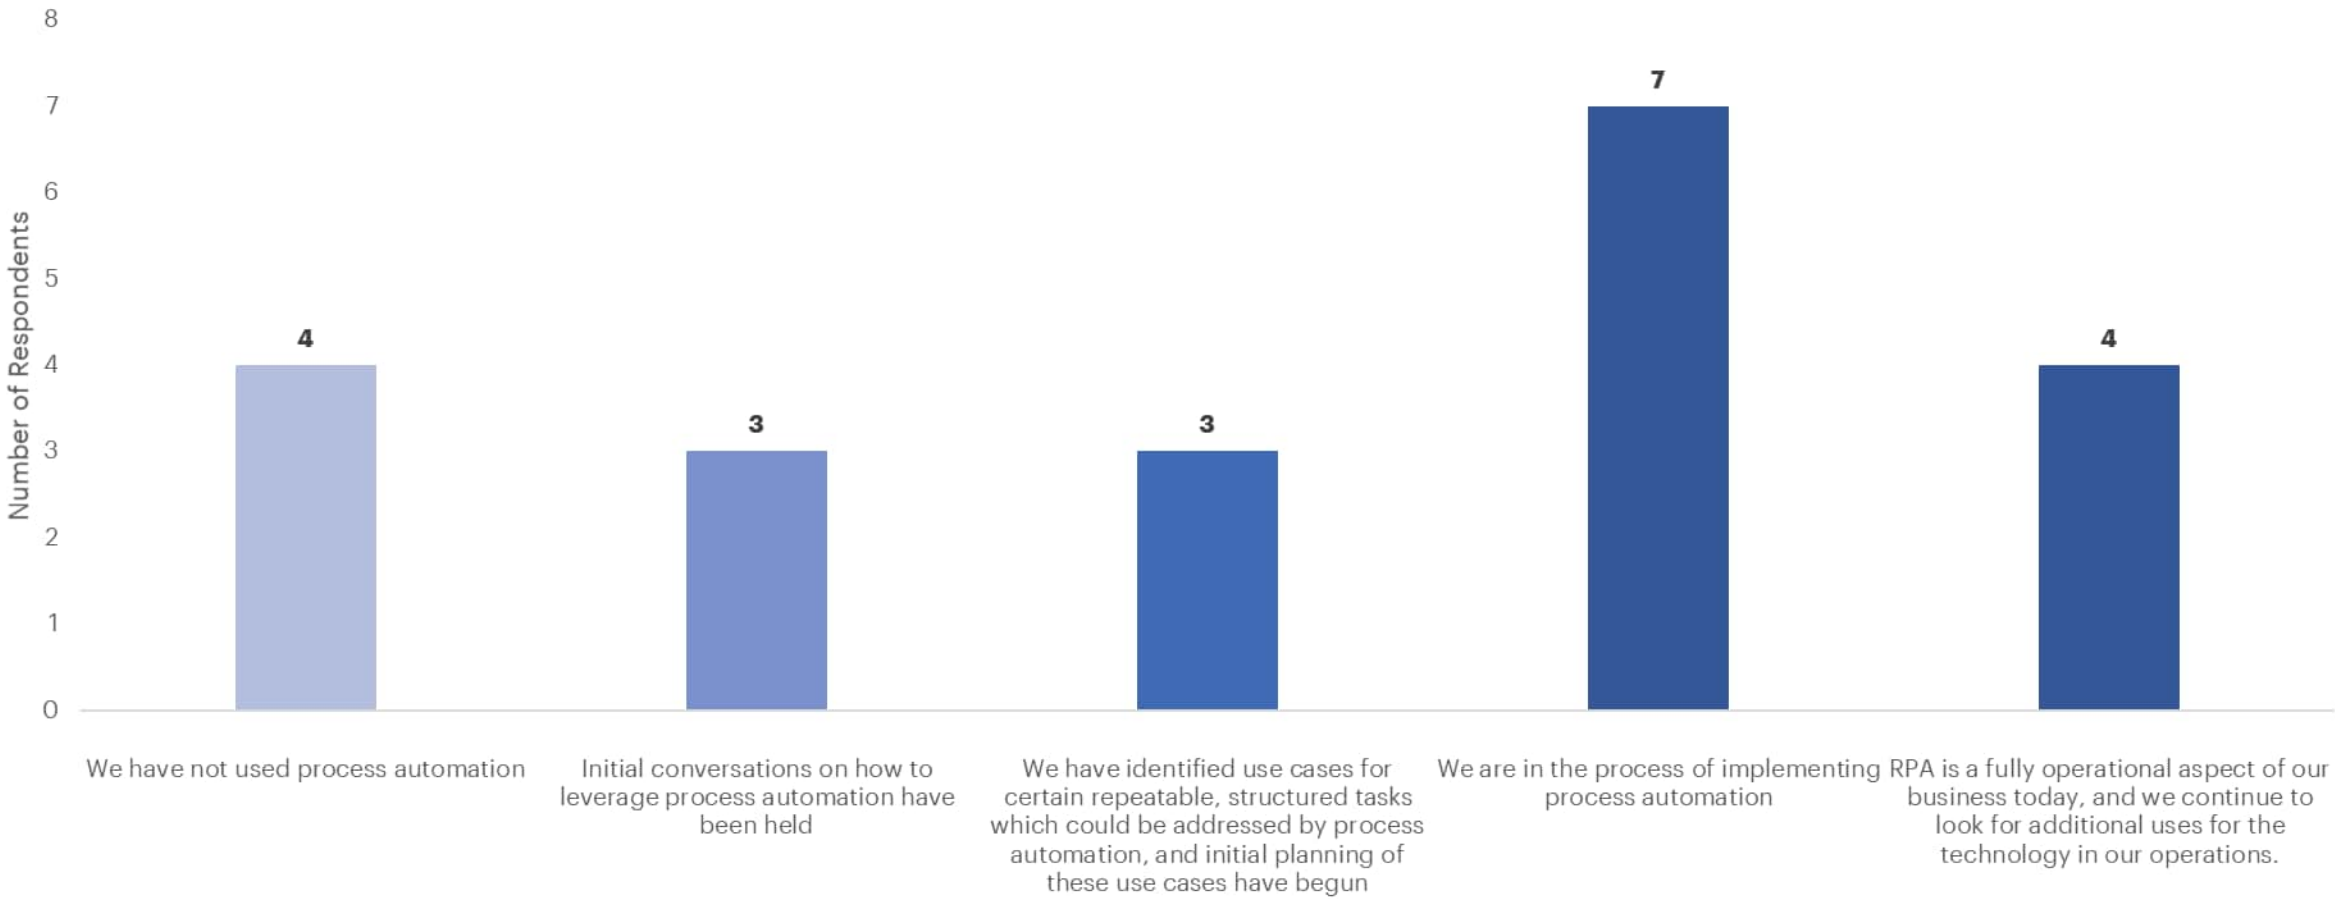
5.2) Field Data Recording

Question:	What is the most common medium used by field employees for recording field data?



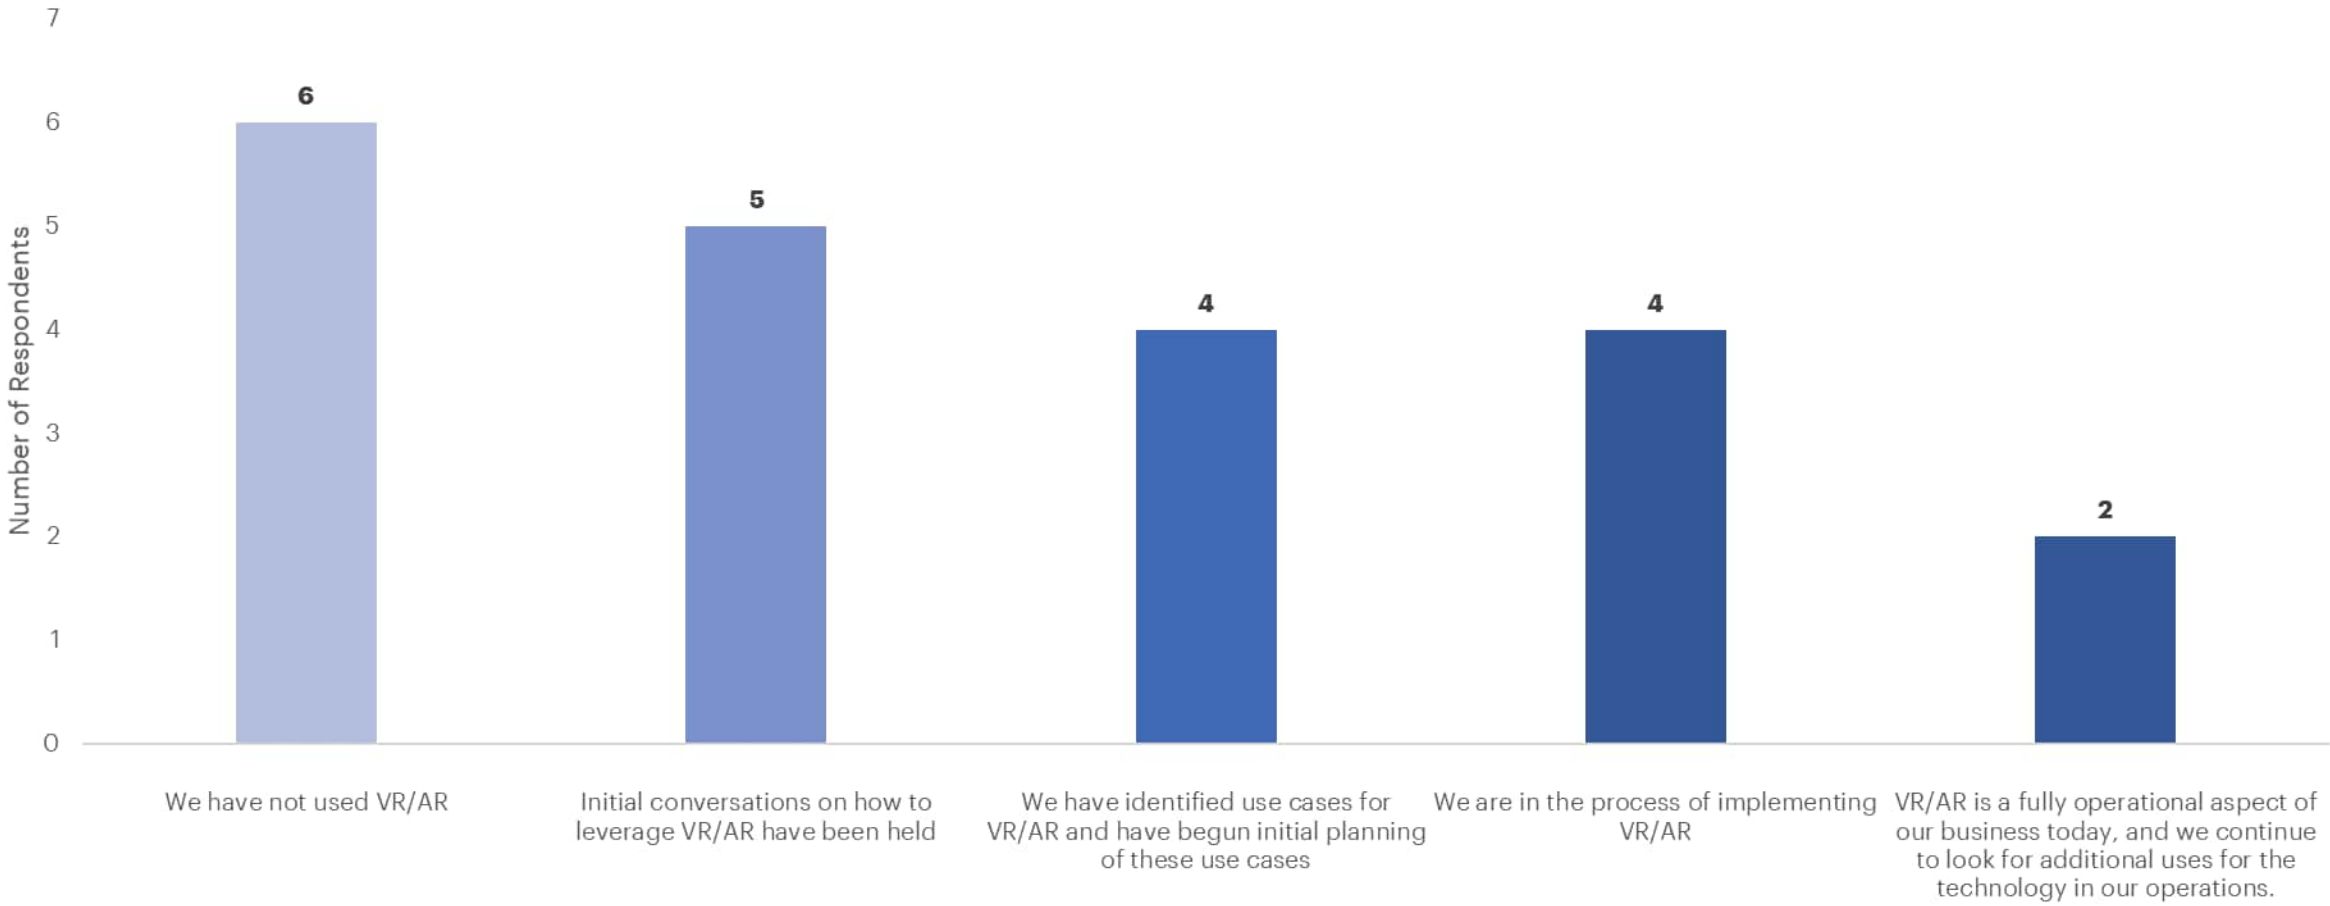
5.3) Smart Devices

Question:	How prevalent are smart devices in your field operations? NOTE: Here, "smart devices" refer to machinery/equipment that replaces human intervention (for the sake of safety &/or efficiency) such as a probe that sits inside a transformer and communicates an issue to field operations in lieu of conducting oil tests manually



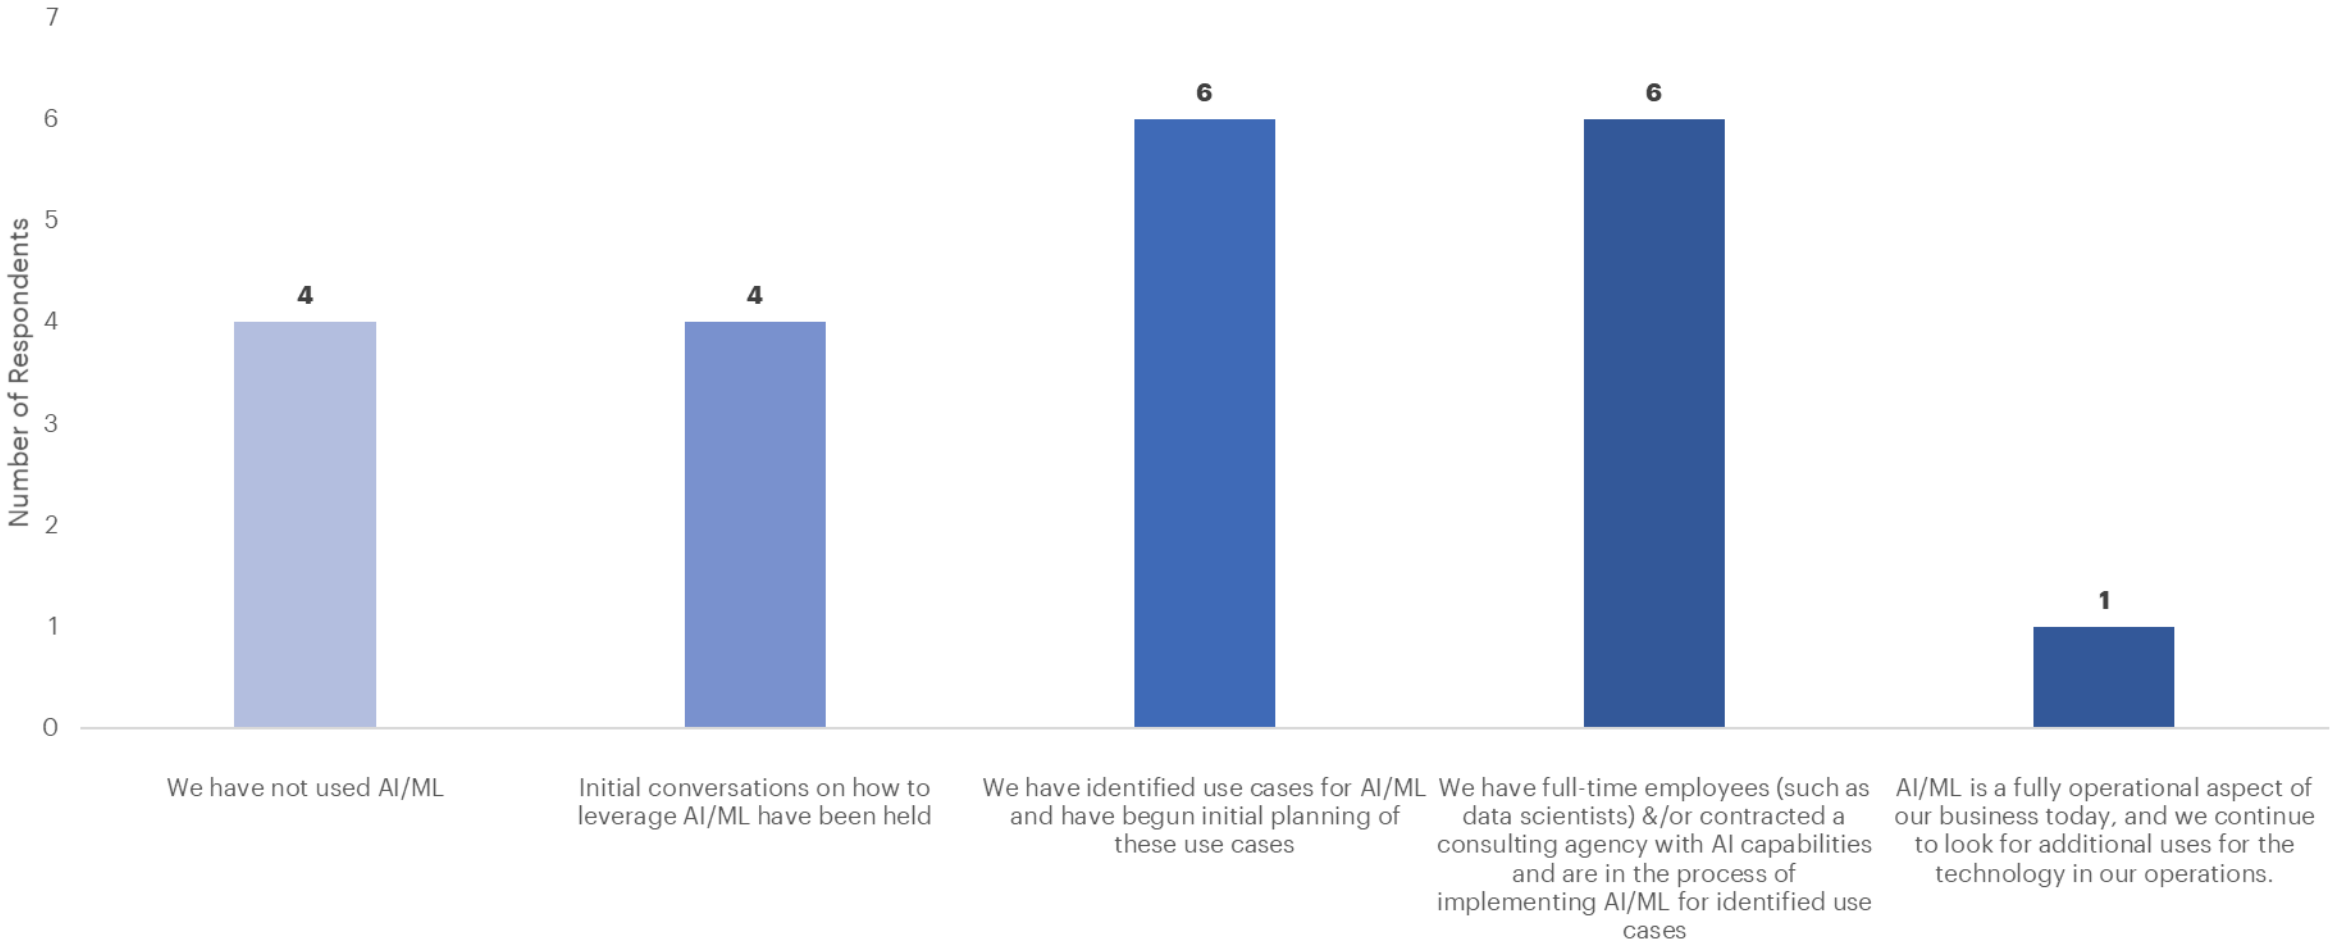
5.4) Drones

Question:	Which of the following best describes your use of drones for tasks such as inspections or damage assessments?



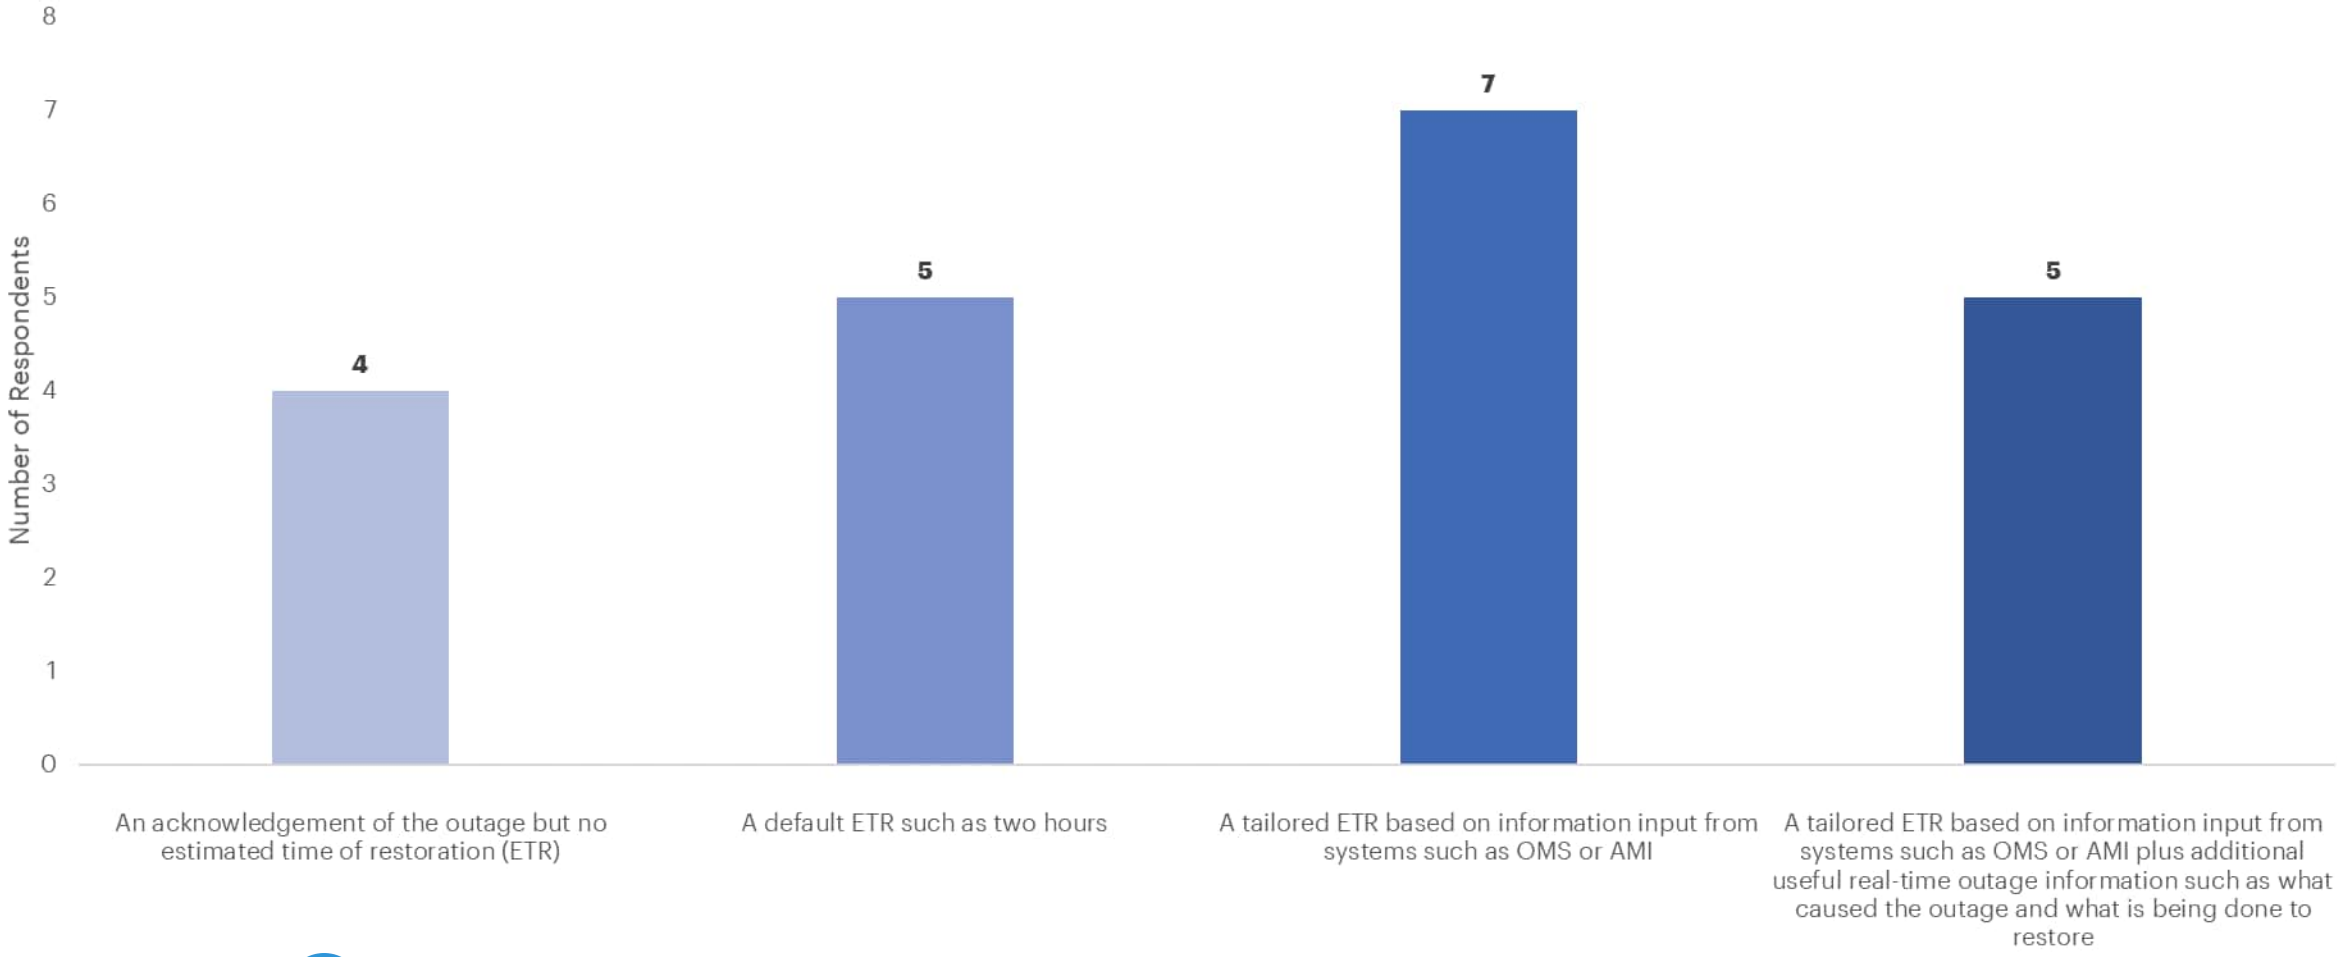
5.5) Process Automation Technology

Question:	Which of the following best describes the integration of process automation technology within your business, such as bots or robotic process automation (RPA)? NOTE: Process automation refers to the use of technology such as a bot or robotic process automation (RPA) to automate tasks.



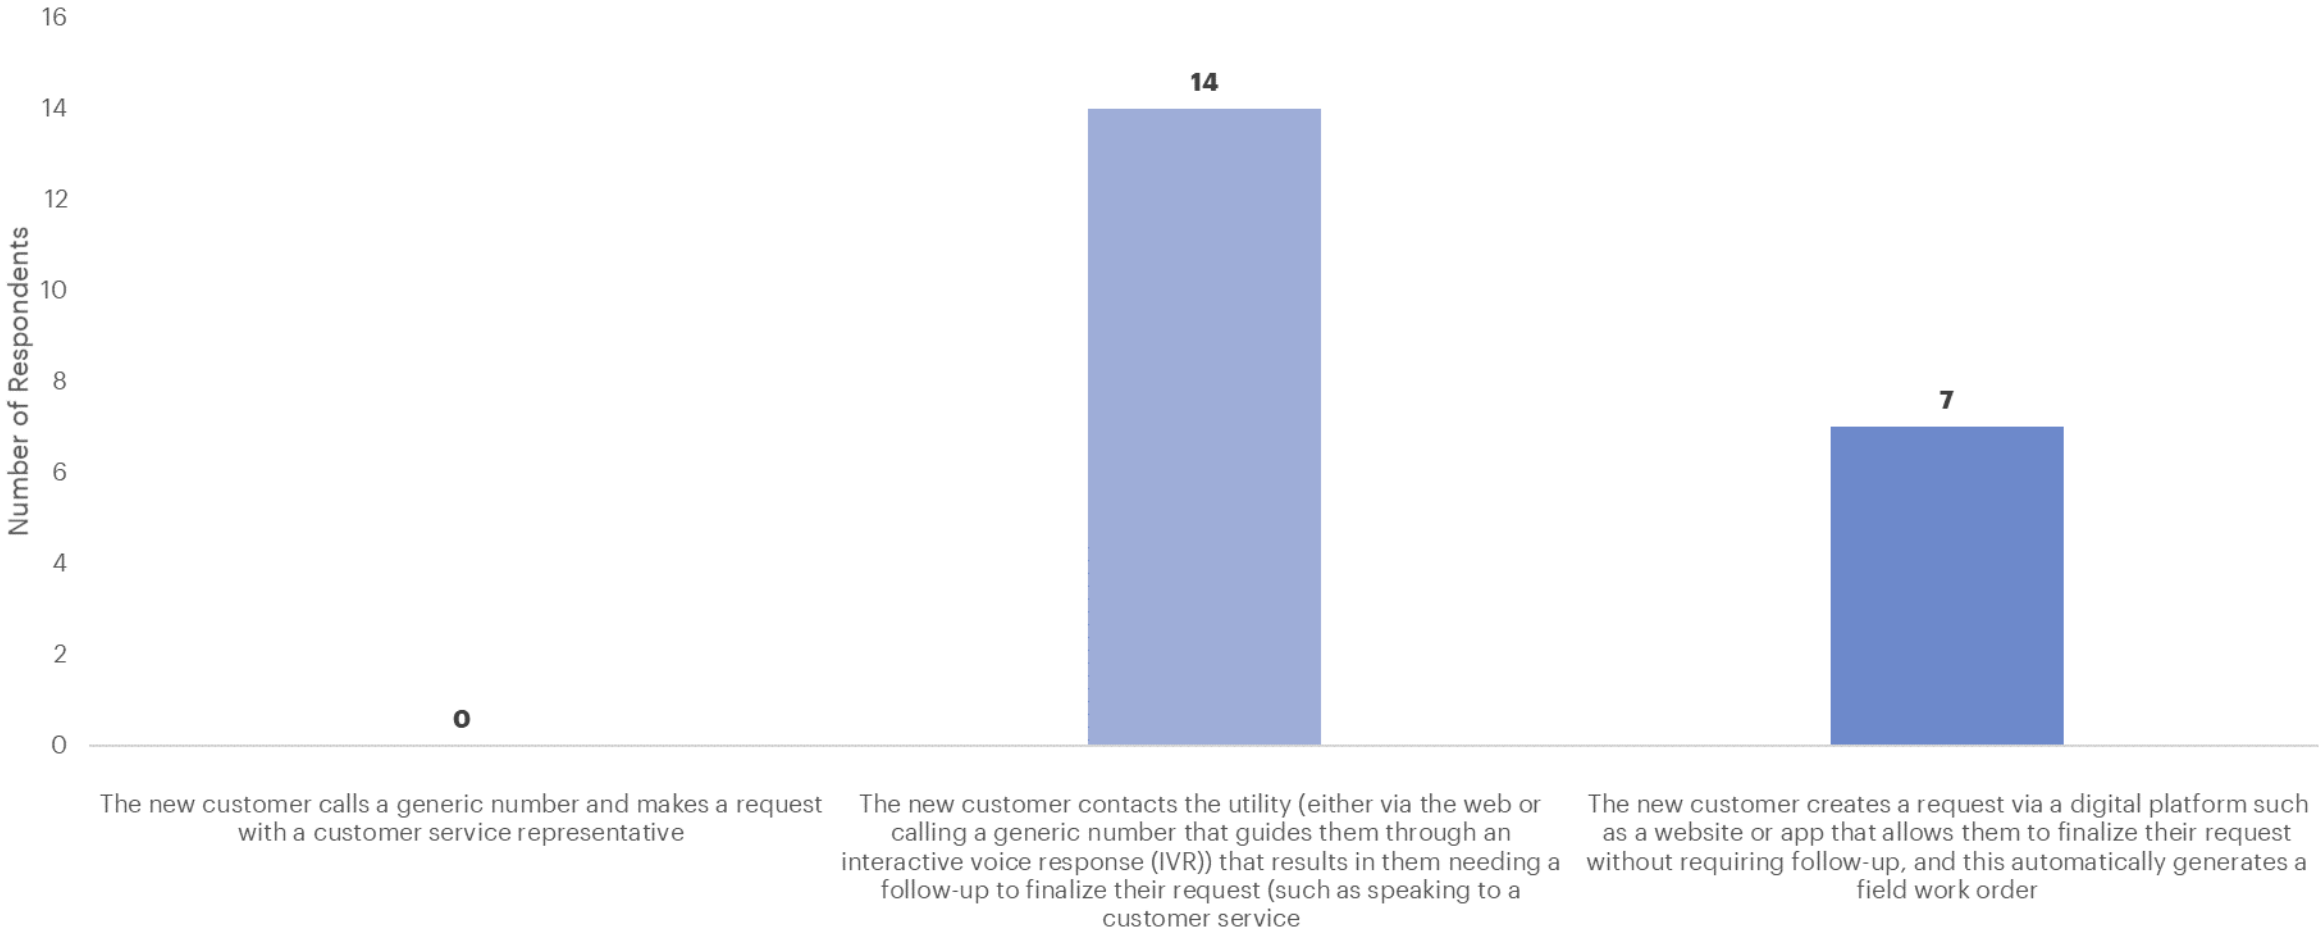
5.6) Virtual and Augmented Reality

Question:	Is virtual reality (VR) or augmented reality (AR) leveraged in operations, such as for training purposes or field use?



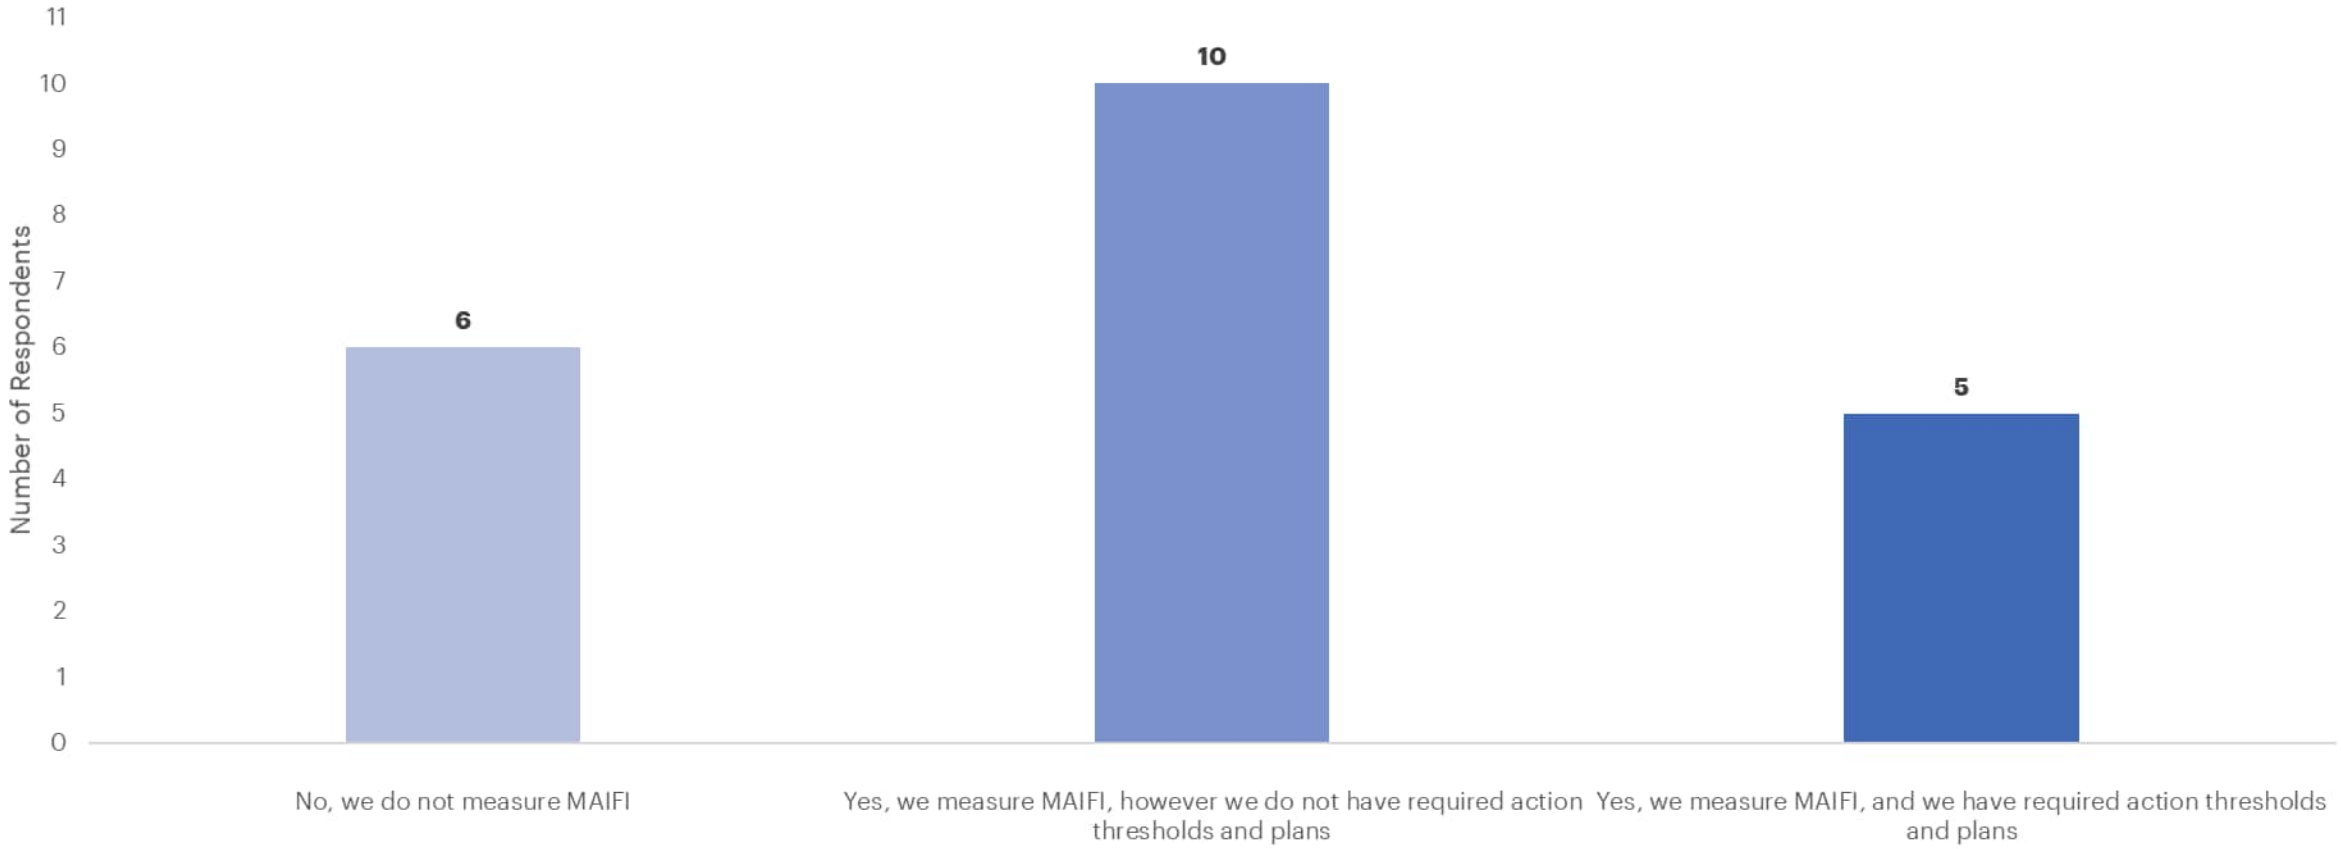
5.7) Artificial Intelligence / Machine Learning

Question:	Which of the following best describes your involvement with and use of artificial intelligence (AI) and machine learning (ML) within distribution operations?



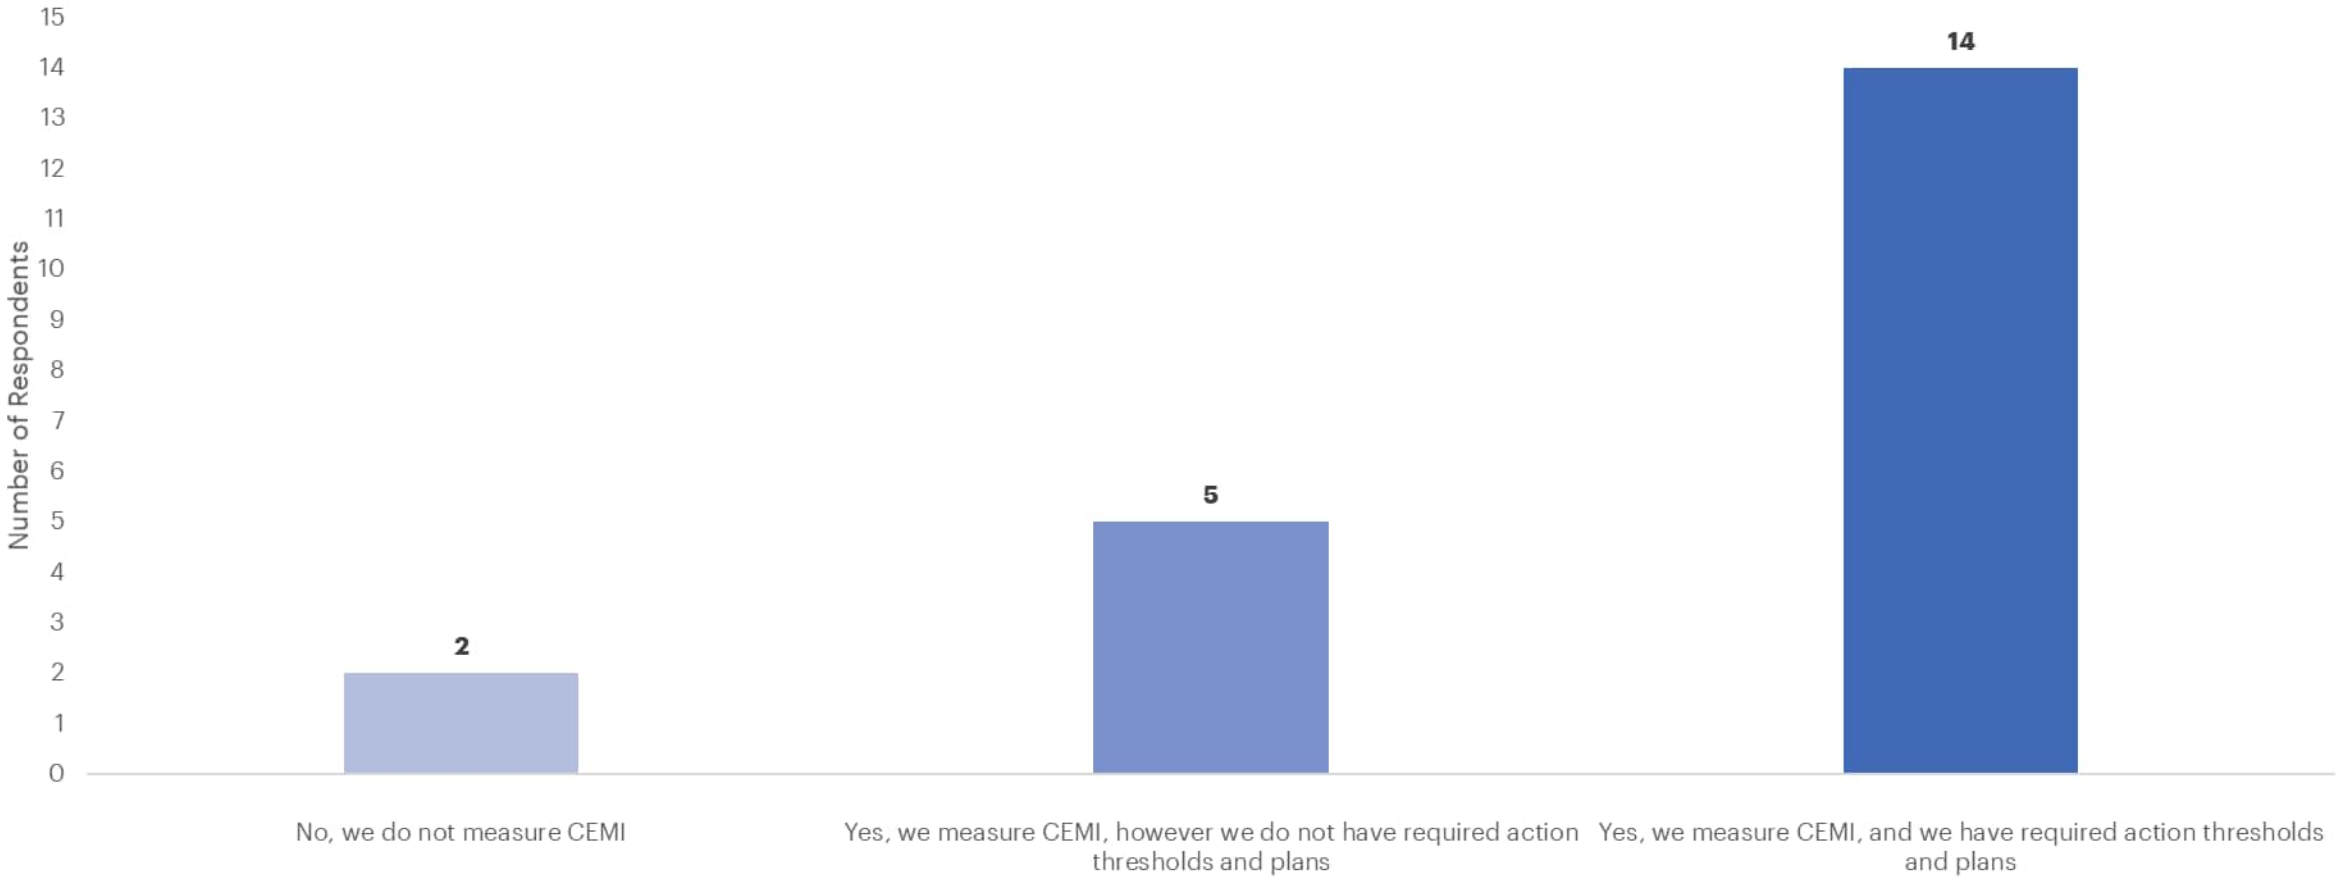
6.1) Outage Feedback

Question:	When a customer experiences an outage, what information is provided at their first touchpoint (e.g. their first call or visit to your website)?



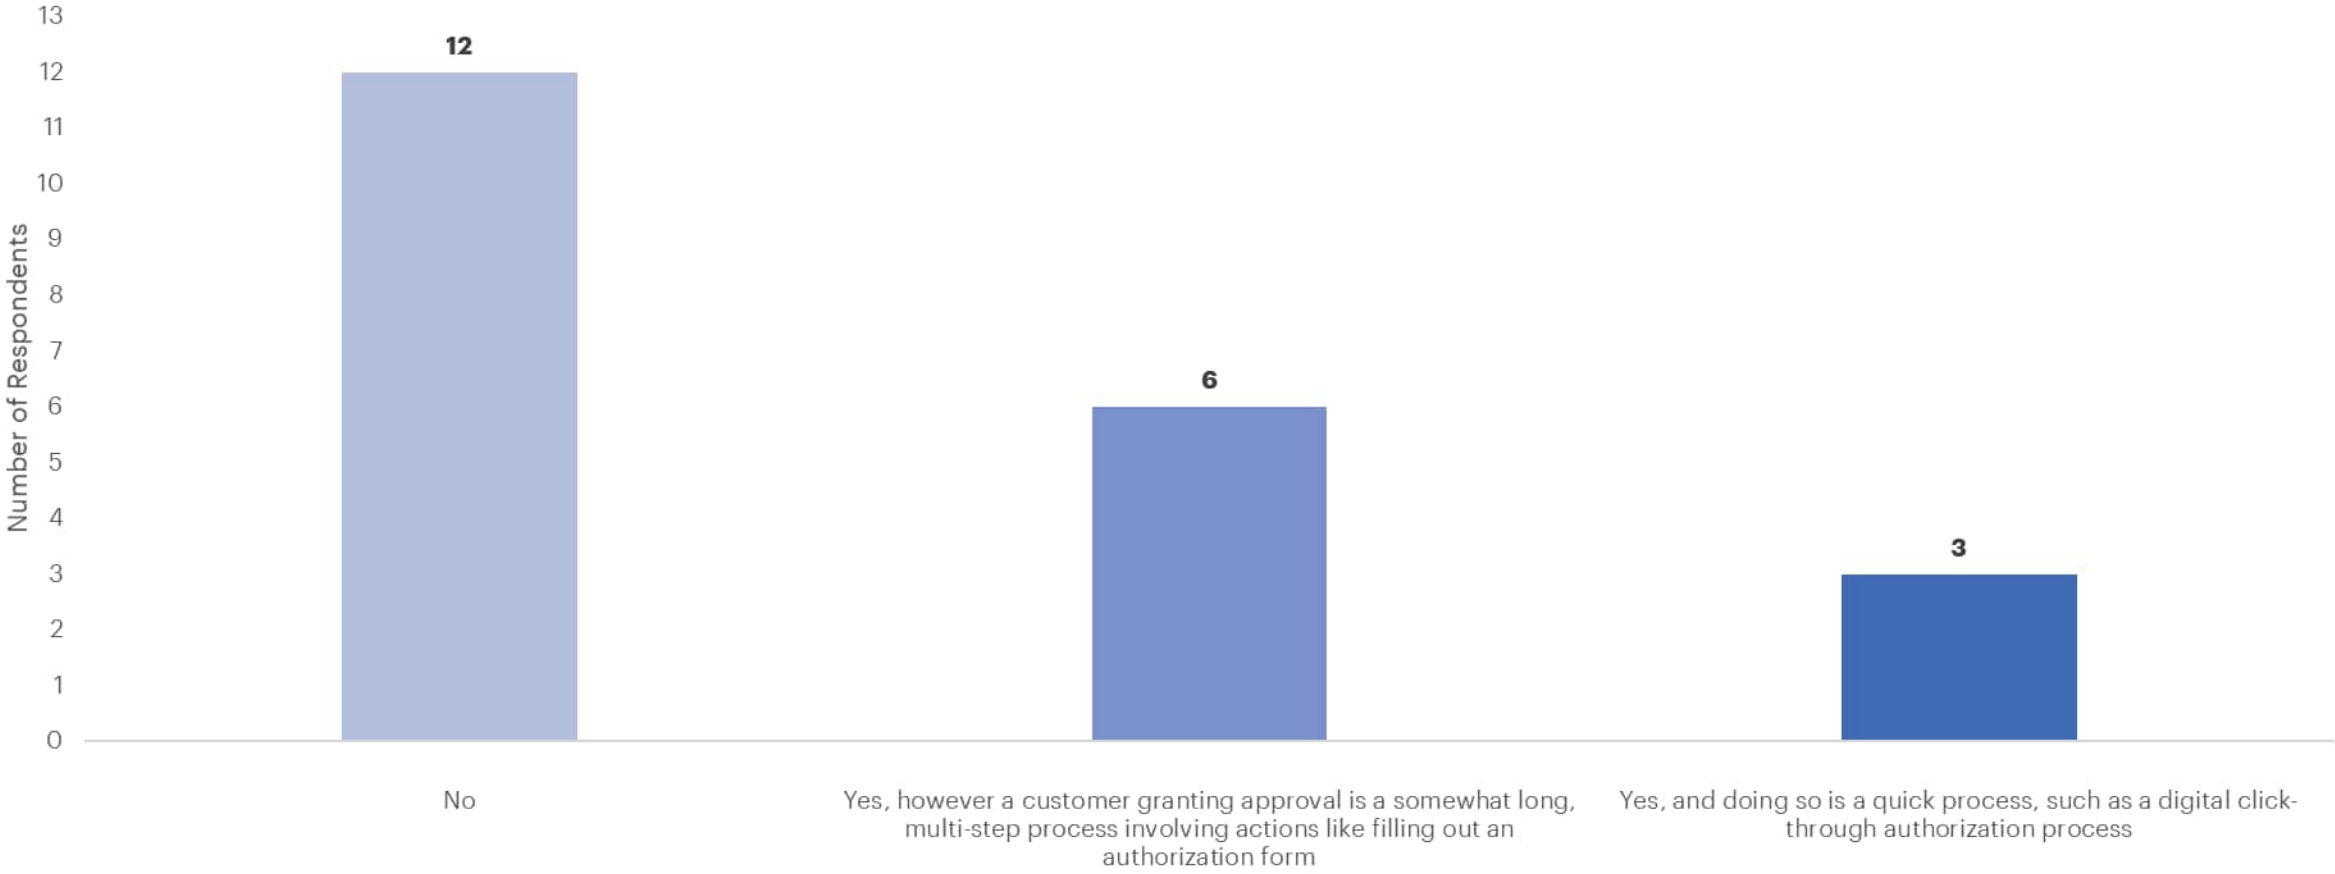
6.2) New Service Request

Question:	How does a new customer request service?



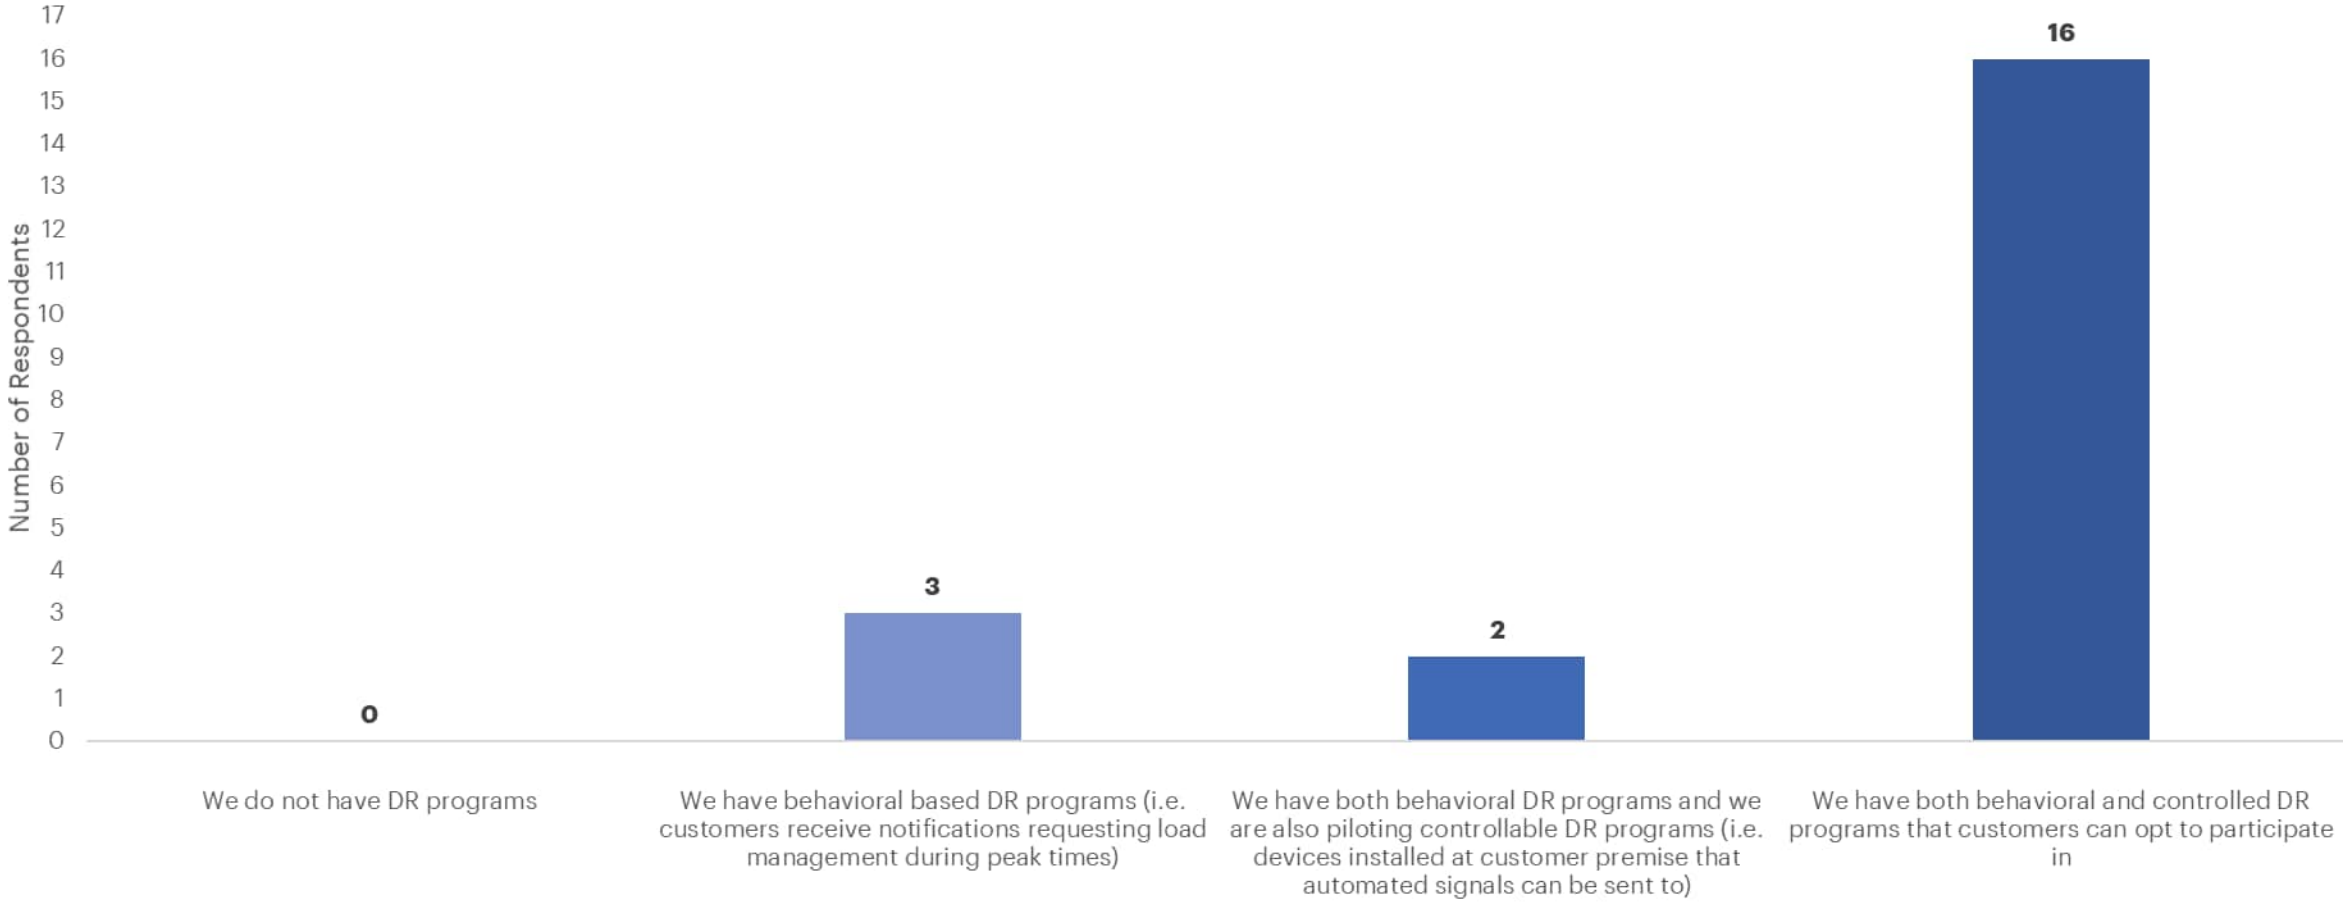
6.3) Distribution Breaker Momentary Response

Question:	Do you measure MAIFI (momentary average interruption frequency index) at the distribution breaker level, and do you have thresholds for required action? NOTE: “Thresholds for required action" would mean a prescribed action plan when a distribution breaker experiences multiple relay events.



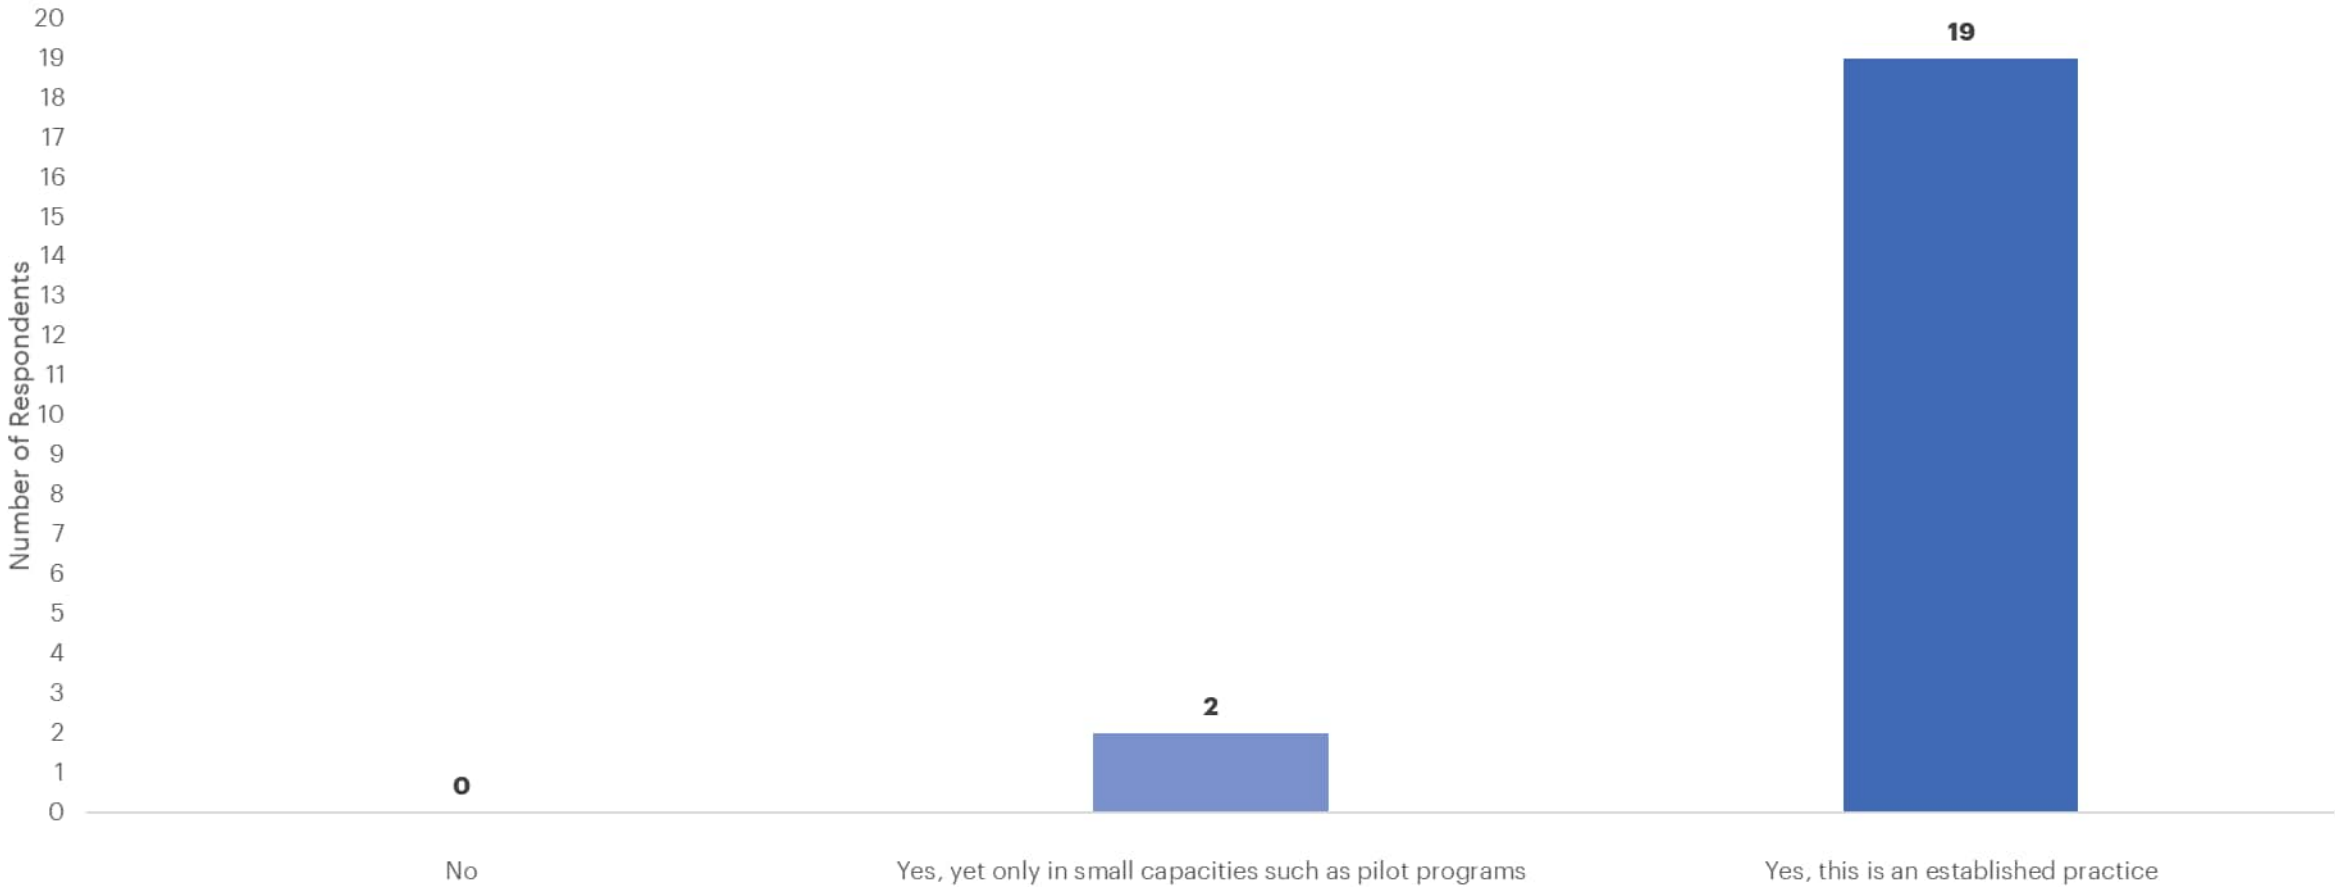
6.4) CEMI

Question:	Do you measure CEMI (customers experiencing multiple interruptions), and do you have thresholds for required action? NOTE: "Thresholds for required action" would mean a prescribed action plan when a customer reaches a given CEMI value



6.5) Data Access To Third Parties

Question:	Do you permit third party access to customer usage data upon customer approval?



6.6) Demand Response Programs

Question:	Does your utility have demand response (DR) programs available to customer?

6.7) Energy Efficiency Programs

Question:	Does your utility have energy efficiency programs with your customers? NOTE: An example of an "energy efficiency program" would be a rebate program for a customer installing an energy efficient device in their home

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-6

Reference: Exhibit 1B

Please provide a copy of all budget guidance documents that were issued regarding the budgets that underlie the application.

RESPONSE:

The requested information is provided in Appendices A to D of this interrogatory response. Please note that Toronto Hydro has redacted content that does not contain guidance related to the development of budgets (e.g. information with respect to process management) and information that was superseded and no longer reflects the utility's business plan (e.g. outdated planning and application filing timelines). Supporting evidence detailing Toronto Hydro's business planning process can be found at: (i) Exhibit 1B, Tab 1, Schedule 1, at pages 14-17; (ii) Exhibit 2B, Section E2, (iii) Exhibit 4, Tab 1, Schedule 1; and (iv) interrogatory responses 2B-SEC-32, 2B-SEC-33, 1B-CCC-14, and 4-CCC-58 (d). /C

2022 Investment Planning and Portfolio Reporting (IPPR) Kick-Off

Presented by Integrated Planning & Modernization

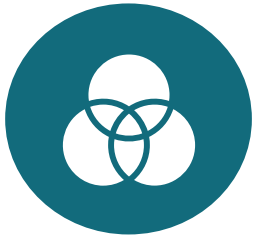
- IPPR Changes
- Next Steps
- Questions & Appendices

2022 IPPR Introduction

® A registered trademark of Toronto Hydro Corporation used under licence. "Toronto Hydro" means Toronto Hydro-Electric System Limited.

IPPR Process

WHAT?



IPPR is a comprehensive and integrated annual planning process for all distribution system, fleet, facilities, and IT/OT investment programs.

Analyze
current state and future needs

Develop
short-term and long-term plans

Optimize
risks, outcomes, and cost

WHY?

- Ensure effective **execution** of the OEB-approved Distribution System Plan
- Identify and adapt to evolving **risks** and customer/stakeholder **needs**
- Enable effective short- and long-term **strategic** and **financial planning**
- Support efficient and effective development of future **regulatory evidence**
- Integrate **new** and **innovative** investment programs
- Facilitate **continuous improvement** in asset management and planning

Funding Cycle

Non-Application Year

Live Application Year

Re-baseline Plan for Funding Approval

Planning Discretion:
Current Rate Period: **Moderate**
Next Rate Period : **Very High**

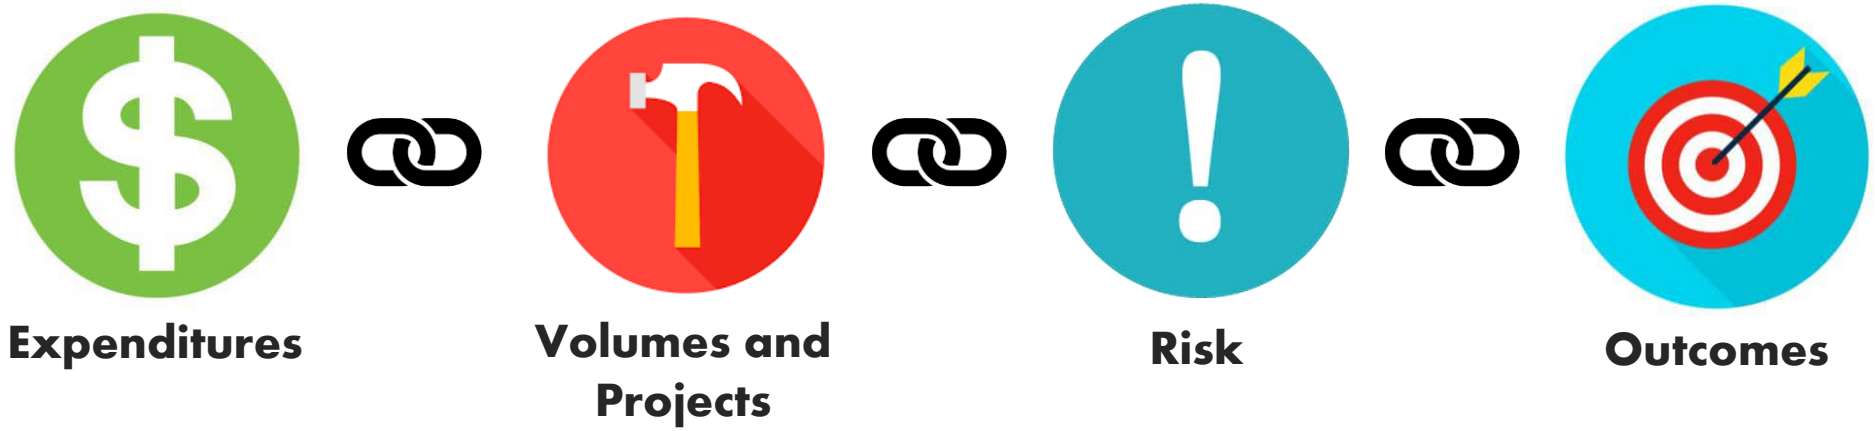
Work the Plan

Planning Discretion:
Current Rate Period : **Low**
Next Rate Period : **Very High**

★ Plan for Next Funding Cycle

Planning Discretion:
Current Rate Period : **Low**
Next Rate Period : **High**

Draft and File Next Plan



Planning Discretion:
Current Rate Period : **Very Low**
Next Rate Period : **Moderate**

Defend Next Plan

Planning Discretion:
Current Rate Period : **None**
Next Rate Period : **Moderate**

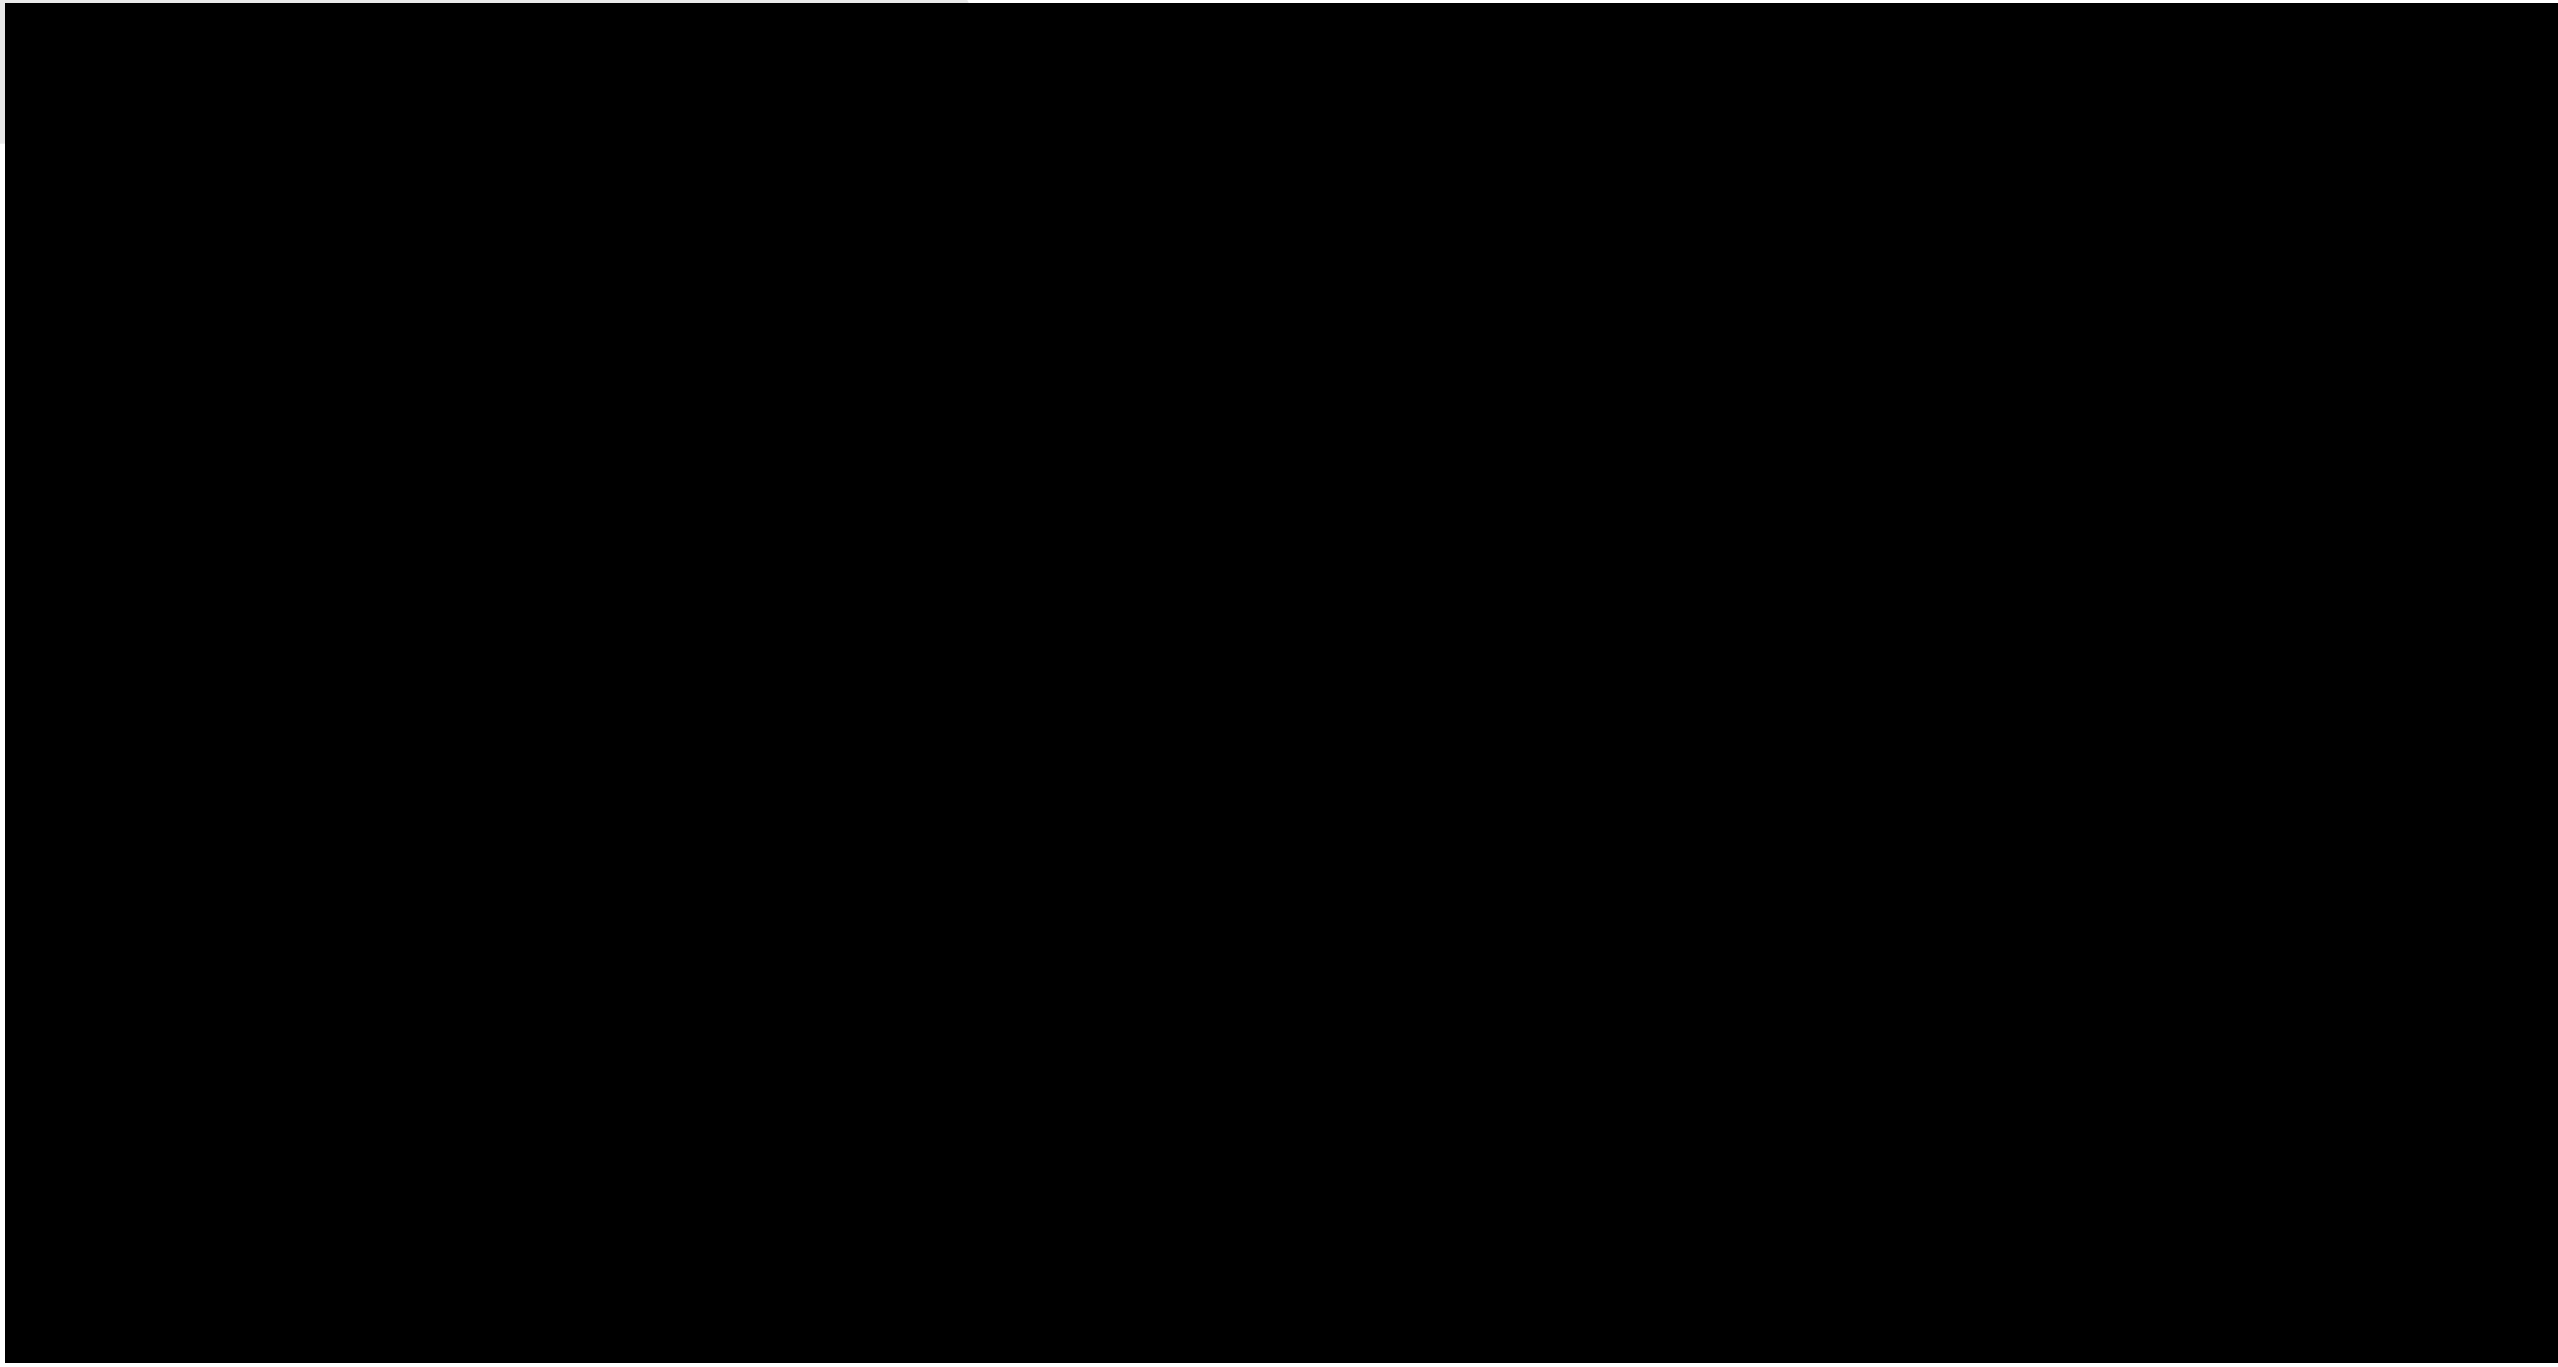
Planning Scenarios

Financially Constrained Scenarios (2020-2024)

Financially Unconstrained Scenarios (2025-2029)

Strategic Inputs

Planning for a more dynamic future...



- This year's IPPR is the beginning of an extended, iterative planning process that will result in the 2025-2029 Rate Application
- In parallel, we are running a number of industry-leading strategic projects that will help us sculpt a clear-eyed and objective-driven plan for a changing energy landscape
- Project owners will engage planners and their leaders as strategic inputs become available during the IPPR, Business Planning, and Rate Application Drafting processes

Agenda

1. **Customer Engagement Overview**
   Filing Requirements, CE Process; Phase I Methodology and the Placemat
2. **Phase I – Customer Engagement Results**
   Customer Needs and Preferences
3. **Next Steps**
   Planning Guidelines; Phase II - Customer Engagement

Customer Engagement Overview

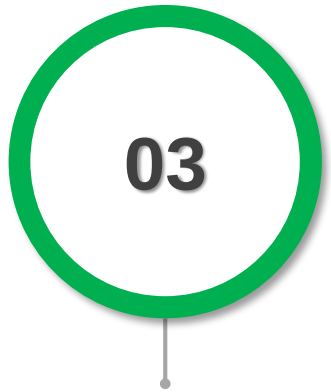
Filing Requirements; Customer Engagement Process; Phase I Methodology and the Placemat

Privileged & Confidential

Why Customer Engagement?

OEB Requirements and Utility Stewardship	
	Utilities are expected to develop a genuine understanding of their customers' interests and preferences
	Customer engagement is expected to inform the development of utility plans, and utilities are expected to demonstrate in their proposals how customer expectations have been integrated into their plans, including the trade-offs between outcomes and costs
	Utilities are expected to demonstrate value for money by delivering genuine benefits to customers and by providing services in a manner which is responsive to customer preferences.

Customer Engagement Process



Phase I – Needs and Priorities

- *Assess customer needs and preferences in relation to outcomes relevant to our program and services.*
- *It a comprehensive view of customer priorities to as a front-end input to the Business and Investment Planning processes.*

Targeted Engagement

- *Strategically explore and seek feedback on key topics relative to specific customers and emerging issues.*
- *These engagements are intended to add another layer of understanding further driving inputs and strategy for the Plan.*

Phase II – Customer Feedback

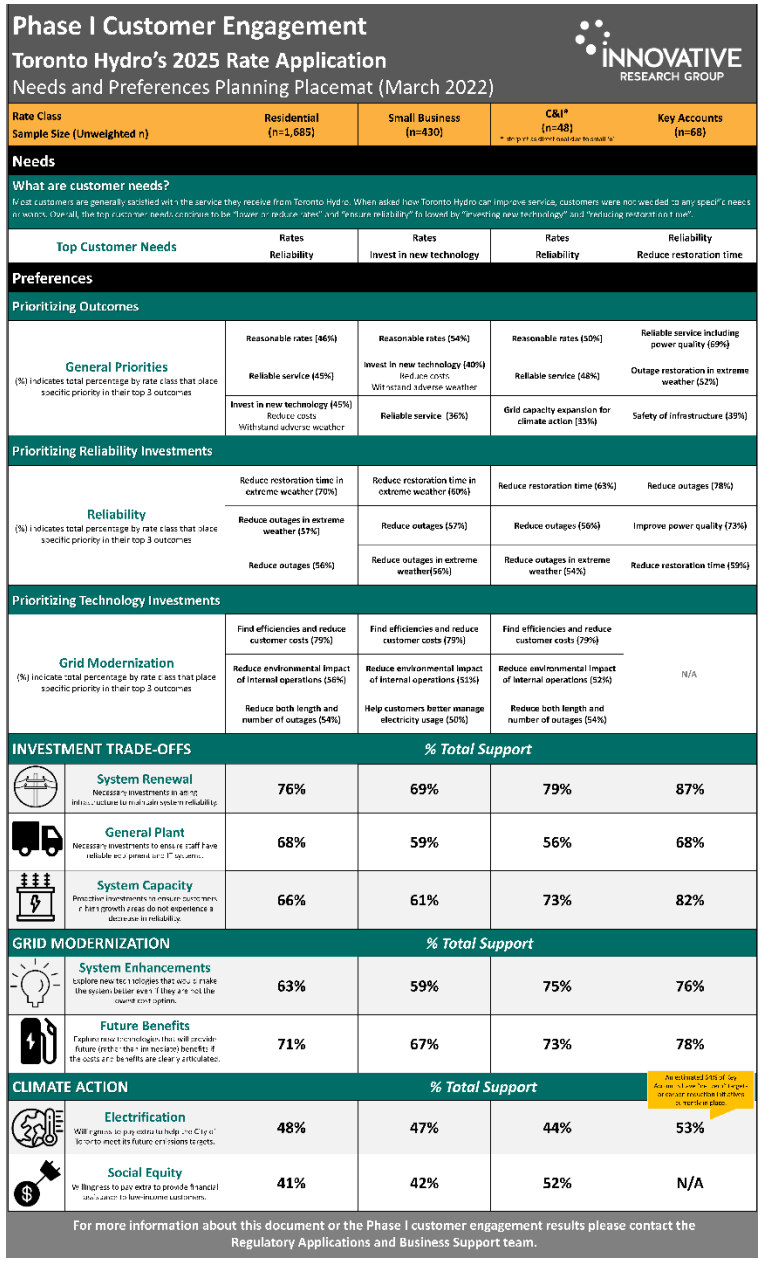
- *Confirm Phase I customer needs, preferences, and priorities.*
- *Solicit feedback on our plans and their subsequent rate impacts including customer preferences on specific programs where trade-offs on pacing exist.*

Phase I Methodology

Qualitative research informs subsequent survey design

Qualitative Research

- 4 focus groups with residential customers
- 4 focus groups with small business customers
- 4 focus groups with C&I customers
- 14 in-depth interviews with Key Account customers



Quantitative Research

- **Residential**
  Telephone survey n=**1,006**
  Online survey n=**1,685**
- **Small Business**
  Telephone survey n=**401**
  Online survey n=**430**
- **C&I Customers (GS>50kW)***
  Online survey n=**48**
- **Key Account Customers**
  Online survey n=**68**

The Placemat

- A high-level, one-page “Placemat” summary of the findings, by rate-class (e.g. customer type).
- Placemat Structure:
  - Customer Needs;
  - Priorities: General; Reliability; and Technology
  - Investment Trade-Offs
  - Grid Modernization
  - Climate Action; and
  - Social Equity

Phase I Customer Engagement

Toronto Hydro’s 2025 Rate Application

Needs and Preferences Planning Placemat (March 2022)

INNOVATIVE RESEARCH GROUP

Rate Class / Sample Size (Unweighted n)	Residential (n=1,685)	Small Business (n=430)	C&I* (n=48)	Key Accounts (n=68)
Needs				
What are customer needs? Most customers are generally satisfied with the service they receive from Toronto Hydro. When asked how Toronto Hydro can improve service, customers were not wedded to any specific needs or wants. Overall, the top customer needs continue to be “lower or reduce rates” and “ensure reliability” followed by “investing new technology” and “reducing restoration time”.				
Top Customer Needs	Rates Reliability	Rates Invest in new technology	Rates Reliability	Reliability Reduce restoration time
Preferences				
Prioritizing Outcomes				
General Priorities (%) indicates total percentage by rate class that place specific priority in their top 3 outcomes	Reasonable rates (46%) Reliable service (45%) Invest in new technology (45%) Reduce costs Withstand adverse weather	Reasonable rates (54%) Invest in new technology (40%) Reduce costs Withstand adverse weather Reliable service (36%)	Reasonable rates (50%) Reliable service (48%) Grid capacity expansion for climate action (33%)	Reliable service including power quality (69%) Outage restoration in extreme weather (52%) Safety of infrastructure (39%)
Prioritizing Reliability Investments				
Reliability (%) indicates total percentage by rate class that place specific priority in their top 3 outcomes	Reduce restoration time in extreme weather (70%) Reduce outages in extreme weather (57%) Reduce outages (56%)	Reduce restoration time in extreme weather (60%) Reduce outages (57%) Reduce outages in extreme weather(56%)	Reduce restoration time (63%) Reduce outages (56%) Reduce outages in extreme weather (54%)	Reduce outages (78%) Improve power quality (73%) Reduce restoration time (59%)
Prioritizing Technology Investments				
Grid Modernization (%) indicate total percentage by rate class that place specific priority in their top 3 outcomes	Find efficiencies and reduce customer costs (79%) Reduce environmental impact of internal operations (56%) Reduce both length and number of outages (54%)	Find efficiencies and reduce customer costs (79%) Reduce environmental impact of internal operations (51%) Help customers better manage electricity usage (50%)	Find efficiencies and reduce customer costs (79%) Reduce environmental impact of internal operations (52%) Reduce both length and number of outages (54%)	N/A
INVESTMENT TRADE-OFFS		*% Total Support*		
System Renewal Necessary investments in aging infrastructure to maintain system reliability	76%	69%	79%	87%
General Plant Necessary investments to ensure staff have reliable tools, premises and IT systems	68%	59%	56%	68%
System Capacity Proactive investments to ensure customers in fast growth areas do not experience a decrease in reliability.	66%	61%	73%	82%
GRID MODERNIZATION		*% Total Support*		
System Enhancements Explore new technologies that would make the system better even if they are not the lowest cost option.	63%	59%	75%	76%
Future Benefits Explore new technologies that will provide future (rather than immediate) benefits if the costs and benefits are clearly articulated.	71%	67%	73%	78%
CLIMATE ACTION		*% Total Support*		An estimated 54% of key Actions to achieve Toronto’s targets are given priority for action in this area.
Electrification Willingness to pay extra to help the City of Toronto meet its future emissions targets.	48%	47%	44%	53%
Social Equity Willingness to pay extra to provide financial assistance to low-income customers.	41%	42%	52%	N/A

For more information about this document or the Phase I customer engagement results please contact the Regulatory Applications and Business Support team.

Privileged & Confidential

Phase I – Customer Engagement Results

Customer Needs and Preferences

Privileged & Confidential

Customer Needs

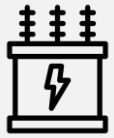
Rate Class	Residential	Small Business	C&I*	Key Accounts
What are customer needs? Most customers are generally satisfied with the service they receive from Toronto Hydro. When asked how Toronto Hydro can improve service, customers were not wedded to any specific needs or wants. Overall, the top customer needs continue to be "lower or reduce rates" and "ensure reliability" followed by "investing new technology" and "reducing restoration time".				
Top Customer Needs	**Rates**	**Rates**	**Rates**	**Reliability**
	Reliability	**Invest in new technology**	**Reliability**	**Reduce restoration time**

Preferences: General Priorities

Rate Class	Residential	Small Business	C&I*	Key Accounts
Prioritizing Outcomes				
General Priorities (%) indicates total percentage by rate class that place specific priority in their top 3 outcomes	**Reasonable rates (46%)**	**Reasonable rates (54%)**	**Reasonable rates (50%)**	**Reliable service including power quality (69%)**
	Reliable service (45%)	**Invest in new technology (40%)** Reduce costs Withstand adverse weather	**Reliable service (48%)**	**Outage restoration in extreme weather (52%)**
	Invest in new technology (45%) Reduce costs Withstand adverse weather	**Reliable service (36%)**	**Grid capacity expansion for climate action (33%)**	**Safety of infrastructure (39%)**

Preferences: Reliability

Rate Class	Residential	Small Business	C&I*	Key Accounts
Prioritizing Reliability Investments				
Reliability (%) indicates total percentage by rate class that place specific priority in their top 3 outcomes	**Reduce restoration time in extreme weather (70%)**	**Reduce restoration time in extreme weather (60%)**	**Reduce restoration time (63%)**	**Reduce outages (78%)**
	Reduce outages in extreme weather (57%)	**Reduce outages (57%)**	**Reduce outages (56%)**	**Improve power quality (73%)**
	Reduce outages (56%)	**Reduce outages in extreme weather (56%)**	**Reduce outages in extreme weather (54%)**	**Reduce restoration time (59%)**



- *Consider options increase the resilience of the grid during extreme weather events. For example, increasing switching capability within the system can help reduce restoration times. Similarly, increasing proactive inspection and corrective action for storm guying requirements can help reduce pole failures during extreme wind events.*

Preferences: Technology

Rate Class	Residential	Small Business	C&I*	Key Accounts
Prioritizing Technology Investments				
Grid Modernization (%) indicate total percentage by rate class that place specific priority in their top 3 outcomes	**Find efficiencies and reduce customer costs (79%)**	**Find efficiencies and reduce customer costs (79%)**	**Find efficiencies and reduce customer costs (79%)**	N/A
	Reduce environmental impact of internal operations (56%)	**Reduce environmental impact of internal operations (51%)**	**Reduce environmental impact of internal operations (52%)**	
	Reduce both length and number of outages (54%)	**Help customers better manage electricity usage (50%)**	**Reduce both length and number of outages (54%)**	

- *Consider an increased pace of monitoring and control capabilities allowing for potential OPEX savings in the future, help identify oil spills early, and reducing service failures.*

Investment Trade-Offs

Rate Class		Residential	Small Business	C&I*	Key Accounts
INVESTMENT TRADE-OFFS		*% Total Support*			
	**System Renewal** Necessary investments in aging infrastructure to maintain system reliability.	**76%**	**69%**	**79%**	**87%**
	**General Plant** Necessary investments to ensure staff have reliable equipment and IT systems.	**68%**	**59%**	**56%**	**68%**
	**System Capacity** Proactive investments to ensure customers in high growth areas do not experience a decrease in reliability.	**66%**	**61%**	**73%**	**82%**

Grid Modernization

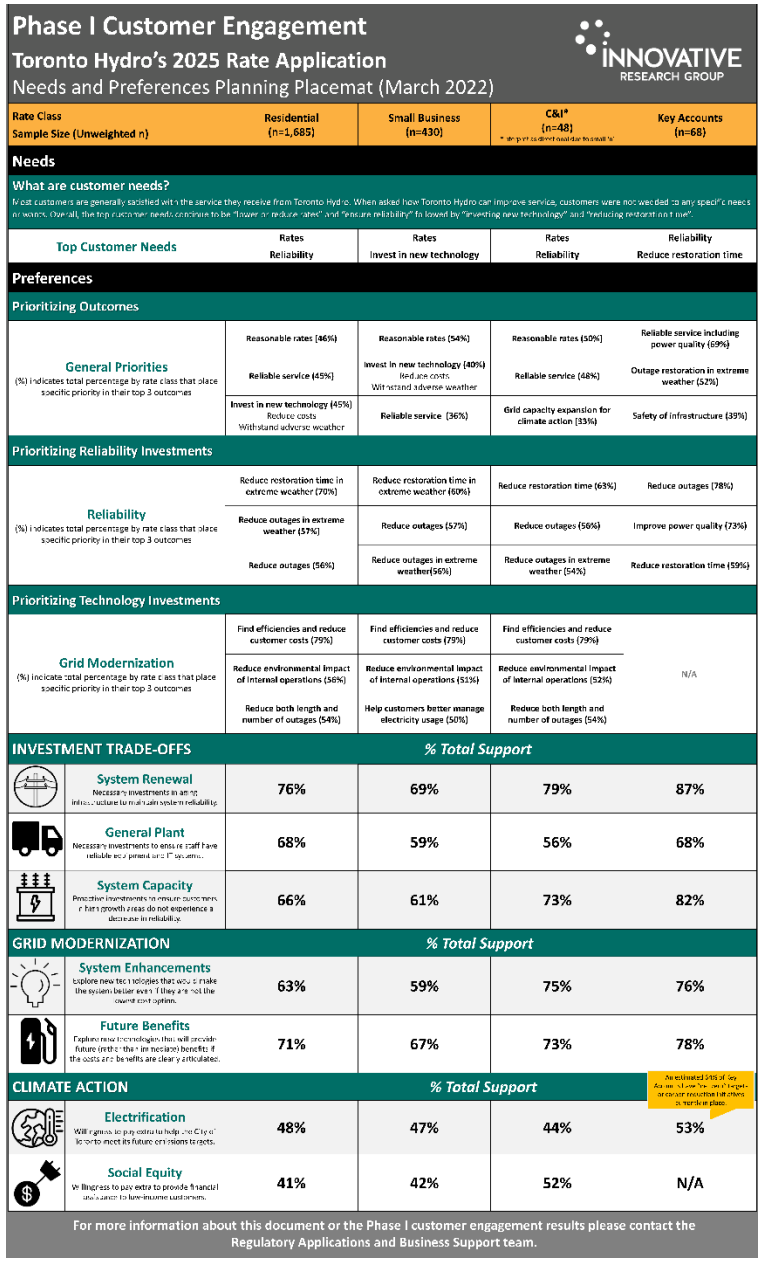
Rate Class		Residential	Small Business	C&I*	Key Accounts
GRID MODERNIZATION		*% Total Support*			
	**System Enhancements** Explore new technologies that would make the system better even if they are not the lowest cost option.	**63%**	**59%**	**75%**	**76%**
	**Future Benefits** Explore new technologies that will provide future (rather than immediate) benefits if the costs and benefits are clearly articulated.	**71%**	**67%**	**73%**	**78%**

- *For example, consider an option to increase the pace of investment in automation technologies like FLISR to allow Toronto Hydro to have greater flexibility within the distribution system and to leverage this technology to reduce outage impacts.*

Climate Action & Social Equity

Rate Class		Residential	Small Business	C&I*	Key Accounts
CLIMATE ACTION			*% Total Support*		
	**Electrification** Willingness to pay extra to help the City of Toronto meet its future emissions targets.	**48%**	**47%**	**44%**	**53%**
	**Social Equity** Willingness to pay extra to provide financial assistance to low-income customers.	**41%**	**42%**	**52%**	**N/A**

An estimated 64% of Key Accounts have "net zero" targets or carbon reduction initiatives currently in place.



- *For example, consider investments that reduce Toronto Hydro's GHG emissions such as fleet electrification; as well as investments that support City electrification, such as renewable enabling investments like GPMC or system expansions.*

Next Steps

General Planning Guidance; Phase II - Customer Engagement

General Planning Guidance

- Phase I customer engagement results provide the general priorities for Toronto Hydro's customers
  - Review program investment options presented within IPPR to ensure general alignment with these priorities
  - Tie-in customer priorities clearly as part of IPPR narratives where applicable
- Articulate the balance of costs, risks, and benefits for the grid and the customer as part of narratives, especially for programs focused on new technologies that may have future benefits

Customer Engagement Phase 2

01

Phase I – Needs and Priorities

- *Assess customer needs and preferences in relation to outcomes relevant to our program and services.*
- *It a comprehensive view of customer priorities to as a front-end input to the Business and Investment Planning processes.*

02

Targeted Engagement

- *Strategically explore and seek feedback on key topics relative to specific customers and emerging issues.*
- *These engagements are intended to add another layer of understanding further driving inputs and strategy for the Plan.*

03

Phase II – Customer Feedback

- *Confirm Phase I customer needs, preferences, and priorities.*
- *Solicit feedback on our plans and their subsequent rate impacts including customer preferences on specific programs where trade-offs on pacing exist.*

Thank you

For more information about the Placemat or the Phase I customer engagement results please contact the Regulatory Applications and Business Support team.

For additional insights into the integration of the results into Business and Investment Planning, please contact Elissar El-Hage and/or Sakaran Manivannan.

System Renewal, System Access (GPMC and Metering) Preventive and Predictive Mtce, Corrective Mtce, Emergency Response, General Plant

2020-2024

Option	Description
Baseline Minus*	This option represents a percent or dollar reduction to the Baseline Option(L1), where a 5-year budget, with annual targets, will be provided by PIA. Units, outcomes, short and long term impacts and risks will need to be determined.
Baseline*	This option is equivalent to the current Business Plan as approved by the Board of Directors, where the 5-year (2020-2024) dollars are known. Total funding considered under the baseline option must be equivalent to the 5-year Business Plan total. Units, outcomes, short and long term impacts and risks will need to be determined.
Custom	This represents a custom (i.e. unconstrained) option where planners have the ability to set spending, unit and outcome achievements. Short and long term impacts and risks will need to be determined.

* Constrained options.

System Renewal, System Access (GPMC and Metering) Preventive and Predictive Mtce, Corrective Mtce, Emergency Response, General Plant

2025-2029

Option	Description
Managed Deterioration	This option represents the management of the system without realizing the full outcomes, benefits and/or performance expected from the Sustainment Investment Strategy. This option must be at a level sufficient to maintain short-term performance of the system while allowing for some incremental risk. Funding levels considered for this option should not be sustainable over the long-term.
Sustainment	This option represents the baseline level of investment required to maintain the system at status quo as measured by key indicators of risk and performance that are most relevant to the program (i.e. reliability, asset condition, system capacity, customers connected on time etc.)
Improvement	This option achieves outcomes, benefits and/or performance beyond those achieved in the Sustainment Option, while accounting for the need to keep year-over-year spending changes within reasonable limits.

System Service

2020-2024

Option	Description
Baseline Minus *	This option represents a percent or dollar reduction to the Baseline Option(L1), where a 5-year budget, with annual targets, will be provided by PIA. Units, outcomes, short and long term impacts and risks will need to be determined.
Baseline*	This option is equivalent to the current Business Plan as approved by the Board of Directors, where the 5-year (2020-2024) dollars are known. Total funding considered under the baseline option must be equivalent to the 5-year Business Plan total. Units, outcomes, short and long term impacts and risks will need to be determined.
Custom	This represents a custom (i.e. unconstrained) option where planners have the ability to set spending, unit and outcome achievements. Short and long term impacts and risks will need to be determined.

*Constrained options.

System Service

2025-2029

Option	Description
Sustainment	This option represents the minimum amount of spending required to achieve minimize required outcome (e.g. meet long-term system capacity requirements) or otherwise advance the program (e.g. pilot level spending).
Improvement	This option achieves outcomes, benefits and/or performance beyond those achieved in the Sustainment Option, while accounting for the need to keep year-over-year spending changes within reasonable limits.
Accelerated Improvement	This option achieves outcomes, benefits and/or performance beyond those achieved in the Improvement Investment Strategy.

System Access (excl GPMC and Revenue Metering), Customer Driven Work OpEx

2020-2029

Option	Description
Lower Bound	This option must consider variation of assumptions from the baseline scenario to determine a reasonable lower bound on required spending.
Baseline -Most Likely	This option represents the most likely investment scenario based on the program forecast methodology.
Upper Bound	This option must consider variation of assumptions from the baseline scenario to determine a reasonable upper bound on required spending.

2023–2029
BUSINESS PLANNING

TORONTO HYDRO®

*A registered trademark of Toronto Hydro Corporation used under licence. "Toronto Hydro" means Toronto Hydro-Electric System Limited.

AGENDA

1. Meeting Kick-off
2. Business Plan approach and assumptions overview
3. Regulatory Application Planning and timelines
4. Investment Planning approach
5. Enterprise Risk Management considerations
6. Next steps and Q&A

Critical Themes

Business Plan

- Capital Investment and Operational Requirements
- Utility of the Future
- Resource Strategy
- Inflationary Costs pressures
- COVID-19 ongoing impacts
- Climate Action Plan and Expanded Distributor

Integrated Business Plan

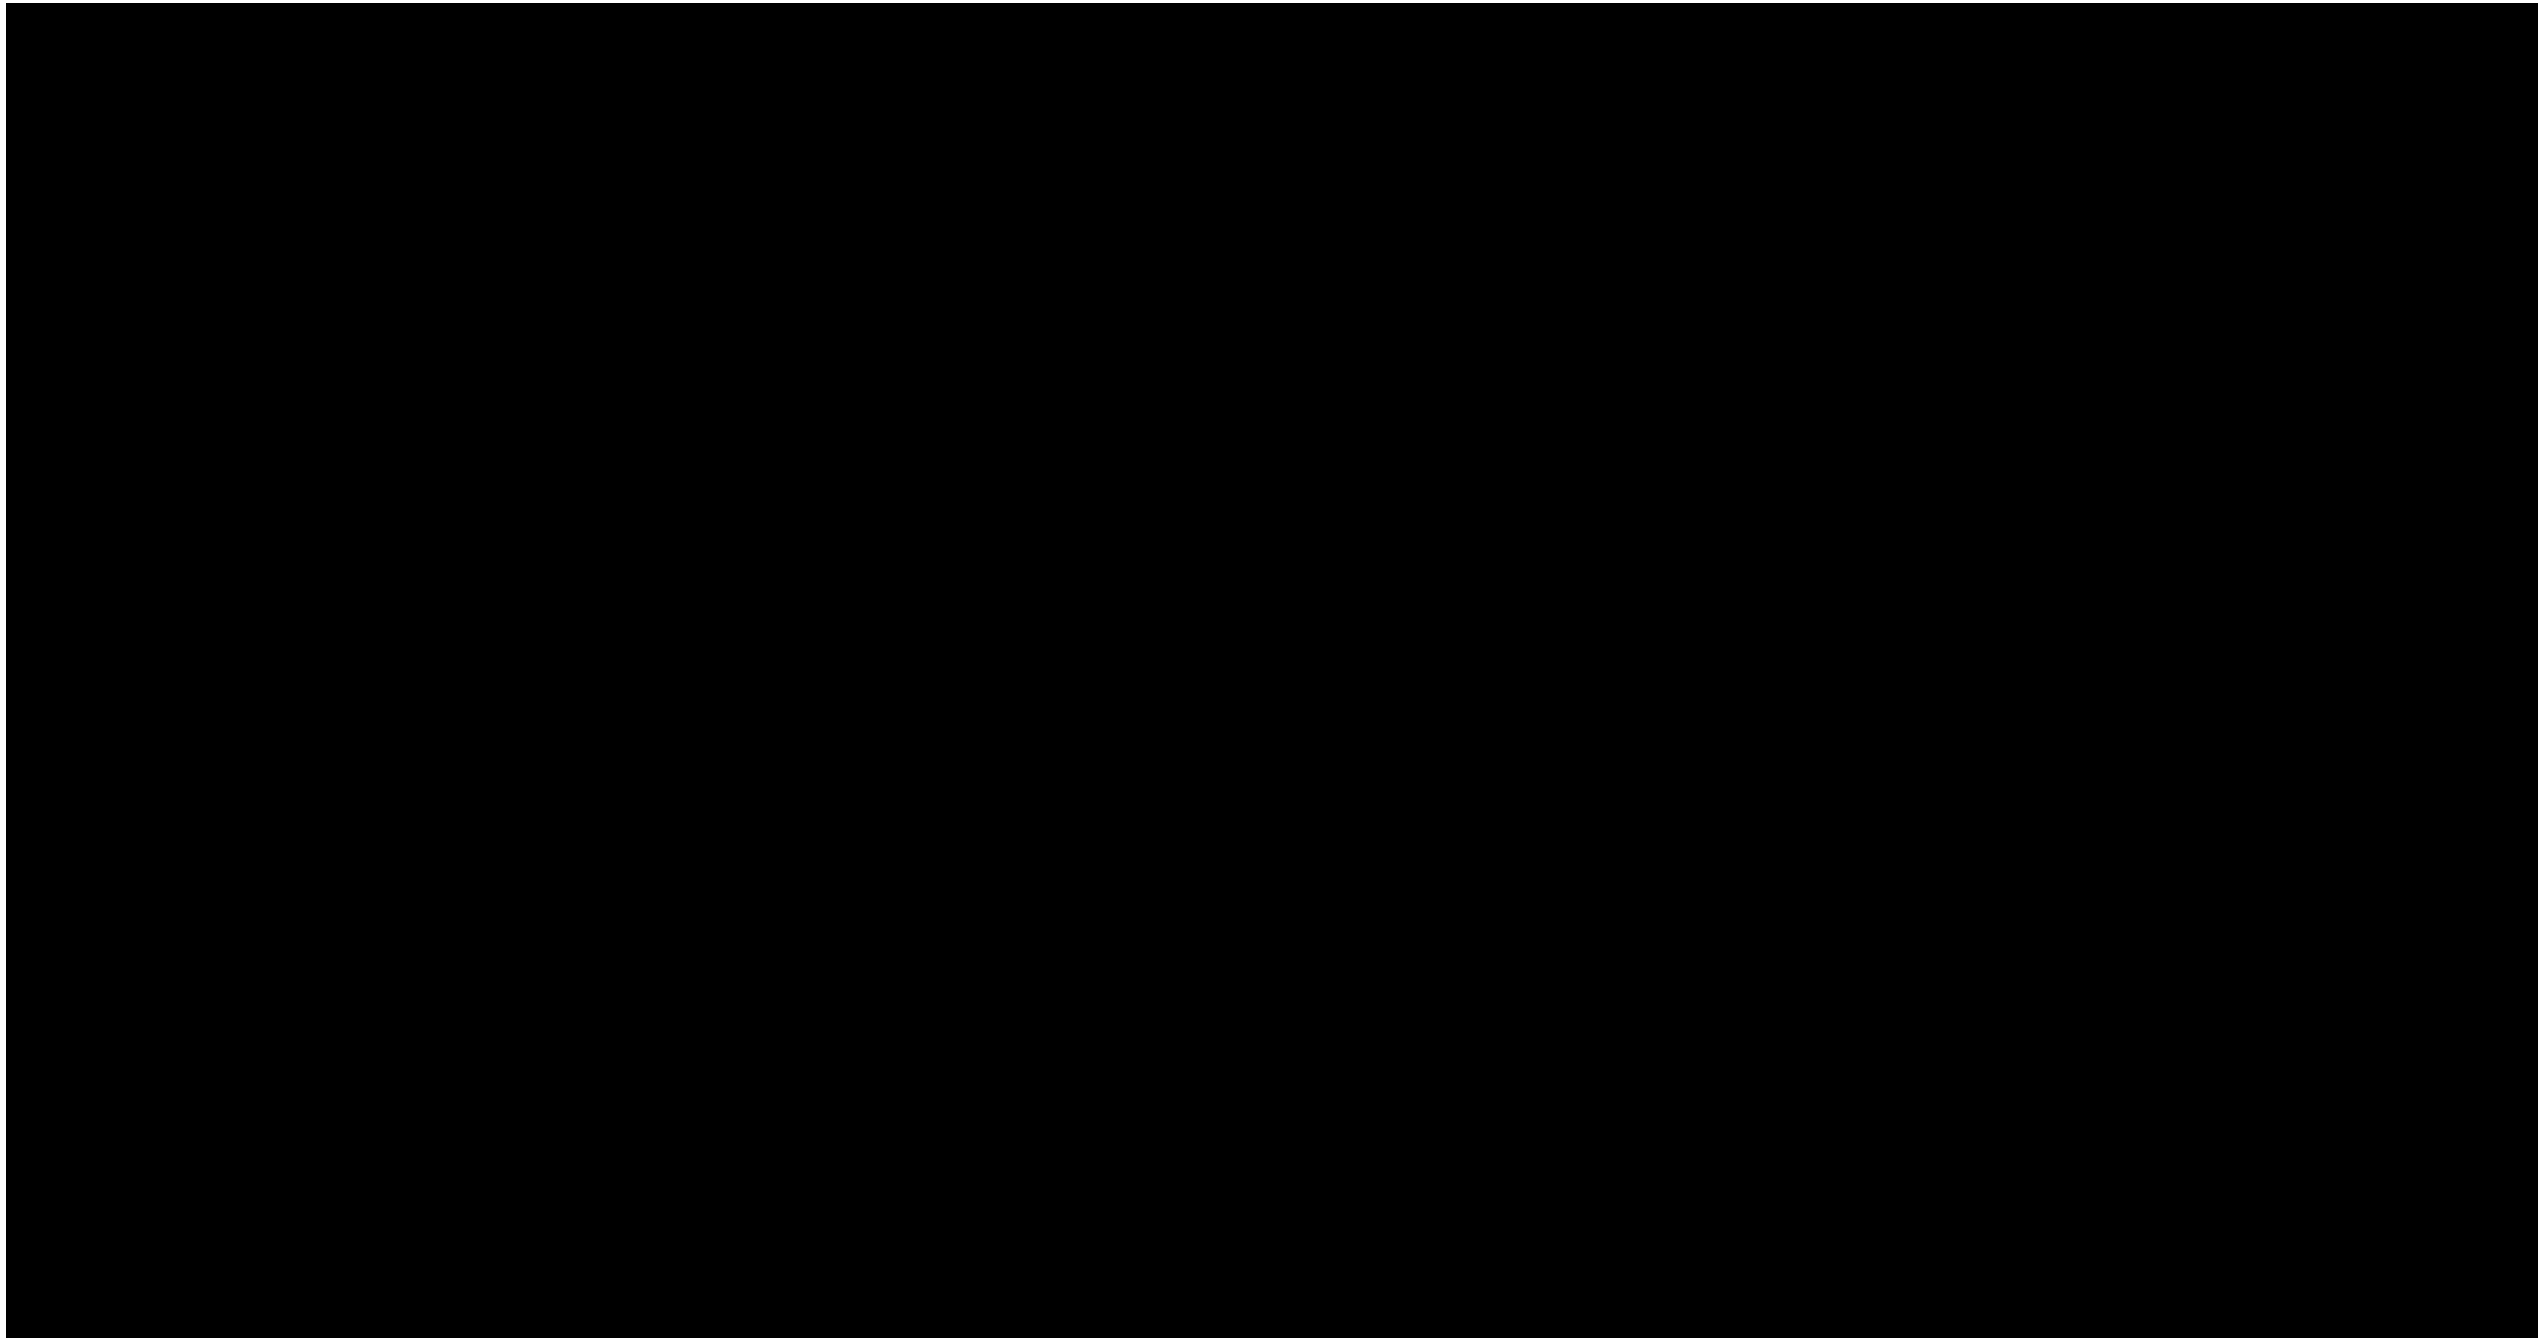
CORPORATE STRATEGY
The Interactive Grid

Alignment to the 10-year Utility of the Future Strategy and strategic priorities

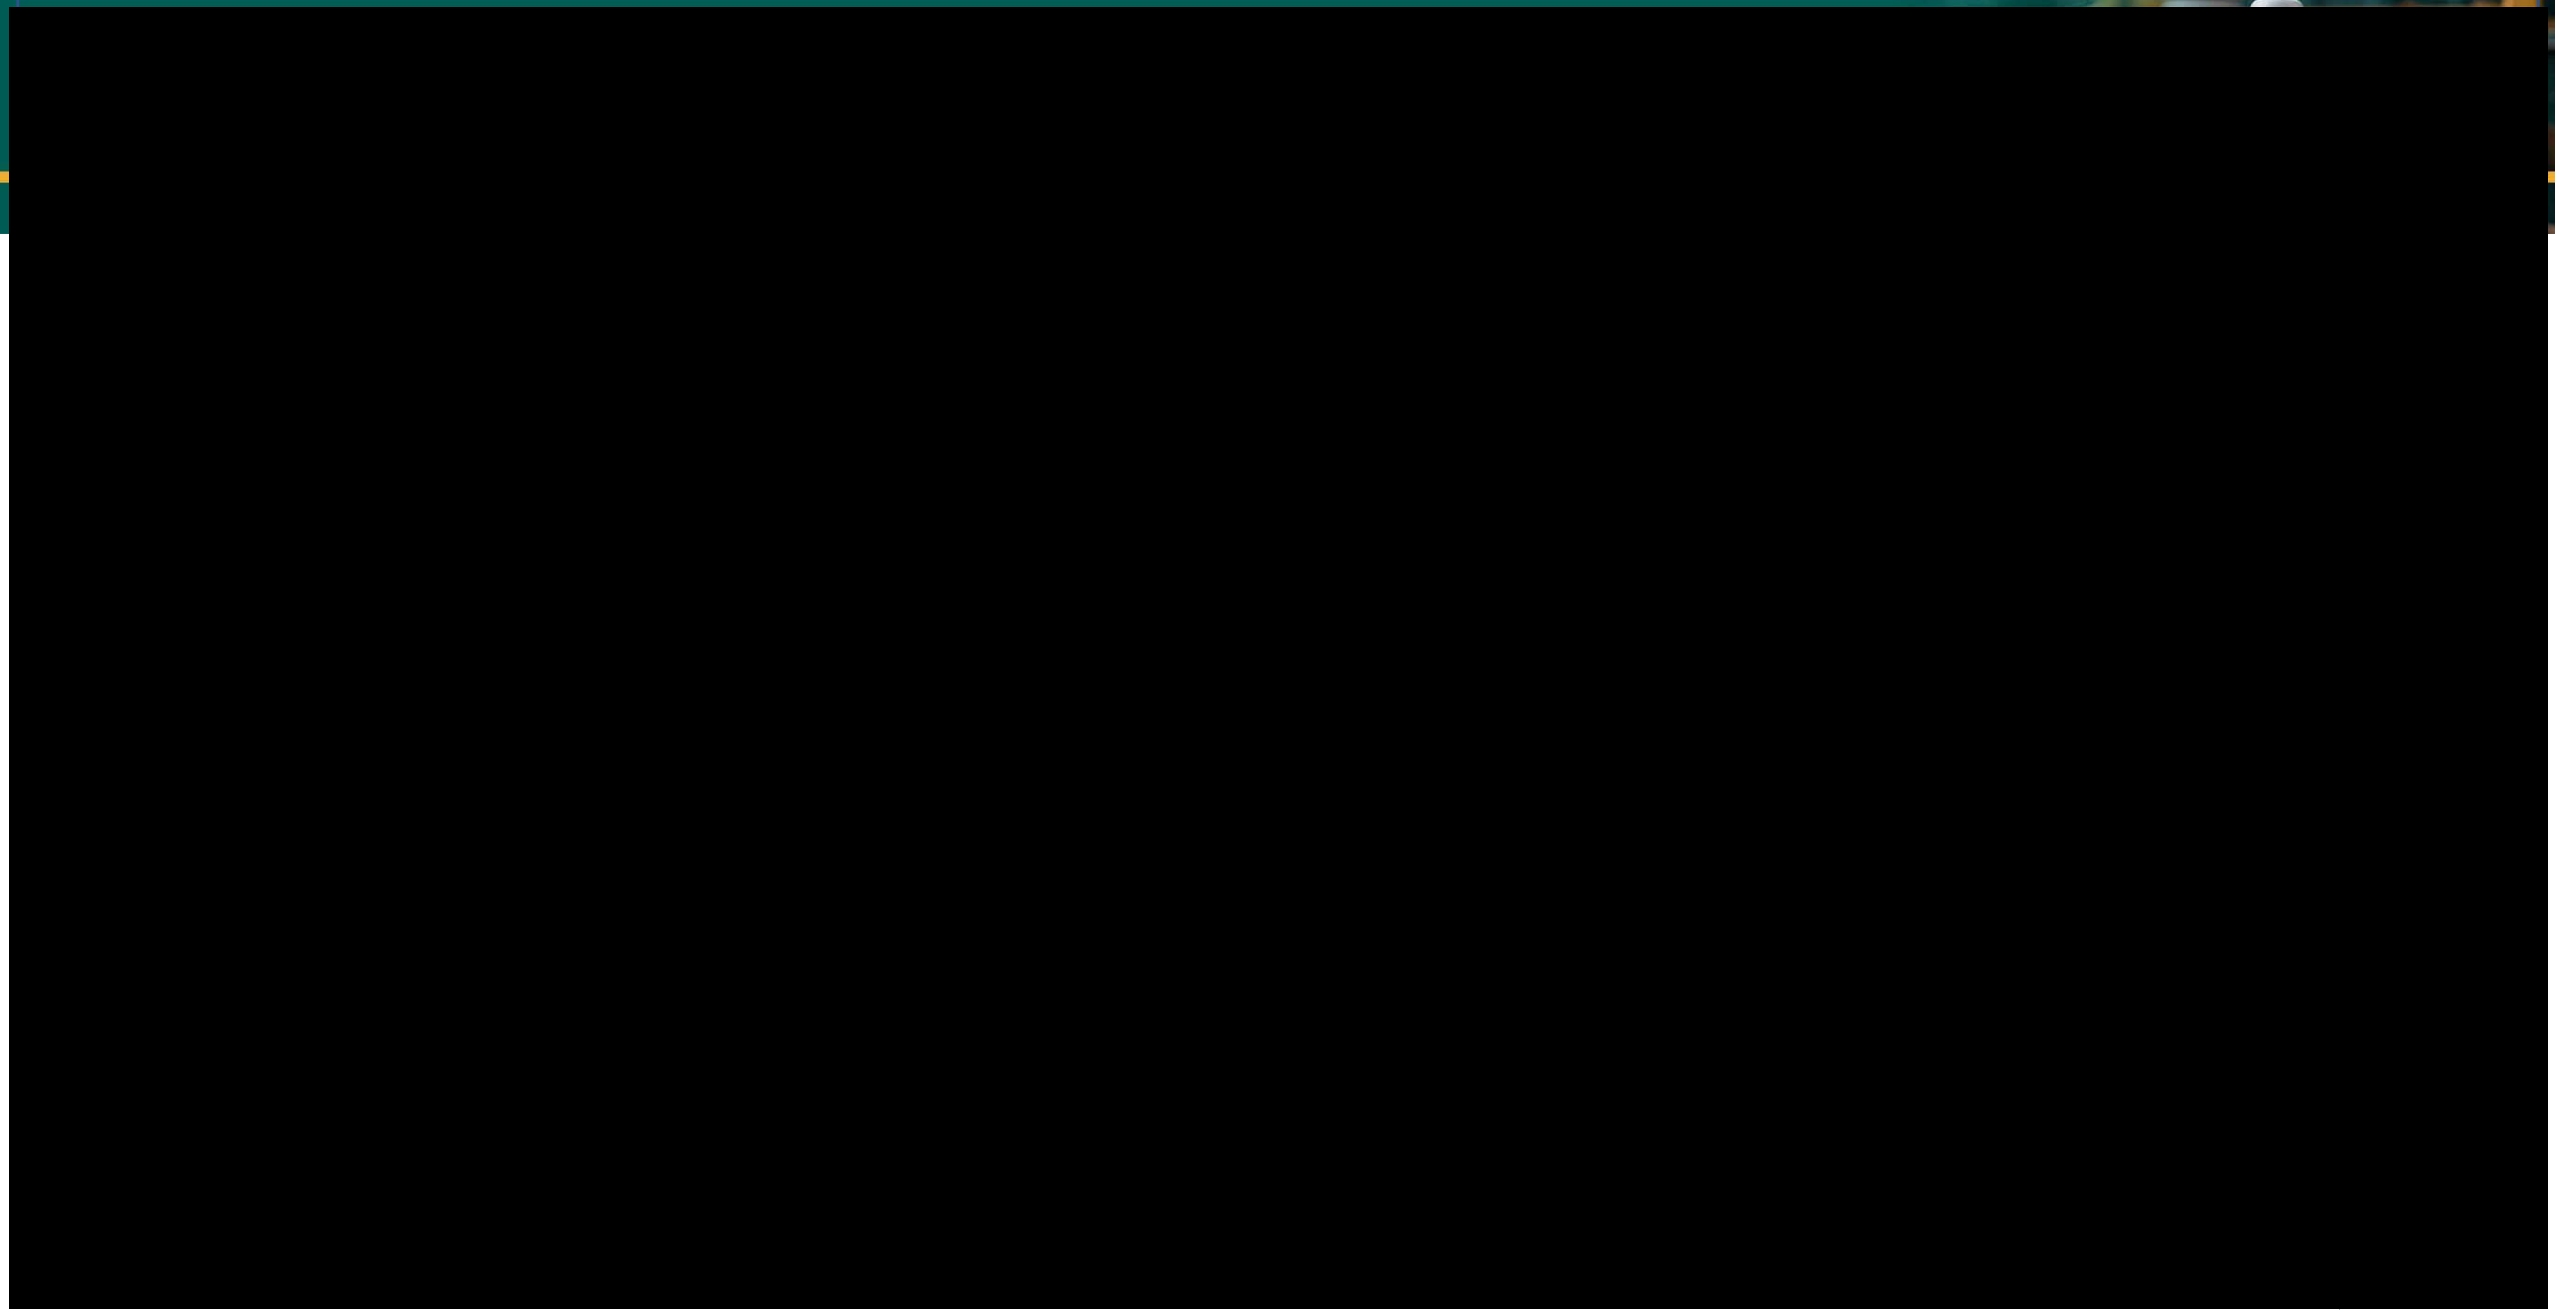
BUSINESS NEEDS
Identification of Capital Investment and Operational needs that underpin the Corporate Pillars

PEOPLE STRATEGY
Workforce of Tomorrow

Build a culture of safety, sustainment and innovation that propels TH into the future



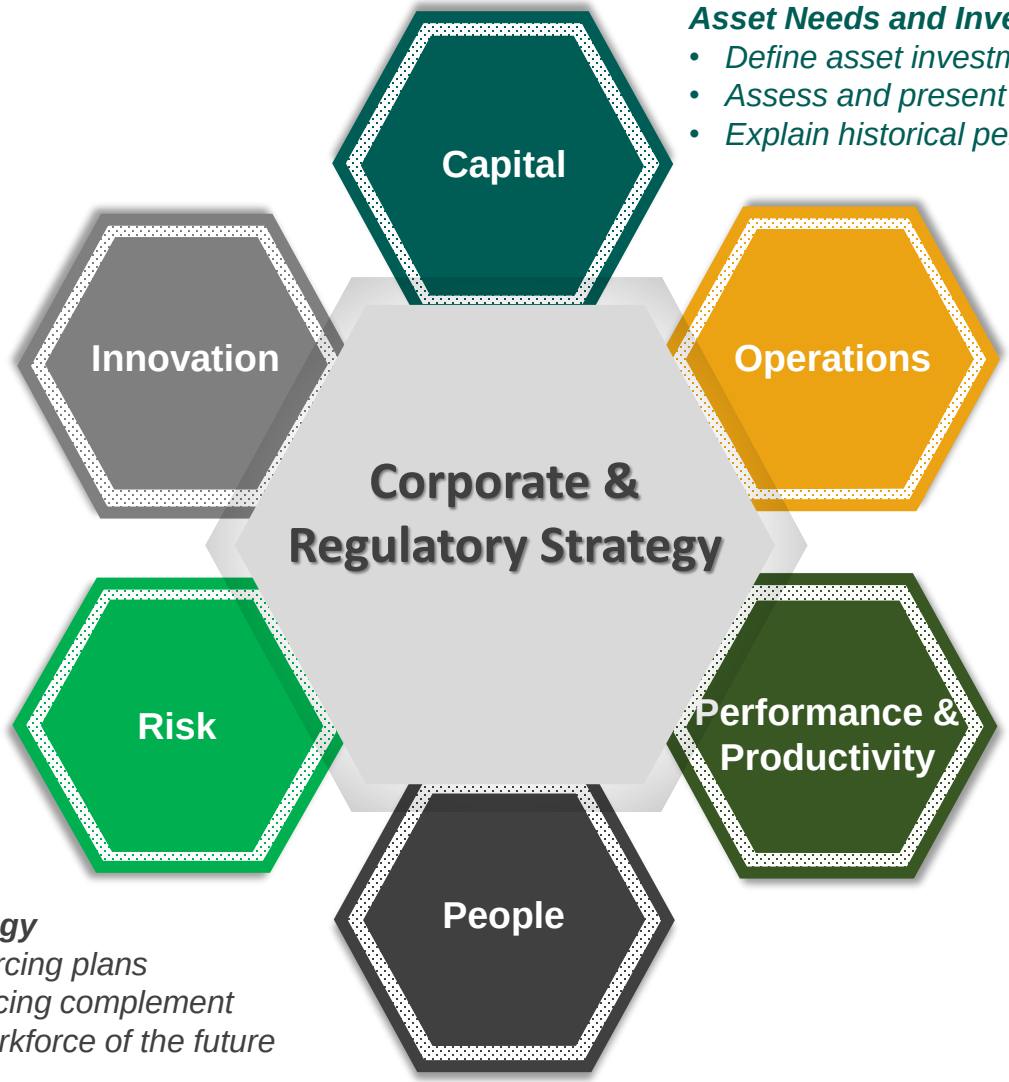
COMPLIANCE REVIEW
Consideration of compliance requirements and related mitigating actions



REGULATORY ALIGNMENT
- 2023-2024: Alignment to 2020-2024 OEB decision and inclusion of new emerging issues (e.g.: customer connections, inflation)
- 2025-2029: Alignment to 2025 rate application strategy

RISK ALIGNMENT
Ensure the Business Plan is grounded in ERM assessments and mitigation plans

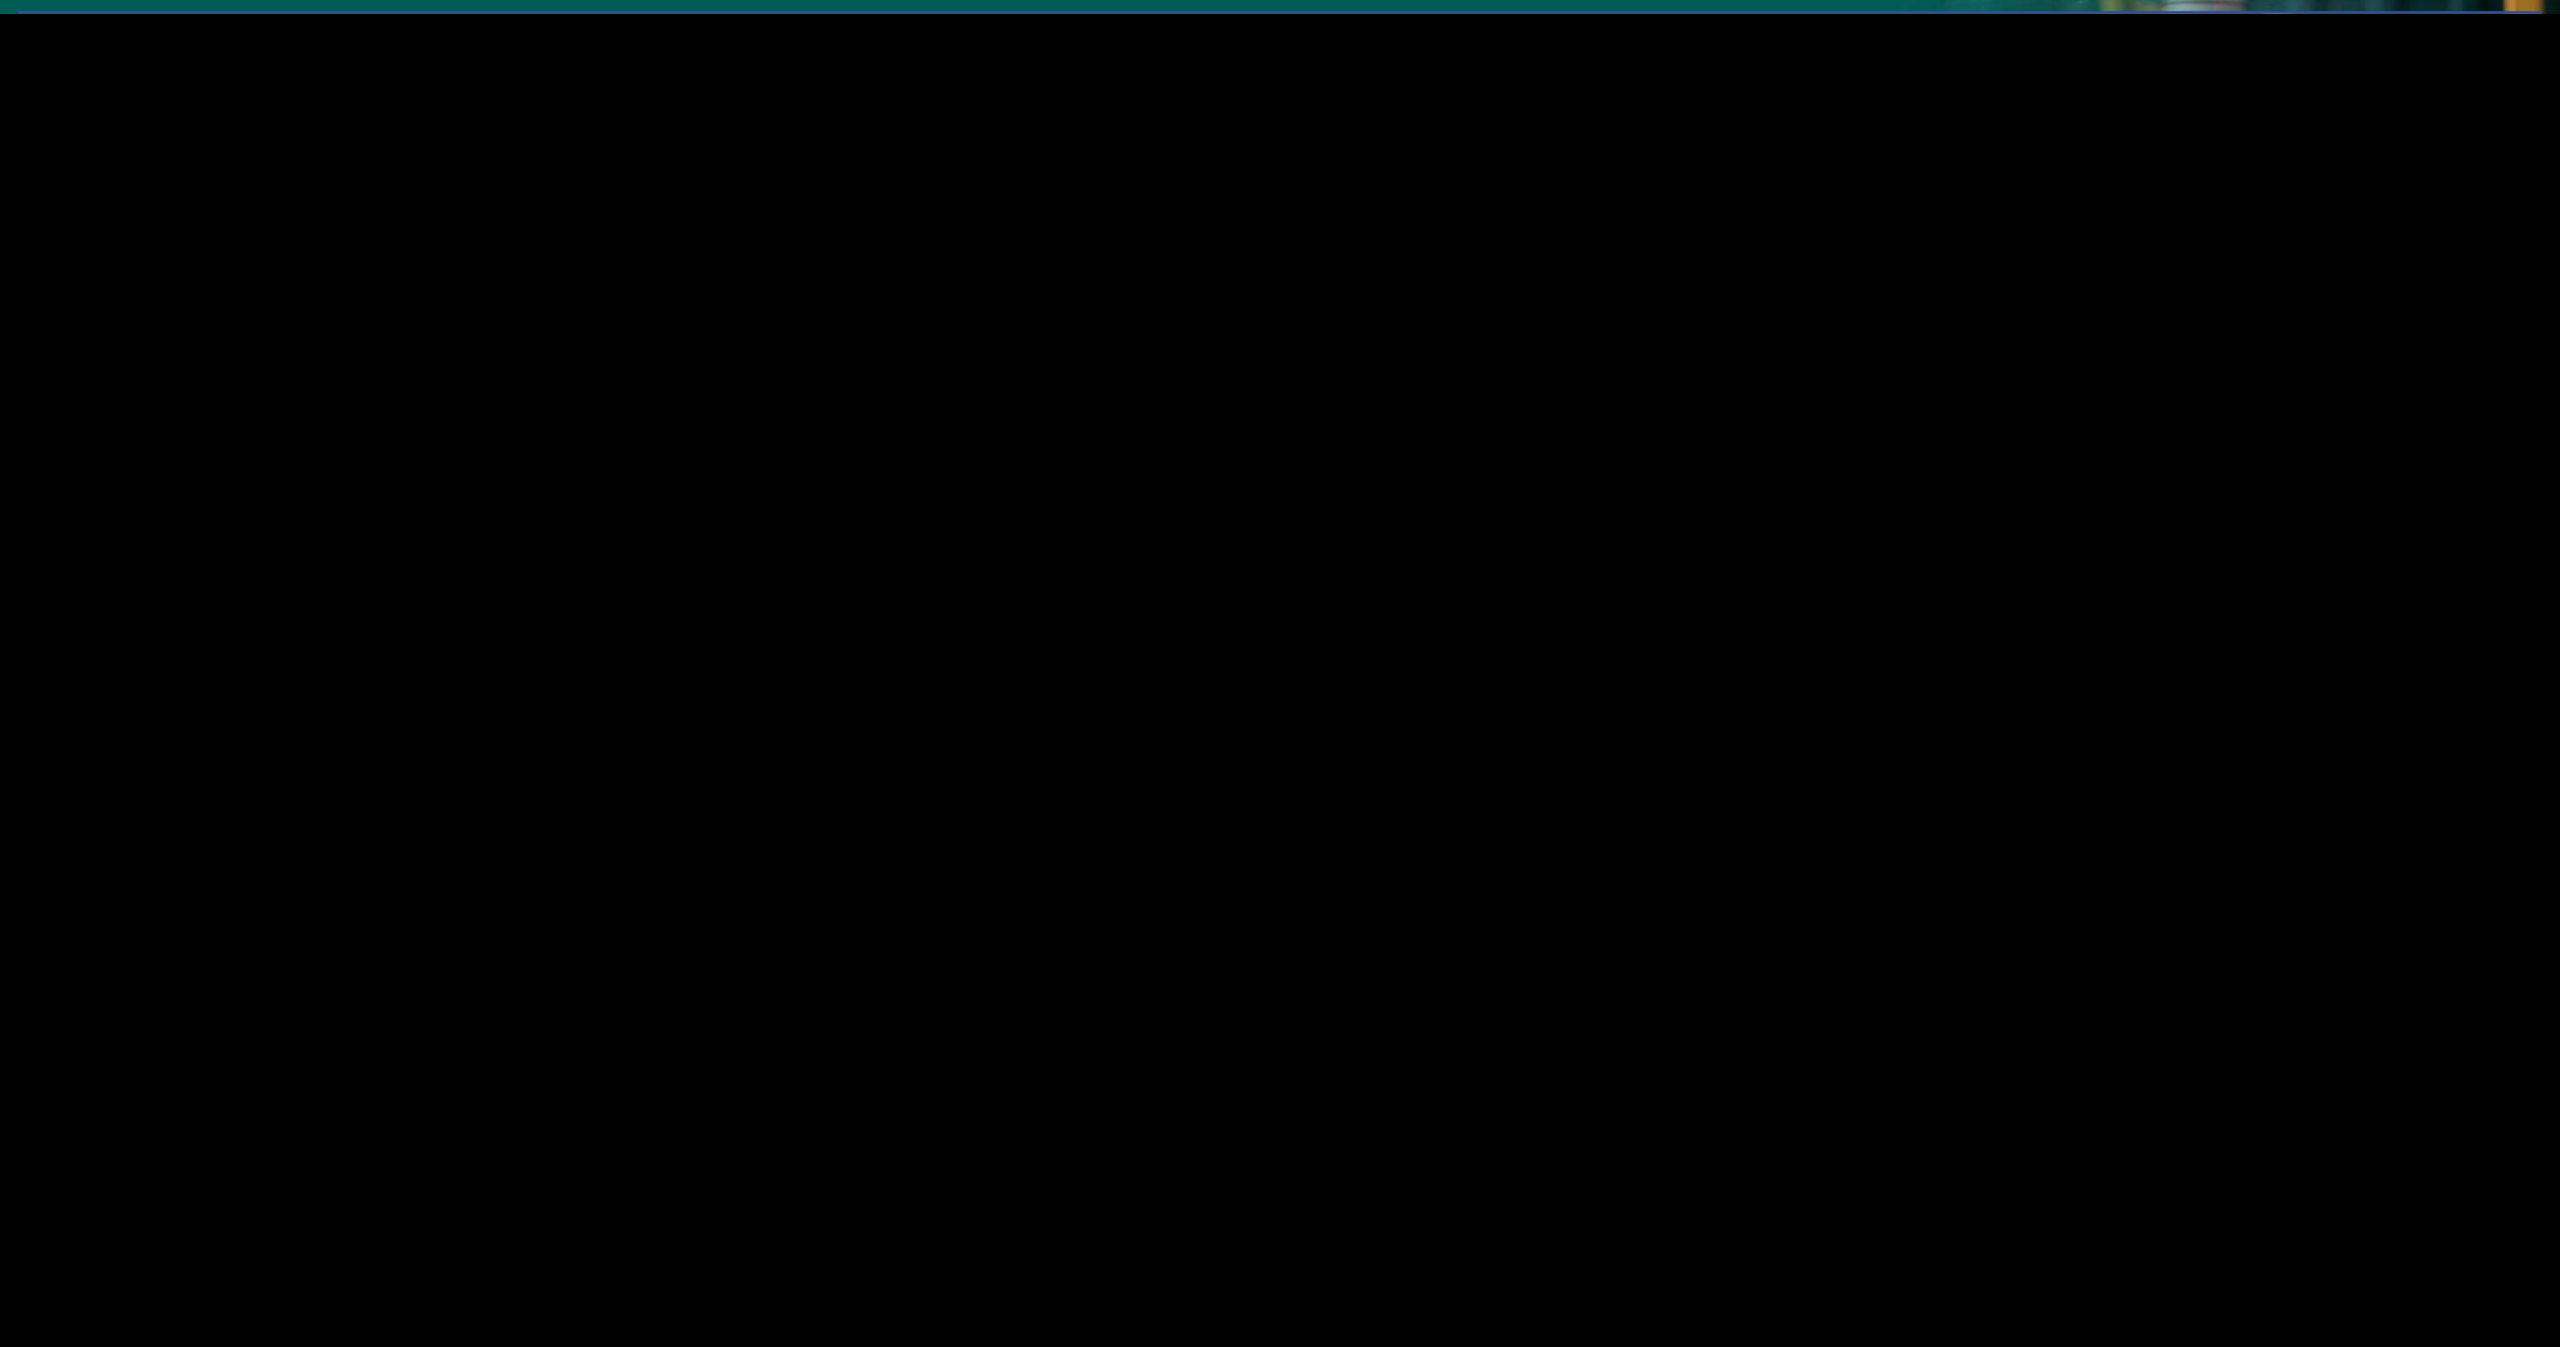
CLIMATE ACTION PLAN
- Support to the Transform TO strategy and initiatives
- Expanded Distributor
- LED Conversion
- Other climate mandates



Regulatory
2025-29 Planning Focus

Asset Needs and Investment Drivers
- *Define asset investment needs and drivers for the 2023-2029*
- *Assess and present options to manage performance*
- *Explain historical performance and cost variances*

Innovation
- *New technologies and practices*
- *Non-Wires Alternatives/DERs*
- *Grid optimization and modernization*



Operational Needs and Drivers.
- *Define business needs and drivers for 2023-2025*
- *Assess emerging trends and needs 2026-2029*
- *Explain historical performance and cost variances*

Enterprise Risk Framework
- *Manage oversight risk (e.g. disallowances)*
- *Develop a balanced risk-adjusted plan*

Performance & Productivity
- *Integrate performance objectives into planning analysis and decision-making*
- *Create direct links between planning and productivity/efficiency (e.g. benefits realization)*

Workforce Strategy
- *Optimize resourcing plans*
- *Balance resourcing complement*
- *Develop the workforce of the future*

Investment Planning & Portfolio Reporting

WHAT?

IPPR is a comprehensive and integrated annual planning process for all distribution system, fleet, facilities, and IT/OT investment programs.

Analyze
current state and future needs

Develop
short-term and long-term plans

Optimize
risks, outcomes, and cost

FOCUS

	2020-2024 Planning	Planning Discretion	2025-2029 Planning	Planning Discretion
Year 1	Re-baseline Plan	Moderate	Strategic Planning	Very High
Year 2	Work the Plan	Low	Strategic Planning	Very High
Year 3	**Work the Plan**	**Low**	**Penultimate Plan**	**High**
Year 4	Work the Plan	Very Low	Final Plan	Moderate
Year 5	Close-out the Plan	None	Prepare to Re-baseline	Moderate

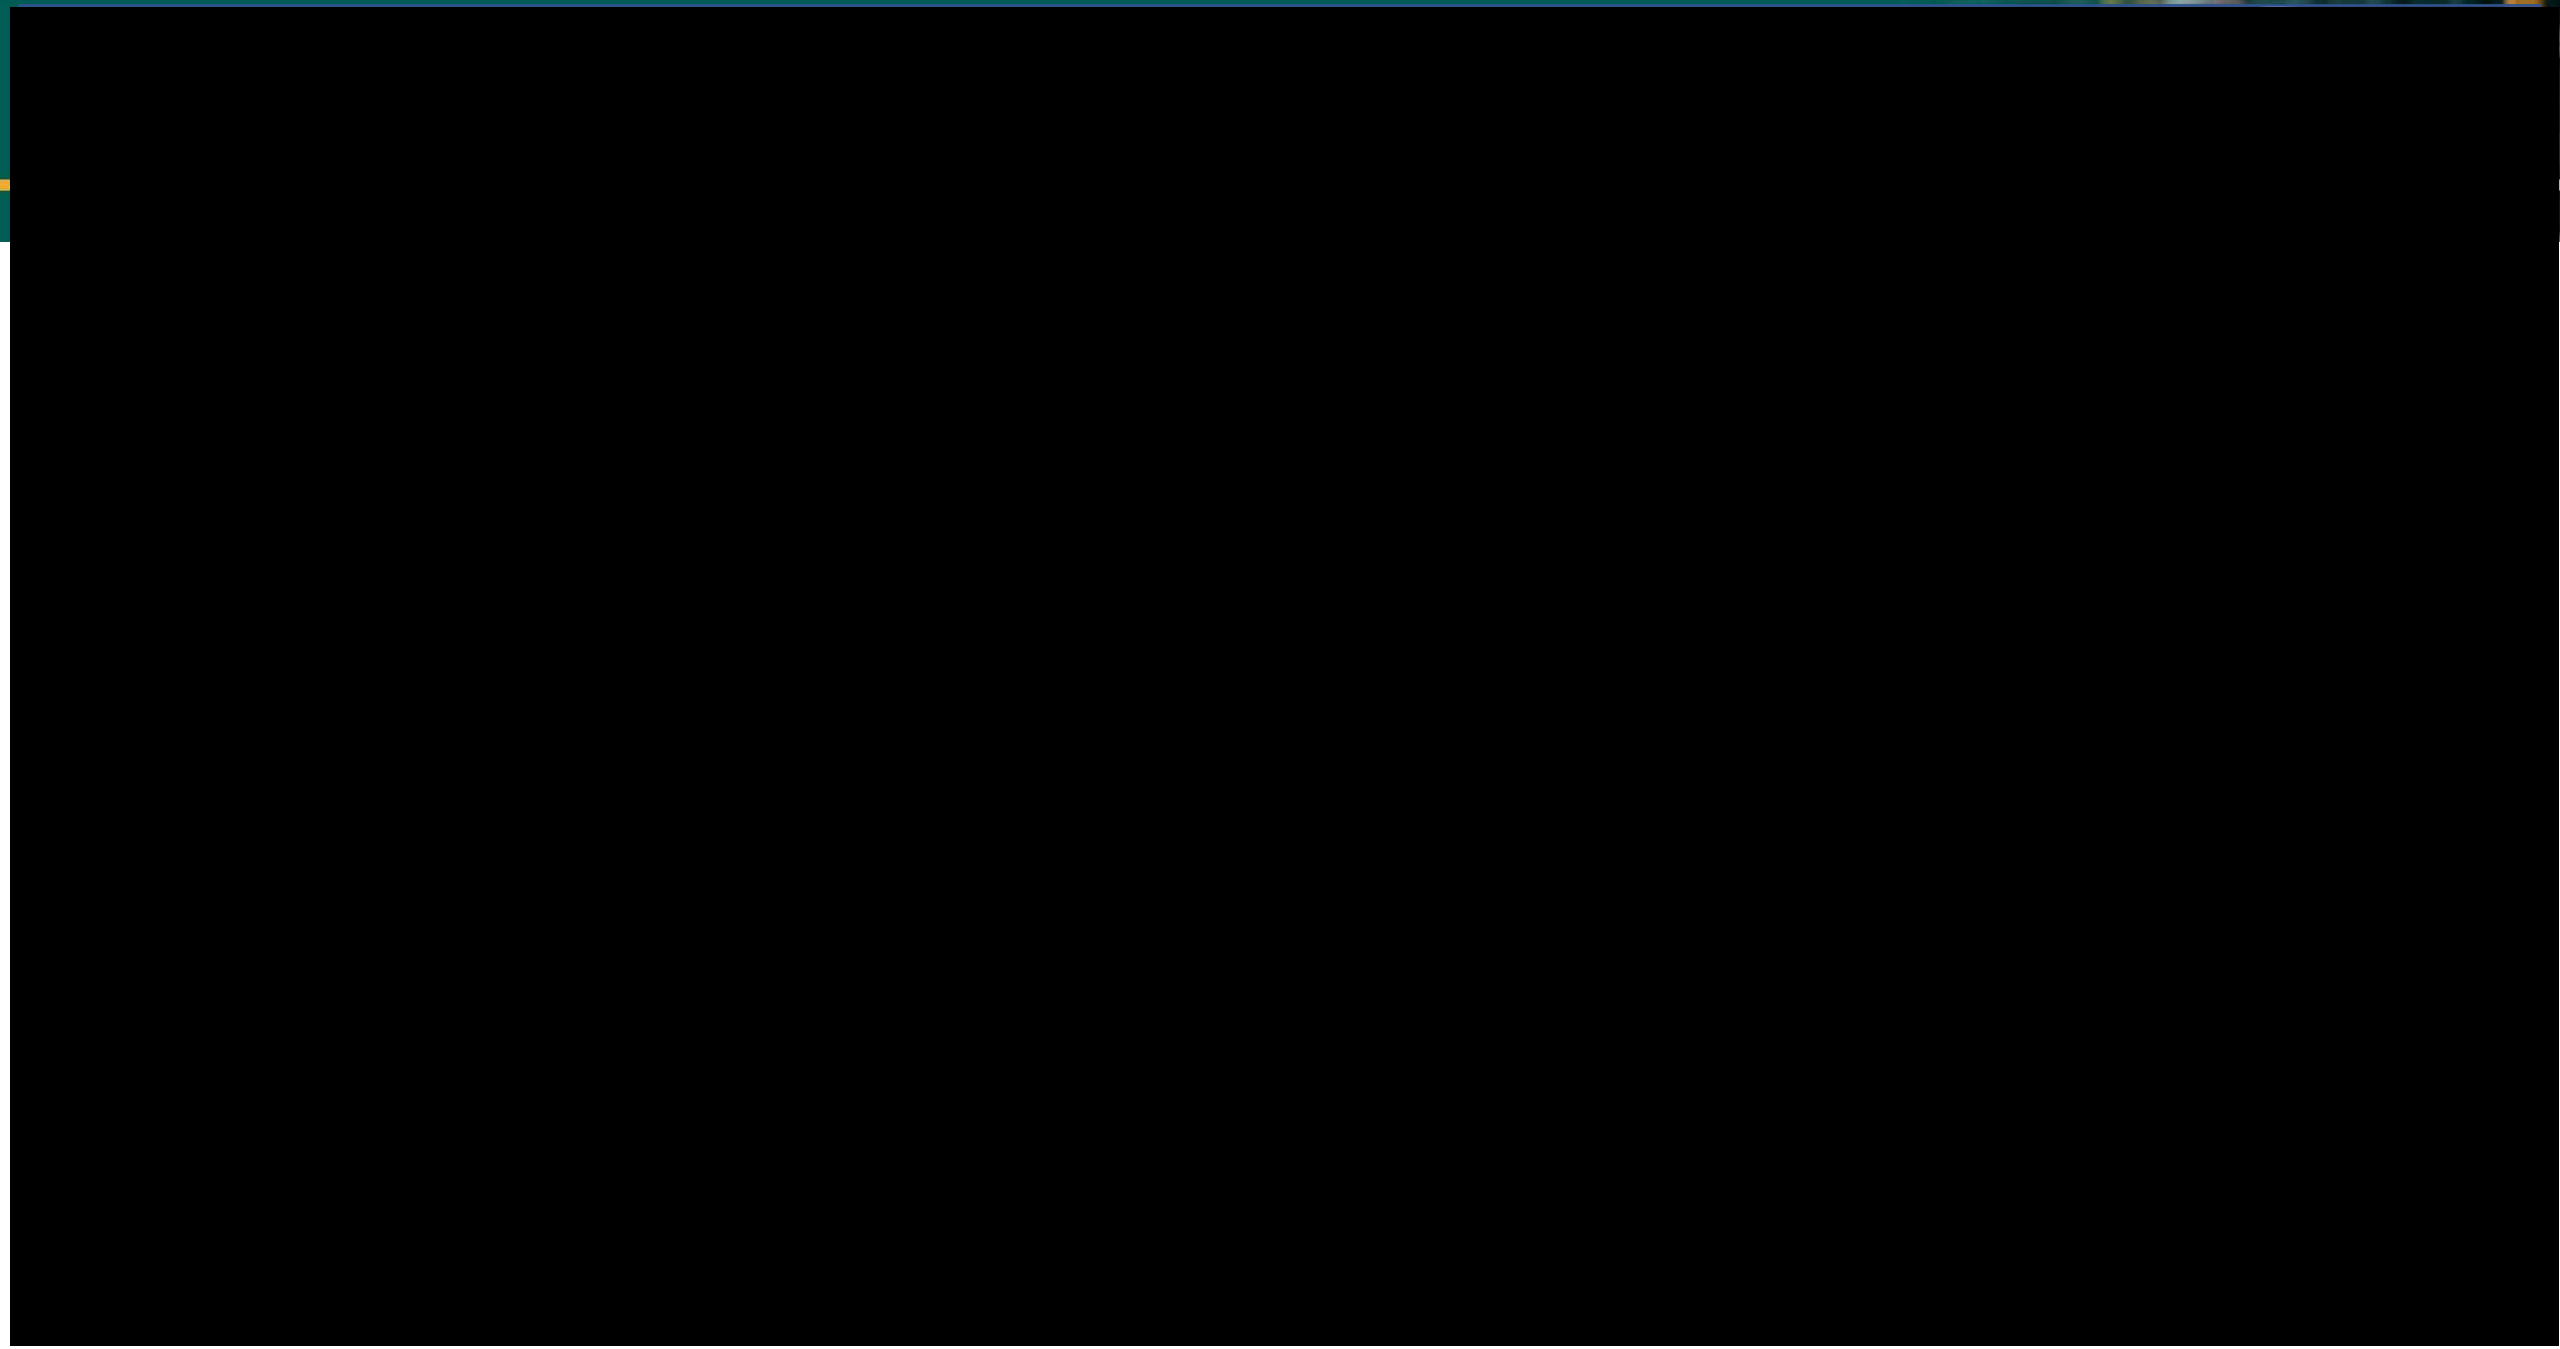
Business Plan Risk Review

Overview

Goal

Ensure the 2023 Business Plan addresses the enterprise risks and mitigations as identified in the corporate risk assessment (RA) process

Collaborate



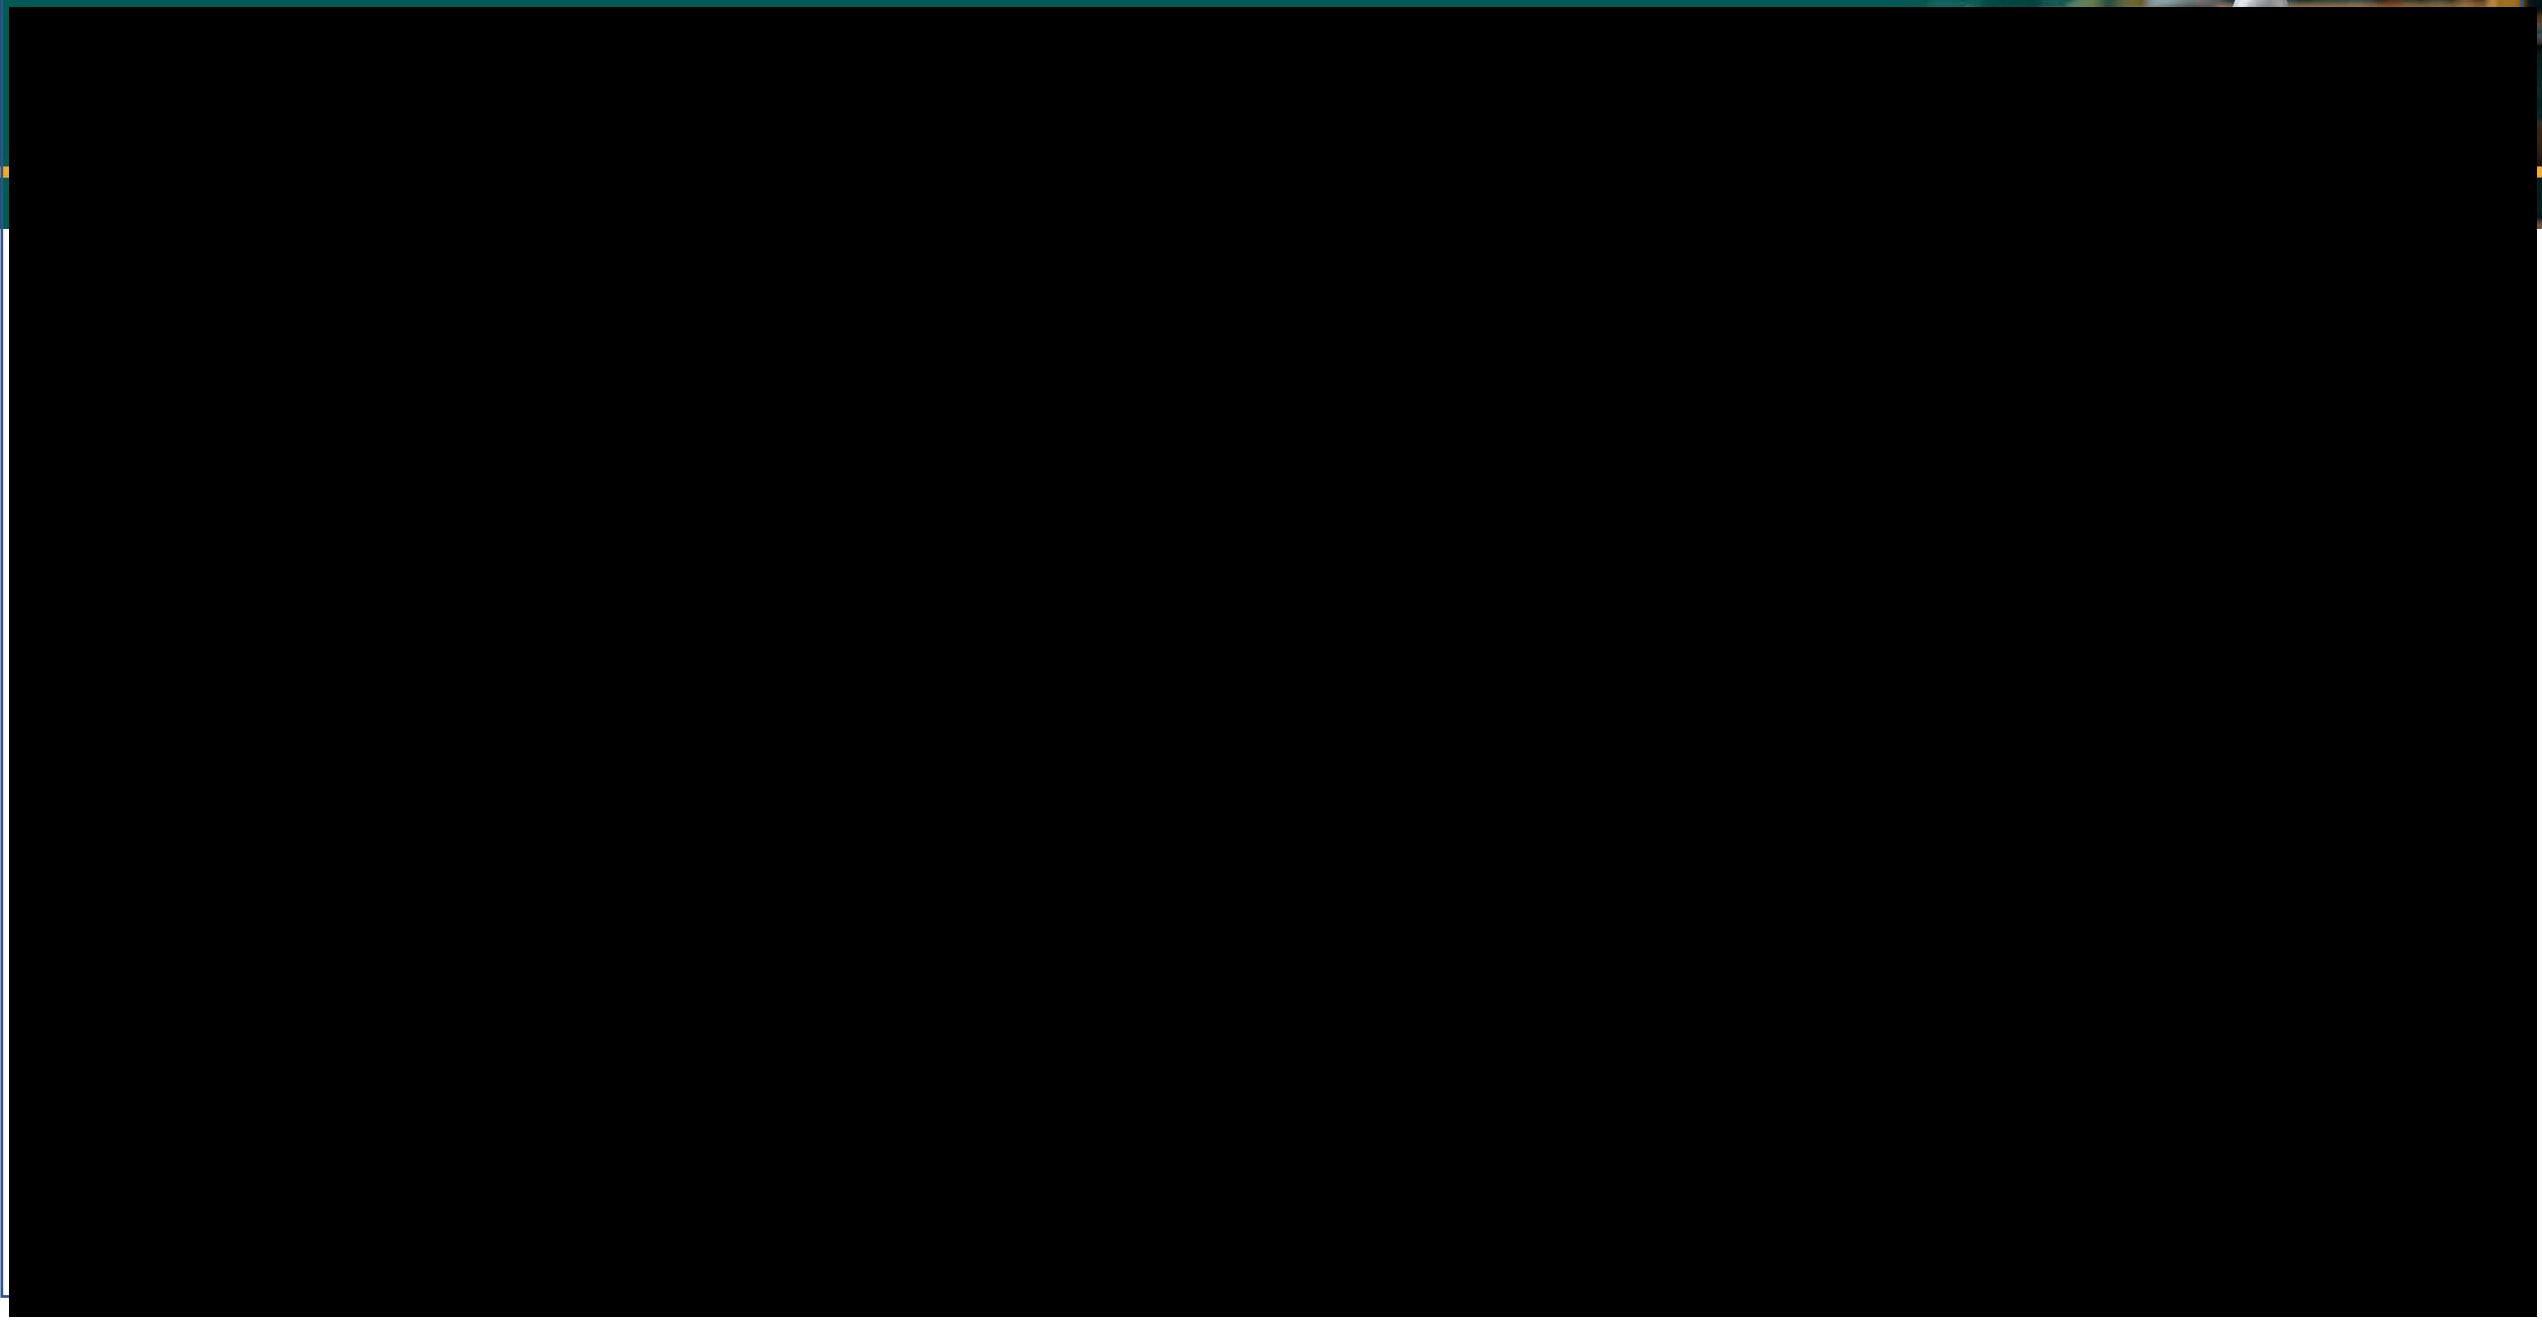
- Risk DRPs identified control weaknesses, mitigations and required actions during the annual RA process
- ERM key partner in business plan process at the outset

Process

- Critically examine proposed impacts to key mitigations
- Close control deficiencies identified during RA and test/implement action plans

Results

- Presentation on control deficiency closure and RA action plan implementation
- Consideration of RA heat map results
- Determine impact on risk position



Connect with us

TORONTO HYDRO®

APPENDIX

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-7

Reference: [Ex.1B]

QUESTION:

Please provide summaries of all internal audit reports conducted since 2020, related to any aspect that directly or indirectly relates to Toronto Hydro's business, their findings, recommendations, and the status of any actions that have or are to be taken.

RESPONSE:

Please refer to the attached appendix.

Insight: 29 reports were issued between 2020 and 2024 (February 2024), including 209 observations. 150 are remediated and 59 are unremediated but on track for timely completion.

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
07-May-20	Information Technology General Controls - 2020	Documentation of changes to IT Incidents	Changes, including delays and priorities, are not formally documented to ensure that IT incidents are resolved in a timely manner	**Completed**	31-Jan-21
07-May-20	Information Technology General Controls - 2020	Monitoring of application security logs	User application logs, pertaining to key applications, in some instances are not formally monitored by the Information Security Team using an appropriate monitoring application to ensure that security threats (such as unauthorized access) are identified and resolved on a timely basis	**In-Progress**	30-Sep-24
07-May-20	Information Technology General Controls - 2020	Password policy compliance	Password configurations for the Operational Data Store (ODS) application and MV90 database do not fully comply with Toronto Hydro password policies	**Completed**	30-Sep-23
07-May-20	Information Technology General Controls - 2020	Review of information security policy, standards and guidelines	IT Standards and Guidelines, in one instance, was not formally reviewed and signed off to ensure that published versions used by Toronto Hydro personnel are accurate and appropriately approved	**Completed**	30-Jun-21
07-May-20	Information Technology General Controls - 2020	Review of third-party Connexo database controls	Third party controls over the Connexo database, used to store hydro consumption data, are not being formally reviewed to ensure compliance with Toronto Hydro standards	**Completed**	30-Jun-21
07-May-20	Information Technology General Controls - 2020	SAP configuration change management	An opportunity exists to formalize the documentation and approval process for configuration changes, involving the locking and unlocking of the SAP production environment	**Completed**	30-Jun-21
31-Jul-20	IESO Settlement	IESO Invoice Review and Payment Approval	An opportunity exists to streamline and enhance the effectiveness of the IESO invoice review and payment approval process by incorporating high level analysis and insights to support the accuracy of the IESO invoice	**Completed**	31-Dec-20
31-Jul-20	IESO Settlement	Meter Data Review	The daily review of meter data accuracy does not currently include a completeness review to ensure that all grid supply point (GSP) meters are part of the review for load accuracy and reasonability	**Completed**	30-Sep-20
31-Jul-20	IESO Settlement	Purchase Load Completeness Reconciliation	The completeness of the monthly IESO purchase load is not validated by reconciling the total meters included within our monthly purchase load records to the total meters within the IESO records	**Completed**	30-Sep-20
31-Jul-20	IESO Settlement	Timeliness of Journal Entry Reviews	Monthly journal entries pertaining to the cost of power are not in all cases reviewed on a timely basis and the Accounting Policy does not define the deadline for the approval of standard journal entries	**Completed**	31-Dec-20
31-Jul-20	IESO Settlement	IESO Submission Review	Regulatory reporting activities pertaining to the monthly wholesale settlement submissions are not formally and independently reviewed prior to online submission to the IESO	**Completed**	5-Jun-20
31-Jul-20	IESO Settlement	IESO Website Access	Access, for approved Toronto Hydro personnel to login and submit regulatory reporting information to the IESO website, is not reviewed on a periodic basis in accordance with the IESO Market Participant Control Considerations	**Completed**	31-Jul-20
31-Jul-20	IESO Settlement	Monitoring Conservation Demand Management Claims and Receipts	Conservation Demand Management (CDM) claims and receipts from the IESO that are recorded within our financial records are not reconciled on a periodic (ie monthly) basis to ensure timely detection of misalignment requiring investigation	**Completed**	30-Sep-20
31-Jul-20	IESO Settlement	Process Map and Standard Operating Procedures	End-to-End documentation of process maps and standard operating procedures (SOP's) including internal controls are not formally documented	**Completed**	31-Dec-20
31-Jul-20	IESO Settlement	Review of System and Organization Controls (SOC) Report for IESO	IESO's System and Organization Controls (SOC) report is not reviewed to ensure reliance on IESO's control environment is appropriate	**Completed**	31-Dec-22
04-Aug-20	Ontario Cyber Security Framework Compliance	Compliance Documentation	An opportunity exists to establish a more structured and robust work program to ensure consistency, sufficiency and completeness of the documentation supporting compliance with the Ontario Cyber Security Framework	**Completed**	30-Sep-22
04-Aug-20	Ontario Cyber Security Framework Compliance	External Audit Coverage	An opportunity exists to document and report external risk assessment coverage across all cyber security risk domains, including those covered through the assessment of OCSF compliance	**Completed**	31-Dec-21
04-Aug-20	Ontario Cyber Security Framework Compliance	OEB Risk Assessment Tool	An opportunity exists to supplement Toronto Hydro internal Cyber Security risk assessment by utilizing the OEB recommended Inherent Risk Profile Tool to ensure that TH's risk assessment results are determined based on standardized criteria that can be compared with external benchmarks from other local distribution companies	**Completed**	24-Jun-20
04-Aug-20	Ontario Cyber Security Framework Compliance	Residual Risk Assessment	An opportunity exists to perform the residual risk assessment, as recommended by the Ontario Cyber Security Framework, to ensure that the residual risks after controls are appropriately managed	**Completed**	30-Sep-22
07-Aug-20	Employee Travel and Expense	Expense Auditing Methodology	An opportunity exists to assess if a risk-based sampling methodology can more efficiently reduce the residual risk of an inappropriate expense claim to an acceptable level	**Completed**	31-Dec-22

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
07-Aug-20	Employee Travel and Expense	Manager review effectiveness	Employees are submitting a significant volume of reports containing errors and their Leaders are not consistently performing an effective review of their expense reports to ensure that these errors are detected and prevented	**Completed**	30-Apr-21
07-Aug-20	Employee Travel and Expense	Reporting and scorecarding of non-compliance with Expense Reimbursement Policy	Opportunity exists to improve the effectiveness of the existing non-compliance reporting process	**Completed**	31-Jan-21
07-Aug-20	Employee Travel and Expense	Sensitive T&E access	Access to perform highly sensitive T&E SAP transactions has not been appropriately restricted	**Completed**	31-Jan-21
07-Aug-20	Employee Travel and Expense	Standard Operating Procedures	Standard Operating Procedures (SOPs) are not reviewed and updated on timely basis	**Completed**	31-Mar-21
19-Nov-20	Engineering, Capital Planning & Execution - Phase 1	Access to Capital Planning and Budgeting files	Access to key capital planning and budgeting files (eg Capital Model, Capex Budget, etc) is not appropriately restricted to ensure that only authorised personnel have read/write access	**Completed**	31-Dec-20
19-Nov-20	Engineering, Capital Planning & Execution - Phase 1	Process Map and Standard Operating Procedures	End-to-End documentation of process maps and standard operating procedures (SOP's) are not formally documented	**Completed**	31-Dec-20
19-Nov-20	Engineering, Capital Planning & Execution - Phase 1	Reporting Root Causes for Change Requests	An opportunity exists to enhance the existing review process for the key budgetary documents including the Capital Expenditure Budget, In-Service Additions Budget and Capital Model	**Completed**	31-Dec-20
01-Feb-21	Data Loss Prevention	Information Classification Guidelines and Handling Procedures	Guidelines and information handling procedures to support the implementation of the Information Classification Policy have not been developed to ensure that all applicable Toronto Hydro users of information have sufficient awareness and practical guidance required to classify, transmit and store sensitive information in accordance with the policy	**Completed**	30-Jun-22
01-Feb-21	Data Loss Prevention	Third-Party DLP Awareness Program	Opportunities exist for the development of a third-party contractor DLP awareness program to ensure that third-party contractors (ie all vendors with access to our systems and/or handling our sensitive and confidential data) are aware of our requirements and expectations	**Completed**	31-Dec-22
01-Feb-21	Data Loss Prevention	Access to TH Facilities	Access to different parts of the TH facilities including data centers are not reviewed for adequacy, especially for employees who moved within Toronto Hydro organizational structure	**Completed**	31-Dec-21
01-Feb-21	Data Loss Prevention	Change Management for DLP Application	An opportunity exists to formalize the change management governance procedures for McAfee DLP application to address the confidentiality of data and configurations	**Completed**	30-Sep-21
01-Feb-21	Data Loss Prevention	Information Uploads through Cloud Services	Uploads to third party emails (eg Gmail) and cloud storage websites (eg Google Drive) are monitored but not blocked	**Completed**	31-Dec-22
01-Feb-21	Data Loss Prevention	Periodic Review of DLP Rulesets	An opportunity exists to formalize the periodic review procedures of DLP rulesets, including who, when and how the review is performed and documented	**Completed**	31-Dec-21
01-Feb-21	Data Loss Prevention	Retention and Disposal of Data stored by DLP Application	An opportunity exists to define and document the records retention period for data collected by the DLP Monitor application, which is used to scan the majority of data transmitted externally from within Toronto Hydro	**Completed**	31-Dec-21
01-Feb-21	Data Loss Prevention	Review of SOPs and Project Documents	An opportunity exists to review key documents such as the Standard Operating Procedures, Operational Project Documents and Incident Response Playbook(s) to ensure that the most recent versions, being used by personnel, are accurate and appropriately approved	**Completed**	30-Sep-21
01-Feb-21	Information Technology General Controls - 2021	Formalizing the Review and Reporting of Vulnerability Assessment Reports	Timely vulnerability remediation activities are being performed and documented, however monthly Vulnerability Assessment reports are not being formally prepared, reviewed and reported in compliance with the Vulnerability Management Standard	**Completed**	30-Nov-21
01-Feb-21	Information Technology General Controls - 2021	Additional Financial System Backups	Additional financial system's backups (ie an additional backup on top of the full back performed weekly) are not being performed on an annual basis in compliance with Toronto Hydro's Backup policy	**Completed**	30-Sep-21
01-Feb-21	Information Technology General Controls - 2021	Obsolete Guidance	A process that ensures timely decommissioning of obsolete system architecture standards and guidelines, stored on PluggedIn, has not been established	**Completed**	31-Dec-21
01-Feb-21	SCADA	Information Classification Guidelines and Handling Procedures (Remediation in progress)	Guidelines and information handling procedures to support the implementation of the Information Classification Policy have not been developed to ensure that all applicable Toronto Hydro users of information have sufficient awareness and practical guidance required to classify, transmit and store sensitive information in accordance with the policy	**Completed**	30-Jun-22
30-Jul-21	Unbilled Revenue	Journal Entry & Account Reconciliation Review	The journal entry and account reconciliation review controls did not prevent recording errors of Ontario Electricity Rebate (OER) reimbursements from the IESO that resulted in misclassifications between account receivable accounts (ie accounts receivable and unbilled revenue receivables) during Q2 and Q3 2020	**Completed**	30-Jun-21

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
30-Jul-21	Unbilled Revenue	Unbilled Revenue Accrual Analysis	An opportunity exists to further substantiate the reasonability of the unbilled revenue accrual, determined by the Electricity Revenue Application, with a more robust analysis including the comparison of the estimated accrual to the subsequent actual billings	**Completed**	31-Dec-22
30-Jul-21	Unbilled Revenue	Unbilled Revenue Accrual Methodology	The methodology for calculating the unbilled revenue accrual, which varies across the electrical utility sector, is not periodically reviewed with a pre-defined frequency (eg annually or bi-annually) to ensure ongoing alignment with best and leading practices	**Completed**	31-Dec-22
30-Jul-21	Unbilled Revenue	Process Map and Standard Operating Procedures	End-to-End documentation of process maps and standard operating procedures (SOP's) including internal controls are not being maintained on a pre-defined frequency	**Completed**	31-Dec-22
30-Jul-21	Unbilled Revenue	Rate Change Assessment Documentation	Changes to rates in the CC&B billing system are reviewed for potential impacts to the unbilled revenue accrual according to Management, however the change assessment impacts are not documented in instances where rate changes are determined to have no impact	**Completed**	30-Sep-21
30-Jul-21	Unbilled Revenue	Retention and Disposal of Data Stored in ERA	An opportunity exists to define and document the records retention period for data collected in ERA	**Completed**	31-Dec-22
30-Jul-21	Unbilled Revenue	System Reconciliation Documentation	The ERA, used to calculate the Unbilled Revenue Accrual, relies on data from the billing system (CC&B), however management has not established a process to evidence the pre-existing monthly completion and review of the system reconciliation	**Completed**	30-Sep-21
05-Nov-21	Customer Billing	Documentation of Process Map and Standard Operating Procedures	End-to-end documentation of operational process maps) and Standard Operating procedures, including internal controls, are not being adequately documented, reviewed and maintained	**Completed**	31-Dec-22
05-Nov-21	Customer Billing	Review of Customer Communication Templates	Customer Letters pertaining to the applicability of the Ontario Energy Rebate and rate pricing options (ie time of use vs fixed rate) were not effectively reviewed prior to distribution and in some circumstances, the letters contained errors	**Completed**	31-Jan-22
05-Nov-21	Customer Billing	Third Party Control Reliance	Reliance is placed on third party vendors for bill processing in Toronto Hydro's CC&B Billing system and for printing customer hydro bills, however the third-party vendors' controls are not validated (via SOC 2 third party control report, control testing or periodic audit) on a predefined basis to ensure that reliance is appropriate	**Completed**	30-Aug-22
05-Nov-21	Customer Billing	Bill Adjustment Approval Access	Access to approve manual billing adjustments (including refunds) in CC&B has not been appropriately restricted	**Completed**	31-Dec-21
05-Nov-21	Customer Billing	Documentation of Billing Quality Assurance Monitoring	The Revenue Assurance and Compliance team performs quality assurance monitoring of Customer Bills on a monthly basis, however the results of expanded sampling, which are performed when exceptions are noted in the original sample, are not documented or included within the internal scorecard metric for billing accuracy	**Completed**	31-May-22
05-Nov-21	Customer Billing	Refund Adjustment Review	In some instances, the monthly review of refund adjustments below $2K is not completed within the control timeline and in some instances the review and approval of the refund adjustment is not documented in an unalterable format by the Supervisor, Accounts Receivable	**Completed**	31-Dec-21
05-Nov-21	SAP Security 2021	Access to development functionality	Access to sensitive development functions are not restricted to authorized personnel	**Completed**	30-Apr-22
05-Nov-21	SAP Security 2021	Firefighter access roles	Access within the Firefighter role in SAP ECC is not sufficiently restricted as it includes more sensitive administrative functions than required	**Completed**	30-Apr-22
05-Nov-21	SAP Security 2021	Access reviews of SAP ECC	Access to Supervisors and above is not included in the annual access review of SAP ECC	**Completed**	31-Jul-22
05-Nov-21	SAP Security 2021	Access reviews of SAP non-ECC systems	An opportunity exists to formalize the documentation for periodic review of access in non-ECC systems to ensure reviews are consistently performed	**Completed**	31-Dec-22
05-Nov-21	SAP Security 2021	Custom program access control	Custom programs & transaction codes in the SAP production environment, some of which may provide user access to update critical financial data and transactions (eg posting journal entries), are not appropriately secured using authorization checks to prevent execution by unauthorized users	**Completed**	31-Oct-22
05-Nov-21	SAP Security 2021	Review of Firefighter access logs	Review evidence of Firefighter access logs, which shows how sensitive access is used by authorized users, is not formally documented	**Completed**	31-Jul-22
05-Nov-21	SAP Security 2021	Review of SOPs	An opportunity exists to review Standard Operating Procedures (SOPs) to ensure that the most recent versions, being used by personnel, are accurate and appropriately approved	**Completed**	31-Jul-22

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
05-Nov-21	Software Licensing	IT Software Procurement Guidance	The Procurement Policy provides guidance on IT software purchases greater than $25K, however, guidance for IT software purchases below $25K are not documented within the policy to ensure awareness of the requisite stakeholder workflow and process requirements (eg Review and approval of cloud-based solutions prior to contractual agreements)	**Completed**	30-Apr-22
05-Nov-21	Software Licensing	Software Request Intake and Documentation	In some cases, software requests are not being routed & tracked through the requisite centralized Remedy service ticketing system or being appropriately supported with the required software request scoping document template	**Completed**	31-Mar-22
05-Nov-21	Software Licensing	License Monitoring Program	Guidelines for Toronto Hydro's Licence Monitoring Program are not formally documented to clearly define the program parameters	**Completed**	31-May-22
05-Nov-21	Software Licensing	Software Cost Reporting	OPEX software costs are not tracked and monitored by business cost center or division to ensure cost awareness and collaborative efforts to monitor and control software costs	**Completed**	31-Aug-22
05-Nov-21	Software Licensing	Documentation of Process Maps	Process maps for business case and scoping document (the evaluation method for software requisitioning) are formally documented but do not reflect the current approval processes by the Center of Excellence and IT Senior Leadership	**Completed**	31-Mar-22
05-Nov-21	Software Licensing	Review of Service Request Management Guideline	Evidence of review and approval of the Service Request Management Guideline is not documented and retained	**Completed**	31-Oct-21
05-Nov-21	Software Licensing	Software Cost for Desktop Applications	Business cost center owners are not informed of individual software costs when approving the software access requisitions for desktop apps within Remedy IT ticketing system	**Completed**	31-Dec-21
05-Nov-21	Software Licensing	Software Utilization Review Documentation	Review of software licence utilization, which ensures that purchased software licences are being appropriately deployed and used, are in some cases not formally documented, including sign-off and dating	**Completed**	31-Mar-22
24-Mar-22	Customer Connections	Administrative Duties Management (Design & Billing)	Especially in the absence of an end-to-end integrated customer connection system, administrative duties and related processes within the Designer role require greater levels of diligence, timely execution and management oversight as they are substantially impacting all other downstream processes within the Customer Connection process	**Completed**	31-Dec-22
24-Mar-22	Customer Connections	Backlogged Customer Connection Requests (Intake & Design)	Customer Connection requests, pertaining to low and high voltage connections that are forwarded from Intake to the Design team for triage, are backlogged as they are not consistently being allocated to individual designers by the Design Supervisors (ie for high voltage) and Design Student (ie for low voltage) on a timely basis and/or within the OEB prescribed timelines	**Completed**	31-Dec-22
24-Mar-22	Customer Connections	CC&B Data Input and Integrity (Reporting)	Customer connection data (eg disconnection and connection dates, customer service request dates, etc) is not being consistently entered into the CC&B Billing system by the Office Administration Team on a timely basis as the operational data is not consistently communicated to them by Designers on a timely basis	**Completed**	30-Jun-22
24-Mar-22	Customer Connections	Green Construction Folders (Construction)	Green Construction Folders, which are used to maintain accurate site drawings and hydro asset locations in the GEAR System, are not consistently returned to the Enterprise Program Management Office (EPMO) group upon completion of customer connections projects	**Completed**	31-Jul-22
24-Mar-22	Customer Connections	Intake Process Bypass (Intake)	Complete and accurate records of all customer connection intake requests, required for end-to-end tracking of customer connection projects, are not being maintained in the CC&B system as the intake process is being bypassed in some instances (eg Direct Designer contact by customers instead of call center/online connection requests)	**Completed**	30-Jun-22
24-Mar-22	Customer Connections	System Alignment and Integration (Reporting)	The CRM Project Management System, CC&B System, and SAP Financial Recording System, used within the Customer Connection process, are not reconciled on a predefined basis or with a sufficiently robust process to consistently facilitate optimized data flow and data accuracy within customer billing, OEB reporting, ongoing project status monitoring and financial recording	**Completed**	31-Jul-24
24-Mar-22	Customer Connections	Customer Connection Estimate Disclosure (Design & Billing)	An opportunity exists to review, revise and standardize the documented guidance and practices for disclosing preliminary estimates to customers in advance of the review process, especially as it pertains to customer connections with higher pricing risk, such as large, material and non-routine projects	**Completed**	30-Jun-22
24-Mar-22	Customer Connections	Design Job Quotation Review for Non-OTC Connections Above 50K (Design & Billing)	The review of job quotations that do not require an OTC (eg temporary connections, isolations, demolitions, relocations, etc) is not consistently performed in accordance with the authorization level requirements with the Toronto Hydro Signing Policy for quotations above 50K	**Completed**	31-Mar-22

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
24-Mar-22	Customer Connections	Design Work in Advance of Payment (Design & Billing)	Design work, in some circumstances, is performed in advance of payment received from customer without a defined process and/or documented approval for non-compliance with Toronto Hydro standards as documented within the Offer-to-Connect customer agreement	**Completed**	31-Jul-24
24-Mar-22	Customer Connections	Enhancement Work and Customer Connections (Design & Billing)	There are inconsistencies on when and how enhancement work (eg replacement of an aging transformer, asset or duct/cables) is being included in designs and on internal process forms (ie, Designer Input Form) and an opportunity exists to standardize the identification of enhancement work with the Customer Connection work	**Completed**	31-Dec-22
24-Mar-22	Customer Connections	Expanded Variance Analysis (Reporting)	There is an opportunity to expand the existing project variance analysis to periodically identify materials and labour variance trends, insights and anomalies by estimate preparer, estimate reviewer and customer over time	**Completed**	31-Dec-22
24-Mar-22	Customer Connections	Intake Channel Monitoring (Intake)	A process to track, monitor and metric customer connections by intake channel (ie online or call center) has not been established to encourage most cost-efficient channel utilization, establish baseline channel volumes ahead of the incoming improved online intake customer connection portal and identify connection requests received through unofficial channels (eg direct customer to designer contact)	**Completed**	30-Sep-22
24-Mar-22	Customer Connections	Project Variance Threshold Review (Reporting)	While customer connection projects exceeding predefined KPI thresholds are reviewed by the Enterprise Program Management Office on an annual basis, there may be an opportunity to lower/tighten the threshold and/or expand variance analysis using additional selection criteria to ensure that random coverage exists for variances outside of the predefined thresholds	**Completed**	30-May-22
24-Mar-22	Customer Connections	Regional Team Process Standardization (Design & Billing)	There is an opportunity to standardize and document the Designer and Construction team roles, responsibilities and best practices across the East, West and Central regional groups	**Completed**	31-Jul-23
24-Mar-22	Customer Connections	Regulatory Reporting of Service-level Metrics – Timely Completion of Connection Requests (Reporting)	There is an increased risk of inaccurate reporting to the OEB regarding percentage of low-voltage customer connection requests serviced within five days, due to management misinterpretations of the calculation inclusions (ie disconnections were incorrectly included within the calculations) which flowed into the review process	**Completed**	28-Feb-21
24-Mar-22	Customer Connections	Regulatory Reporting of Service-level Metrics – Timely Written Responses to Customer Enquiries and Appointment Scheduling (Reporting)	There is an increased risk of inaccurate reporting to the OEB due to inconsistencies in the methodology of metrics measuring the timeliness of responses to customer enquiries and booking of customer appointments	**Completed**	30-Jun-22
24-Mar-22	Customer Connections	Capital Contribution Rebates from Customers Connected to Assets Previously Expanded (Design & Billing)	There is no process established to identify capital contribution rebates to be collected from customers with Short Form Offers to Connect (OTC) who are being connected to an asset that was previously expanded through a pre-existing OTC	**Completed**	31-Dec-22
24-Mar-22	Customer Connections	Designer Input Form Review (Design & Billing)	A process to review and sign-off the Designer Input Form, the data of which is used to calculate design estimates, capital contributions and expansion deposits, has not been established	**Completed**	31-Jan-23
24-Mar-22	Customer Connections	Payment Instructions (Design & Billing)	An opportunity exists to revise the payment instructions, sent to Connection Customers along with their invoice, to explicitly limit cash payments to situations only allowed under OEB's Distribution System Code, and discourage cash payments	**Completed**	30-Sep-22
24-Mar-22	Customer Connections	Upstream Prerequisites Facilitating Automated Project Variance Analysis (Design & Billing)	The automation of Project Variance Calculations within SAP requires manual intervention to perform as Design Supervisors are not consistently inputting their paper-based customer connection estimate approvals into SAP, which is a prerequisite for the automation of the project variance calculations	**Completed**	31-Dec-22
24-Mar-22	Customer Connections	Work Allocation & Rotation (Design & Billing)	A standardized methodology for allocating design work and work rotation has not been established to ensure that design work is appropriately assigned and that customer familiarity risks are managed and mitigated	**Completed**	31-Dec-22
14-Apr-22	Information Technology General Controls - 2022	Access Approval for New Hires	In some cases, System Access for new hires is not being approved within the Remedy IT Service Ticketing System by the appropriate level of management, as required by the Internal Access Control Standard	**Completed**	30-Jun-22
14-Apr-22	Information Technology General Controls - 2022	Periodic review of Policies, Guidelines and Standards	Information Technology policies, guidelines and standards are not being reviewed within a defined timeline	**Completed**	31-Dec-22
22-Aug-22	Employee Travel and Expense 2022	Expense Auditing Methodology and Duplicate Expense Claim	An opportunity exists to assess if a risk-based sampling methodology can more efficiently reduce the residual risk of an inappropriate expense claim to an acceptable level and to automate the controls for detecting and preventing duplicate T&E claims	**Completed**	29-Dec-23
22-Aug-22	Employee Travel and Expense 2022	Duplicate Expense Claims	An opportunity exists to automate the controls for detecting and preventing duplicate T&E claims	**Completed**	29-Dec-23

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
22-Aug-22	Employee Travel and Expense 2022	Non-Compliance Reporting (Repeat Observation)	Reporting of T&E Policy non-compliances, detected and corrected through the review process, are not consistently being reported to Executives on a quarterly basis	**Completed**	31-Jan-24
22-Aug-22	Road Cut Accrual	Differentiating Permits Requiring Restoration Accruals	A process to differentiate which permits require future restoration has not been sufficiently defined and documented to ensure completeness of PM Work Orders and accruals	**Completed**	31-Dec-22
22-Aug-22	Road Cut Accrual	Post-Restoration Accrual Reversal Process	A well-defined process to initiate the road cut accrual reversals in SAP, has not been maintained to ensure all completed projects, for which all invoices have been received, are communicated by the Project Owners to Finance on a timely basis	**Completed**	28-Feb-23
22-Aug-22	Road Cut Accrual	Project Ownership & Assignment	A sufficient process does not exist to ensure that all road cut restoration projects are assigned to a Project Owner upon initiation or to ensure that projects are reassigned in the event of change (ie employee turnover)	**Completed**	31-Dec-22
22-Aug-22	Road Cut Accrual	Reconciliation of Operational and Financial Records	Operational records of road cuts, which trigger the liability for restoration, are not formally reconciled to the road cut accruals recorded in SAP on a predefined frequency, to ensure completeness of the road cut accrual	**Completed**	31-Jan-23
22-Aug-22	Road Cut Accrual	Reconciliation of Toronto Hydro and City Permit Records	Reconciliations, comparing Toronto Hydro's permit records with the City's permit records, are not performed on a predefined frequency, to ensure all road cut permits are tracked and recorded on a timely basis	**Completed**	31-Dec-22
22-Aug-22	Road Cut Accrual	Road Cut Accrual Aging Analysis	A road cut accrual aging analysis has not been established to ensure long-outstanding accruals are identified, monitored and reviewed on a predefined frequency as required by TH policy	**Completed**	31-Oct-22
22-Aug-22	Road Cut Accrual	Timely Execution & Monitoring of Road Cut Restorations	Road cut restorations are not monitored for timely completion or to ensure compliance with the two-year permit deadline	**Completed**	31-Mar-23
22-Aug-22	Road Cut Accrual	Accrual Recording Process	There is an opportunity to increase the auditability, audit trail and transparency associated with road cut recording in SAP by aligning the process for accrual setup and reversal (ie either at the permit or accrual level)	**Completed**	30-Apr-23
22-Aug-22	Road Cut Accrual	Customer Enquiry Process	The Customer Enquiry process does not currently have a process for matching customer complaints with restoration projects and associated project owners to facilitate timely customer responses to complaints and enquiries	**Completed**	31-Dec-22
22-Aug-22	Road Cut Accrual	Management of Restorations Under Warranty	An opportunity exists to clarify the starting point for the two-year warranty period provided by Toronto Hydro (TH) to the City of Toronto for road cut restorations	**Completed**	28-Feb-23
22-Aug-22	Road Cut Accrual	Project Variance Analysis	Road restoration project variance analysis (PVA) are not performed to ensure that actual costs are reasonable when compared to budgeted (estimated) costs	**Completed**	31-Dec-23
22-Aug-22	Road Cut Accrual	Roles, Responsibilities and Process Governance Documentation	An opportunity exists to document the end-to-end road cut restoration accrual process and controls to ensure that roles and responsibilities are clearly defined	**Completed**	31-Dec-23
22-Aug-22	Warehousing and Inventory Management	Assessment of Excess and Obsolete Inventory	Opportunities exist to enhance the analysis of excess and obsolete inventory by including a slow-moving and aged inventory review	**In-Progress**	31-Mar-24
22-Aug-22	Warehousing and Inventory Management	Inventory Count Documentation	Surprise inventory counts, performed by Toronto Hydro personnel at third party (ie TOC Logistics Inc) warehouses, are not documented or performed on a predetermined minimum frequency	**Completed**	31-Dec-22
22-Aug-22	Warehousing and Inventory Management	Physical Access Review	Physical access records for Toronto Hydro warehouses are not reviewed on a predefined frequency and evidence of review is not consistently documented	**Completed**	30-Apr-22
22-Aug-22	Warehousing and Inventory Management	Purchase Requisition Change Access	Changes made to purchase requisitions by employees in the business, after Supply Chain Services has submitted purchase orders to suppliers, is not restricted in the system and a sufficient and standardized process for the business to advise Supply Chain Services of changes does not exist	**Completed**	31-Jul-23
22-Aug-22	Warehousing and Inventory Management	System Access and Segregation of Duties	Inventory system (ie Red Prairie) access provided to Warehouse Managers has not been appropriately segregated as some incompatible transactions in the system are not restricted through necessary system access controls	**Completed**	31-Jul-23
22-Aug-22	Warehousing and Inventory Management	Inventory Count Adjustment Analysis	Root-cause analysis of the inventory count adjustments is not formally documented and maintained	**Completed**	31-Jul-23
22-Aug-22	Warehousing and Inventory Management	Inventory Receipt Documentation	Inventory receipt documentation, including evidence of dated sign-off and validation of quantity received, is not being consistently performed	**Completed**	31-Jul-23
22-Aug-22	Warehousing and Inventory Management	Inventory Returns	Inventory returned to the warehouse is not consistently received into the system on a timely basis	**Completed**	31-Jul-23

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
22-Aug-22	Warehousing and Inventory Management	Monitoring Purchase Order Changes	Buyers, within the Supply Chain Services team, have access to make changes to business-initiated purchase orders in emergency or time sensitive circumstances, however, no monitoring is performed to ensure changes are appropriate, approved and limited to allowable circumstances	**Completed**	31-Jul-23
22-Aug-22	Warehousing and Inventory Management	Relocated Inventory Recording	Relocation of inventory, associated with moving harness equipment for safety inspections, is not reflected in the inventory system which can compromise the accuracy of inventory counts or impact availability of inventory for shipping and/or use	**Completed**	31-Jul-23
22-Aug-22	Warehousing and Inventory Management	SAP System Access	System access to create material master data and set up re-order points in SAP has not been appropriately restricted	**Completed**	31-Mar-22
22-Aug-22	Warehousing and Inventory Management	Standard Operating Procedures	In some cases, Standard Operating Procedures are not formally documented, reviewed and updated on timely basis	**Completed**	31-Jul-23
22-Aug-22	Warehousing and Inventory Management	Warehousing Rate Agreement	The agreement with the third-party inventory provider (TOC Logistics Inc) requires an amendment to reflect the current labour rates being charged to and paid by Toronto Hydro	**Completed**	30-Nov-22
29-Aug-22	Customer Connections	Intake Channel Monitoring (Intake) - New issue opened to monitor implementation of KPIs	A process to track, monitor and metric customer connections by intake channel (ie online or call center) has not been established to encourage most cost-efficient channel utilization, establish baseline channel volumes ahead of the incoming improved online intake customer connection portal and identify connection requests received through unofficial channels (eg direct customer to designer contact)	**Completed**	30-Jun-23
14-Nov-22	Entity Level Controls	Fraud Risk Assessment	A fraud risk assessment is not being performed in accordance with the entity level control requirements for the Internal Controls over Financial Reporting (ICFR)	**In-Progress**	31-Dec-24
14-Nov-22	Entity Level Controls	Tracking and Approving Control Overrides	A process to track and approve control overrides, pertaining to ICFR has not been established	**Completed**	31-Jul-23
14-Nov-22	Entity Level Controls	Code of Conduct – Employee Sign-Off Frequency	An opportunity exists to review the three-year frequency for which employees are required to review and sign-off on the Code of Conduct against the annual best practice within the Canadian Hydro Utility sector	**In-Progress**	31-Dec-25
14-Nov-22	Entity Level Controls	Defining Governance Documentation Requirements	An opportunity exists to define the documentation requirements for critical governance, including Policies and Standard Operating Procedures (SOP)	**In-Progress**	31-Dec-24
14-Nov-22	Entity Level Controls	Financial Control Impact Assessment	An opportunity exists to formally evaluate the impact of significant changes to people, process and technology on the ICFR	**Completed**	1-May-23
14-Nov-22	Entity Level Controls	Joint Fraud Committee	An opportunity exists for the Joint Fraud Committee to establish a minimum meeting frequency to ensure ongoing consideration of fraud risk management and related activities	**In-Progress**	30-Apr-24
07-Feb-23	Capital Planning & Execution	Approval for Changes to Capital Projects	Capital Project Change Requests, pertaining to project cost, scope and schedule, are not consistently submitted and approved prior to execution and / or on a timely basis	**Completed**	30-Jun-23
07-Feb-23	Capital Planning & Execution	Reporting Root Causes for Change Requests	A formal process to document and report root causes for Capital Project Change Requests (CR) has not been established, however, is required to support the precision and accuracy of capital project scoping and costing within the Capital Plan	**Completed**	30-Nov-23
07-Feb-23	Capital Planning & Execution	Capital Planning Process SOP Documentation	Some areas of the long-term and short-term capital planning process are not formally documented	**Completed**	30-Sep-23
07-Feb-23	Capital Planning & Execution	Green Construction Folders SOP Documentation	An opportunity exists to formally document the standard operating procedures for returning electronic Green Construction Folders (eGCF)	**Completed**	31-Aug-23
14-Feb-23	Advanced Metering Infrastructure Remediation Review	Tracking and Monitoring of Cyber Security Gaps	Cyber security vulnerabilities identified through externally performed cyber security assessments have not been addressed by Non-SecOps stakeholders on a timely basis	**Completed**	1-Jun-23
15-Feb-23	Software Update Process (Change Management)	System Change Approvals	In one instance a material system change was implemented in advance of approval	**Completed**	1-Jun-23
15-Feb-23	Software Update Process (Change Management)	System Change Documentation, Detection and Monitoring	An opportunity exists to supplement the manual self-reporting process, used to monitor system changes, with an automated system change detection program, to ensure that a full record of system changes is maintained and can be monitored for appropriate pre-approval and potential post-implementation review/correction	**Completed**	1-Jul-23
15-Feb-23	Software Update Process (Change Management)	Validation Procedure and Documentation Standardization	System Change Validation Procedures (ie test requirements) are not formally documented and consistently applied across the Information Technology department	**Completed**	1-Jun-23
15-Feb-23	Software Update Process (Change Management)	Escalation of Latent Changes	An opportunity exists to implement a formal process for the escalation of latent changes to senior management	**Completed**	1-Jun-23
15-Feb-23	Software Update Process (Change Management)	Risk Criteria and Review	An opportunity exists to develop objective criteria to assess the risk associated with system changes and to regularly compare the risk levels assessed by the implementer against the actual incurred risks	**Completed**	1-Jul-23

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
28-Feb-23	Advanced Metering Infrastructure Remediation Review	Tracking and Monitoring of Cyber Security Gaps	Cyber security vulnerabilities identified through externally performed cyber security assessments have not been addressed by Non-SecOps stakeholders on a timely basis	**Completed**	1-Jun-23
26-Apr-23	Executive Expense Reimbursement	Expenses Posting on Toronto Hydro Website	An opportunity exists to define a reasonable timeline for posting the Executive and Board of Directors expenses on the external Toronto Hydro website	**Completed**	30-Jun-23
01-Jun-23	Capital Planning & Execution	Long-term Capital Planning Stakeholder Input Consideration (Materials Planning)	An opportunity exists to improve the long-term Investment Planning & Portfolio Reporting (IPPR) process by considering inputs from the Supply Chain Services team with respect to supply chain risks that have been elevated as a result of the pandemic	**Completed**	28-Feb-24
30-Jun-23	Customer Connections	Regional Team Process Standardization (Design & Billing)	Customer Connections & Key Account team has worked with PwC to develop formalized SOPs for customer connections processes	**In-Progress**	30-Apr-24
09-Aug-23	Customer Billing, Global Adjustment	GA Eligibility Governance (Eligibility Determination)	Sufficient governance (eg Internal Policies, Standard Operating Procedures, etc) to interpret the non-prescriptive, complex and evolving requirements of the GA, administered through the ICI program (Class A customers), have not been documented to support the accurate application of the regulation	**Completed**	31-Dec-23
09-Aug-23	Customer Billing, Global Adjustment	Load Aggregation Determination (Eligibility Determination)	Load aggregation (ie the summation of hydro load from customers with multiple accounts for the purpose of determining Class A eligibility for the GA) process and controls are not sufficiently designed and refined to identify all accounts belonging to the same customer and within the same facility	**In-Progress**	15-Apr-24
09-Aug-23	Customer Billing, Global Adjustment	Non-Interval Meters and Class A-Eligibility (Eligibility Determination)	The existing process for validating Class A eligibility does not take into consideration the OEB requirement to review and exclude non-internal meters (ie meters that do not measure when and how much consumption occurred during specific time-intervals)	**Completed**	29-Feb-24
09-Aug-23	Customer Billing, Global Adjustment	Review and Documentation of Load Aggregation (Eligibility Determination)	The algorithm programmed in Alteryx, a tool used to identify accounts in CC&B for load aggregation (ie the summation of hydro load from customers with multiple accounts for the purpose of determining Class A eligibility for the GA), has not been formally documented and reviewed to ensure that all the instances of eligible accounts for load aggregation are identified	**Completed**	29-Feb-24
09-Aug-23	Customer Billing, Global Adjustment	Review and Documentation of the Class A Eligibility Assessment Results (Eligibility Determination)	The procedures for the Class A eligibility assessment for the GA are not sufficiently defined and documented	**In-Progress**	30-Apr-24
09-Aug-23	Customer Billing, Global Adjustment	GA Billing Accuracy Review (Billing)	There is no review of GA billings for Class A customer to ensure that the individual customer billing in the new adjustment period is accurately set-up in CC&B and that the total annual value of GA is billed to the correct customers during the year	**In-Progress**	31-Aug-24
09-Aug-23	Customer Billing, Global Adjustment	Monitoring Changes in Market Participants (Billing)	Roles and responsibilities over monitoring of changes in market participants, that should be excluded from GA billing from Toronto Hydro through Class A, are not defined, assigned and formalized	**In-Progress**	31-Mar-24
09-Aug-23	Customer Billing, Global Adjustment	Review of System Billing Data Inputs (Billing) - Tracking long term action plan of physical review of Billing Data Inputs	Manual updates to Class A accounts in CC&B (ie flagging of Class A status and entry of PDF values) are not independently reviewed to ensure the accurate billing of GA charges	**In-Progress**	30-Sep-24
09-Aug-23	Customer Billing, Global Adjustment	Review of System Billing Data Inputs (Billing) - Tracking short term action plan of developing a review mechanism	Manual updates to Class A accounts in CC&B (ie flagging of Class A status and entry of PDF values) are not independently reviewed to ensure the accurate billing of GA charges	**Completed**	30-Jun-24
10-Aug-23	Payroll and Related Activities	Observation 1	For details, please refer the Payroll and Related Activities report	**In-Progress**	31-Mar-24
10-Aug-23	Payroll and Related Activities	Observation 2	For details, please refer the Payroll and Related Activities report	**Completed**	15-Jan-24
10-Aug-23	Payroll and Related Activities	Observation 3	For details, please refer the Payroll and Related Activities report	**Completed**	15-Jan-24
10-Aug-23	Payroll and Related Activities	Observation 10	For details, please refer the Payroll and Related Activities report	**Completed**	31-May-23
10-Aug-23	Payroll and Related Activities	Observation 4	For details, please refer the Payroll and Related Activities report	**Completed**	10-Nov-23
10-Aug-23	Payroll and Related Activities	Observation 5	For details, please refer the Payroll and Related Activities report	**Completed**	31-Dec-23
10-Aug-23	Payroll and Related Activities	Observation 6	For details, please refer the Payroll and Related Activities report	**Completed**	31-Dec-23
10-Aug-23	Payroll and Related Activities	Observation 7	For details, please refer the Payroll and Related Activities report	**Completed**	10-Jan-24
10-Aug-23	Payroll and Related Activities	Observation 8	For details, please refer the Payroll and Related Activities report	**Completed**	31-Dec-23
10-Aug-23	Payroll and Related Activities	Observation 9	For details, please refer the Payroll and Related Activities report	**Completed**	31-Mar-23

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Documentation of General Backup Requirements	General backup procedures for protecting data contained within operational technologies (eg remote terminal units used for collecting data from electric sensors and equipment, supervisory control systems used for monitoring electric equipment activity, and intelligent electronic devices, electronic sensors used to monitor equipment function) have not been documented within the IT departments Security Standards, which is used to document their processes and procedures	**In-Progress**	30-Apr-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Documentation of Recovery Time and Recovery Point Objectives	Recovery time (i.e. the maximum acceptable amount of time that an organization is willing to wait for the recovery of its IT systems and services after a disaster or disruption) and recovery point (i.e. the maximum acceptable amount of data loss that an organization is willing to tolerate) objectives have not been documented within Toronto Hydro's Business Continuity and Recovery Plans.	**In-Progress**	30-Apr-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Pre-Configuration Backup Requirements	Data backup procedures, that precede software configuration changes, have not been documented in the IT departments Security Standards document to ensure that data contained within operational technologies can be recovered in the event of an unsuccessful software configuration change	**In-Progress**	30-Apr-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Asset Disposal and Decommissioning Management	Asset disposal and decommissioning procedures for IT/OT hardware and data storage do not include guidelines pertaining to OT assets to ensure compliance with the NIST requirements	**In-Progress**	30-Oct-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Data-in-Transit Protection	The System Development Standards document, prepared by the Security Operations team, requires improvement in its data-at-rest section and the addition of baseline data flow diagram requirements to ensure compliance with the NIST requirements	**In-Progress**	30-Oct-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Documentation of Access and Authentication Requirements	The Internal Access Control Standards document does not currently provide guidance pertaining to access parameters (eg changing default factory passwords, ongoing validation of superuser access, etc) for IP-based OT assets	**In-Progress**	30-Apr-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Identification of Asset Vulnerabilities	Asset management requirements (eg security incident response simulations, log monitoring, patch management, configuration review etc) have not been documented for OT assets to ensure that vulnerabilities are identified and anaged on a timely basis	**In-Progress**	30-Oct-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Inventory of Information Technology Systems	The inventory of information technology systems has not been documented to ensure cyber security threats from all systems is being tracked and monitored	**In-Progress**	30-Oct-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	Operational Technology Data Disposal	Procedures (eg, data sanitization and destruction, physical asset disposal, notification and communication, documentation and records etc) for the disposal and the decommissioning of data contained within OT assets have not been formally documented	**In-Progress**	30-Oct-24
07-Nov-23	Cyber Security, National Institute of Standards and Technology Compliance	System Development Life Cycle	The System Development Life Cycle (SDLC) requirements for OT assets has not been documented in accordance with NIST to ensure they are appropriately tracked, managed, utilized and protected	**In-Progress**	30-Oct-24
08-Nov-23	Accounts Receivable & Expected Credit Loss	Process Documentation – Accounts Receivable Operations (Customer Care)	Sufficient process governance has not been formally documented to support the Accounts Receivable Operations determination of the critical data inputs for the ECL calculation	**In-Progress**	15-Sep-24
08-Nov-23	Accounts Receivable & Expected Credit Loss	Approval of Inputs to Expected Credit Loss Calculations (Customer Care)	Evidence of approval of the quarterly inputs (eg, Winter Disconnection Moratorium, Arrears Payment Arrangement, write-off accruals, etc) to the ECL calculations prepared by the Accounts Receivable Operations team has not been formally retained in some instances	**Completed**	15-Dec-23
30-Dec-23	Road Cut Accrual	Roles, Responsibilities and Process Governance Documentation	An opportunity exists to document the end-to-end road cut restoration accrual process and controls to ensure that roles and responsibilities are clearly defined	**In-Progress**	30-Jun-24
20-Feb-24	Cyber Security, Cloud Storage	Cloud-Based Risk Assessments	An opportunity exists to perform risk reassessments for cloud-based applications on a pre-defined basis to enhance the existing framework which is event driven which may not sufficiently keep pace with application changes or the rapidly evolving cyber threats	**In-Progress**	31-Dec-24
20-Feb-24	Cyber Security, Cloud Storage	Vendor Cyber Security Requirements	Vendor Cyber Security requirements, as documented within Toronto Hydro's Security Checklist Template, are not being reviewed/revised on a regular basis or on a pre-defined frequency to ensure that evolving Cyber Security threats and organizational security standards are reflected in a timely manner	**In-Progress**	31-Oct-24
20-Feb-24	Cyber Security, Cloud Storage	Vendor Privacy Requirements	Vendor privacy requirements, as documented within Toronto Hydro's Privacy Checklist Template, are not being reviewed/revised on a regular basis or on a pre-defined frequency to ensure that evolving Cyber Security threats and organizational security standards are reflected on a timely basis	**In-Progress**	31-Oct-24

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
20-Feb-24	Cyber Security, Cloud Storage	Application Change Documentation	Minor changes and updates to cloud-based applications hosted by vendors are not consistently being tracked and documented in Remedy, Toronto Hydro's service request ticketing system	**In-Progress**	31-Oct-24
20-Feb-24	Cyber Security, Cloud Storage	Data Sensitivity Assessment	An opportunity exists to enhance the effectiveness of data sensitivity assessments by implementing a systematic and periodic review process for the Data Sensitivity Questionnaire template	**In-Progress**	31-Oct-24
20-Feb-24	Cyber Security, Cloud Storage	Total Data Sensitivity Ratings	There is an opportunity to enhance Cyber Security, for all data including data hosted in cloud applications, by implementing a process to consistently review and revise all total data sensitivity ratings, which are used to describe how sensitive data is for the organization	**In-Progress**	31-Jan-25
20-Feb-24	SAP Security - 2023	Periodic Review of Standard Operating Procedures	An opportunity exists to periodically review the standard operating procedures (SOP's) for SAP security to ensure that they remain current, reflect formal approval and include the current governance requirements and best practices	**In-Progress**	30-Sep-24
20-Feb-24	SAP Security - 2023	Standard Operating Procedures for SuccessFactors	There is an opportunity to improve the existing Standard Operating Procedures for SAP SuccessFactors by ensuring that they are periodically reviewed / approved and address critical inclusions such as access management, change management and governance procedures	**In-Progress**	30-Sep-24
23-Feb-24	Miscellaneous Accounts Receivable	Centralized Cheque Intake	The absence of a formalized, well-defined, and centralized process for handling cheque receipts pertaining to MAR has led to instances of misplaced cheques that were not deposited on a timely basis, became stale dated and required replacements from customers	**In-Progress**	15-Mar-24
23-Feb-24	Miscellaneous Accounts Receivable	Key Performance Indicators (KPI's)	Effective KPI's (e.g., percentage of overdue accounts receivable, timely cheque deposit, timely unapplied payments resolution, timely clearing of customer bank deposits, aging of accounts receivable, write-off rate, etc.) have not been established (i.e., to measure the performance of MAR processes) and are not being reported to key stakeholders on an ongoing basis	**In-Progress**	15-Feb-25
23-Feb-24	Miscellaneous Accounts Receivable	Overdue Receivables Collection Process	A formal process for the collection and management of overdue receivable balances has not been established to ensure that timely action is taken to collect outstanding receivables and minimize write-offs	**In-Progress**	15-Sep-24
23-Feb-24	Miscellaneous Accounts Receivable	Resourcing and Accounting Skillsets	Sufficient resources and requisite accounting skillsets within the MAR department are not in place following personnel turnover, interim resource streamlining attempts and challenges recruiting well suited resources	**In-Progress**	15-May-24
23-Feb-24	Miscellaneous Accounts Receivable	Unapplied Payments Backlog	There is a backlog of long-outstanding unapplied payments from customers, that have accumulated between 2019 to 2023, that have not been applied against customer accounts	**In-Progress**	15-Oct-24
23-Feb-24	Miscellaneous Accounts Receivable	Uncleared Bank Receipts	There is no validation process for ensuring that bank receipts are administratively cleared (i.e., each receipt is accurately applied against a customer invoice) in the SAP system and not over or under applied	**In-Progress**	15-Oct-24
23-Feb-24	Miscellaneous Accounts Receivable	Cheque Clearing Monitoring	A process to monitor and manage customer cheque payments that do not clear has not been established to ensure accurate recording of receivables at the customer account level	**In-Progress**	15-Apr-24
23-Feb-24	Miscellaneous Accounts Receivable	Cheque Deposit Roles and Responsibilities	Roles and responsibilities pertaining to the cheque deposit process have not been appropriately defined and documented to ensure that cheques are handled by appropriate personnel and deposited and recorded on a timely basis (e.g., deposit schedule, appropriate personnel performing, vacation backups, etc.)	**In-Progress**	15-Mar-25
23-Feb-24	Miscellaneous Accounts Receivable	Cheque Deposit Slips	There are cheque payment clearing delays as a result of the use of one deposit slip for multiple cheques, which requires that all cheque payments within the same deposit be properly identified and applied before any of them can be cleared in SAP	**Completed**	21-Aug-23
23-Feb-24	Miscellaneous Accounts Receivable	Cheque Image Record Keeping	Financial records pertaining images of cheques received from customers have not been consistently retained in accordance with TH's records retention policy	**Completed**	31-May-23
23-Feb-24	Miscellaneous Accounts Receivable	Cheque Register Process	A daily cheque register process, that record all cheques received and their details (i.e., payee information, job quote, invoice number, amount, date received, cheque #, etc.) has not been established to ensure that all cheques received, at the MAR department level, are tracked, recorded and deposited on a timely basis	**Completed**	31-May-23
23-Feb-24	Miscellaneous Accounts Receivable	Cheque Register Reconciliation and Review	A cheque register reconciliation, at the MAR department level, is not being prepared and reviewed to ensure a complete and accurate record of cheques received	**In-Progress**	15-Apr-24
23-Feb-24	Miscellaneous Accounts Receivable	Cheque Safekeeping	Cheques received from customers are not consistently being safeguarded and stored in secure location to ensure they are not misplaced, lost or accessible by unauthorized personnel	**Completed**	31-May-23
23-Feb-24	Miscellaneous Accounts Receivable	Customers' Remittance Process	Customers are not complying with remittance process (e.g., not providing sufficient payment details) and an opportunity to simplify the remittance process to encourage compliance exists	**In-Progress**	15-Jan-26
23-Feb-24	Miscellaneous Accounts Receivable	Operational Stakeholder Communication	An effective two-way communication process has not been established to ensure that Operational stakeholders and the MAR group are collaborating to resolve unmatched payments on a timely basis	**In-Progress**	15-Apr-24

Summary of Internal Audit Findings since 2020 with Status of Actions Taken by Management

Report Issue Date	Internal Audit Report Name	Title of Observation	Summary of Observation	Remediation Status	Agreed Completion Date
23-Feb-24	Miscellaneous Accounts Receivable	Payment Instruction Sheet Enhancement	There is an opportunity to enhance the delivery, format and communication of the payment instructions to facilitate customer compliance (i.e., the inclusion of payment identification information to facilitate the payment matching process)	**In-Progress**	15-Dec-24
23-Feb-24	Miscellaneous Accounts Receivable	Policy Documentation and Credit Memo's	A dedicated policy has not been established to address the unique characteristics and requirements of MAR's and there is no policy guidance pertaining to non-routine / emergency type credit memos	**In-Progress**	15-Jun-25
23-Feb-24	Miscellaneous Accounts Receivable	Receivables Aging Visibility	The accounts receivable aging report, which is included within the accounts receivable account reconciliation, combines all balances greater than 120 days into one category and therefore does not provide the account reconciliation reviewer with sufficient information and visibility to perform an effective review and analysis of the account receivable balance	**In-Progress**	15-Apr-24
23-Feb-24	Miscellaneous Accounts Receivable	Substantiating Long-Outstanding Unapplied Payments	Long-outstanding unapplied payments (i.e., a customer payment that has not been posted and cleared against a customer account/invoice in SAP) within the MAR aging report, are not substantiated with documented explanations to support the reviewer with assessing the validity of aged balances and documentation to support the aged account collection follow up and/or write off process	**In-Progress**	15-Jul-24
23-Feb-24	Miscellaneous Accounts Receivable	Timely Recording of Construction Receivables	Construction service receivables are being recorded when cash/payment is received, as opposed to when payment is owed, in accordance with the accrual basis of accounting	**In-Progress**	15-Sep-24
23-Feb-24	Miscellaneous Accounts Receivable	Uncollectible Write-Offs	A process has not been established to ensure that long-outstanding balances are written off on a timely basis in accordance with the Accounts Receivable policy	**In-Progress**	15-Oct-24
23-Feb-24	Miscellaneous Accounts Receivable	Unidentified Payment Intake	A front-end process to prevent payments without adequate identifying information from being processed and deposited to avoid subsequent payment matching delays and backlogs	**In-Progress**	15-Jan-26
23-Feb-24	Miscellaneous Accounts Receivable	Unidentified Payment Resolution	Unidentified payments are not being monitored, investigated and resolved on a timely basis, resulting in a backlog of unapplied payments	**In-Progress**	15-Jun-24
23-Feb-24	Miscellaneous Accounts Receivable	Bank Counter Cash Payments	The customer payment instructions do not include a cautionary note to help prevent customers from making cash payments at the bank counter to TH bank account	**In-Progress**	15-Dec-24
23-Feb-24	Miscellaneous Accounts Receivable	Cheque Deposit Review	There is no review of the weekly cheque deposits to ensure cheques are consistently deposited to the correct Toronto Hydro entity and for the correct amounts	**In-Progress**	15-Apr-24
23-Feb-24	Miscellaneous Accounts Receivable	Customer Compliance Monitoring	The tracking and monitoring of customer adherence to payment instructions are not in place to assess the efficacy of these instructions and the front-end management of the customer remittance process	**In-Progress**	15-Jan-25
23-Feb-24	Miscellaneous Accounts Receivable	Department Governance Sustainment Process	An opportunity exists to ensure ongoing compliance and maintenance of the central governance processes (e.g. KPI's, Standard Operating Procedures, Internal Controls, etc.) by tracking and reporting on these within the Operational Status Meetings and underlying department scorecard	**In-Progress**	15-Nov-24
23-Feb-24	Miscellaneous Accounts Receivable	Standard Operating Procedures (SOP) Documentation	A comprehensive SOP or procedure manual to show the step-by-step procedure of all aspects of the end-to-end MAR process does not exist	**In-Progress**	15-May-25
23-Feb-24	Miscellaneous Accounts Receivable	System Access Alignment with Roles and Responsibilities	There is an opportunity to review MAR personnel access to ensure that it is limited to their roles and responsibilities	**In-Progress**	15-Jul-24
23-Feb-24	Miscellaneous Accounts Receivable	Training and Reference Materials	Sufficient, formal and ongoing training and reference materials for new and existing personnel has not been established to ensure that MAR activities are consistently, accurately and efficiently performed	**In-Progress**	15-Jan-25

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-8

Reference: Exhibit 1B, Tab 1, Schedule 3, Table 9

QUESTION:

Please provide the details of the $5.5 million adjustments, by program for OM&A and by USoA for Other Revenue, which were made to the 2020 approved OM&A of $272.2 million and Other Revenue of $48.1 million, to normalize for the changes related to Accounts 4375 and 4380.

RESPONSE:

It is Toronto Hydro's understanding that in the interrogatory, SEC made a typo in referring to Other Revenues approved by the OEB. Toronto Hydro's OEB approved Other Revenues for 2020 before adjustment for shared services costs was $47.8 million[1].

Toronto Hydro made changes on how shared services costs are presented in accordance with the OEB's decision[2]. As a result, shared services expenses were recorded in USoA 4380 and therefore were reclassified from OM&A to revenue offsets as required by the Account Procedures Handbook.

The adjustments to the 2020 approved OM&A of $272.2 million are summarized in Table 1 below whereas, the adjustments to the 2020 approved Other Revenue of $47.8 million are summarized in Table 2.

[1] EB-2018-0165, Toronto Hydro-Electric System Limited ("Toronto Hydro"), 2020-2024 Custom Incentive Rate-setting ("Custom IR") Application – DRO Reply Submission & DRO Update (February 12, 2020), Schedule 11
[2] EB-2018-0165, Decision and Order (December 19, 2019) at page 131.

Table 1: Adjustment to OM&A

	($ Millions)
2020 OEB Approved OM&A	$272.2
Less: Reclass to USoA 4380 from Allocation and Recoveries Program; Shared Services Segment in OM&A	($5.5)
2020 Normalized OEB Approved OM&A	**$266.7**

The OM&A related revenue requirement approved by the OEB in 2020 was $266.7 (adjusted for Account 4380). The OEB approved this amount on an envelope basis, and therefore Toronto Hydro cannot provide a further breakdown as requested.

Table 2: Adjustment to Revenue Offset

	($ Millions)
2020 OEB Approved Revenue Offsets	$47.8
Less: Reclass to USoA 4380 from Allocation and Recoveries Program; Shared Services Segment	($5.5)
2020 Normalized OEB Approved Revenue Offsets	**$42.3**

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-9

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 12

With respect to Figure 1, please provide the data and underlying calculations and assumptions used.

RESPONSE:

Please see the response to interrogatory 1B-Staff-12(a) and (b) for the requested information.

For the IRM Scenario, Toronto Hydro determined the 2026-2029 revenue requirement by escalating the 2025 revenue requirement outlined in Exhibit 6 with the standard Price Cap IR parameters, namely: an inflation factor (based on a 2% forecast) minus a 0.6% X-factor. Please see the response to 1B-VECC-01 for a breakdown of the capital-related revenue under IRM.

For the CIR 1.0 scenario, Toronto Hydro determined the 2026-2029 revenue that would be collected through rates by escalating the 2025 revenue requirement (outlined in Exhibit 6 and summarized in 1B-Staff-03 at Table 1) with the Custom Price Cap Index (CPCI) approved by the OEB for the current 2020-2024 rate period, namely:

- For non-Capital Related Revenue Requirement (i.e. OM&A and Revenue Offsets) an inflation factor (based on a 2% forecast) minus a 0.6% X-factor (consistent with Price Cap IR parameters).
- For Capital Related Revenue Requirement (CRRR) (i.e. Amortization/Depreciation, Return on Equity, Interest Expense and PILS) the utility applied a 0.9% X-factor to reduce the 2026-2029 forecasted CRRR outlined in Exhibit 6.

Please see the response to interrogatory 1B-Staff-12(b) for a breakdown of the CPCI.

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-10

References: EB-2018-0165, Decision and Order, p.24

Preamble

The OEB in its Decision and Order in EB-2018-0165 stated:

"The OEB notes that the Custom IR approach taken has required extensive evidence and time to consider the details provided. Toronto Hydro is encouraged to consider an alternative approach in the future that might be more efficient in establishing the revenue requirement for the base year and following years as well as meeting OEB RRF objectives, and improving the balance of risk between customers and the utility. Toronto Hydro should not assume that future panels will continue to accept Toronto Hydro's current proposed Custom IR framework."

QUESTIONS (A) – (C):

a. Did Toronto Hydro "consider an alternative approach in the future that might be more efficient in establishing the revenue requirement for the base year and following years as well as meeting OEB RRF objectives, and improving the balance of risk between customers and the utility"?
b. If the answer to part (a) is yes, please provide details including a copy of any analysis undertaken and the conclusions that Toronto Hydro drew from that analysis.
c. If the answer to part (a) is no, please explain why not.

RESPONSES (A) – (C):

Revenue requirement reflects the amount of funds that a utility needs to cover the costs of providing its services, namely: operating expenses, maintenance, debt service, and a fair return on investment for shareholders as determined by the cost of capital parameters.[1]

Toronto Hydro forecasted its 2025-2029 revenue requirement in accordance with existing approaches, prescribed rate models, and the OEB's expectations as set out in the *Renewed Regulatory Framework for Electricity Distributors ("*RRF*")* and in the *Handbook for Utility Rate Applications* ("Rate Handbook"):

- In the Custom IR method, rates are set based on a five-year forecast of a distributor's revenue requirement and sales volumes.[2]
- The Board expects that a distributor that applies under this method will file robust evidence of its cost and revenue forecasts over a five-year horizon, as well as detailed infrastructure investment plans over that same time frame.[3]
- The OEB sets just and reasonable rates based on a total revenue requirement that is informed by an assessment of a utility's spending proposals.[4]
- Historical and forecast information: Information filed in support of a rate application facilitates a thorough review of the utility's proposals and ensures continuity in the regulation of each utility over time. The filing of this information does not mean that the OEB will approve every aspect of what is filed in a rate application. The OEB assesses the utility's plans, and the resultant costs and revenue requirement, in order to consider the benefits to customers and a fair return for utilities in setting just and reasonable rates.[5]

In light of the OEB requirements summarized in the bullets above, Toronto Hydro did not explore other approaches to determining the revenue requirement. Rather, it responded to the OEB's

guidance in the 2020-2024 decision by challenging itself to innovate and evolve the custom rate framework to improve the balance of risk between customers and the utility in a way that is consistent with RRF objectives. That innovation is the Performance Incentive Mechanism (PIM) – an asymmetrical mechanism (to the benefit of customers) that shifts earnings and performance risk to the utility, ensures greater accountability to customers for outcomes, and maintains the utility's financial viability in accordance with the Fair Return Standard in providing Toronto Hydro the opportunity (*not the guarantee*) to earn the allowed rate of return by achieving target performance outcomes. For more information about how the proposed rate framework aligns with the OEB's requirements outlined in the RRF and the Rate Handbook please see Exhibit 1B, Tab 2, Schedule 2 at page 6.

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-11

Reference: Exhibit 1B

For each third-party expert report filed in this proceeding, please provide a copy of a) the retainer and b) the specific instructions/direction provided to the expert regarding their work not included in the retainer.

RESPONSE:

Please see the table below. The scopes of work for each retainer are attached as appendices to the response. As noted in the March 11, 2024 cover letter accompanying the interrogatory responses, the utility is in the process of obtaining consent from the third-parties in question with respect to the disclosure and confidentiality of the underlying agreements, and will file this information an update to this interrogatory response, as soon as reasonably possible.

Agreement for Professional Consulting Services

THIS AGREEMENT is made this 22nd day of September, 2021,

BETWEEN:

Toronto Hydro-Electric System Limited,

a corporation incorporated under the laws of Ontario

(hereinafter called "Toronto Hydro")

and

Innovative Research Group Inc.,

a corporation incorporated under the laws of British Columbia

(hereinafter called the "Consultant")

WHEREAS:

A. Toronto Hydro has retained the Consultant to provide certain consulting services as detailed in SCHEDULE A (collectively, the "Services"); and

B. the Consultant has indicated to Toronto Hydro that it has the skill and expertise to provide the Services on the terms and conditions set forth herein;

NOW THEREFORE, in consideration of the mutual covenants set forth herein and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

1. INTERPRETATION

Unless otherwise indicated, all capitalized terms in this Agreement shall be as defined in SCHEDULE B and any reference to currency in this Agreement shall refer to lawful money of Canada.

2. RELATIONSHIP OF THE PARTIES

2.1 Retainer

Toronto Hydro hereby retains the Consultant to provide the Services, and the Consultant hereby agrees to provide the Services, during the Term, in accordance with the terms and conditions of this Agreement.

2.2 Independent Contractors

(a) Notwithstanding any provision hereof, this Agreement does not constitute and shall not be construed as constituting a partnership, joint venture, principal/agency relationship, or employer/employee relationship between the parties. The Consultant and Toronto Hydro shall at all times remain independent contractors of each other, and neither party shall represent itself to be an agent or employee of the other.

(b) Without limiting the generality of paragraph 2.2(a), the Consultant hereby acknowledges and agrees that neither it nor its Representatives shall be eligible or entitled, by reason of this Agreement, to participate in any employee-related program offered by Toronto Hydro or any of its Affiliates, including, without limitation, any benefit, insurance, compensation, health plan, bonus or retirement program.

(c) The Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities or claims whatsoever against Toronto Hydro or its Representatives resulting from or relating to the Consultant or its Representatives being deemed to be an employee of Toronto Hydro or any of its Affiliates.

2.3 Conflicts of Interest

The Parties acknowledge that there is potential for a conflict of interest based on services provided by the Consultant from time to time to Toronto Hydro. The Consultant agrees to take all such steps as Toronto Hydro deems necessary, acting reasonably, to remove, mitigate or minimize such conflict of interest.

3. TERM

3.1 Term

Unless otherwise terminated in accordance with the provisions hereof, this Agreement shall be for a term commencing on September 1, 2021 and terminating on June 30, 2024 (the "**Term**").

3.2 Renewal

Toronto Hydro may, at its sole option, and upon written notice to the Consultant at least thirty (30) Business Days before the end of the Initial Term, elect to renew the Agreement for two (2) one (1) year terms on the same terms and conditions contained herein (the "Renewal Term"). The Initial Term and Renewal Term, if any, shall hereinafter together be referred to as the "Term".

4. SERVICE REQUIREMENTS

4.1 Services

During the Term, the Consultant shall perform the Services as detailed in SCHEDULE A hereto.

4.2 Applicable Laws

(a) The Consultant shall, at its sole expense, obtain and maintain during the Term of this Agreement, all permits, licences and approvals required by all Applicable Laws to perform its obligations under this Agreement. The terms and conditions of this Agreement shall be carried out in strict compliance with all Applicable Laws and in the event of any conflict between any Applicable Laws, the Applicable Laws with the most stringent standard shall apply.

(b) Without limiting the generality of the foregoing, the Consultant shall comply with the *Municipal Freedom of Information and Protection of Privacy Act* (Ontario) ("MFIPPA"), the *Personal Information Protection and Electronic Documents Act* (Canada) ("PIPEDA") and any other applicable privacy legislation (collectively, "Privacy Laws") with respect to any personal information collected, used or disclosed in connection with this Agreement and shall indemnify and hold harmless Toronto Hydro and its Representatives from and against any and all claims, demands, suits, losses, damages, causes of action, fines or judgments (including related expenses and legal costs) they may incur related to or arising out of any non-compliance therewith.

(c) Where any Deliverable is subject to the approval or review of any authority, department, government or agency other than Toronto Hydro, such applications for approval or review shall, unless otherwise authorized by Toronto Hydro in writing, be prepared by the Consultant to be approved and submitted by and through the offices of Toronto Hydro, and the Consultant shall not have any direct dealings with the authority, department, government or agency in question with regards to the Deliverable.

(d) The Consultant and the Consultant's personnel shall comply with all rules and direction of Toronto Hydro, whether specified in this Agreement or otherwise, while working on Toronto Hydro's premises or when accessing or connecting to Toronto Hydro's information technology systems, including rules and directions concerning health, safety, security and environmental protection, including without limitation, Toronto Hydro's *Code of Business Conduct*, Toronto Hydro's *Disclosure Policy*, Toronto Hydro's *Social Media and Digital Communication Guidelines*, Toronto Hydro's *Accessibility Policy*, Toronto Hydro's *Workplace Harassment Policy*, Toronto Hydro's *Violence Prevention in the Workplace Policy*, Toronto Hydro's *Alcohol and Drug Policy*, Toronto Hydro's *Environmental Policy*, Toronto Hydro's *Occupational Health & Safety Policy*, Toronto Hydro's *Physical Security* Policy, Toronto Hydro's *Privacy Policy Statement*, Toronto Hydro's *Cyber Security Policy*, Toronto Hydro's *Technology Use Guidelines*, Toronto Hydro's *Physical Security Policy*, Toronto Hydro's *COVID-19 Vaccination Policy* and the *Affiliate Relationships Code for Electricity Distributors and Transmitters* issued by the OEB (together, the "Guidelines"). The Consultant agrees to comply with and to direct its Representatives to comply with such Guidelines, as amended.

4.3 Performance

(a) The Services shall be performed to the satisfaction of Toronto Hydro, and Toronto Hydro shall have the right at all reasonable times, to inspect or otherwise review the Services

performed or being performed. The Consultant shall, upon the request of Toronto Hydro, acting reasonably, provide Toronto Hydro with written reports of the status of the Deliverables and the Consultant's progress in providing the Services.

(b) In the event of any dispute between Toronto Hydro and the Consultant relating to the quality or acceptability or rate of progress of any of the Services, or relating to the interpretation of any instructions or specifications concerning the Services, Toronto Hydro and the Consultant shall attempt to mutually reach a resolution in good faith. Failing a good faith resolution, the reasonable opinion of Toronto Hydro shall govern and be binding on the parties hereto.

5. REPRESENTATIONS, WARRANTIES, INDEMNITIES AND INSURANCE

5.1 Representations and Warranties

The Consultant hereby represents, warrants and agrees that:

(i) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has/have the necessary experience and qualifications to perform the Services;

(ii) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) will perform the Services in a diligent, expeditious and workmanlike manner, consistent with standards generally observed by reputable and competent members of the same industry providing similar services;

(iii) all Services shall be the Consultant's (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) original work and none of the Services or any invention, development, use, production, distribution or exploitation relating thereto will infringe, misappropriate or violate any intellectual property or other right of any person or entity.

5.2 Indemnity

a) The Consultant shall be liable for and shall indemnify and hold harmless Toronto Hydro and its Representatives from all claims, demands, actions, penalties, damages, losses, judgments and settlements, liabilities, costs, expenses, including legal fees and other related costs and expenses arising out of, related to, or incident to, the Consultant or any of its Representatives' performance of the Services under this Agreement, including, without limitation:

i. any breach, violation or non-performance by the Consultant or any of its Representatives of any terms, conditions, warranties, obligations or covenants contained in this Agreement;
ii. any breach or violation by the Consultant or any of its Representatives of any Applicable Laws; and
iii. any actions, omissions, negligence or wilful misconduct of the Consultant or any of its Representatives

except to the extent caused by the negligence or wilful misconduct of Toronto Hydro or its Representatives.

b) In no event shall either party be liable for loss of profit or use or for any indirect, special, incidental or consequential damages of any nature or kind including but not limited to delays, loss of revenue, loss of use, loss of data, loss of product, costs of capital or costs or replacement power, even if that party has been advised of the possibility of such damages.

c) Subject to section 5.2(d), the Consultant's liability for a claim for damages shall be limited to the amount payable by Toronto Hydro to the Consultant pursuant to this Agreement.

d) Notwithstanding the foregoing, no exclusion or limitation of liability shall apply to:

i. Breach of the confidentiality or privacy obligations in this Agreement
ii. Intentional misconduct or gross negligence;
iii. Breach of Applicable Law; or
iv. Breach of intellectual property indemnity in Section 9.

5.3 Insurance

(a) The Consultant shall, during the Term, and at its own expense, maintain and keep in full force and effect (and, when requested, provide Toronto Hydro with proof thereof):

(b) commercial general liability insurance on an occurrence basis having a minimum inclusive coverage limit, including personal injury and property damage, of not less than five million dollars ($5,000,000) per occurrence, which commercial general liability insurance shall be extended to cover contractual liability, products and completed operations liability, and owners/contractors protective liability;

(c) Automobile liability insurance on all owned and non-owned vehicles used in connection with this Agreement and such insurance coverage shall have a limit of not less than two million dollars ($2,000,000.00) per vehicle, in respect of bodily injury (including passenger hazard) and property damage inclusive of any one accident and mandatory accident benefits;

(i) Computer Security and Privacy Liability insurance covering actual or alleged acts, errors or omissions committed by the Vendor or its Representatives of not less than two million dollars ($2,000,000.00), and which shall also extend to include the intentional, fraudulent or criminal acts of the Vendor or its Representatives. The policy shall expressly provide, but not be limited to, coverage for the following perils:

i. unauthorized use/access of a computer system
ii. defense of any regulatory action involving a breach of privacy
iii. failure to protect confidential information (personal and commercial information) from disclosure notification costs, whether or not required by statute.

(d) All insurance coverages and limits required to be maintained hereunder shall: (i) be primary to any insurance maintained by Toronto Hydro, which insurance shall be excess and non-contributory; (ii) contain a cross liability clause and a severability of interest clause; and (iii) contain a thirty (30) day prior written notice to Toronto Hydro for any cancellation, non-renewal or adverse material change.

(e) The Consultant agrees that the insurance required hereunder in no way limits the Consultant's liability pursuant to the Liability and Indemnity provision in Section 5.3.

(f) A waiver of subrogation shall be provided by the insurer(s) to Toronto Hydro.

6. FEES

6.1 Fees

(a) Subject to paragraphs 6.1(c) - 6.1(f), in exchange for the performance of the Services in accordance with the terms hereof, Toronto Hydro shall pay the Consultant the rates outlined in SCHEDULE A, not including HST (the "Fee").

(b) The Fee noted in subsection 6.1(a) shall be the only fee payable by Toronto Hydro under this Agreement. Without limiting the generality of the foregoing, the Consultant hereby agrees and acknowledges that all out-of-pocket expenses, travelling costs, and other disbursements shall be at the sole expense of the Consultant, except with the prior written approval from Toronto Hydro.

(c) Any disbursements for additional incidentals incurred by the Consultant in relation to this Agreement ("Disbursements") must be pre-approved by Toronto Hydro in writing.

(d) The Consultant shall not incur or submit invoices for any work outside the scope of the Services without prior written approval from Toronto Hydro.

(e) The Consultant shall make all payment of taxes, employment insurance premiums, pension plan contributions and any other taxes or other payment of any nature, imposed by any authority in respect of the Fee paid by Toronto Hydro to the Consultant under this Agreement (together, the "Remittances"), and the Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities and claims whatsoever against Toronto Hydro or its Representatives, in any way arising out of or relating to any failure to deduct, withhold, or remit any Remittance.

(f) Without limiting the generality of paragraph 6.1(a), Toronto Hydro reserves the right to deduct any applicable non-resident withholding taxes from any Fee owing to the Consultant under this Agreement and remit such amounts to the applicable taxation authority.

6.2 Payment

The Consultant shall submit invoices to Toronto Hydro on a monthly basis containing:

(i) a description of the Services performed during the invoice period;

(ii) the monthly payment amount;

(iii) the total HST applicable to the Services during the invoice period, as well as the Consultant's HST registration number; and

(iv) a detailed description of the Disbursements incurred around the invoice period, supported by documentation in a form acceptable to Toronto Hydro.

Unless otherwise provided in this Agreement, the Consultant shall invoice Toronto Hydro after final inspection and acceptance by Toronto Hydro of the Services performed and subject to receipt of all documents required by this Agreement. **Invoices must be sent electronically to: AP@torontohydro.com.** Subject to approval of the invoice by Toronto Hydro, receipt of all documents required by this Agreement, and final review by Toronto Hydro, Toronto Hydro shall make payment to the Consultant via electronic funds transfer not later than thirty (30) days following receipt of an acceptable invoice and the EFT Information (as set out below). **The Consultant must provide Toronto Hydro with, in the case of the first payment only, (i) a void cheque, pre-printed deposit slip or bank confirmation letter and (ii) the email address where the Consultant wishes to receive remittance information (together, "EFT Information"). EFT Information must be sent electronically to efthelp@torontohydro.com or to 14 Carlton Street, Toronto, ON, M5B 1K5, Attention: Treasury Department.** Toronto Hydro reserves the right to pay the Consultant through other payment methods.

7. SUSPENSION OR TERMINATION

7.1 Suspension or Termination

(a) Toronto Hydro may, at any time during the Term by notice in writing, suspend all or a portion of the Services. Upon receipt of such written notice, the Consultant shall perform no further work other than as directed by Toronto Hydro, and shall be entitled to payment for time spent in performing the Services up to the date of suspension.

(b) Either party may terminate this Agreement immediately upon written notice where the other party enters into liquidation, whether compulsory or voluntarily, or where a proceeding in receivership, bankruptcy or insolvency has been instituted by or against such party or its property.

(c) Toronto Hydro, at its sole discretion, may terminate this Agreement immediately upon written notice where the Consultant or any of its Representatives has been in material default in the performance of its duties, obligations or undertakings under this Agreement, and has not taken immediate steps to remedy such default within two (2) Business Days following written notice of the specific default by Toronto Hydro. For the purposes of this section, a material default shall include, without limitation, a breach of any of the representations or warranties contained herein or the failure or refusal to provide the Services in accordance with the terms and conditions of this Agreement.

(d) Notwithstanding any other provision in this Agreement, Toronto Hydro, at its sole discretion, shall have the right to terminate this Agreement, for any reason, upon two (2) weeks written notice to the Consultant.

(e) In the event that this Agreement is terminated in accordance with this section 7.1 by either party, the Consultant shall be entitled to payment for time spent in performing the Services up to the date of suspension.

7.2 Effect of Termination

Upon the termination or expiration of this Agreement, upon Toronto Hydro's request, the Consultant shall return to Toronto Hydro and delete any and all electronic copies the Consultant may have of all documents and materials in its possession relating to the Services or this Agreement, including all Confidential Information and all Deliverables, whether completed or not.

8. CONFIDENTIALITY

8.1 Non-Disclosure

In performing the Services required by this Agreement, the Consultant may be provided access to Confidential Information. The Consultant acknowledges and agrees that:

(a) the Consultant shall not disclose, permit access to, transmit, or transfer the Confidential Information to any third party without the prior written authorization of Toronto Hydro;

(b) the Consultant shall protect the confidentiality of the Confidential Information in its possession by exercising the same security measures it normally exercises with respect to its own confidential information and at minimum a reasonable standard of care;

(c) upon the request of Toronto Hydro, and in any event upon the expiration or termination of this Agreement for any reason, the Consultant shall return (or delete, in the case of electronic documents) forthwith to Toronto Hydro all Confidential Information, including all copies and other materials containing the Confidential Information, which are in the possession or under the control of the Consultant; and

(d) the Consultant shall not use any Confidential Information for any purpose other than to perform the Services required by this Agreement. Without limiting the foregoing, the Consultant shall not, and shall not permit any of its Representatives to, use any Confidential Information in furtherance of its, or their, individual business or for its, or their, own benefit, profit or advantage, or for the benefit, profit or advantage of any other party.

Notwithstanding the foregoing, the Consultant may disclose such Confidential Information to any of the Representatives of the Consultant who agree to be bound by the obligations of confidentiality herein and who have a reasonable need to know such Confidential Information in the course of their duties for the Consultant but only for the purposes of the Consultant exercising its rights and obligations under this Agreement; and in the event that the Consultant believes it is required by law to disclose, or is requested by a governmental authority to disclose, any Confidential Information to a governmental authority; provided that the Consultant shall, to the extent permitted by law, first inform Toronto Hydro of the request or requirement for disclosure to allow an opportunity for Toronto Hydro to apply for an order to prohibit or restrict such disclosure.

8.2 Non-Solicitation

Unless Toronto Hydro's Chief Executive Officer provides prior written consent, the Consultant hereby covenants and agrees that during the term of this Agreement and for a period of two (2) years following the termination of the Agreement, however caused, the Consultant will not directly or indirectly, either individually or in partnership or jointly or in conjunction with any other Person,

a) hire or otherwise engage any Protected Employee who is currently employed by Toronto Hydro;

b) hire or otherwise engage any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause;

c) solicit or attempt to solicit any Protected Employee who is currently employed by Toronto Hydro or encourage any such person to leave his/her employment with Toronto Hydro; and

d) solicit or attempt to solicit any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause.

Given the unique expertise and intimate knowledge that the employees have of the operations of Toronto Hydro the Consultant acknowledges and agrees that the restrictions contained in this Subsection 8.2 are reasonable and necessary to preserve the value of Toronto Hydro's business.

9. INTELLECTUAL PROPERTY

9.1 Use

Nothing in this Agreement shall be deemed to transfer, license, assign, permit the use of, or otherwise convey an interest in whole or in part to the Consultant of any Intellectual Property belonging to Toronto Hydro or any of its Representatives or any third party whose Intellectual Property is in Toronto Hydro's custody or control, and the use by the Consultant of any such Intellectual Property shall be subject to the prior written approval of Toronto Hydro.

9.2 Ownership

Toronto Hydro shall at all times have full rights and title to the Deliverables, and may at all times take possession of or use any completed or partially completed Deliverables, notwithstanding any provision, express or implied, to the contrary. Without limiting the generality of the foregoing, Toronto Hydro shall own all Intellectual Property rights in all Deliverables, and the Consultant hereby waives and assigns to Toronto Hydro any such rights, and agrees to give Toronto Hydro and its Representatives all assistance as may be reasonably required to perfect such rights including, without limitation and where the Consultant is a corporation or partnership, obtaining waiver of moral rights from any of the Consultant's employees, partners or other Representatives.

10. HEALTH AND SAFETY

The Consultant shall be responsible for managing the health and safety of its own personnel and other Representatives. Neither Toronto Hydro, nor its Representatives, shall be liable for any loss, damages or claims arising directly or indirectly from the Consultant's access to or work in or around Toronto Hydro's facilities, and the Consultant hereby waives any claims to which it may become entitled for loss or damage and releases Toronto Hydro and its Representatives from any and all such claims.

11. MISCELLANEOUS

11.1 Survival

In addition to the terms in this Agreement that by their nature survive the expiry or termination of the Agreement, the terms of section 5 (Representations, Warranties and Indemnities), section 8 (Confidentiality), section 9 (Intellectual Property), and subsection 11.3 (Injunctive Relief) shall survive the expiry of this Agreement for a term of five (5) years.

11.2 Subcontracting

The Consultant may not subcontract the performance of any part of the Services without Toronto Hydro's prior written approval. Where Toronto Hydro provides its prior written approval to the Consultant to subcontract all or part of the Services, then the Consultant shall enter into agreements with such permitted subcontractor(s) to require the permitted subcontractor(s) to provide Services in accordance with all of the terms of this Agreement. Notwithstanding the foregoing, the Consultant shall remain liable for any and all acts or omissions of any subcontractor(s) as if such acts or omissions were those of Consultant.

11.3 Injunctive Relief

(a) The Consultant acknowledges and agrees that the terms of section 8 (Confidentiality) and section 9 (Intellectual Property) of this Agreement are reasonably necessary to protect the legitimate interests of Toronto Hydro, are reasonable in scope and duration, and are not unduly restrictive.

(b) The Consultant further acknowledges that a breach of any of the terms of section 8 (Confidentiality) or section 9 (Intellectual Property) would render irreparable harm to Toronto Hydro, and that a remedy at law for breach of these sections would be inadequate, and that Toronto Hydro shall therefore be entitled to any and all equitable relief, including, without limitation, injunctive relief, and any other remedy that may be available at law or in equity.

11.4 Force Majeure

Either party will be relieved of liability for delays in performance of its obligations hereunder where such delay is a result of Force Majeure. The party affected by the Force Majeure shall give prompt notice thereof to the other party and, upon cessation of the Force Majeure, shall take all reasonable steps to resume the performance of its obligations hereunder. If a delay in performance by reason of Force Majeure extends beyond thirty (30) Business Days, then either party may terminate this Agreement by written notice.

11.5 Non-Exclusive Agreement

This Agreement will not be interpreted to grant to the Consultant exclusive rights to provide the Services or to bind Toronto Hydro in any way to an exclusive relationship with the Consultant with regards to the Services or any other service.

11.6 Waiver

No delay on the part of either party in exercising any of its rights hereunder or failure to exercise the same, nor the acquiescence thereto shall operate as a waiver except in the specific instance for which it is given and where such waiver is provided in writing by the party waiving its rights.

11.7 Amendments

None of the terms, conditions or provisions of this Agreement shall be varied, modified or altered except by written agreement signed by an authorized representative of each parties.

11.8 Assignment

Save and except for Toronto Hydro's right to assign this Agreement to any of its Affiliates, neither party may assign this Agreement or any of their rights or obligations hereunder, without the prior written authorization of the other party, acting reasonably.

11.9 Enurement

This Agreement shall enure to the benefit of, and be binding upon, the parties hereto and their respective successors and permitted assigns.

11.10 Severability

In the event that any provision or portion of this Agreement is determined to be invalid or unenforceable for any reason, the remaining provisions or portions of this Agreement will be unaffected and will remain in full force and effect to the fullest extent permitted by law.

11.11 Neutral Construction

The parties to this Agreement agree that this Agreement was negotiated fairly between them at arm's length, that the final terms of this Agreement are the product of the parties' negotiations, and that this Agreement shall be deemed to have been jointly and equally drafted by them, and that the provisions thereof should not be construed against a party on the grounds that such party drafted the Agreement in whole or in part.

11.12 Entire Agreement

This Agreement constitutes the entire agreement between the parties relating to the subject matter hereof. This Agreement supersedes any and all prior correspondence, warranties, covenants, collateral undertakings, or agreements, oral or otherwise, express or implied, unless otherwise contained herein.

11.13 Notices

(a) All questions or other communications regarding this Agreement, including any notices required by this Agreement, are to be addressed to the following addresses:

to Toronto Hydro:

Name:	**Richard McCluskey**
Title:	Director, Public Relations, Litigation and Privacy
Address:	14 Carlton Street, Toronto, ON M5B 1K5

Email: glyle@innovativeresearch.ca

(b) All notices or communications shall be deemed to be received on the date of acceptance (as evidenced by the signature of the party) if delivered by personal delivery or courier, on the fifth (5th) Business Day after mailing, if mailed by first class mail, or on the first (1st) Business Day after transmission, if sent by facsimile (provided the transmission is evidenced by documented proof of proper fax transmittal).

11.14 Governing Law

This Agreement shall be governed by and construed in accordance with the law of the Province of Ontario and the laws of Canada applicable therein.

11.15 Execution

This Agreement may be signed in counterparts and delivered by electronic means, each of which shall be deemed an original and all of which, together, shall have the same effect as if all constitute one and the same Agreement.

IN WITNESS WHEREOF, the parties have duly executed this Agreement as of the date first written above:

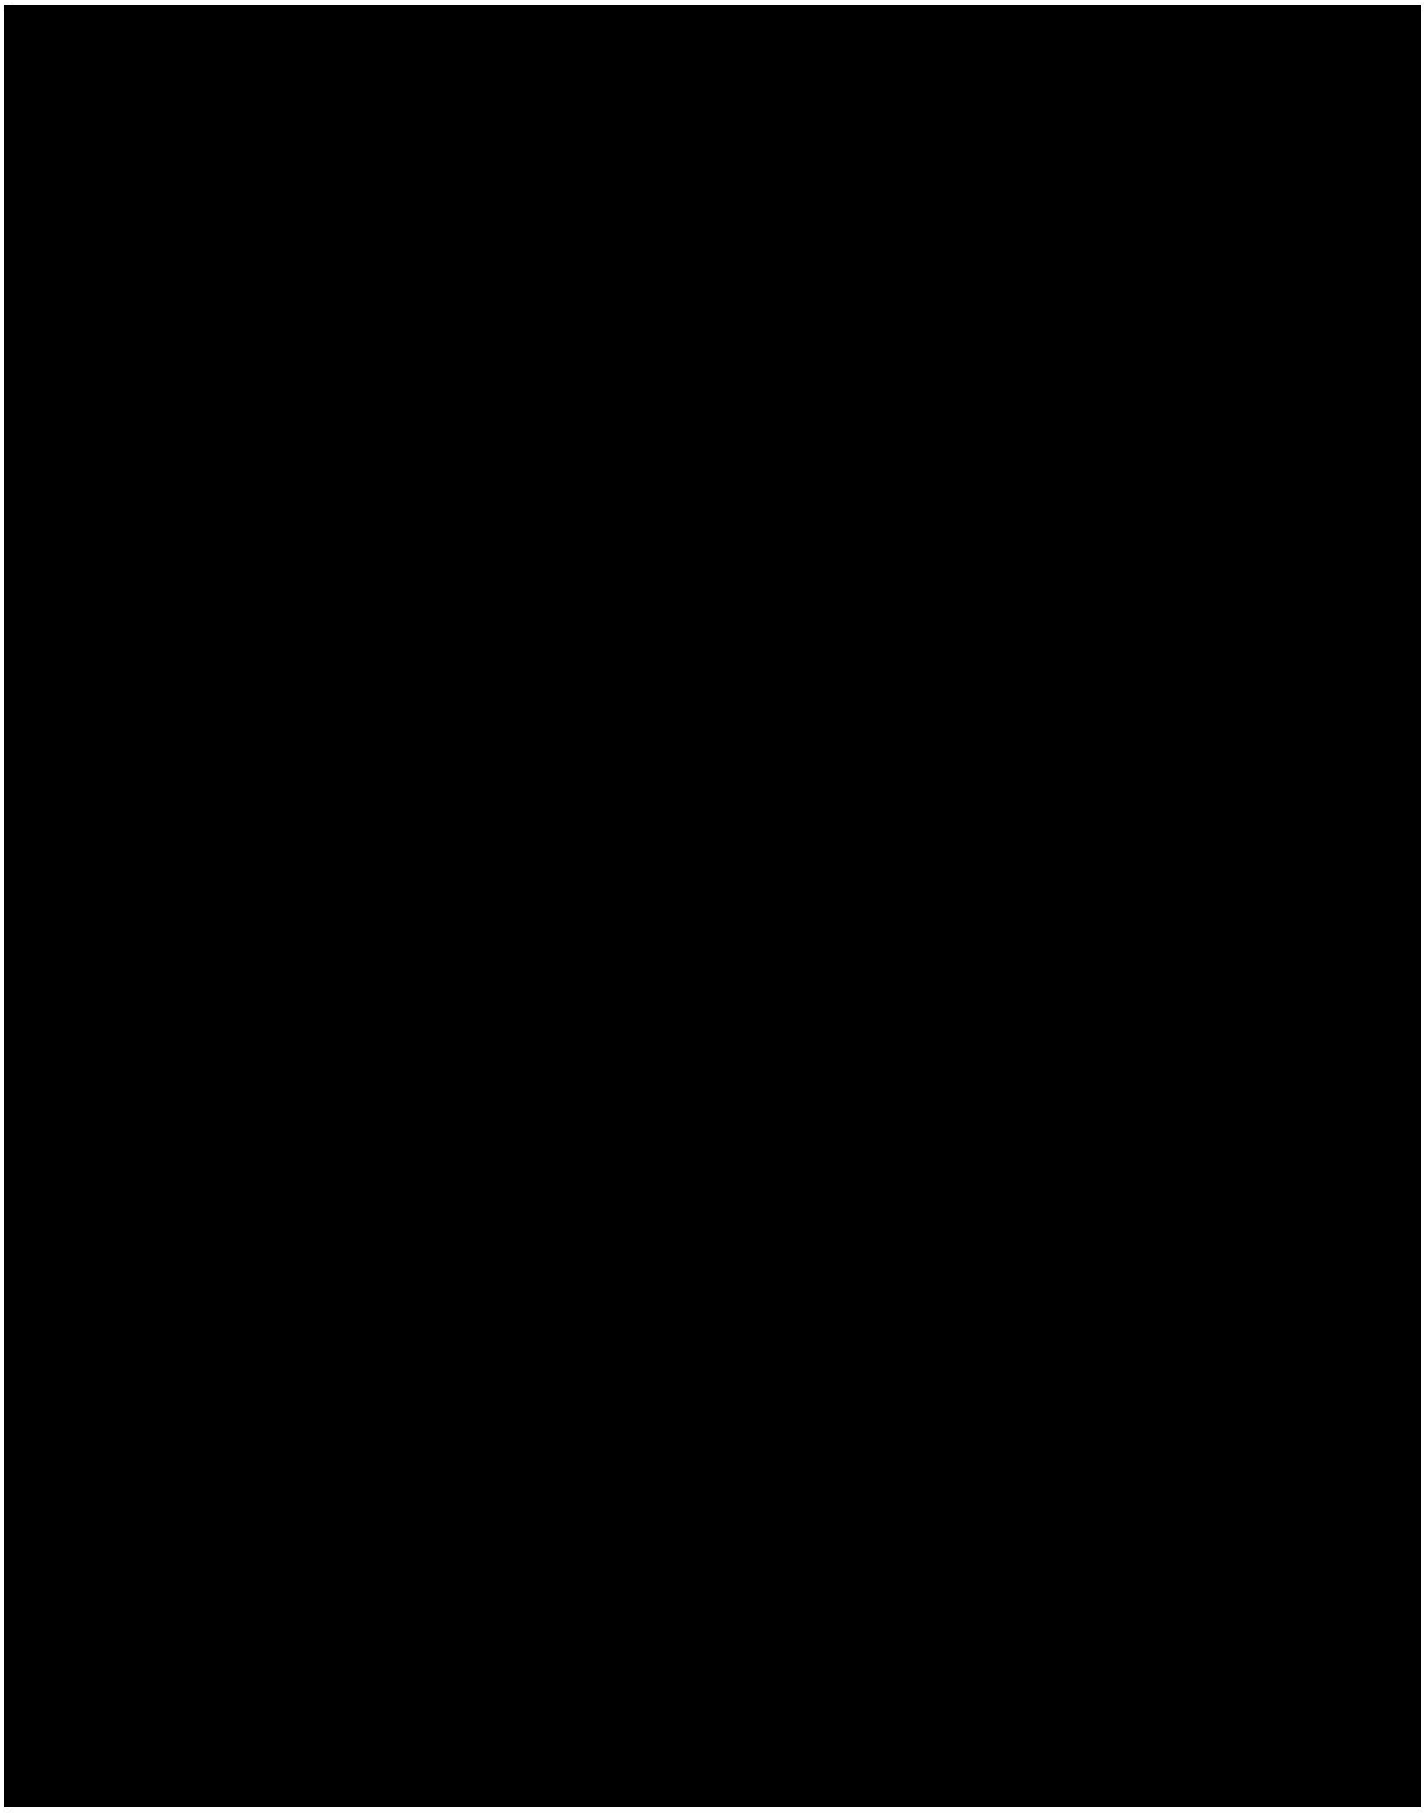
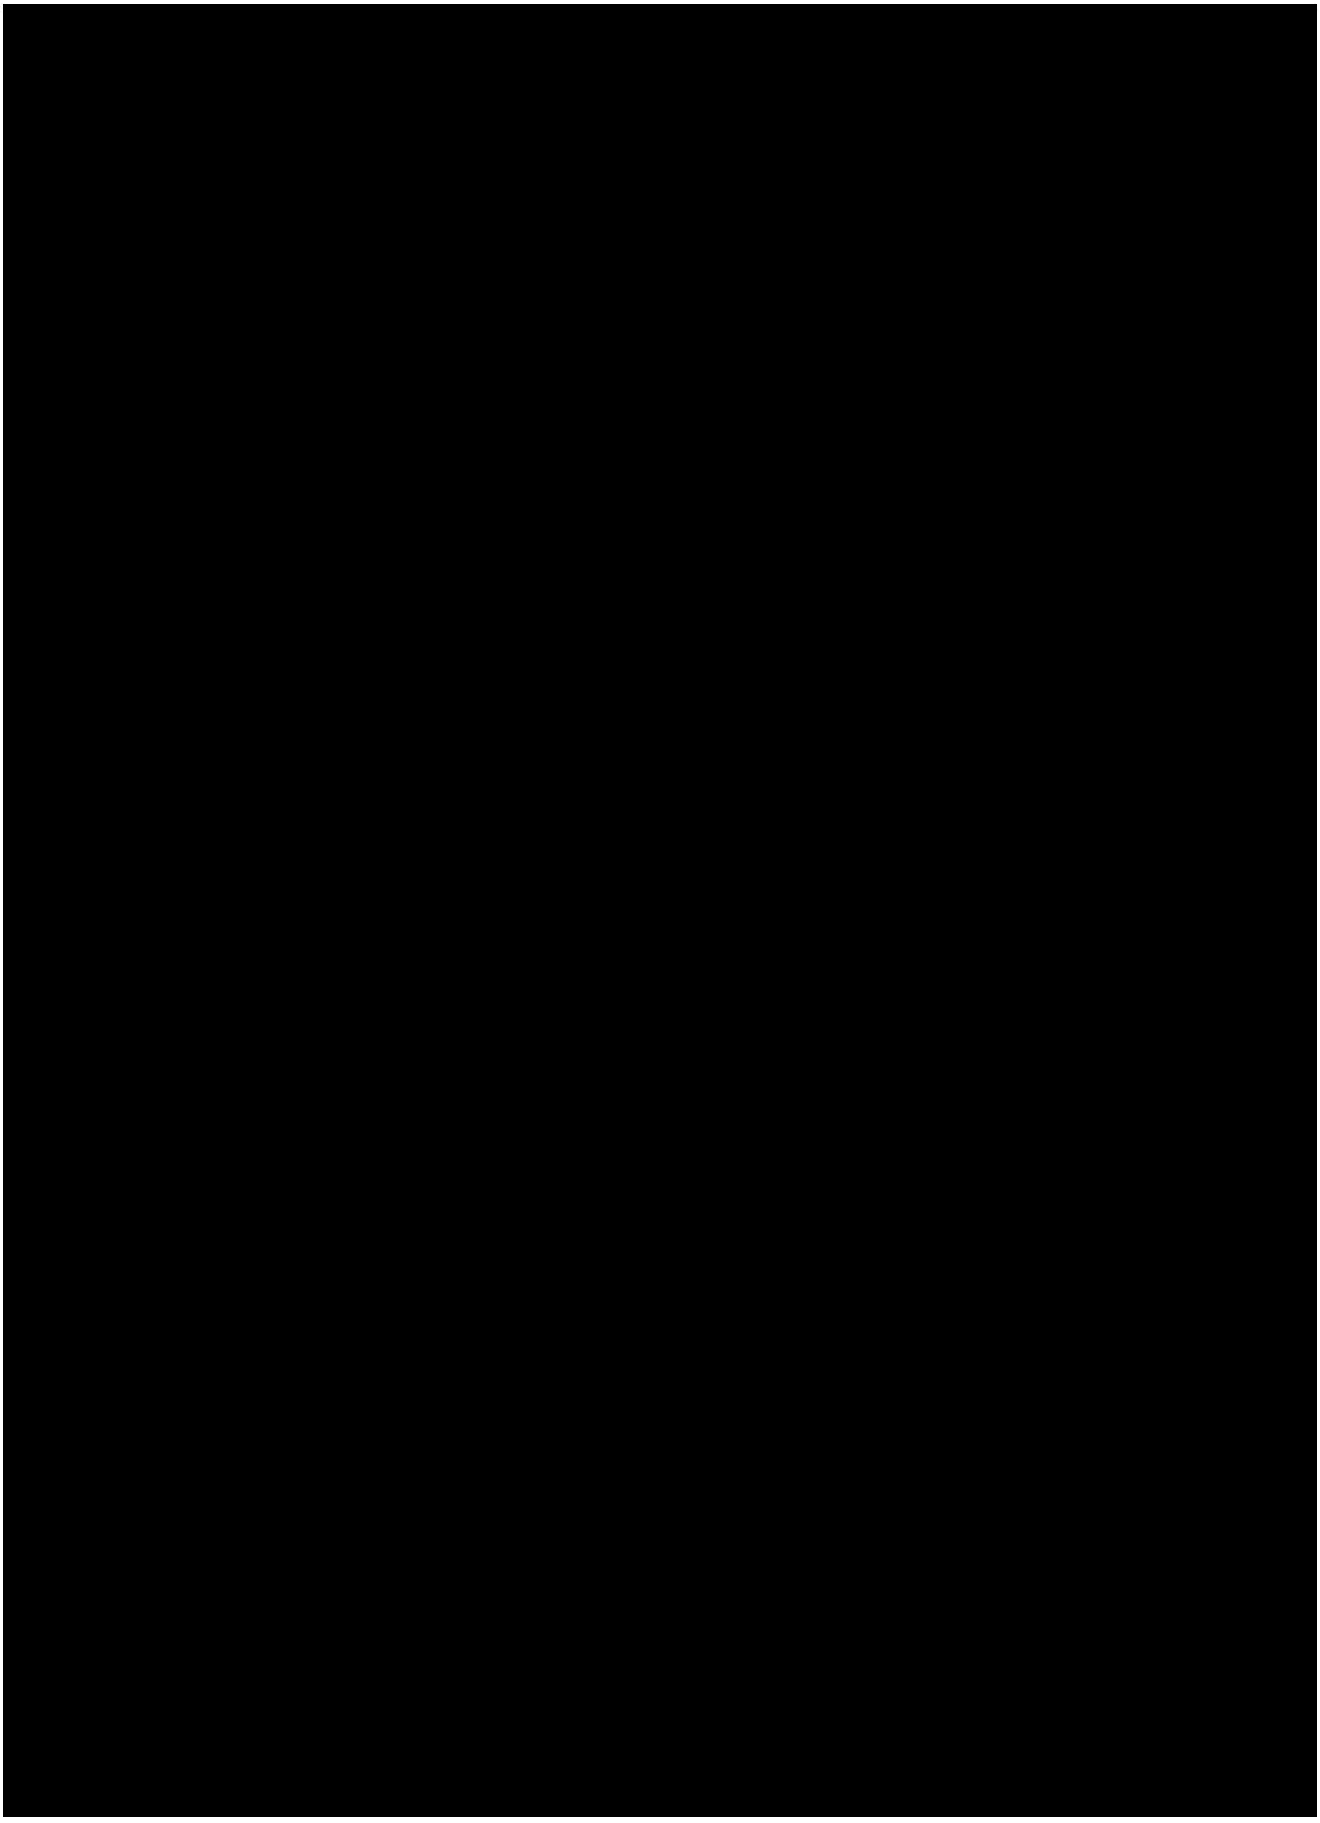
SCHEDULE B

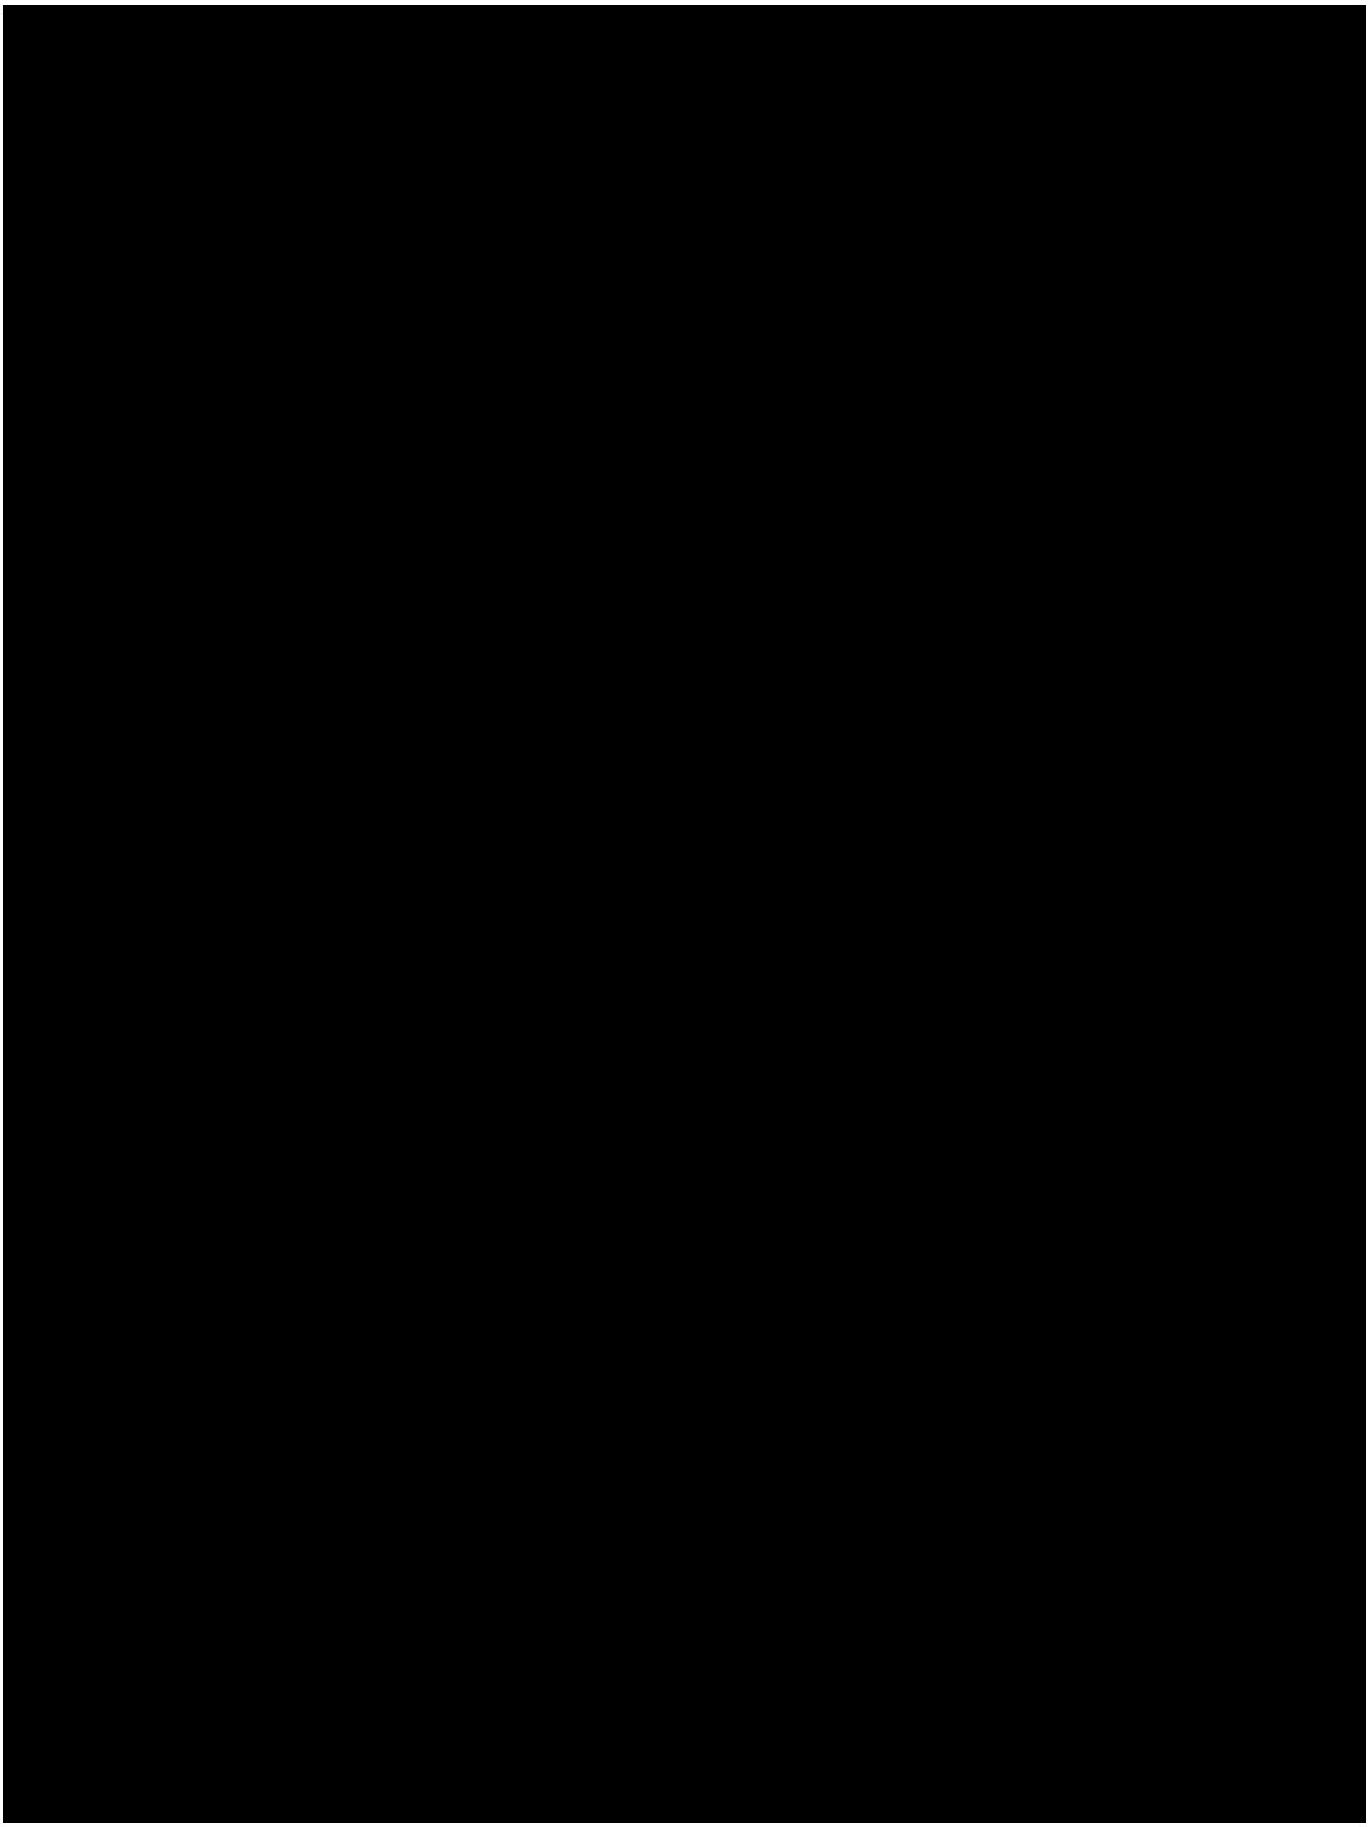
DEFINITIONS



In this Agreement, the following definitions shall apply:



"Affiliates"	has the meaning prescribed to it in the *Business Corporations Act* of Ontario, as amended from time to time;
"Agreement"	means this Agreement for Professional Consulting Services, including all recitals, schedules and attachments thereto;
"Applicable Laws"	means all federal, provincial and municipal statutes, regulations, codes, by-laws, orders in council, directives, rules, guidelines and ordinances applicable to this Agreement, including without limitation all applicable OEB codes, rules or guidelines;
"Business Day"	means a day on which banks are open for business in the City of Toronto, Ontario, but does not include a Saturday, Sunday, or a civic or statutory holiday in the Province of Ontario;
"Confidential Information"	means the terms of this Agreement and any and all data or information relating to the business, management or affairs of Toronto Hydro, its customers, employees, or any of its Affiliates disclosed by Toronto Hydro to the Consultant pursuant to this Agreement, whether or not such Confidential Information is expressly identified as confidential. Notwithstanding the foregoing, Confidential Information does not include any information or data which: (a) information or data that is or becomes publicly known through no breach of the terms or conditions of this Agreement; (b) information or data that is independently developed without reference to Confidential Information and without breach of the terms and conditions of this Agreement; or (c) Confidential Information that is required by court order or other legal compulsion to be disclosed, in which case the Consultant shall give Toronto Hydro prior written notice of such disclosure, as permitted by law;
"Consultant"	means The Innovation Research Group Inc.;
"Deliverable"	means any and all works prepared, generated, created or designed by the Consultant pursuant to this Agreement, including without limitation all drawings, models, designs, formulae, methods, documents, reports, software, specifications, or source codes, and any related works, enhancements, modifications or additions thereto;
"Disbursements"	shall have the meaning as prescribed in paragraph 6.1(c);
"Fees"	shall have the meaning as prescribed in paragraph 6.1(a);



"Force Majeure"	means any impediments beyond the control of the applicable party due, wholly or in part, directly or indirectly, to: strikes, lockouts, riots, epidemics, war, governmental regulations, fire, explosions, acts of God, or any other impediment beyond the control of the party affected;
"Hourly Rate"	shall have the meaning prescribed in paragraph 6.1(a);
"HST"	means Harmonized Sales Tax;
"Guidelines"	has the meaning prescribed in paragraph 4.2(d);
"Intellectual Property"	includes all trademarks, copyrights, patents, business names, trade secrets, proprietary software, analysis or techniques (whether or not patented or patentable), confidential or secret designs and processes, source codes, plans or devices, or other proprietary and intellectual property rights;
"Intervenor"	means any interested group or individual who participates actively in an OEB proceeding either by submitting evidence, arguments or interrogatories (written questions) or by cross-examining a witness or witnesses at an oral hearing;
"Person"	means any individual, firm, corporation, unlimited liability company, partnership, limited liability partnership, joint venture, trust, unincorporated association, unincorporated syndicate, any governmental authority and any other legal or business entity.
"Protected Employee"	means any individual who, during the course of their employment with Toronto Hydro, was directly or indirectly involved in: i. the procurement of the Services of the Consultant on behalf of Toronto Hydro; ii. the negotiation of the Consultant's Agreement on behalf of Toronto Hydro; and/or the awarding and/or approval of the Consultant's Agreement on behalf of Toronto Hydro.
"Remittances"	has the meaning prescribed to it in paragraph 6.1(e);
"Term"	has the meaning prescribed to it in subsection 3.1; and
"Toronto Hydro"	means Toronto Hydro-Electric System Limited.

SECOND AMENDING AGREEMENT

THIS SECOND AMENDING AGREEMENT (the "Second Amending Agreement") is made effective as of June 1, 2023 (the "Effective Date") between **INNOVATIVE RESEARCH GROUP INC.** ("Consultant") and **TORONTO HYDRO-ELECTRIC SYSTEM LIMITED** ("Toronto Hydro") (collectively, the "Parties").

WHEREAS:

1. Toronto Hydro and Consultant entered into an agreement for certain research-based consulting services (the "Services") dated September 22, 2021 (the "Purchase Agreement"); and

2. The Parties entered into an amending agreement dated November 30, 2022 to add Toronto Hydro's privacy terms and conditions to the Agreement (the "First Amending Agreement", and together with the Purchase Agreement, the "Agreement").

3. The Parties wish to further amend the Agreement by attaching the Ontario Energy Board's *Rules of Practice and Procedure* Rule 13A, and make associated amendments related to the Consultant's participation in Toronto Hydro's upcoming rate application, as provided herein.

NOW THEREFORE, THIS SECOND AMENDING AGREEMENT WITNESSES that in consideration of the mutual covenants contained herein and for other valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Toronto Hydro and Consultant agree as follows:

1. Any capitalized terms used but not defined herein shall be as defined in the Agreement. The recitals above are agreed by the Parties to be true and deemed to form part of this Second Amending Agreement as if specifically restated herein.

2. Section 4.2 of the Agreement is amended by adding the following subsection (e) immediately following subsection 4.2(d):

   (e) Without limiting the generality of subsection 4.2(a) above, the Consultant shall comply with Rule 13A Expert Evidence of the OEB's *Rules of Practice and Procedure*, attached as SCHEDULE C hereto, in the course of providing the Services and agrees to accept the responsibilities that are or may be imposed on them by that rule.

3. SCHEDULE A is amended by adding the following Section 3 immediately following Section 2:

   3. Participation in Toronto Hydro's Regulatory Application Process

   The Consultant shall be available to speak to the Services in a regulatory proceeding as required by Toronto Hydro and/or the Ontario Energy Board relating to Toronto Hydro's 2025 rate application.

   The degree of Consultant's participation shall be dependent on the degree of interest in the Services by OEB staff or any intervenors. Consultant's participation in such proceeding may entail, but is not limited to, preparation of expert report(s), responding to interrogatories and undertakings, provision of support prior to and during any hearings required by the OEB, and answers to any questions regarding the form, methodology, assumptions, and choices made in the provision of the Services, in either written or oral format (the latter in acting as a witness for Toronto Hydro).

DocuSign Envelope ID: CF035C2F-6191-4E94-BD1C-57646BBFD43A

The Consultant shall comply with the requirements and agrees to accept the responsibilities set out in Rule 13A of the OEB's *Rules of Practice and Procedure*, attached as SCHEDULE C to this Agreement, when providing any Services relating to Toronto Hydro's 2025 rate application.

4. The Parties agree to add a new SCHEDULE C to the Agreement, attached hereto as Appendix 1 to this Second Amending Agreement.

5. All other terms and conditions of the Agreement remain continuously in full force and effect, unamended, and shall be deemed to apply to this Second Amending Agreement.

6. This Second Amending Agreement, together with the Agreement, shall hereinafter constitute the entire agreement between the Parties with respect to the Services as further described in the Agreement, and supersedes any and all other agreements, understandings, discussions, negotiations, representations and correspondence which may have been made by or between the Parties respecting the same.

IN WITNESS WHEREOF the Parties hereto have executed this Second Amending Agreement as of the date first written above.

APPENDIX 1

SCHEDULE C

Ontario Energy Board *Rules of Practice and Procedure* Rule 13A

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

a. the expert's name, business name and address, and general area of expertise;
b. the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;
c. the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;
d. the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;
e. in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and
f. an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

a. in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and
b. at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

a. scope and timing;
b. the involvement of any expert engaged by the OEB;
c. the costs associated with the conduct of the activities;
d. the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of Rule **13A.04**; and
e. any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A.**

Agreement for Professional Consulting Services

THIS AGREEMENT is made this 21st day of March, 2022 ("Effective Date")

BETWEEN:

Toronto Hydro-Electric System Limited,

a corporation incorporated under the laws of Ontario

(hereinafter called "Toronto Hydro")

and

Clearspring Energy Advisors, LLC,

a corporation incorporated under the laws of Wisconsin

(hereinafter called the "Consultant")

WHEREAS:

A. Toronto Hydro has retained the Consultant to provide certain consulting services as detailed in SCHEDULE A (collectively, the "Services"); and

B. the Consultant has indicated to Toronto Hydro that it has the skill and expertise to provide the Services on the terms and conditions set forth herein;

NOW THEREFORE, in consideration of the mutual covenants set forth herein and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

1. INTERPRETATION

Unless otherwise indicated, all capitalized terms in this Agreement shall be as defined in SCHEDULE C and any reference to currency in this Agreement shall refer to lawful money of Canada.

2. RELATIONSHIP OF THE PARTIES

2.1 Retainer

Toronto Hydro hereby retains the Consultant to provide the Services, and the Consultant hereby agrees to provide the Services, during the Term, in accordance with the terms and subject to the conditions of this Agreement.

2.2 Independent Contractors

(a) Notwithstanding any provision hereof, this Agreement does not constitute and shall not be construed as constituting a partnership, joint venture, principal/agency relationship, or employer/employee relationship between the parties. The Consultant acts at all times in the capacity of an independent contractor, and neither party shall represent itself to be an agent or employee of the other. The Consultant and its Representatives have no authority to commit, act for or on behalf of Toronto Hydro, or to bind Toronto Hydro to any obligation or liability.

(b) Without limiting the generality of Section 2.2(a), the Consultant hereby acknowledges and agrees that neither it nor its Representatives shall be eligible or entitled, by reason of this Agreement, to participate in any employee-related program offered by Toronto Hydro or any of its Affiliates, including, without limitation, any benefit, insurance, compensation, health plan, bonus or retirement program.

(c) The Consultant hereby covenants and agrees to indemnify, defend and hold harmless Toronto Hydro and its Representatives from and against all costs, liabilities or claims whatsoever against Toronto Hydro or its Representatives resulting from or relating to the Consultant or its Representatives being deemed to be an employee of Toronto Hydro or any of its Affiliates.

(d) The Consultant hereby acknowledges and agrees that Toronto Hydro shall not be responsible for and shall not have control or charge of any means, methods, techniques, sequences or procedures used for or in respect of the Services, or for the safety precautions or programs required for the Services or otherwise prescribed hereunder.

2.3 Conflicts of Interest

The Parties acknowledge that there is potential for a conflict of interest based on services provided by the Consultant from time to time to Toronto Hydro. The Consultant agrees to take all such steps as Toronto Hydro deems necessary, acting reasonably, to remove, mitigate or minimize such conflict of interest. The parties acknowledge that the Consultant working for other utility clients will not constitute a conflict of interest unless the work involves a regulatory application put forth by Toronto Hydro.

3. TERM

3.1 Initial Term

This Agreement shall be effective as of the Effective Date and shall continue, unless terminated in accordance with the terms hereof or extended pursuant to Section 3.2, for a period of four (4) years (the "Initial Term").

3.2 Renewal

Toronto Hydro may, at its sole option, elect to renew this Agreement for two (2) additional one (1) year terms (each a "Renewal Term") by giving written notice to the Consultant at least thirty (30) days before the end of the Initial Term or the first Renewal Term (as applicable). The same terms and conditions contained herein shall apply during the Renewal Term(s), save and except as amended in writing by the parties.

3.3 Term

The Initial Term and Renewal Term, if any, shall hereinafter together be referred to as the "Term".

4. SERVICE REQUIREMENTS

4.1 Services

During the Term, the Consultant shall perform the Services as detailed in SCHEDULE A hereto

(a) in accordance with the terms and subject to the conditions set forth in this Agreement;

(b) using personnel of required skill, experience, licences and qualifications;

(c) in a workerlike and professional manner; and

(d) consistent with standards generally observed by reputable and competent members of the same industry providing similar services.

4.2 Revision to Services

(a) The parties acknowledge and agree that the Services to be undertaken and completed by the Consultant under this Agreement may be subject to revision or amendment from time to time during the Term: (i) as required by Toronto Hydro to comply with the Guidelines; (ii) as required by Toronto Hydro to comply with Applicable Laws or any order, instruction, directive or legal requirement of a Governmental Authority; or (iii) as required by Toronto Hydro to ensure that Toronto Hydro receives the expected funding and benefits with respect to the project to which the Services relate.

(b) Toronto Hydro agrees to provide the Consultant with written notice of any revision or amendment to the Services required pursuant to this Section 4.2, and the Consultant shall comply with all such directives.

(c) In the event that the Consultant fails to comply with a directive issued by Toronto Hydro pursuant to this Section 4.2, Toronto Hydro shall have the right, in addition to any other remedies which may be available to Toronto Hydro hereunder or otherwise at law, to terminate this Agreement by giving written notice of termination to the Consultant whereupon this Agreement shall terminate as at the effective date of termination specified in the notice and Section 7 shall apply.

4.3 Applicable Laws

(a) The Consultant shall, at its sole expense, obtain and maintain during the Term of this Agreement, all permits, licences and approvals required to perform its obligations under

this Agreement in accordance with Applicable Laws. The terms and conditions of this Agreement shall be carried out in strict compliance with all Applicable Laws and in the event of any conflict between any Applicable Laws, the Applicable Laws with the most stringent standard shall apply.

(b) Without limiting the generality of the foregoing, the Consultant shall comply with the *Municipal Freedom of Information and Protection of Privacy Act* (Ontario) ("MFIPPA"), the *Personal Information Protection and Electronic Documents Act* (Canada) ("PIPEDA") and any other applicable privacy legislation (collectively, "Privacy Laws") with respect to any personal information collected, used or disclosed in connection with this Agreement and shall indemnify and hold harmless Toronto Hydro and its Representatives from and against any and all claims, demands, suits, losses, damages, causes of action, fines or judgments (including related expenses and legal costs) they may incur related to or arising out of any non-compliance therewith.

(c) Where any Deliverable is subject to the approval or review of any authority, department, government or agency other than Toronto Hydro, such applications for approval or review shall, unless otherwise authorized by Toronto Hydro in writing, be prepared by the Consultant to be approved and submitted by and through the offices of Toronto Hydro, and the Consultant shall not have any direct dealings with the authority, department, government or agency in question with regards to the Deliverable.

(d) The Consultant and the Consultant's personnel and Representatives shall comply with all rules and direction of Toronto Hydro, whether specified in this Agreement or otherwise, while working on Toronto Hydro's premises or when accessing or connecting to Toronto Hydro's information technology systems, including rules and directions concerning health, safety, security and environmental protection, including without limitation, Toronto Hydro's *Code of Business Conduct and Whistleblower Procedure,* Toronto Hydro's *Disclosure Policy*, Toronto Hydro's *Social Media and Digital Communication Policy,* Toronto Hydro's *Accessibility Policy,* Toronto Hydro's *Workplace Harassment Policy and Program*, Toronto Hydro's *Violence Prevention in the Workplace Policy*, Toronto Hydro's *Workplace Alcohol and Drug Policy*, Toronto Hydro's *Environmental Policy,* Toronto Hydro's *Occupational Health and Safety Policy*, Toronto Hydro's *Privacy Policy*, Toronto Hydro's *Cyber Security Policy*, Toronto Hydro's *Technology Use Guidelines*, Toronto Hydro's *Physical Security Policy*, Toronto Hydro's *COVID-19 Vaccination Policy*, and the *Affiliate Relationships Code for Electricity Distributors and Transmitters* issued by the OEB (together, the "Guidelines"). Toronto Hydro premises includes, but is not limited to, all Toronto Hydro-owned or leased buildings, sites, work centres, stations, substations, vaults, radio antenna sites, and any other location where Toronto Hydro stores or maintains physical assets. The Consultant agrees to comply with and to direct its Representatives to comply with such Guidelines, as amended.

4.4 Performance

(a) The Services shall be performed to the satisfaction of Toronto Hydro, and Toronto Hydro shall have the right at all reasonable times, to inspect or otherwise review the Services performed or being performed. The Consultant shall, upon the request of Toronto Hydro, acting reasonably, provide Toronto Hydro with written reports of the status of the Deliverables and the Consultant's progress in providing the Services.

(b) In the event of any dispute between Toronto Hydro and the Consultant relating to the quality or acceptability or rate of progress of any of the Services, or relating to the interpretation of any instructions or specifications concerning the Services, Toronto Hydro and the Consultant shall attempt to mutually reach a resolution in good faith. Failing a good faith resolution, the reasonable opinion of Toronto Hydro shall govern and be binding on the parties hereto.

5. REPRESENTATIONS, WARRANTIES, INDEMNITIES AND INSURANCE

5.1 Representations and Warranties

The Consultant hereby represents, warrants and agrees that:

(a) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has/have the necessary experience and qualifications to perform the Services;

(b) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) will perform the Services in a diligent, expeditious and workerlike manner, consistent with standards generally observed by reputable and competent members of the same industry providing similar services;

(c) all Services shall be the Consultant's (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) original work and none of the Services or any invention, development, use, production, distribution or exploitation relating thereto will infringe, misappropriate or violate any intellectual property or other right of any person or entity.

(d) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has the corporate power and authority to enter into this Agreement and to perform its obligations hereunder, and that this Agreement constitutes a legal, valid, and binding obligation of the Consultant, enforceable against the Consultant in accordance with its terms.

5.2 Indemnity

a) The Consultant shall be liable for and shall indemnify, defend and hold harmless Toronto Hydro and its Representatives from all claims, demands, actions, penalties, damages, losses, judgments and settlements, liabilities, costs, expenses, including legal fees and other related costs and expenses arising out of, related to, or incidental to, the Consultant or any of its Representatives' performance of the Services under this Agreement, including, without limitation:

i. any breach, violation or non-performance by the Consultant or any of its Representatives of any terms, conditions, warranties, obligations or covenants contained in this Agreement;
ii. any breach or violation by the Consultant or any of its Representatives of any Applicable Laws; and
iii. any actions, omissions, negligence or wilful misconduct of the Consultant or any of its Representatives

except to the extent caused by the negligence or wilful misconduct of Toronto Hydro or its Representatives.

b) In no event shall either party be liable for loss of profit or use or for any indirect, special, incidental or consequential damages of any nature or kind including but not limited to delays, loss of revenue, loss of use, loss of data, loss of product, costs of capital or costs or replacement power, even if that party has been advised of the possibility of such damages.

c) Subject to Section 5.2(d), the Consultant's liability for a claim for damages shall be limited to the maximum amounts payable by Toronto Hydro to the Consultant for the Term pursuant to SCHEDULE B.

d) Notwithstanding the foregoing, no exclusion or limitation of liability shall apply to:

i. Breach of the confidentiality or privacy obligations in this Agreement
ii. Intentional misconduct or gross negligence;
iii. Breach of Applicable Law; or
iv. Breach of intellectual property indemnity in Section 9.

5.3 Insurance

The Consultant shall, during the Term, and at its own expense, maintain and keep in full force and effect (and, when requested, provide Toronto Hydro with proof thereof):

(a) commercial general liability insurance on an occurrence basis having a minimum inclusive coverage limit, including personal injury and property damage, of not less than two million dollars ($2,000,000) per occurrence, which commercial general liability insurance shall be extended to cover contractual liability, products and completed operations liability, and owners/contractors protective liability;

(b) Errors and Omissions Insurance (Professional Liability) covering actual or alleged acts, errors or omissions committed by the Consultant or its Representatives, arising out of the performance of this Agreement, which shall also extend to include personal injury, bodily injury and property damage from the performance of professional services, in the amount of not less than two million dollars ($2,000,000);

(c) All insurance coverages and limits required to be maintained hereunder shall: (i) be primary to any insurance maintained by Toronto Hydro, which insurance shall be excess and non-contributory; (ii) contain a cross liability clause and a severability of interest clause; and (iii) contain a thirty (30) day prior written notice to Toronto Hydro for any cancellation, non-renewal or adverse material change.;

(d) The Consultant agrees that the insurance required hereunder in no way limits the Consultant's liability pursuant to the Liability and Indemnity provision in Section 5.3; and

(e) A waiver of subrogation shall be provided by the insurer(s) to Toronto Hydro.

6. FEES

6.1 Fees

(a) Subject to Sections 6.1(c) - 6.1(f), in exchange for the performance of the Services in accordance with the terms hereof, Toronto Hydro shall pay the Consultant the rates

outlined in SCHEDULE B, not including HST (the "Fees"). Fees shall not be in excess of the maximum amounts set out in SCHEDULE B.

(b) The Fees noted in Section 6.1(a) shall be the only fees payable by Toronto Hydro under this Agreement. Without limiting the generality of the foregoing, the Consultant hereby agrees and acknowledges that all out-of-pocket expenses, travelling costs, and other disbursements shall be at the sole expense of the Consultant, except with the prior written approval from Toronto Hydro.

(c) Any disbursements for additional incidentals incurred by the Consultant in relation to this Agreement ("Disbursements") must be pre-approved by Toronto Hydro in writing.

(d) The Consultant shall not incur or submit invoices for any work outside the scope of the Services without prior written approval from Toronto Hydro.

(e) The Consultant shall make all payment of taxes, employment insurance premiums, pension plan contributions and any other taxes or other payment of any nature, imposed by any authority in respect of the Fee paid by Toronto Hydro to the Consultant under this Agreement (together, the "Remittances"), and the Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities and claims whatsoever against Toronto Hydro or its Representatives, in any way arising out of or relating to any failure to deduct, withhold, or remit any Remittance.

(f) Without limiting the generality of Section 6.1(a), Toronto Hydro reserves the right to deduct any applicable non-resident withholding taxes from any Fee owing to the Consultant under this Agreement and remit such amounts to the applicable taxation authority.

6.2 Payment

The Consultant shall submit invoices to Toronto Hydro on a monthly basis containing:

(a) a description of the Services performed during the invoice period;

(b) the monthly payment amount;

(c) the total HST applicable to the Services during the invoice period, as well as the Consultant's HST registration number; and

(d) a detailed description of the Disbursements incurred around the invoice period, supported by documentation in a form acceptable to Toronto Hydro.

Unless otherwise provided in this Agreement, the Consultant shall invoice Toronto Hydro after final inspection and acceptance by Toronto Hydro of the Services performed and subject to receipt of all documents required by this Agreement. **Invoices must be sent electronically to: AP@torontohydro.com.** Subject to approval of the invoice by Toronto Hydro, receipt of all documents required by this Agreement, and final review by Toronto Hydro, Toronto Hydro shall make payment to the Consultant via electronic funds transfer not later than thirty (30) days following receipt of an acceptable invoice and the EFT Information (as set out below). **The Consultant must provide Toronto Hydro with, in the case of the first payment only, (i) a void**

cheque, pre-printed deposit slip or bank confirmation letter and (ii) the email address where the Consultant wishes to receive remittance information (together, "EFT Information"). EFT Information must be sent electronically to efthelp@torontohydro.com or to 14 Carlton Street, Toronto, ON, M5B 1K5, Attention: Treasury Department. Toronto Hydro reserves the right to pay the Consultant through other payment methods.

7. SUSPENSION OR TERMINATION

7.1 Suspension or Termination

(a) Toronto Hydro may, at any time during the Term by notice in writing, suspend all or a portion of the Services. Upon receipt of such written notice, the Consultant shall perform no further work other than as directed by Toronto Hydro, and shall be entitled to payment for time spent in performing the Services up to the date of suspension.

(b) Either party may terminate this Agreement immediately upon written notice where the other party enters into liquidation, whether compulsory or voluntarily, or where a proceeding in receivership, bankruptcy or insolvency has been instituted by or against such party or its property.

(c) Toronto Hydro, at its sole discretion, may terminate this Agreement immediately upon written notice where the Consultant or any of its Representatives has been in material default in the performance of its duties, obligations or undertakings under this Agreement, and has not taken immediate steps to remedy such default within two (2) Business Days following written notice of the specific default by Toronto Hydro. For the purposes of this section, a material default shall include, without limitation, a breach of any of the representations or warranties contained herein or the failure or refusal to provide the Services in accordance with the terms and conditions of this Agreement.

(d) Notwithstanding any other provision in this Agreement, Toronto Hydro, at its sole discretion, shall have the right to terminate this Agreement, for any reason, upon two (2) weeks written notice to the Consultant.

(e) In the event that this Agreement is terminated in accordance with this Section 7.1 by either party, the Consultant shall be entitled to payment for time spent in performing the Services up to the date of suspension.

7.2 Effect of Termination

Upon the termination or expiration of this Agreement, upon Toronto Hydro's request, the Consultant shall return to Toronto Hydro and delete any and all electronic copies the Consultant may have of all documents and materials in its possession relating to the Services or this Agreement, including all Confidential Information and all Deliverables, whether completed or not and shall, upon written request by Toronto Hydro, certify in writing to Toronto Hydro that it has complied with the requirements of this Section 7.2.

8. CONFIDENTIALITY

8.1 Non-Disclosure

In performing the Services required by this Agreement, the Consultant may be provided access to Confidential Information. The Consultant acknowledges and agrees that:

(a) the Consultant shall not disclose, permit access to, transmit, or transfer the Confidential Information to any third party without the prior written authorization of Toronto Hydro;

(b) the Consultant shall protect the confidentiality of the Confidential Information in its possession by exercising the same security measures it normally exercises with respect to its own confidential information and at minimum a reasonable standard of care;

(c) upon the request of Toronto Hydro, and in any event upon the expiration or termination of this Agreement for any reason, the Consultant shall return (or delete, in the case of electronic documents) forthwith to Toronto Hydro all Confidential Information, including all copies and other materials containing the Confidential Information, which are in the possession or under the control of the Consultant; and

(d) the Consultant shall not use any Confidential Information for any purpose other than to perform the Services required by this Agreement. Without limiting the foregoing, the Consultant shall not, and shall not permit any of its Representatives to, use any Confidential Information in furtherance of its, or their, individual business or for its, or their, own benefit, profit or advantage, or for the benefit, profit or advantage of any other party.

(e) Toronto Hydro is subject to MFIPPA and is governed by Governmental Authority such as IESO and the OEB and shall have the right to disclose Confidential Information in accordance with the provisions of MFIPPA or as required by the IESO or the OEB.

Notwithstanding the foregoing, the Consultant may disclose such Confidential Information to any of the Representatives of the Consultant who agree to be bound by the obligations of confidentiality herein and who have a reasonable need to know such Confidential Information in the course of their duties for the Consultant but only for the purposes of the Consultant exercising its rights and obligations under this Agreement; and in the event that the Consultant believes it is required by law to disclose, or is requested by a Governmental Authority to disclose, any Confidential Information to a Governmental Authority; provided that the Consultant shall, to the extent permitted by law, first inform Toronto Hydro of the request or requirement for disclosure to allow an opportunity for Toronto Hydro to apply for an order to prohibit or restrict such disclosure.

8.2 Non-Solicitation

Unless Toronto Hydro's Chief Executive Officer provides prior written consent, the Consultant hereby covenants and agrees that during the term of this Agreement and for a period of two (2) years following the termination of the Agreement, however caused, the Consultant will not directly or indirectly, either individually or in partnership or jointly or in conjunction with any other Person,

(a) hire or otherwise engage any Protected Employee who is currently employed by Toronto Hydro;

(b) hire or otherwise engage any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause;

(c) solicit or attempt to solicit any Protected Employee who is currently employed by Toronto Hydro or encourage any such person to leave his/her employment with Toronto Hydro; and

(d) solicit or attempt to solicit any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause.

8.3 Non-Compete

Given the unique expertise and intimate knowledge that the employees have of the operations of Toronto Hydro the Consultant acknowledges and agrees that the restrictions contained in this section are reasonable and necessary to preserve the value of Toronto Hydro's business.

(a) During the Term and for a period of ten (10) years following the termination of this Agreement, the Consultant shall not appear as an Intervenor, nor aid, assist, or provide services to an Intervenor (whether as an employee, contractor, consultant, agent, or officer) where the services are (i) related to a regulatory proceeding at the OEB involving Toronto Hydro; or (ii) likely to result in disclosure of Toronto Hydro's Confidential Information to an Intervenor or the use of Toronto Hydro's Confidential Information on behalf of an Intervenor;

(b) During the Term, the Consultant shall not aid, assist, or provide services to the OEB; and

(c) For a period of ten (10) years following the termination of this Agreement, the Consultant shall not aid, assist, or provide services to the OEB (whether as an employee, contractor, consultant, agent, or officer) where the services are (i) related to a regulatory proceeding at the Ontario Energy Board (the "OEB") involving Toronto Hydro; or (ii) likely to result in disclosure of Toronto Hydro's Confidential Information to the OEB or the use of Toronto Hydro's Confidential Information in the service of the OEB.

9. INTELLECTUAL PROPERTY

9.1 Use

Nothing in this Agreement shall be deemed to transfer, license, assign, permit the use of, or otherwise convey an interest in whole or in part to the Consultant of any Intellectual Property belonging to Toronto Hydro or any of its Representatives or any third party whose Intellectual Property is in Toronto Hydro's custody or control, and the use by the Consultant of any such Intellectual Property shall be subject to the prior written approval of Toronto Hydro.

9.2 Ownership

Toronto Hydro shall at all times have full rights and title to the Deliverables, and may at all times take possession of or use any completed or partially completed Deliverables, notwithstanding any provision, express or implied, to the contrary. Without limiting the generality of the foregoing,

Toronto Hydro shall own all Intellectual Property rights in all Deliverables, and the Consultant hereby waives and assigns to Toronto Hydro any such rights, and agrees to give Toronto Hydro and its Representatives all assistance as may be reasonably required to perfect such rights including, without limitation and where the Consultant is a corporation or partnership, obtaining waiver of moral rights from any of the Consultant's employees, partners or other Representatives.

9.3 Intellectual Property Protection

The Consultant expressly warrants that the manufacture, delivery, sale or use of the Consultant's Services will not infringe any Canadian or foreign patents, trademarks, copyrights, industrial design or other intellectual property rights and the Consultant shall indemnify and save Toronto Hydro harmless from all claims, judgments and decrees that may be entered against Toronto Hydro or its Representatives and against all damage, liability, costs and expenses (including legal fees and other attendant costs and expenses**)** Toronto Hydro incurs by reason of any infringement or claim thereof.

9.4 Pre-Existing Intellectual Property

Any pre-existing Intellectual Proprietary ("Pre-Existing IP") of Consultant or its licensors used to perform Services, or included in any Development, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of the Consultant and its licensors (collectively, "Consultant Information"). To the extent that Consultant incorporates any Consultant Information into the Development(s), Consultant hereby grants to Toronto Hydro a fully paid up, royalty free, irrevocable and non-cancellable, non-exclusive, assignable and transferable right to Use the Consultant Information without restriction, except that any such Use must be in conjunction with the Developments in which the Consultant Information is incorporated and not as a separate item. For the purpose of the foregoing, "Use" means one or more of the following rights to: use; modify; adapt; translate; create changes, alterations, modifications, improvements, adoptions, enhancements and derivative works based upon or derived from the Consultant Information; reproduce; copy; display; perform; communicate in any manner; license or sublicense. Consultant shall provide Toronto Hydro with a list of any freeware, shareware or open source software used in the Developments. Any pre-existing intellectual property of Toronto Hydro, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of Toronto Hydro.

10. HEALTH AND SAFETY

The Consultant shall be responsible for managing the health and safety of its own personnel and other Representatives. Neither Toronto Hydro, nor its Representatives, shall be liable for any loss, damages or claims arising directly or indirectly from the Consultant's access to or work in or around Toronto Hydro's facilities, and the Consultant hereby waives any claims to which it may become entitled for loss or damage and releases Toronto Hydro and its Representatives from any and all such claims.

11. MISCELLANEOUS

11.1 Survival

In addition to the terms in this Agreement that by their nature survive the expiry or termination of the Agreement, the terms of Section 5 (Representations, Warranties and Indemnities), Section 8

(Confidentiality), Section 9 (Intellectual Property), and Section 11.3 (Injunctive Relief) shall survive the expiry of this Agreement for a term of five (5) years.

11.2 Subcontracting

The Consultant shall not subcontract the performance of all or any part of the Services without Toronto Hydro's prior written approval. Where Toronto Hydro provides its prior written approval to the Consultant to subcontract all or part of the Services, then the Consultant shall enter into agreements with such permitted subcontractor(s) to require the permitted subcontractor(s) to provide Services in accordance with all of the terms of this Agreement. Notwithstanding the foregoing, the Consultant shall remain liable for any and all acts or omissions of any subcontractor(s) as if such acts or omissions were those of Consultant.

11.3 Injunctive Relief

(a) The Consultant acknowledges and agrees that the terms of Section 8 (Confidentiality) and Section 9 (Intellectual Property) of this Agreement are reasonably necessary to protect the legitimate interests of Toronto Hydro, are reasonable in scope and duration, and are not unduly restrictive.

(b) The Consultant further acknowledges that a breach of any of the terms of Section 8 (Confidentiality) or Section 9 (Intellectual Property) would render irreparable harm to Toronto Hydro, and that a remedy at law for breach of these sections would be inadequate, and that Toronto Hydro shall therefore be entitled to any and all equitable relief, including, without limitation, injunctive relief, and any other remedy that may be available at law or in equity.

11.4 Force Majeure

Either party will be relieved of liability for delays in performance of its obligations hereunder where such delay is a result of Force Majeure. The party affected by the Force Majeure shall give prompt notice thereof to the other party and, upon cessation of the Force Majeure, shall take all reasonable steps to resume the performance of its obligations hereunder as soon as reasonably practicable. If a delay in performance by reason of Force Majeure extends beyond thirty (30) Business Days, then either party may terminate this Agreement by written notice.

11.5 Non-Exclusive Agreement

This Agreement will not be interpreted to grant to the Consultant exclusive rights to provide the Services or to bind Toronto Hydro in any way to an exclusive relationship with the Consultant with regards to the Services or any other service.

11.6 Waiver

No delay on the part of either party in exercising any of its rights hereunder or failure to exercise the same, nor the acquiescence thereto shall operate as a waiver except in the specific instance for which it is given and where such waiver is provided in writing by the party waiving its rights.

11.7 Amendments

None of the terms, conditions or provisions of this Agreement shall be varied, modified or altered except by written agreement signed by an authorized representative of each parties.

11.8 Assignment

Save and except for Toronto Hydro's right to assign this Agreement to any of its Affiliates, neither party may assign this Agreement or any of their rights or obligations hereunder, without the prior written authorization of the other party, acting reasonably.

11.9 Enurement

This Agreement shall enure to the benefit of, and be binding upon, the parties hereto and their respective successors and permitted assigns.

11.10 Severability

In the event that any provision or portion of this Agreement is determined to be invalid or unenforceable for any reason, the remaining provisions or portions of this Agreement will be unaffected and will remain in full force and effect to the fullest extent permitted by law.

11.11 Neutral Construction

The parties to this Agreement agree that this Agreement was negotiated fairly between them at arm's length, that the final terms of this Agreement are the product of the parties' negotiations, and that this Agreement shall be deemed to have been jointly and equally drafted by them, and that the provisions thereof should not be construed against a party on the grounds that such party drafted the Agreement in whole or in part.

11.12 Entire Agreement

This Agreement constitutes the entire agreement between the parties relating to the subject matter hereof. This Agreement supersedes any and all prior correspondence, warranties, covenants, collateral undertakings, or agreements, oral or otherwise, express or implied, unless otherwise contained herein.

11.13 Notices

(a) All questions or other communications regarding this Agreement, including any notices required by this Agreement, are to be addressed to the following addresses:

to Toronto Hydro:

Name:	Anila Dumont
Title:	Manager, Regulatory Services
Address:	14 Carlton Street, Toronto ON 5B 1K5

Email: steve.fenrick@clearspringenergy.com

(b) All notices or communications shall be deemed to be received on the date of acceptance (as evidenced by the signature of the party) if delivered by personal delivery or courier, on the fifth (5th) Business Day after mailing, if mailed by first class mail, or on the first (1st) Business Day after transmission, if sent by facsimile (provided the transmission is evidenced by documented proof of proper fax transmittal).

11.14 Governing Law

This Agreement shall be governed by and construed in accordance with the law of the Province of Ontario and the laws of Canada applicable therein.

11.15 Execution

This Agreement may be signed in counterparts and delivered by electronic means, each of which shall be deemed an original and all of which, together, shall have the same effect as if all constitute one and the same Agreement.

IN WITNESS WHEREOF, the parties have duly executed this Agreement as of the date first written above:

SCHEDULE A

SCOPE OF SERVICES

1. Services to be Performed

(a) Regulatory Applications and Advocacy

Toronto Hydro is retaining the Consultant to undertake technical analysis, provide advice and/or assist with preparatory activities for upcoming rate applications and regulatory filings at the OEB. Broadly, the Consultant will research and support Toronto Hydro in respect of the following:

- Analyzing regulatory policies, reports, decisions, laws and other energy policy proposals of governments or regulators in relevant jurisdictions;
- Developing advocacy positions and written submissions;
- Detailing application timeline, schedule and milestones;
- Managing the discovery and interrogatory processes;
- Delivering expert testimony in regulatory proceedings;
- Understanding new or modified policies and developing new or modified approach for implementation and compliance purposes;
- Evaluating and creating regulatory frameworks, paradigms and first mover policy ideas to advance the interests of Toronto Hydro; and
- Undertaking technical analysis, drafting evidence and other preparatory activities for rate applications and regulatory filings.

In addition to the foregoing, the Consultant has been retained to provide specific expertise in the areas below. Please note that the list of work or tasks in SCHEDULE A is not guaranteed to include the subjects listed, nor is it limited to the examples listed.

(b) Regulatory Analytics and Technical Services

Toronto Hydro requires support from the Consultant on rate design. The OEB sees a comprehensive rate application as consisting of three main components: the business plan (along with supporting documentation and reports), historical and forecast information, and rate models that show the derivation of specific proposed rates based on the data. The OEB's adjudicative process on Toronto Hydro's regulatory applications can involve a number of steps to ensure that Toronto Hydro's proposals are adequately examined and "tested" during the review to ensure that it is delivering cost effective, efficient, reliable and responsive services to customers. In relation to this, the Consultant will be relied on for its experience, skillsets, knowledge and training in the area of analytics and technical services focused on the following tasks:

- Business case development;
- Econometrics and benchmarking analysis and studies;
- Productivity studies; and
- Incentive regulation principles and frameworks.

Other areas of analytics and technical services may require advice or direction from the Consultant, such as:

- Load and Customer Forecast;
- Energy market analysis
- Lead Lag Study;
- Cost Allocation Model (CAM) review;
- Rate design review;
- Load Profile Analysis as part Cost Allocation Requirements;
- Transformer Allowance;
- Cost Study for Specific Service Charge;
- Standby rates;
- EV rates;
- Loss Adjustment Factor;
- Energy & Demand Load Research Analysis;
- Distributed Energy Resources;
- Line Loss Study;
- Load Profile Analysis;
- IESO market settlement;
- Rate design principles;
- Quantitative models; and
- Other analytics and technical matters that arise.

SCHEDULE B

RATES

Resource Type	**Resource Type Hourly Cost ($/hr)**	**Percentage of Duties**
Principal Consultant (>20 Years experience, Expert Witness)	[redacted]	
Economics Consultant (>10 Years experience)		
Data Analyst (<10 Years experience)		

SCHEDULE C

DEFINITIONS

In this Agreement, the following definitions shall apply:

"Affiliates"	has the meaning prescribed to it in the *Business Corporations Act* of Ontario, as amended from time to time;
"Agreement"	means this Agreement for Professional Consulting Services, including all recitals, schedules and attachments thereto;
"Applicable Laws"	means all federal, provincial and municipal statutes, regulations, codes, by-laws, orders in council, directives, rules, guidelines and ordinances applicable to this Agreement, including without limitation all applicable OEB codes, rules or guidelines;
"Business Day"	means a day on which banks are open for business in the City of Toronto, Ontario, but does not include a Saturday, Sunday, or a civic or statutory holiday in the Province of Ontario;
"Confidential Information"	means the terms of this Agreement and any and all data or information relating to the business, management or affairs of Toronto Hydro, its customers, employees, or any of its Affiliates disclosed by Toronto Hydro to the Consultant pursuant to this Agreement, whether or not such Confidential Information is expressly identified as confidential. Notwithstanding the foregoing, Confidential Information does not include any information or data which: (a) information or data that is or becomes publicly known through no breach of the terms or conditions of this Agreement; (b) information or data that is independently developed without reference to Confidential Information and without breach of the terms and conditions of this Agreement; or (c) Confidential Information that is required by court order or other legal compulsion to be disclosed, in which case the Consultant shall give Toronto Hydro prior written notice of such disclosure, as permitted by law;
"Consultant"	means Clearspring Energy Advisors LLC;
"Consultant Information"	shall have the meaning as prescribed in Section 9.4
"Deliverable"	means any and all works prepared, generated, created or designed by the Consultant pursuant to this Agreement, including without limitation all drawings, models, designs, formulae, methods, documents, reports, software, specifications, or source codes, and any related works, enhancements, modifications or additions thereto;
"Disbursements"	shall have the meaning as prescribed in Section 6.1(c);
"Fees"	shall have the meaning as prescribed in Section 6.1(a);

"Force Majeure"	means any impediments beyond the control of the applicable party due, wholly or in part, directly or indirectly, to: strikes, lockouts, riots, epidemics (other than related to or associated with SARS-Co-V-2 or COVID-19 and any evolutions or mutations thereof), war, governmental regulations, fire, explosions, acts of God, or any other impediment beyond the control of the party affected;
"Governmental Authority"	means any government, legislature, municipality, regulatory authority, agency, commission, department, board or court or other law, regulation or rule-making public entity of similar authority, including, without limitation the OEB;
"Guidelines"	has the meaning prescribed in Section 4.3(d);
"Hourly Rate"	shall have the meaning prescribed in Section 6.1(a);
"HST"	means Harmonized Sales Tax;
"IESO"	Means the Independent Electricity System Operator;
"Initial Term"	has the meaning prescribed to it in Section 3.1;
"Intellectual Property"	includes all trademarks, copyrights, patents, business names, trade secrets, proprietary software, analysis or techniques (whether or not patented or patentable), confidential or secret designs and processes, source codes, plans or devices, or other proprietary and intellectual property rights;
"Intervenor"	means any interested group or individual who participates actively in an OEB proceeding involving Toronto Hydro either by submitting evidence, arguments or interrogatories (written questions) or by cross-examining a witness or witnesses at an oral hearing involving Toronto Hydro;
"MFIPPA"	means the *Municipal Freedom of Information Act*;
"OEB"	means the Ontario Energy Board;
"Person"	means any individual, firm, corporation, unlimited liability company, partnership, limited liability partnership, joint venture, trust, unincorporated association, unincorporated syndicate, any governmental authority and any other legal or business entity.
"Protected Employee"	means any individual who, during the course of their employment with Toronto Hydro, was directly or indirectly involved in: i. the procurement of the Services of the Consultant on behalf of Toronto Hydro;

ii. the negotiation of the Consultant's Agreement on behalf of Toronto Hydro; and/or

iii. the awarding and/or approval of the Consultant's Agreement on behalf of Toronto Hydro.

"Representative"	in respect of a party, means such party's directors, officers, employees, agents, contractors and advisors, the party's Affiliates, and all such Affiliates' respective directors, officers, employees, agents, contractors and advisors;
"Remittances"	has the meaning prescribed to it in Section 6.1(e);
"Renewal Term"	has the meaning prescribed to it in Section 3.2;
"Services"	means all of the Deliverables, services and specifications to be provided, performed and met by the Consultant under this Agreement, as more particularly described in SCHEDULE A;
"Term"	has the meaning prescribed to it in Section 3.3; and
"Toronto Hydro"	means Toronto Hydro-Electric System Limited.

AMENDING AGREEMENT

THIS AMENDING AGREEMENT (the "Amending Agreement") is made effective as of June 1, 2023 (the "Effective Date") between **CLEARSPRING ENERGY ADVISORS, LLC** ("Consultant") and **TORONTO HYDRO-ELECTRIC SYSTEM LIMITED** ("Toronto Hydro") (collectively, the "Parties").

WHEREAS:

1. Toronto Hydro and Consultant entered into an agreement for professional consulting services dated March 21, 2022 (the "Agreement") pursuant to which the Consultant shall provide various regulatory applications, advocacy, analytics, and technical services (the "Services"); and

2. The Parties wish to amend the Agreement by attaching the Ontario Energy Board's *Rules of Practice and Procedure* Rule 13A, and make associated amendments related to the Consultant's participation in Toronto Hydro's upcoming rate application, as provided herein.

NOW THEREFORE, THIS AMENDING AGREEMENT WITNESSES that in consideration of the mutual covenants contained herein and for other valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Toronto Hydro and Consultant agree as follows:

1. Any capitalized terms used but not defined herein shall be as defined in the Agreement. The recitals above are agreed by the Parties to be true and deemed to form part of this Amending Agreement as if specifically restated herein.

2. Section 4.3 of the Agreement is amended by adding the following subsection (e) immediately following subsection 4.3(d):

   (e) Without limiting the generality of subsection 4.3(a) above, the Consultant shall comply with Rule 13A Expert Evidence of the OEB's *Rules of Practice and Procedure*, attached as SCHEDULE D hereto, in the course of providing the Services and agrees to accept the responsibilities that are or may be imposed on them by that rule.

3. The Parties agree to add a new SCHEDULE D to the Agreement, attached hereto as Appendix 1 to this Amending Agreement.

4. All other terms and conditions of the Agreement remain continuously in full force and effect, unamended, and shall be deemed to apply to this Amending Agreement.

5. This Amending Agreement, together with the Agreement, shall hereinafter constitute the entire agreement between the Parties with respect to the Services as further described in the Agreement, and supersedes any and all other agreements, understandings, discussions, negotiations, representations and correspondence which may have been made by or between the Parties respecting the same.

APPENDIX 1

SCHEDULE D

Ontario Energy Board *Rules of Practice and Procedure* Rule 13A

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

a. the expert's name, business name and address, and general area of expertise;
b. the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;
c. the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;
d. the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;
e. in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and
f. an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

a. in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and
b. at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

a. scope and timing;
b. the involvement of any expert engaged by the OEB;
c. the costs associated with the conduct of the activities;
d. the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of Rule **13A.04**; and
e. any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A.**

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

AGREEMENT FOR PROFESSIONAL CONSULTING SERVICES

THIS AGREEMENT is made as of the 24th day of March, 2023 between Toronto Hydro-Electric System Limited ("Toronto Hydro"), a corporation incorporated under the laws of the province of Ontario and UMS Group Inc., a corporation incorporated under the laws of the state of New Jersey in the United States of America (the "Consultant"), pursuant to which Toronto Hydro shall retain the Consultant to provide certain Services, and the Consultant shall provide such Services, during the Term, subject to the terms and conditions hereof;

NOW THEREFORE, in consideration of the mutual covenants set forth herein and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

1. INTERPRETATION

Unless otherwise indicated, all capitalized terms in this Agreement shall be as defined in C and any reference to currency in this Agreement shall refer to lawful money of Canada.

2. RELATIONSHIP OF THE PARTIES

2.1 Retainer

Toronto Hydro hereby retains the Consultant to provide the Services, and the Consultant hereby agrees to provide the Services, during the Term, in accordance with the terms and conditions of this Agreement.

2.2 Independent Contractors

(a) Notwithstanding any provision hereof, this Agreement does not constitute and shall not be construed as constituting a partnership, joint venture, principal/agency relationship, or employer/employee relationship between the parties. The Consultant and Toronto Hydro shall at all times remain independent contractors of each other, and neither party shall represent itself to be an agent or employee of the other.

(b) Without limiting the generality of Subsection 2.2(a), the Consultant hereby acknowledges and agrees that neither it nor its Representatives shall be eligible or entitled, by reason of this Agreement, to participate in any employee-related program offered by Toronto Hydro or any of its Affiliates, including, without limitation, any benefit, insurance, compensation, health plan, bonus or retirement program.

(c) The Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities or claims whatsoever against Toronto Hydro or its Representatives resulting from or relating to the Consultant or its Representatives being deemed to be an employee of Toronto Hydro or any of its Affiliates.

(d) The Consultant hereby acknowledges and agrees that Toronto Hydro shall not be responsible for and shall not have control or charge of any means, methods, techniques, sequences or procedures

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

used for or in respect of the Services, or for the safety precautions or programs required for the Services or otherwise prescribed hereunder.

3. TERM

3.1 Initial Term

Unless otherwise terminated in accordance with the provisions hereof, this Agreement shall be for a term of approximately one (1) year and nine (9) months and seven (7) days commencing on March 24, 2023 and terminating on December 31, 2024 (the "Term").

4. SERVICE REQUIREMENTS

4.1 Services

During the Term, the Consultant shall perform the Services as detailed in SCHEDULE A hereto.

4.2 Time and Availability

(a) Unless otherwise directed in writing by Toronto Hydro, the Consultant shall have discretion in selecting the dates and times it performs the Services throughout the month, giving due regard to the needs of Toronto Hydro's business requirements and provided that any access to Toronto Hydro property shall be during regular business hours.

4.3 Key Employee

The Consultant acknowledges that Jeff Cummings and Nick Austin (the "Key Employee") are each a key employee of the Consultant and are integral to the successful performance of the Services by the Consultant under the Agreement. The Consultant acknowledges and agrees that the Key Employee will manage and be responsible for the performance of the Services and that a substantial portion of the Services will be performed by the Key Employee, unless Toronto Hydro otherwise consents in writing.

4.4 Revision to Services

(a) The Parties acknowledge and agree that the Services to be undertaken and completed by the Consultant under this Agreement may be subject to revision or amendment from time to time during the Term: (i) as required by Toronto Hydro to comply with the Guidelines; (ii) as required by Toronto Hydro to comply with the Applicable Laws or any order, instruction, directive or legal requirement of a Governmental Authority; or (iii) as required by Toronto Hydro to ensure that Toronto Hydro receives the expected funding and benefits with respect to the project to which the Services relate.

(b) Toronto Hydro agrees to provide the Consultant with written notice of any revision or amendment to the Services required pursuant to this Section 4.4 and the Consultant shall comply with all such directives.

(c) In the event that the Consultant fails to comply with a directive issued by Toronto Hydro pursuant to this Section 4.4, Toronto Hydro shall have the right, in addition to any other remedies which may be available to Toronto Hydro hereunder or otherwise at law, to terminate this Agreement by giving written notice of termination to the Consultant whereupon this Agreement shall terminate

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

as at the effective date of termination specified in the notice and the provision of Section 7 shall apply.

4.5 Applicable Laws

(a) The Consultant shall, at its sole expense, obtain and maintain during the Term of this Agreement, all permits, licences and approvals required by all Applicable Laws to perform its obligations under this Agreement. The terms and conditions of this Agreement shall be carried out in strict compliance with all Applicable Laws and in the event of any conflict between any Applicable Laws, the Applicable Laws with the most stringent standard shall apply.

(b) Without limiting the generality of the foregoing, the Consultant shall comply with the *Municipal Freedom of Information Act* ("MFIPPA"), the *Personal Information Protection and Electronic Documents Act* (Canada) ("PIPEDA") and any other applicable privacy legislation (collectively, "Privacy Laws") with respect to any personal information collected, used or disclosed in connection with this Agreement and shall indemnify and hold harmless Toronto Hydro and its Representatives from and against any and all claims, demands, suits, losses, damages, causes of action, fines or judgments (including related expenses and legal costs) they may incur related to or arising out of any non-compliance therewith.

(c) Where any Development is subject to the approval or review of any authority, department, government or agency other than Toronto Hydro, such applications for approval or review shall, unless otherwise authorized by Toronto Hydro in writing, be prepared by the Consultant to be approved and submitted by and through the offices of Toronto Hydro, and the Consultant shall not have any direct dealings with the authority, department, government or agency in question with regards to the Development.

(d) The Consultant and the Consultant's personnel shall comply with all rules and direction of Toronto Hydro, whether specified in this Agreement or otherwise, while working on Toronto Hydro's facilities: Toronto Hydro's *Code of Business Conduct and Whistleblower Procedure*, Toronto Hydro's *Disclosure Policy,* Toronto Hydro's *Social Media and Digital Communication Policy,* Toronto Hydro's *Accessibility Policy,* Toronto Hydro's *Workplace Harassment Policy and Program,* Toronto Hydro's *Violence Prevention in the Workplace Policy,* Toronto Hydro's *Workplace Alcohol and Drug Policy*, Toronto Hydro's *Environmental Policy,* Toronto Hydro's *Occupational Health and Safety Policy,* Toronto Hydro's *Privacy Policy,* Toronto Hydro's *Cyber Security Policy*, Toronto Hydro's *Technology Use Guidelines,* Toronto Hydro's *External Supplier Access to Application Services Policy,* Toronto Hydro's *Physical Security Policy* and the *Affiliate Relationships Code for Electricity Distributors and Transmitters* issued by the OEB (together, the "Guidelines"). The Consultant acknowledges that it has been provided with a copy of the Guidelines, has provided and will provide a copy of the Guidelines to each of its Representatives and that it agrees to comply with and to direct its Representatives to comply with such Guidelines, as amended.

4.6 Participation in Toronto Hydro's Regulatory Application Process

(a) The Consultant shall be available to speak to the work carried out as part of Services under this Agreement in a regulatory proceeding as required by the Ontario Energy Board as related to Toronto Hydro's 2025 Rate Application.

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

(b) The degree of Consultant's participation shall be dependent on the degree of interest in the Benchmark Study or any other Service deliverable by OEB staff and any intervenors. Consultant's participation in such proceeding may entail, but is not limited to, response to interrogatories and undertakings, provision of support prior to and during any hearings required by the OEB, and answers to any questions regarding the Benchmark Study form, methodology, assumptions, and choices made, in either written or oral format (the latter in acting as a witness for Toronto Hydro). Where the Consultant is required to testify or otherwise provide evidence at a hearing before the OEB, the Consultant shall comply with the requirements set out in rules 13 and 13A of the OEB's Rules of Practice and Procedure, appended hereto as APPENDIX A.1 to this SCHEDULE A.

4.7 Performance

(a) The Services shall be performed to the satisfaction of Toronto Hydro, and Toronto Hydro shall have the right at all reasonable times, to inspect or otherwise review the Services performed or being performed. The Consultant shall, upon the request of Toronto Hydro, provide Toronto Hydro with written reports of the status of the Developments and the Consultant's progress in providing the Services.

(b) Toronto Hydro will have the right to reject any part thereof which is found to be inappropriate or otherwise not in accordance with specifications and of the Developments set out in the Agreement or otherwise required by law. The Consultant, at no additional cost to Toronto Hydro, will promptly redo any of the Services so rejected. This will include, but is not limited to, all reports, policy manuals, implementation plans and written work (howsoever recorded, that is, whether written or on digital media) and data prepared by the Consultant under the Agreement which are found, within a period of one year from date of transmittal to Toronto Hydro, to be incomplete or inaccurate due to a failure to comply with the Agreement or with said specifications and standards.

(c) In the event of any dispute between Toronto Hydro and the Consultant relating to the quality or acceptability or rate of progress of any of the Services, or relating to the interpretation of any instructions or specifications concerning the Services, the reasonable opinion of Toronto Hydro shall govern and be binding on the parties hereto.

4.8 Conflict of Interest

The Consultant is not engaged, and will not engage, in other commercial activities or retainers which conflict with the Services and/or its obligations hereunder. For clarity, the Consultant must obtain Toronto Hydro's consent in writing to provide services to any other entity in any capacity other than Toronto Hydro in relation to the 2025 Rate Application or any associated proceeding. Where Toronto Hydro is involved in an OEB proceeding as an intervenor and/or participant that is not the 2025 Rate Application, the Consultant may provide services to any other entity in any capacity provided that the Consultant utilizes confidentiality or other safeguards, including, but not limited to separate engagement teams and data access controls for the protection of Toronto Hydro's Confidential Information. Consultant commits to comply strictly with the confidentiality terms of this Agreement and to restrict access to – and use of – Toronto Hydro Confidential Information as set out in this Agreement.

4.9 ISNetworld

The Consultant shall subscribe with ISN Software Corporation as a registrant for ISNetworld, maintain such subscription throughout the Term, provide all records and information as required

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

by ISN Software Corporation and Toronto Hydro to allow for the maintenance of such subscription and maintain a rating of B or higher on the ISNetworld during the performance of the Services.

4.10 Health and Safety

The Consultant shall be responsible for managing the health and safety of its own personnel and other Representatives. Neither Toronto Hydro, nor its Representatives, shall be liable for any loss, damages or claims arising directly or indirectly from the Consultant's access to or work in or around Toronto Hydro's facilities, and the Consultant hereby waives any claims to which it may become entitled for loss or damage and releases Toronto Hydro and its Representatives from any and all such claims.

4.8 Non-Solicitation

[Intentionally Deleted]

4.9 Security

[Intentionally Deleted]

5. REPRESENTATIONS, WARRANTIES, INDEMNITIES AND INSURANCE

5.1 Representations and Warranties

The Consultant hereby represents, warrants and agrees that:

(i) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has/have the necessary experience and qualifications to perform the Services;

(ii) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) will perform the Services in a diligent, expeditious and workmanlike manner, consistent with standards generally observed by reputable and competent members of the same industry providing similar services;

(iii) all Services shall be the Consultant's (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) original work and none of the Services or any invention, development, use, production, distribution or exploitation relating thereto will infringe, misappropriate or violate any intellectual property or other right of any person or entity;

(iv) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has the corporate power and authority to enter into this Agreement and to perform its obligations hereunder, and that this Agreement constitutes a legal, valid, and binding obligation of the Consultant, enforceable against the Consultant in accordance with its terms.

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

5.2 Indemnity

The Consultant shall be liable for and shall indemnify and hold harmless Toronto Hydro and its Representatives from all claims, demands, actions, penalties, damages, losses, judgments and settlements, liabilities, costs, expenses, including legal fees and other related costs and expenses arising out of, related to, or incident to, the Consultant or any of its Representatives' performance of the Services under this Agreement, including, without limitation:

a) any breach, violation or non-performance by the Consultant or any of its Representatives of any terms, conditions, warranties, obligations or covenants contained in this Agreement;

b) any breach or violation by the Consultant or any of its Representatives of any Applicable Laws; and

c) any actions, omissions, negligence or wilful misconduct of the Consultant or any of its Representatives.

5.3 Insurance

(a) The Consultant shall, during the Term, and at its own expense, maintain and keep in full force and effect (and, when requested, provide Toronto Hydro with proof thereof) the following insurance:

(i) commercial general liability insurance on an occurrence basis having a minimum inclusive coverage limit, including personal injury and property damage, of not less than one million dollars ($1,000,000.00) per occurrence with property damage deductible of not more than fifty thousand dollars ($50,000.00), which commercial general liability insurance shall be extended to cover contractual liability, products and completed operations liability, contingent employer's liability, and owners/contractors protective liability;

(ii) Errors and Omissions Insurance (Professional Liability) in the amount of not less than four million dollars ($4,000,000.00); and

(iii) automobile liability insurance on all owned and non-owned vehicles used in connection with this Agreement, with such automobile insurance coverage having a limit of not less than one million dollars ($1,000,000.00) per vehicle, in respect of bodily injury (including passenger hazard), property damage and mandatory accident benefits.

(b) All insurance coverages and limits required to be maintained by the Consultant shall be primary to any insurance maintained by Toronto Hydro, which shall be excess and non-contributory. Prior to the commencement of the delivery of the Services, the Consultant shall deliver to Toronto Hydro a certificate of insurance which evidences the Consultant's compliance with this section, including the provision of a thirty (30) day prior written notice of cancellation, non-renewal or adverse material change, to Toronto Hydro.

(c) The Consultant agrees that the insurance described herein does in no way limit the Consultant's liability pursuant to the indemnity provisions of this Agreement.

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

(d) A waiver of subrogation shall be provided by the insurer(s) to Toronto Hydro.

6. FEES

6.1 Fees

(a) In exchange for the performance of the Benchmarking Study, analysis and report Services detailed in Section 1 of SCHEDULE A and in accordance with the terms hereof, Toronto Hydro shall pay the Consultant a fee of [redacted] in accordance with the milestones detailed in SCHEDULE B, inclusive of all applicable taxes.

(b) In exchange for the performance of the Interrogatory Response and Expert Witness Services detailed in Section 2 of SCHEDULE A and in accordance with the terms hereof, Toronto Hydro shall pay the Consultant a fee on a time and material basis at the rates detailed in SCHEDULE B, inclusive of all applicable taxes.

(c) Without limiting the generality of the foregoing, the Consultant hereby agrees and acknowledges that all out-of-pocket expenses, travelling costs, and other disbursements shall be at the sole expense of the Consultant.

(d) The Consultant shall not incur or submit fees for any additional work outside the scope of the Services without prior written approval from Toronto Hydro.

6.2 Payment

The Consultant shall submit invoices to Toronto Hydro on a monthly basis or as otherwise agreed in Section 6.1(a) above, containing:

(i) a detailed description of the Services performed during the invoice period;

(ii) the dates and the amount of time spent by the Consultant for the provision of the Services;

(iii) the total HST applicable to the Services during the invoice period, as well as the Consultant's HST registration number; and

Unless otherwise provided in this Agreement, the Consultant shall invoice Toronto Hydro after final inspection and acceptance by Toronto Hydro of the Services performed and subject to receipt of all documents required by this Agreement. **Invoices must be sent electronically to: AP@torontohydro.com.** Subject to approval of the invoice by Toronto Hydro, receipt of all documents required by this Agreement, and final review by Toronto Hydro, Toronto Hydro shall make payment to the Consultant via electronic funds transfer not later than thirty (30) days following receipt of an acceptable invoice and the EFT Information (as set out below). **The Consultant must provide Toronto Hydro with, in the case of the first payment only, (i) a void cheque, pre-printed deposit slip or bank confirmation letter and (ii) the email address where the Consultant wishes to receive remittance information (together, "EFT Information"). EFT Information must be sent electronically to efthelp@torontohydro.com or to 14 Carlton Street, Toronto, ON, M5B 1K5, Attention: Treasury Department.** Toronto Hydro reserves the right to pay the Consultant through other payment methods.

6.3 Non-Residents: Permits and Withholding Tax

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

(a) If applicable, the Consultant is responsible for applying, at its own expense, to Immigration Canada for admission of personnel into Canada and for obtaining work permits where required. All payments made by Toronto Hydro to non-residents of Canada will be made net of any required taxes or withholdings.

(b) Consultant acknowledges that it is a non-resident of Canada for income tax purposes and agrees that Toronto Hydro shall withhold any applicable non-resident withholding taxes from any amount owing hereunder and remit such taxes to the applicable federal taxing authority without provision for gross-up. Services provided in Canada should be detailed and separated from Services provided outside of Canada on invoices issued for payment.

7. SUSPENSION OR TERMINATION

7.1 Suspension or Termination

(a) Toronto Hydro may, at any time during the Term by notice in writing, suspend all or a portion of the Services. Upon receipt of such written notice, the Consultant shall perform no further work other than as directed by Toronto Hydro, and shall be entitled to payment for time spent in performing the Services up to the date of suspension.

(b) Either party may terminate this Agreement immediately upon written notice where the other party enters into liquidation, whether compulsory or voluntarily, or where a proceeding in receivership, bankruptcy or insolvency has been instituted by or against such party or its property.

(c) Toronto Hydro, at its sole discretion, may terminate this Agreement immediately upon written notice where the Consultant or any of its Representatives has been in default in the performance of its duties, obligations or undertakings under this Agreement, and has not taken immediate steps to remedy such default within five (5) Business Days following written notice of the specific default by Toronto Hydro. For the purposes of this section, a material default shall include, without limitation, a breach of any of the representations or warranties contained herein or the failure or refusal to provide the Services in accordance with the terms and conditions of this Agreement.

(d) Notwithstanding any other provision in this Agreement, Toronto Hydro, at its sole discretion, shall have the right to terminate this Agreement, for any reason, upon two (2) weeks written notice to the Consultant.

7.2 Effect of Termination

Upon the termination or expiration of this Agreement, the Consultant shall return to Toronto Hydro and delete any and all electronic copies the Consultant may have of all documents and materials in its possession relating to the Services or this Agreement, including all Confidential Information and all Developments, whether completed or not.

8. CONFIDENTIALITY

(a) In performing the Services required by this Agreement, the Consultant may be provided access to Confidential Information. The Consultant acknowledges and agrees that:

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

(i) the Consultant shall not disclose, permit access to, transmit, or transfer the Confidential Information to any third party without the prior written authorization of Toronto Hydro;

(ii) the Consultant shall protect the confidentiality of the Confidential Information in its possession by exercising the same security measures it normally exercises with respect to its own confidential information and at minimum a reasonable standard of care;

(iii) upon the request of Toronto Hydro, and in any event upon the expiration or termination of this Agreement for any reason, the Consultant shall return (or delete, in the case of electronic documents) forthwith to Toronto Hydro all Confidential Information, including all copies and other materials containing the Confidential Information, which are in the possession or under the control of the Consultant;

(iv) the Consultant shall not use any Confidential Information for any purpose other than to perform the Services required by this Agreement. Without limiting the foregoing, the Consultant shall not, and shall not permit any of its Representatives to, use any Confidential Information in furtherance of its, or their, individual business or for its, or their, own benefit, profit or advantage, or for the benefit, profit or advantage of any other party; and

(v) Toronto Hydro is subject to MFIPPA and is governed by Governmental Authority such as the Independent Electricity System Operator ("IESO") and the Ontario Energy Board ("OEB") and shall have the right to disclose Confidential Information in accordance with the provisions of MFIPPA or as required by the IESO or the OEB.

(b) Notwithstanding the foregoing, the Consultant may disclose such Confidential Information:

(i) to any of the Representatives of the Consultant who agree to be bound by the obligations of confidentiality herein and who have a reasonable need to know such Confidential Information in the course of their duties for the Consultant but only for the purposes of the Consultant exercising its rights and obligations under this Agreement; and

(ii) in the event that the Consultant believes it is required by law to disclose, or is requested by a Governmental Authority to disclose, any Confidential Information to a Governmental Authority; provided that the Consultant shall, to the extent permitted by law, first inform Toronto Hydro of the request or requirement for disclosure to allow an opportunity for Toronto Hydro to apply for an order to prohibit or restrict such disclosure.

9. INTELLECTUAL PROPERTY

9.1 Use

Nothing in this Agreement shall be deemed to transfer, license, assign, permit the use of, or otherwise convey an interest in whole or in part to the Consultant of any Intellectual Property belonging to Toronto Hydro or any of its Representatives or any third party whose Intellectual Property is in Toronto Hydro's custody or control, and the use by the Consultant of any such Intellectual Property shall be subject to the prior written approval of Toronto Hydro.

9.2 Ownership

Toronto Hydro shall at all times have full rights and title to the Developments, and may at all times take possession of or use any completed or partially completed Developments, notwithstanding any

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

provision, express or implied, to the contrary. Without limiting the generality of the foregoing, Toronto Hydro shall own all Intellectual Property rights in all Developments, and the Consultant hereby waives and assigns to Toronto Hydro any such rights, and agrees to give Toronto Hydro and its Representatives all assistance as may be reasonably required to perfect such rights including, without limitation and where the Consultant is a corporation or partnership, obtaining waiver of moral rights from any of the Consultant's employees, partners or other Representatives.

9.3 Intellectual Property Protection

The Consultant expressly warrants that the manufacture, delivery, sale or use of the Consultant's Services will not infringe any Canadian or foreign patents, trademarks, copyrights, industrial design or other intellectual property rights and the Consultant shall indemnify and save Toronto Hydro harmless from all claims, judgments and decrees that may be entered against Toronto Hydro or its Representatives and against all damage, liability, costs and expenses (including legal fees and other attendant costs and expenses**)** Toronto Hydro incurs by reason of any infringement or claim thereof.

9.4 Pre-Existing Intellectual Property

Any pre-existing Intellectual Proprietary ("Pre-Existing IP") of Consultant or its licensors used to perform Services, or included in any Development, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of the Consultant and its licensors (collectively, "Consultant Information"). To the extent that Consultant incorporates any Consultant Information into the Development(s), Consultant hereby grants to Toronto Hydro a fully paid up, royalty free, irrevocable and non-cancellable, non-exclusive, assignable and transferable right to Use the Consultant Information without restriction, except that any such Use must be in conjunction with the Developments in which the Consultant Information is incorporated and not as a separate item. For the purpose of the foregoing, "Use" means one or more of the following rights to: use; modify; adapt; translate; create changes, alterations, modifications, improvements, adoptions, enhancements and derivative works based upon or derived from the Consultant Information; reproduce; copy; display; perform; communicate in any manner; license or sublicense. Consultant shall provide Toronto Hydro with a list of any freeware, shareware or open source software used in the Developments. Any pre-existing intellectual property of Toronto Hydro, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of Toronto Hydro.

10. MISCELLANEOUS

10.1 Survival

In addition to the terms in this Agreement that by their nature survive the expiry or termination of the Agreement, the terms of Section 5 (Representations, Warranties and Indemnities), Section 8 (Confidentiality), Section 9 (Intellectual Property), and Section 10.2 (Injunctive Relief) shall survive the expiry of this Agreement for a term of five (5) years.

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

10.2 Injunctive Relief

(a) The Consultant acknowledges and agrees that the terms of Section 8 (Confidentiality) and Section 9 (Intellectual Property) of this Agreement are reasonably necessary to protect the legitimate interests of Toronto Hydro, are reasonable in scope and duration, and are not unduly restrictive.

(b) The Consultant further acknowledges that a breach of any of the terms of Section 8 (Confidentiality) or Section 9 (Intellectual Property) would render irreparable harm to Toronto Hydro, and that a remedy at law for breach of these sections would be inadequate, and that Toronto Hydro shall therefore be entitled to any and all equitable relief, including, without limitation, injunctive relief without proof of actual damages, and any other remedy that may be available at law or in equity.

10.3 Subcontracting

The Consultant may not subcontract the performance of any part of the Services without Toronto Hydro's prior written approval. Where Toronto Hydro provides its prior written approval to the Consultant to subcontract all or part of the Services, then the Consultant shall enter into agreements with such permitted subcontractor(s) to require the permitted subcontractor(s) to provide Services in accordance with all of the terms of this Agreement. Notwithstanding the foregoing, the Consultant shall remain liable for any and all acts or omissions of any subcontractor(s) as if such acts or omissions were those of Consultant.

10.4 Force Majeure

Either party will be relieved of liability for delays in performance of its obligations hereunder where such delay is a result of Force Majeure. The party affected by the Force Majeure shall give prompt notice thereof to the other party and, upon cessation of the Force Majeure, shall take all reasonable steps to resume the performance of its obligations hereunder. If a delay in performance by reason of Force Majeure extends beyond thirty (30) Business Days, then either party may terminate this Agreement by written notice.

10.5 Waiver

No delay on the part of either party in exercising any of its rights hereunder or failure to exercise the same, nor the acquiescence thereto shall operate as a waiver except in the specific instance for which it is given and where such waiver is provided in writing by the party waiving its rights.

10.6 Amendments

None of the terms, conditions or provisions of this Agreement shall be varied, modified or altered except by written agreement signed by an authorized representative of each parties.

10.7 Assignment

Save and except for Toronto Hydro's right to assign this Agreement to any of its Affiliates, neither party may assign this Agreement or any of their rights or obligations hereunder, without the prior written authorization of the other party.

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

10.8 Enurement

This Agreement shall enure to the benefit of, and be binding upon, the parties hereto and their respective successors and permitted assigns.

10.9 Severability

In the event that any provision or portion of this Agreement is determined to be invalid or unenforceable for any reason, the remaining provisions or portions of this Agreement will be unaffected and will remain in full force and effect to the fullest extent permitted by law.

10.10 Non-Exclusive Agreement

This Agreement will not be interpreted to grant to the Consultant exclusive rights to provide the Services or to bind Toronto Hydro in any way to an exclusive relationship with the Consultant with regards to the Services or any other service. However, Consultant shall not provide services to an Intervenor (whether as an employee, contractor, consultant, agent, or officer) that are (i) the same or similar to the services provided to the Client under this Agreement, or (ii) likely to result in disclosure of Client Confidential Information to an Intervenor or the use of Client Confidential Information on behalf of a Intervenor.

10.11 Neutral Construction

The parties to this Agreement agree that this Agreement was negotiated fairly between them at arm's length, that the final terms of this Agreement are the product of the parties' negotiations, and that this Agreement shall be deemed to have been jointly and equally drafted by them, and that the provisions thereof should not be construed against a party on the grounds that such party drafted the Agreement in whole or in part.

10.12 Entire Agreement

This Agreement constitutes the entire agreement between the parties relating to the subject matter hereof. This Agreement supersedes any and all prior correspondence, warranties, covenants, collateral undertakings, or agreements, oral or otherwise, express or implied, unless otherwise contained herein.

10.13 Notices

(a) All questions or other communications regarding this Agreement, including any notices required by this Agreement, are to be addressed to the following addresses:

to Toronto Hydro:

(b) All notices or communications shall be deemed to be received on the date of acceptance (as evidenced by the signature of the party) if delivered by personal delivery or courier, on the fifth (5th) Business Day after mailing, if mailed by first class mail, or on the first (1st) Business Day after transmission, if sent by facsimile (provided the transmission is evidenced by documented proof of proper fax transmittal).

10.14 Governing Law

This Agreement shall be governed by and construed in accordance with the law of the Province of Ontario and the laws of Canada applicable therein.

10.15 Execution

This Agreement may be signed in counterparts and delivered by electronic means, each of which shall be deemed an original and all of which, together, shall have the same effect as if all constitute one and the same Agreement.

IN WITNESS WHEREOF, the parties have duly executed this Agreement as of the day and year first written above:

SCHEDULE A

SERVICES

1. Benchmarking Services to be Performed

Consultant shall, for the fixed fee set out in Section 6.1(a) of the Agreement, supply Benchmark Study Services to assess the efficiency of Toronto Hydro's system investment and maintenance program execution and identify opportunities for continuous improvement, including:

- Reviewing and evaluating Toronto Hydro's methodology for deriving unit costs and comparing this methodology to industry best practices (either those already known to Consultant from previous work and / or those identified while performing this review).
- Producing a list of specific asset categories and maintenance practices to be benchmarked, such list to be finalized at the project kickoff meeting. Lists provided to Consultant in relation to previous requests for proposals for Overhead Pole Replacement, Underground Cable and Duct Replacement, Station Breaker and Switchgear Replacement, Vegetation Management, Pole Testing, Overhead Line Patrols, Overhead Switch Maintenance, and Underground Vault and Equipment Inspections may be used as a viable starting point for discussion.
- An assessment of the reasonableness of the derived and actual unit costs based on "normalized" industry comparisons. A peer group panel will form the basis of these comparisons, the composition of which will be firmed up during the Project Kickoff Meeting.
- Identifying any external factors (e.g., key technical, environmental, and regulatory drivers) that may need to be accounted for in either "normalizing" the comparisons or offering rationale for what could be deemed acceptable variances.
- The presentation of economic, technical, or other considerations that may be required if Consultant offers recommended practices to improve upon actual unit costs.
- A report of preliminary findings.
- A written report which, upon THESL's review and alignment with the preliminary findings, will be used to detail the methodology and analysis performed and ensuing findings and recommendations. The Consultant shall comply with the requirements set out in Rule 13A of the OEB's Rules of Practice and Procedure, appended hereto as Appendix A.1 in the preparation of the report.

2. Application Support and Expert Witness Services

Consultant shall, as per Section 6.1(b) of the Agreement, provide Application Support and Expert Witness Services on a time and material basis at the rates detailed in SCHEDULE B. Such Application Support and Expert Witness Services shall include:

- Respond to any interrogatories applicable to the report and appear at a technical conference if requested.
- If requested or required, testify to the study's findings as an expert witness in the hearing of the 2025 Rate Application at the OEB, and support providing undertakings resulting from the hearing.

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

- Where the Consultant is required to testify or otherwise provide evidence at a hearing before the OEB, the Consultant shall comply with the requirements set out in rule 13A of the OEB's Rules of Practice and Procedure, appended hereto as APPENDIX A.1

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

APPENDIX A.1

Rules of Practice and Procedure

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

12. Affidavits

12.01 An affidavit shall be confined to the statement of facts within the personal knowledge of the person making the affidavit unless the facts are clearly stated to be based on the information and belief of the person making the affidavit.

12.02 Where a statement is made on information and belief, the source of the information and the grounds on which the belief is based shall be set out in the affidavit.

12.03 An exhibit that is referred to in an affidavit shall be marked as such by the person taking the affidavit, and the exhibit shall be attached to and filed with the affidavit.

12.04 The OEB may require the whole or any part of a document filed to be verified by affidavit.

13. Written Evidence

13.01 Other than oral evidence given at the hearing, where a party intends to submit evidence, or is required to do so by the OEB, the evidence shall be in writing and in a form approved by the OEB.

13.02 The written evidence shall include a statement of the qualifications of the person who prepared the evidence or under whose direction or control the evidence was prepared.

13.03 Where a party is unable to submit written evidence as directed by the OEB, the party shall:

(a) file such written evidence as is available at that time;

(b) identify the balance of the evidence to be filed; and

(c) state when the balance of the evidence will be filed.

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

(a) the expert's name, business name and address, and general area of expertise;

(b) the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;

(c) the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;

(d) the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;

(e) in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and

(f) an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

(a) in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and

(b) at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

(a) scope and timing;

(b) the involvement of any expert engaged by the OEB;

(c) the costs associated with the conduct of the activities;

(d) the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of **Rule 13A.04**; and

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

(e) any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A**.

14. Disclosure

14.01 A party who intends to rely on or refer to any document that has not already been filed in a proceeding shall file and serve the document 24 hours before using it in the proceeding, unless the OEB directs otherwise.

14.02 Any party who fails to comply with **Rule 14.01** shall not put the document in evidence or use it in the cross-examination of a witness, unless the OEB otherwise directs.

14.03 Where the good character, propriety of conduct or competence of a party is an issue in the proceeding, the party is entitled to be furnished with reasonable information of any allegations at least 15 calendar days prior to the hearing.

SCHEDULE C

DEFINITIONS

In this Agreement, the following definitions shall apply:

"Affiliates"	has the meaning prescribed to it in the *Business Corporations Act* of Ontario, as amended from time to time;
"Agreement"	means this Agreement for Professional Consulting Services, including all recitals, schedules and attachments thereto;
"Anticipated Hours"	has the meaning prescribed in Section 4.2;
"Applicable Laws"	means all federal, provincial and municipal statutes, regulations, codes, by-laws, orders in council, directives, rules, guidelines and ordinances applicable to this Agreement, including without limitation all applicable OEB codes, rules or guidelines;
"Application Support and Expert Witness Services"	means the Services defined in Section 2 of SCHEDULE A;
"Benchmark Study"	means the Services defined in Section 1 of SCHEDULE A;
"Business Day"	means a day on which banks are open for business in the City of Toronto, Ontario, but does not include a Saturday, Sunday, or a civic or statutory holiday in the Province of Ontario;
"Confidential Information"	means the terms of this Agreement and any and all data or information relating to the business, management or affairs of Toronto Hydro, its customers, employees, or any of its Affiliates disclosed by Toronto Hydro to the Consultant pursuant to this Agreement, whether or not such Confidential Information is expressly identified as confidential. Notwithstanding the foregoing, Confidential Information does not include any information or data which: (a) information or data that is or becomes publicly known through no breach of the terms or conditions of this Agreement; (b) information or data that is independently developed without reference to Confidential Information and without breach of the terms and conditions of this Agreement; or (c) Confidential Information that is required by court order or other legal compulsion to be disclosed, in which case the Consultant shall give Toronto Hydro prior written notice of such disclosure, as permitted by law;
"Consultant"	Means UMS Group Inc.;
“Consultant Information”	has the meaning prescribed in Section 9.4;
"Development"	means any and all works prepared, generated, created or designed by the Consultant pursuant to this Agreement, including without limitation all drawings, models, designs, formulae, methods, documents, reports,

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

	software, specifications, or source codes, and any related works, enhancements, modifications or additions thereto;
"Fees"	shall have the meaning as prescribed in Subsection 6.1(a);
"Force Majeure"	means any impediments beyond the control of the applicable party due, wholly or in part, directly or indirectly, to: strikes, lockouts, riots, epidemics, war, governmental regulations, fire, explosions, acts of God, or any other impediment beyond the control of the party affected;
"Governmental Authority"	means any government, legislature, municipality, regulatory authority, agency, commission, department, board or court or other law, regulation or rule-making public entity of similar authority, including, without limitation the OEB;
"Guidelines"	has the meaning prescribed in Subsection 4.5(d);
"HST"	means Harmonized Sales Tax;
"IESO"	means the Independent Electricity System Operator;
"Initial Term"	has the meaning prescribed to it in Section 3.1;
"Intellectual Property"	includes all trademarks, copyrights, patents, business names, trade secrets, proprietary software, analysis or techniques (whether or not patented or patentable), confidential or secret designs and processes, source codes, plans or devices, or other proprietary and intellectual property rights;
"Key Employee"	has the meaning prescribed in Section 4.3;
"MFIPPA"	means the *Municipal Freedom of Information Act;*
"OEB"	means the Ontario Energy Board;
"PIPEDA"	means the *Personal Information Protection and Electronic Documents Act* (Canada);
"Pre-Existing IP"	has the meaning prescribed to it in Section 9.4;
"Privacy Laws"	has the meaning prescribed to it in Section 4.5;
"Representative"	in respect of a party, means such party's directors, officers, employees, agents, contractors and advisors, the party's Affiliates, and all such Affiliates' respective directors, officers, employees, agents, contractors and advisors;

DocuSign Envelope ID: D4E30470-B264-4D18-B4BE-BE29938F4DCA

"Remittances"	has the meaning prescribed to it in Subsection **Error! Reference source not found.**;
"Services"	means all of the Developments, services and specifications to be provided, performed and met by the Consultant under this Agreement, as more particularly described in SCHEDULE A;
“Service Level”	means the standards for the performance of the Services and for Vendor’s management of Security Incidents, as more particularly set out in this Agreement;
“Specifications”	means for any Service, deliverable, vendor system or vendor facility, the technical, functional, physical or other relevant specification, documentation, or requirements set out in the Agreement, otherwise in identified in writing by the parties, or otherwise inherent or necessarily included as part of the specification or requirements specifically set out herein or therein, including any operating manuals or operating plans referenced in a SOW;
"Term"	has the meaning prescribed to it in Section 3.1; and
"Toronto Hydro"	means Toronto Hydro-Electric System Limited.
"2025 Rate Application"	means the application filed by Toronto Hydro with the OEB for the approval of the 2025-2029 electricity rates.

Agreement for Professional Consulting Services

THIS AGREEMENT is made this 12th day of September, 2022 ("Effective Date")

BETWEEN:

Toronto Hydro-Electric System Limited,

a corporation incorporated under the laws of Ontario

(hereinafter called "Toronto Hydro")

and

ScottMadden Inc.,

a corporation incorporated under the laws of North Carolina

(hereinafter called the "Consultant")

WHEREAS:

A. Toronto Hydro has retained the Consultant to provide certain consulting services as detailed in SCHEDULE A (collectively, the "Services"); and

B. the Consultant has indicated to Toronto Hydro that it has the skill and expertise to provide the Services on the terms and conditions set forth herein;

NOW THEREFORE, in consideration of the mutual covenants set forth herein and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

1. INTERPRETATION

Unless otherwise indicated, all capitalized terms in this Agreement shall be as defined in SCHEDULE C and any reference to currency in this Agreement shall refer to lawful money of Canada.

2. RELATIONSHIP OF THE PARTIES

2.1 Retainer

Toronto Hydro hereby retains the Consultant to provide the Services, and the Consultant hereby agrees to provide the Services, during the Term, in accordance with the terms and subject to the conditions of this Agreement.

2.2 Independent Contractors

(a) Notwithstanding any provision hereof, this Agreement does not constitute and shall not be construed as constituting a partnership, joint venture, principal/agency relationship, or employer/employee relationship between the parties. The Consultant acts at all times in the capacity of an independent contractor, and neither party shall represent itself to be an agent or employee of the other. The Consultant and its Representatives have no authority to commit, act for or on behalf of Toronto Hydro, or to bind Toronto Hydro to any obligation or liability.

(b) Without limiting the generality of Section 2.2(a), the Consultant hereby acknowledges and agrees that neither it nor its Representatives shall be eligible or entitled, by reason of this Agreement, to participate in any employee-related program offered by Toronto Hydro or any of its Affiliates, including, without limitation, any benefit, insurance, compensation, health plan, bonus or retirement program.

(c) The Consultant hereby covenants and agrees to indemnify, defend and hold harmless Toronto Hydro and its Representatives from and against all costs, liabilities or claims whatsoever against Toronto Hydro or its Representatives resulting from or relating to the Consultant or its Representatives being deemed to be an employee of Toronto Hydro or any of its Affiliates.

(d) The Consultant hereby acknowledges and agrees that Toronto Hydro shall not be responsible for and shall not have control or charge of any means, methods, techniques, sequences or procedures used for or in respect of the Services, or for the safety precautions or programs required for the Services or otherwise prescribed hereunder.

2.3 Conflicts of Interest

Anything in this Agreement to the contrary notwithstanding and for avoidance of doubt, where Toronto Hydro is the Applicant in an Ontario Energy Board ("OEB") proceeding and has retained Consultant to support a component(s) of that Application, Consultant must obtain Toronto Hydro's consent in writing to provide services to any other entity in any capacity other than Toronto Hydro at the proceeding. Where Toronto Hydro is involved in an OEB proceeding as an intervenor and/or participant, but not as an Applicant, the Consultant may provide services to any other entity in any capacity provided that the Consultant utilizes confidentiality or other safeguards, including, but not limited to separate engagement teams and data access controls for the protection of Toronto Hydro's Confidential Information. Consultant commits to comply strictly with the confidentiality terms of this Agreement and to restrict access to – and use of – Toronto Hydro Confidential Information as set out in this Agreement.

3. TERM

3.1 Initial Term

This Agreement shall be effective as of the Effective Date and shall continue, unless terminated in accordance with the terms hereof or extended pursuant to Section 3.2, for a period of four (4) years (the "Initial Term").

3.2 Renewal

Toronto Hydro may, at its sole option, elect to renew this Agreement for two (2) additional one (1) year terms (each a "Renewal Term") by giving written notice to the Consultant at least thirty (30) days before the end of the Initial Term or the first Renewal Term (as applicable). The same terms and conditions contained herein shall apply during the Renewal Term(s), save and except as amended in writing by the parties.

3.3 Term

The Initial Term and Renewal Term, if any, shall hereinafter together be referred to as the "Term".

4. SERVICE REQUIREMENTS

4.1 Services

During the Term, the Consultant shall perform the Services as detailed in SCHEDULE A hereto

(a) in accordance with the terms and subject to the conditions set forth in this Agreement;

(b) using personnel of required skill, experience, licences and qualifications;

(c) in a workerlike and professional manner; and

(d) consistent with standards generally observed by reputable and competent members of the same industry providing similar services.

4.2 Revision to Services

(a) The Parties acknowledge and agree that the Services to be undertaken and completed by the Consultant under this Agreement may be subject to revision or amendment from time to time during the Term: (i) as required by Toronto Hydro to comply with the Guidelines; (ii) as required by Toronto Hydro to comply with Applicable Laws or any order, instruction, directive or legal requirement of a Governmental Authority; or (iii) as required by Toronto Hydro to ensure that Toronto Hydro receives the expected funding and benefits with respect to the project to which the Services relate.

(b) Toronto Hydro agrees to provide the Consultant with written notice of any revision or amendment to the Services required pursuant to this Section 4.2, and the Consultant shall comply with all such directives.

(c) In the event that the Consultant fails to comply with a directive issued by Toronto Hydro pursuant to this Section 4.2, Toronto Hydro shall have the right, in addition to any other

remedies which may be available to Toronto Hydro hereunder or otherwise at law, to terminate this Agreement by giving written notice of termination to the Consultant whereupon this Agreement shall terminate as at the effective date of termination specified in the notice and Section 7 shall apply.

4.3 Applicable Laws

(a) The Consultant shall, at its sole expense, obtain and maintain during the Term of this Agreement, all permits, licences and approvals required to perform its obligations under this Agreement in accordance with Applicable Laws. The terms and conditions of this Agreement shall be carried out in strict compliance with all Applicable Laws and in the event of any conflict between any Applicable Laws, the Applicable Laws with the most stringent standard shall apply.

(b) Without limiting the generality of the foregoing, the Consultant shall comply with the *Municipal Freedom of Information and Protection of Privacy Act* (Ontario) ("MFIPPA"), the *Personal Information Protection and Electronic Documents Act* (Canada) ("PIPEDA") and any other applicable privacy legislation (collectively, "Privacy Laws") with respect to any personal information collected, used or disclosed in connection with this Agreement and shall indemnify and hold harmless Toronto Hydro and its Representatives from and against any and all claims, demands, suits, losses, damages, causes of action, fines or judgments (including related expenses and legal costs) they may incur related to or arising out of any non-compliance therewith.

(c) Where any Deliverable is subject to the approval or review of any authority, department, government or agency other than Toronto Hydro, such applications for approval or review shall, unless otherwise authorized by Toronto Hydro in writing, be prepared by the Consultant to be approved and submitted by and through the offices of Toronto Hydro, and the Consultant shall not have any direct dealings with the authority, department, government or agency in question with regards to the Deliverable.

(d) The Consultant and the Consultant's personnel and Representatives shall comply with all rules and direction of Toronto Hydro, whether specified in this Agreement or otherwise, while working on Toronto Hydro's premises or when accessing or connecting to Toronto Hydro's information technology systems, including rules and directions concerning health, safety, security and environmental protection, including without limitation, Toronto Hydro's *Code of Business Conduct and Whistleblower Procedure,* Toronto Hydro's *Disclosure Policy,* Toronto Hydro's *Social Media and Digital Communication Policy,* Toronto Hydro's *Accessibility Policy,* Toronto Hydro's *Workplace Harassment Policy and Program,* Toronto Hydro's *Violence Prevention in the Workplace Policy,* Toronto Hydro's *Workplace Alcohol and Drug Policy*, Toronto Hydro's *Environmental Policy,* Toronto Hydro's *Occupational Health and Safety Policy,* Toronto Hydro's *Privacy Policy,* Toronto Hydro's *Cyber Security Policy*, Toronto Hydro's *Technology Use Guidelines*, Toronto Hydro's *Physical Security Policy*, Toronto Hydro's *COVID-19 Vaccination Policy,* and the *Affiliate Relationships Code for Electricity Distributors and Transmitters* issued by the OEB (together, the "Guidelines"). Toronto Hydro premises includes, but is not limited to, all Toronto Hydro-owned or leased buildings, sites, work centres, stations, substations, vaults, radio antenna sites, and any other location where Toronto Hydro stores or maintains physical assets. The Consultant agrees to comply with and to direct its Representatives to comply with such Guidelines, as amended.

4.4 Performance

(a) The Services shall be performed to the satisfaction of Toronto Hydro, and Toronto Hydro shall have the right at all reasonable times, to inspect or otherwise review the Services performed or being performed. The Consultant shall, upon the request of Toronto Hydro, acting reasonably, provide Toronto Hydro with written reports of the status of the Deliverables and the Consultant's progress in providing the Services.

(b) In the event of any dispute between Toronto Hydro and the Consultant relating to the quality or acceptability or rate of progress of any of the Services, or relating to the interpretation of any instructions or specifications concerning the Services, Toronto Hydro and the Consultant shall attempt to mutually reach a resolution in good faith. Failing a good faith resolution, the reasonable opinion of Toronto Hydro shall govern and be binding on the parties hereto.

5. REPRESENTATIONS, WARRANTIES, INDEMNITIES AND INSURANCE

5.1 Representations and Warranties

The Consultant hereby represents, warrants and agrees that:

(a) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has/have the necessary experience and qualifications to perform the Services;

(b) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) will perform the Services in a diligent, expeditious and workerlike manner, consistent with standards generally observed by reputable and competent members of the same industry providing similar services;

(c) all Services shall be the Consultant's (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) original work and none of the Services or any invention, development, use, production, distribution or exploitation relating thereto will infringe, misappropriate or violate any intellectual property or other right of any person or entity.

(d) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has the corporate power and authority to enter into this Agreement and to perform its obligations hereunder, and that this Agreement constitutes a legal, valid, and binding obligation of the Consultant, enforceable against the Consultant in accordance with its terms.

5.2 Indemnity

a) The Consultant shall be liable for and shall indemnify, defend and hold harmless Toronto Hydro and its Representatives from all claims, demands, actions, penalties, damages, losses, judgments and settlements, liabilities, costs, expenses, including legal fees and other related costs and expenses arising out of, related to, or incidental to, the Consultant or any of its Representatives' performance of the Services under this Agreement, including, without limitation:

i. any breach, violation or non-performance by the Consultant or any of its Representatives of any terms, conditions, warranties, obligations or covenants contained in this Agreement;
ii. any breach or violation by the Consultant or any of its Representatives of any Applicable Laws; and
iii. any actions, omissions, negligence or wilful misconduct of the Consultant or any of its Representatives

except to the extent caused by the negligence or wilful misconduct of Toronto Hydro or its Representatives.

b) In no event shall either party be liable for loss of profit or use or for any indirect, special, incidental or consequential damages of any nature or kind including but not limited to delays, loss of revenue, loss of use, loss of data, loss of product, costs of capital or costs or replacement power, even if that party has been advised of the possibility of such damages.

c) Subject to Section 5.2(d), the Consultant's liability for a claim for damages shall be limited to the maximum amounts payable by Toronto Hydro to the Consultant for the Term pursuant to SCHEDULE B.

d) Notwithstanding the foregoing, no exclusion or limitation of liability shall apply to:

i. Breach of the confidentiality or privacy obligations in this Agreement
ii. Intentional misconduct or gross negligence;
iii. Breach of Applicable Law; or
iv. Breach of intellectual property indemnity in Section 9.

5.3 Insurance

The Consultant shall, during the Term, and at its own expense, maintain and keep in full force and effect (and, when requested, provide Toronto Hydro with proof thereof):

(a) commercial general liability insurance on an occurrence basis having a minimum inclusive coverage limit, including personal injury and property damage, of not less than five million dollars ($5,000,000) per occurrence, which commercial general liability insurance shall be extended to cover contractual liability, products and completed operations liability, and owners/contractors protective liability;

(b) Errors and Omissions Insurance (Professional Liability) covering actual or alleged acts, errors or omissions committed by the Consultant or its Representatives, arising out of the performance of this Agreement, which shall also extend to include personal injury, bodily injury and property damage from the performance of professional services, in the amount of not less than two million dollars ($2,000,000);

(c) All insurance coverages and limits required to be maintained hereunder shall: (i) be primary to any insurance maintained by Toronto Hydro, which insurance shall be excess and non-contributory; (ii) contain a cross liability clause and a severability of interest clause; and (iii) contain a thirty (30) day prior written notice to Toronto Hydro for any cancellation, non-renewal or adverse material change.;

(d) The Consultant agrees that the insurance required hereunder in no way limits the Consultant's liability pursuant to the Liability and Indemnity provision in Section 5.3; and

(e) A waiver of subrogation shall be provided by the insurer(s) to Toronto Hydro.

6. FEES

6.1 Fees

(a) Subject to Section 6.1(c) - 6.1(f), in exchange for the performance of the Services in accordance with the terms hereof, Toronto Hydro shall pay the Consultant the rates outlined in SCHEDULE B, not including HST (the "Fees"). Fees shall not be in excess of the maximum amounts set out in SCHEDULE B.

(b) The Fees noted in Section 6.1(a) shall be the only fees payable by Toronto Hydro under this Agreement. Without limiting the generality of the foregoing, the Consultant hereby agrees and acknowledges that all out-of-pocket expenses, travelling costs, and other disbursements shall be at the sole expense of the Consultant, except with the prior written approval from Toronto Hydro.

(c) Any disbursements for additional incidentals incurred by the Consultant in relation to this Agreement ("Disbursements") must be pre-approved by Toronto Hydro in writing.

(d) The Consultant shall not incur or submit invoices for any work outside the scope of the Services without prior written approval from Toronto Hydro.

(e) The Consultant shall make all payment of taxes, employment insurance premiums, pension plan contributions and any other taxes or other payment of any nature, imposed by any authority in respect of the Fee paid by Toronto Hydro to the Consultant under this Agreement (together, the "Remittances"), and the Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities and claims whatsoever against Toronto Hydro or its Representatives, in any way arising out of or relating to any failure to deduct, withhold, or remit any Remittance.

(f) Without limiting the generality of Section 6.1(a), Toronto Hydro reserves the right to deduct any applicable non-resident withholding taxes from any Fee owing to the Consultant under this Agreement and remit such amounts to the applicable taxation authority.

6.2 Payment

The Consultant shall submit invoices to Toronto Hydro on a monthly basis containing:

(a) a description of the Services performed during the invoice period;

(b) the monthly payment amount;

(c) the total HST applicable to the Services during the invoice period, as well as the Consultant's HST registration number; and

(d) a detailed description of the Disbursements incurred around the invoice period, supported by documentation in a form acceptable to Toronto Hydro.

Unless otherwise provided in this Agreement, the Consultant shall invoice Toronto Hydro after final inspection and acceptance by Toronto Hydro of the Services performed and subject to receipt of all documents required by this Agreement. **Invoices must be sent electronically to: AP@torontohydro.com.** Subject to approval of the invoice by Toronto Hydro, receipt of all documents required by this Agreement, and final review by Toronto Hydro, Toronto Hydro shall make payment to the Consultant via electronic funds transfer not later than thirty (30) days following receipt of an acceptable invoice and the EFT Information (as set out below). **The Consultant must provide Toronto Hydro with, in the case of the first payment only, (i) a void cheque, pre-printed deposit slip or bank confirmation letter and (ii) the email address where the Consultant wishes to receive remittance information (together, "EFT Information"). EFT Information must be sent electronically to efthelp@torontohydro.com or to 14 Carlton Street, Toronto, ON, M5B 1K5, Attention: Treasury Department.** Toronto Hydro reserves the right to pay the Consultant through other payment methods.

7. SUSPENSION OR TERMINATION

7.1 Suspension or Termination

(a) Toronto Hydro may, at any time during the Term by notice in writing, suspend all or a portion of the Services. Upon receipt of such written notice, the Consultant shall perform no further work other than as directed by Toronto Hydro, and shall be entitled to payment for time spent in performing the Services up to the date of suspension.

(b) Either party may terminate this Agreement immediately upon written notice where the other party enters into liquidation, whether compulsory or voluntarily, or where a proceeding in receivership, bankruptcy or insolvency has been instituted by or against such party or its property.

(c) Toronto Hydro, at its sole discretion, may terminate this Agreement immediately upon written notice where the Consultant or any of its Representatives has been in material default in the performance of its duties, obligations or undertakings under this Agreement, and has not taken immediate steps to remedy such default within two (2) Business Days following written notice of the specific default by Toronto Hydro. For the purposes of this section, a material default shall include, without limitation, a breach of any of the representations or warranties contained herein or the failure or refusal to provide the Services in accordance with the terms and conditions of this Agreement.

(d) Notwithstanding any other provision in this Agreement, Toronto Hydro, at its sole discretion, shall have the right to terminate this Agreement, for any reason, upon two (2) weeks written notice to the Consultant.

(e) In the event that this Agreement is terminated in accordance with this Section 7.1 by either party, the Consultant shall be entitled to payment for time spent in performing the Services up to the date of suspension.

7.2 Effect of Termination

Upon the termination or expiration of this Agreement, upon Toronto Hydro's request, the Consultant shall return to Toronto Hydro and delete any and all electronic copies the Consultant may have of all documents and materials in its possession relating to the Services or this Agreement, including all Confidential Information and all Deliverables, whether completed or not and shall, upon written request by Toronto Hydro, certify in writing to Toronto Hydro that it has complied with the requirements of this Section 7.2.

8. CONFIDENTIALITY

8.1 Non-Disclosure

In performing the Services required by this Agreement, the Consultant may be provided access to Confidential Information. The Consultant acknowledges and agrees that:

(a) the Consultant shall not disclose, permit access to, transmit, or transfer the Confidential Information to any third party without the prior written authorization of Toronto Hydro;

(b) the Consultant shall protect the confidentiality of the Confidential Information in its possession by exercising the same security measures it normally exercises with respect to its own confidential information and at minimum a reasonable standard of care;

(c) upon the request of Toronto Hydro, and in any event upon the expiration or termination of this Agreement for any reason, the Consultant shall return (or delete, in the case of electronic documents) forthwith to Toronto Hydro all Confidential Information, including all copies and other materials containing the Confidential Information, which are in the possession or under the control of the Consultant; and

(d) the Consultant shall not use any Confidential Information for any purpose other than to perform the Services required by this Agreement. Without limiting the foregoing, the Consultant shall not, and shall not permit any of its Representatives to, use any Confidential Information in furtherance of its, or their, individual business or for its, or their, own benefit, profit or advantage, or for the benefit, profit or advantage of any other party.

(e) Toronto Hydro is subject to MFIPPA and is governed by Governmental Authority such as IESO and the OEB and shall have the right to disclose Confidential Information in accordance with the provisions of MFIPPA or as required by the IESO or the OEB.

Notwithstanding the foregoing, the Consultant may disclose such Confidential Information to any of the Representatives of the Consultant who agree to be bound by the obligations of confidentiality herein and who have a reasonable need to know such Confidential Information in the course of their duties for the Consultant but only for the purposes of the Consultant exercising its rights and obligations under this Agreement; and in the event that the Consultant believes it is required by law to disclose, or is requested by a Governmental Authority to disclose, any Confidential Information to a Governmental Authority; provided that the Consultant shall, to the extent permitted by law, first inform Toronto Hydro of the request or requirement for disclosure to allow an opportunity for Toronto Hydro to apply for an order to prohibit or restrict such disclosure.

8.2 Non-Solicitation

Unless Toronto Hydro's Chief Executive Officer provides prior written consent, the Consultant hereby covenants and agrees that during the term of this Agreement and for a period of two (2) years following the termination of the Agreement, however caused, the Consultant will not directly or indirectly, either individually or in partnership or jointly or in conjunction with any other Person,

(a) hire or otherwise engage any Protected Employee who is currently employed by Toronto Hydro;

(b) hire or otherwise engage any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause;

(c) solicit or attempt to solicit any Protected Employee who is currently employed by Toronto Hydro or encourage any such person to leave his/her employment with Toronto Hydro; and

(d) solicit or attempt to solicit any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause.

8.3 Non-Compete

Given the unique expertise and intimate knowledge that the employees have of the operations of Toronto Hydro the Consultant acknowledges and agrees that the restrictions contained in this section are reasonable and necessary to preserve the value of Toronto Hydro's business.

(a) During the Term and for a period of ten (10) years following the termination of this Agreement, the Consultant shall not appear as an Intervenor, nor aid, assist, or provide services to an Intervenor (whether as an employee, contractor, consultant, agent, or officer) in accordance with the conditions agreed to in section 2.3 of this Agreement and where the services are likely to result in disclosure of Toronto Hydro's Confidential Information to an Intervenor or the use of Toronto Hydro's Confidential Information on behalf of an Intervenor;

(b) During the Term, the Consultant shall not aid, assist, or provide services to the OEB; and

(c) For a period of ten (10) years following the termination of this Agreement, the Consultant shall not aid, assist, or provide services to the OEB (whether as an employee, contractor, consultant, agent, or officer) in accordance with the conditions agreed to in section 2.3 of this Agreement and where the services are likely to result in disclosure of Toronto Hydro's Confidential Information to the OEB or the use of Toronto Hydro's Confidential Information in the service of the OEB.

9. INTELLECTUAL PROPERTY

9.1 Use

Nothing in this Agreement shall be deemed to transfer, license, assign, permit the use of, or otherwise convey an interest in whole or in part to the Consultant of any Intellectual Property belonging to Toronto Hydro or any of its Representatives or any third party whose Intellectual Property is in Toronto Hydro's custody or control, and the use by the Consultant of any such Intellectual Property shall be subject to the prior written approval of Toronto Hydro.

9.2 Ownership

Toronto Hydro shall at all times have full rights and title to the Deliverables, and may at all times take possession of or use any completed or partially completed Deliverables, notwithstanding any provision, express or implied, to the contrary. Without limiting the generality of the foregoing, Toronto Hydro shall own all Intellectual Property rights in all Deliverables, and the Consultant hereby waives and assigns to Toronto Hydro any such rights, and agrees to give Toronto Hydro and its Representatives all assistance as may be reasonably required to perfect such rights including, without limitation and where the Consultant is a corporation or partnership, obtaining waiver of moral rights from any of the Consultant's employees, partners or other Representatives.

9.3 Intellectual Property Protection

The Consultant expressly warrants that the manufacture, delivery, sale or use of the Consultant's Services will not infringe any Canadian or foreign patents, trademarks, copyrights, industrial design or other intellectual property rights and the Consultant shall indemnify and save Toronto Hydro harmless from all claims, judgments and decrees that may be entered against Toronto Hydro or its Representatives and against all damage, liability, costs and expenses (including legal fees and other attendant costs and expenses) Toronto Hydro incurs by reason of any infringement or claim thereof.

9.4 Pre-Existing Intellectual Property

Anything contained in this Agreement to the contrary notwithstanding, Consultant and Toronto Hydro shall each retain ownership of their respective pre-existing intellectual property. To the extent that such pre-existing intellectual property is included in the products of the Work, Consultant hereby grants to Toronto Hydro a fully paid up, irrevocable and non-cancellable, non-exclusive, non-transferable, royalty-free license to use such intellectual property for Toronto Hydro's internal business purposes only. Also, nothing in this Agreement shall prevent Consultant from utilizing – on behalf of itself or its future customers – any general know-how, ideas, techniques, concepts, methods, processes, or other knowledge applied in performing the Work. Consultant may perform the same or similar services for others, provided that any of Toronto Hydro's confidential information is treated in accordance with the confidentiality requirements of this Agreement.

10. <u>HEALTH AND SAFETY</u>

The Consultant shall be responsible for managing the health and safety of its own personnel and other Representatives. Neither Toronto Hydro, nor its Representatives, shall be liable for any loss, damages or claims arising directly or indirectly from the Consultant's access to or work in or around Toronto Hydro's facilities, and the Consultant hereby waives any claims to which it may become entitled for loss or damage and releases Toronto Hydro and its Representatives from any and all such claims.

11. MISCELLANEOUS

11.1 Survival

In addition to the terms in this Agreement that by their nature survive the expiry or termination of the Agreement, the terms of Section 5 (Representations, Warranties and Indemnities), section 8 (Confidentiality), Section 9 (Intellectual Property), and Section 11.3 (Injunctive Relief) shall survive the expiry of this Agreement for a term of five (5) years.

11.2 Subcontracting

The Consultant shall not subcontract the performance of all or any part of the Services without Toronto Hydro's prior written approval. Where Toronto Hydro provides its prior written approval to the Consultant to subcontract all or part of the Services, then the Consultant shall enter into agreements with such permitted subcontractor(s) to require the permitted subcontractor(s) to provide Services in accordance with all of the terms of this Agreement. Notwithstanding the foregoing, the Consultant shall remain liable for any and all acts or omissions of any subcontractor(s) as if such acts or omissions were those of Consultant.

11.3 Injunctive Relief

(a) The Consultant acknowledges and agrees that the terms of Section 8 (Confidentiality) and Section 9 (Intellectual Property) of this Agreement are reasonably necessary to protect the legitimate interests of Toronto Hydro, are reasonable in scope and duration, and are not unduly restrictive.

(b) The Consultant further acknowledges that a breach of any of the terms of Section 8 (Confidentiality) or Section 9 (Intellectual Property) would render irreparable harm to Toronto Hydro, and that a remedy at law for breach of these sections would be inadequate, and that Toronto Hydro shall therefore be entitled to any and all equitable relief, including, without limitation, injunctive relief, and any other remedy that may be available at law or in equity.

11.4 Force Majeure

Either party will be relieved of liability for delays in performance of its obligations hereunder where such delay is a result of Force Majeure. The party affected by the Force Majeure shall give prompt notice thereof to the other party and, upon cessation of the Force Majeure, shall take all reasonable steps to resume the performance of its obligations hereunder as soon as reasonably practicable. If a delay in performance by reason of Force Majeure extends beyond thirty (30) Business Days, then either party may terminate this Agreement by written notice.

11.5 Non-Exclusive Agreement

This Agreement will not be interpreted to grant to the Consultant exclusive rights to provide the Services or to bind Toronto Hydro in any way to an exclusive relationship with the Consultant with regards to the Services or any other service.

11.6 Waiver

No delay on the part of either party in exercising any of its rights hereunder or failure to exercise the same, nor the acquiescence thereto shall operate as a waiver except in the specific instance for which it is given and where such waiver is provided in writing by the party waiving its rights.

11.7 Amendments

None of the terms, conditions or provisions of this Agreement shall be varied, modified or altered except by written agreement signed by an authorized representative of each parties.

11.8 Assignment

Save and except for Toronto Hydro's right to assign this Agreement to any of its Affiliates, neither party may assign this Agreement or any of their rights or obligations hereunder, without the prior written authorization of the other party, acting reasonably.

11.9 Enurement

This Agreement shall enure to the benefit of, and be binding upon, the parties hereto and their respective successors and permitted assigns.

11.10 Severability

In the event that any provision or portion of this Agreement is determined to be invalid or unenforceable for any reason, the remaining provisions or portions of this Agreement will be unaffected and will remain in full force and effect to the fullest extent permitted by law.

11.11 Neutral Construction

The parties to this Agreement agree that this Agreement was negotiated fairly between them at arm's length, that the final terms of this Agreement are the product of the parties' negotiations, and that this Agreement shall be deemed to have been jointly and equally drafted by them, and that the provisions thereof should not be construed against a party on the grounds that such party drafted the Agreement in whole or in part.

11.12 Entire Agreement

This Agreement constitutes the entire agreement between the parties relating to the subject matter hereof. This Agreement supersedes any and all prior correspondence, warranties, covenants, collateral undertakings, or agreements, oral or otherwise, express or implied, unless otherwise contained herein.

11.13 Notices

(a) All questions or other communications regarding this Agreement, including any notices required by this Agreement, are to be addressed to the following addresses:

to Toronto Hydro:

Name:	Anila Dumont
Title:	Manager, Regulatory Services
Address:	14 Carlton Street, Toronto ON 5B 1K5

SCHEDULE A

SCOPE OF SERVICES

1. Services to be Performed

(a) Regulatory Applications and Advocacy

Toronto Hydro is retaining the Consultant to undertake technical analysis, provide advice and/or assist with preparatory activities for upcoming rate applications and regulatory filings at the OEB. Broadly, the Consultant will research and support Toronto Hydro in respect of the following:

- Analyzing regulatory policies, reports, decisions, laws and other energy policy proposals of governments or regulators in relevant jurisdictions;
- Developing advocacy positions and written submissions;
- Detailing application timeline, schedule and milestones;
- Managing the discovery and interrogatory processes;
- Delivering expert testimony in regulatory proceedings;
- Understanding new or modified policies and developing new or modified approach for implementation and compliance purposes;
- Evaluating and creating regulatory frameworks, paradigms and first mover policy ideas to advance the interests of Toronto Hydro; and
- Undertaking technical analysis, drafting evidence and other preparatory activities for rate applications and regulatory filings.

In addition to the foregoing, the Consultant has been retained to provide specific expertise in the areas below. Please note that the list of work or tasks in SCHEDULE A is not guaranteed to include the subjects listed, nor is it limited to the examples listed.

(b) Energy Policy Analysis

Toronto Hydro's business activities are subject to the actions of regulatory authorities or by changes in regulation, including amendments to Ontario's regulatory model, manner of regulation, and/or broader climate change and energy policy framework. Ontario's electricity industry regulatory and other energy policy developments may affect the electricity distribution rates charged by Toronto Hydro, the costs Toronto Hydro is permitted to recover and the activities Toronto Hydro and others may undertake.

Toronto Hydro actively participates in industry engagement efforts in order to anticipate changes in regulatory, climate change and energy policy development. Through these types of engagements, Toronto Hydro monitors proposed regulatory, climate change and energy policy changes. The Consultant will be relied on for its experience, skillsets, knowledge and training in the area of energy policy for the following tasks:

- Regulatory and energy policy analysis and advocacy;
- Jurisdictional research & comparative analysis;
- Developing the context and history of the policy;
- Conducting interviews with key Toronto Hydro personnel on policy implications;

- Developing a matrix of policy implications for the parties participating in the proceeding;
- Cost-benefit allocation frameworks and studies;
- Rate-setting frameworks and principles;
- Rate design principles;
- Rate design review;
- Rate application strategy, evidence drafting, editing, witness training; and
- Other energy policy matters that arise.

(c) Regulatory Analytics and Technical Services

Toronto Hydro requires support from the Consultant on rate design. The OEB sees a comprehensive rate application as consisting of three main components: the business plan (along with supporting documentation and reports), historical and forecast information, and rate models that show the derivation of specific proposed rates based on the data. The OEB's adjudicative process on Toronto Hydro's regulatory applications can involve a number of steps to ensure that Toronto Hydro's proposals are adequately examined and "tested" during the review to ensure that it is delivering cost effective, efficient, reliable and responsive services to customers. In relation to this, the Consultant will be relied on for its experience, skillsets, knowledge and training in the area of analytics and technical services for the following tasks:

- Business case development;
- Econometrics and benchmarking analysis and studies;
- Productivity studies;
- Load and Customer Forecast;
- Energy market analysis
- Lead Lag Study;
- Cost Allocation Model (CAM) review;
- Rate design review;
- Load Profile Analysis as part Cost Allocation Requirements;
- Transformer Allowance;
- Cost Study for Specific Service Charge;
- Standby rates;
- EV rates;
- Loss Adjustment Factor;
- Energy & Demand Load Research Analysis;
- Distributed Energy Resources;
- Line Loss Study;
- Load Profile Analysis;
- IESO market settlement;
- Rate design principles;
- Quantitative models; and
- Other analytics and technical matters that arise.

SCHEDULE C

DEFINITIONS

In this Agreement, the following definitions shall apply:

"Affiliates"	has the meaning prescribed to it in the *Business Corporations Act* of Ontario, as amended from time to time;
"Agreement"	means this Agreement for Professional Consulting Services, including all recitals, schedules and attachments thereto;
"Applicable Laws"	means all federal, provincial and municipal statutes, regulations, codes, by-laws, orders in council, directives, rules, guidelines and ordinances applicable to this Agreement, including without limitation all applicable OEB codes, rules or guidelines;
"Applicant"	means Toronto Hydro when Toronto Hydro has initiated a proceeding by application to the OEB.
"Business Day"	means a day on which banks are open for business in the City of Toronto, Ontario, but does not include a Saturday, Sunday, or a civic or statutory holiday in the Province of Ontario;
"Confidential Information"	means the terms of this Agreement and any and all data or information relating to the business, management or affairs of Toronto Hydro, its customers, employees, or any of its Affiliates disclosed by Toronto Hydro to the Consultant pursuant to this Agreement, whether or not such Confidential Information is expressly identified as confidential. Notwithstanding the foregoing, Confidential Information does not include any information or data which: (a) information or data that is or becomes publicly known through no breach of the terms or conditions of this Agreement; (b) information or data that is independently developed without reference to Confidential Information and without breach of the terms and conditions of this Agreement; or (c) Confidential Information that is required by court order or other legal compulsion to be disclosed, in which case the Consultant shall give Toronto Hydro prior written notice of such disclosure, as permitted by law;
"Consultant"	means ScottMadden Inc.;
"Deliverable"	means any and all works prepared, generated, created or designed by the Consultant pursuant to this Agreement, including without limitation all drawings, models, designs, formulae, methods, documents, reports, software, specifications, or source codes, and any related works, enhancements, modifications or additions thereto;
"Disbursements"	shall have the meaning as prescribed in Section 6.1(c);

"Fees"	shall have the meaning as prescribed in Section 6.1(a);
"Force Majeure"	means any impediments beyond the control of the applicable party due, wholly or in part, directly or indirectly, to: strikes, lockouts, riots, epidemics (other than related to or associated with SARS-Co-V-2 or COVID-19 and any evolutions or mutations thereof), war, governmental regulations, fire, explosions, acts of God, or any other impediment beyond the control of the party affected;
"Governmental Authority"	means any government, legislature, municipality, regulatory authority, agency, commission, department, board or court or other law, regulation or rule-making public entity of similar authority, including, without limitation the OEB;
"Guidelines"	has the meaning prescribed in Section 4.3(d);
"Hourly Rate"	shall have the meaning prescribed in Section 6.1(a);
"HST"	means Harmonized Sales Tax;
"IESO"	Means the Independent Electricity System Operator;
"Initial Term"	has the meaning prescribed to it in Section 3.1;
"Intellectual Property"	includes all trademarks, copyrights, patents, business names, trade secrets, proprietary software, analysis or techniques (whether or not patented or patentable), confidential or secret designs and processes, source codes, plans or devices, or other proprietary and intellectual property rights;
"Intervenor"	means any interested group or individual who participates actively in an OEB proceeding either by submitting evidence, arguments or interrogatories (written questions) or by cross-examining a witness or witnesses at an oral hearing;
"MFIPPA"	means the *Municipal Freedom of Information Act*;
"OEB"	means the Ontario Energy Board;
"Person"	means any individual, firm, corporation, unlimited liability company, partnership, limited liability partnership, joint venture, trust, unincorporated association, unincorporated syndicate, any governmental authority and any other legal or business entity.
"Protected Employee"	means any individual who, during the course of their employment with Toronto Hydro, was directly or indirectly involved in:

i. the procurement of the Services of the Consultant on behalf of Toronto Hydro;

ii. the negotiation of the Consultant's Agreement on behalf of Toronto Hydro; and/or

iii. the awarding and/or approval of the Consultant's Agreement on behalf of Toronto Hydro.

"Representative"	in respect of a party, means such party's directors, officers, employees, agents, contractors and advisors, the party's Affiliates, and all such Affiliates' respective directors, officers, employees, agents, contractors and advisors;
"Remittances"	has the meaning prescribed to it in Section 6.1(e);
"Renewal Term"	has the meaning prescribed to it in Section 3.2;
"Services"	means all of the Deliverables, services and specifications to be provided, performed and met by the Consultant under this Agreement, as more particularly described in SCHEDULE A;
"Term"	has the meaning prescribed to it in Section 3.3; and
"Toronto Hydro"	means Toronto Hydro-Electric System Limited.

AMENDING AGREEMENT

THIS AMENDING AGREEMENT (the "Amending Agreement") is made effective as of June 1, 2023 (the "Effective Date") between **SCOTTMADDEN INC.** ("Consultant") and **TORONTO HYDRO-ELECTRIC SYSTEM LIMITED** ("Toronto Hydro") (collectively, the "Parties").

WHEREAS:

1. Toronto Hydro and the Consultant previously entered into an Agreement for Professional Consulting Services effective September 12, 2022 (the "Agreement"), pursuant to which the Consultant provides Toronto Hydro with various technical analysis, advisory, and preparatory services related to upcoming rate applications and regulatory filings (the "Services"); and

2. The Parties now wish to amend the Agreement by attaching the Ontario Energy Board's *Rules of Practice and Procedure* Rule 13A, and make associated amendments related to the Consultant's participation in Toronto Hydro's upcoming rate application, as provided herein.

NOW THEREFORE, THIS AMENDING AGREEMENT WITNESSES that in consideration of the mutual covenants contained herein and for other valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Toronto Hydro and Consultant agree as follows:

1. Any capitalized terms used but not defined herein shall be as defined in the Agreement. The recitals above are agreed by the Parties to be true and deemed to form part of this Amending Agreement as if specifically restated herein.

2. Section 4.3 of the Agreement is amended by adding the following subsection (e) immediately following subsection 4.3(d):

   (e) Without limiting the generality of subsection 4.3(a) above, the Consultant shall comply with Rule 13A Expert Evidence of the OEB's *Rules of Practice and Procedure*, attached as SCHEDULE C hereto, in the course of providing the Services and agrees to accept the responsibilities that are or may be imposed on them by that rule.

3. The Parties agree to add a new SCHEDULE C to the Agreement, attached hereto as Appendix 1 to this Amending Agreement.

4. All other terms and conditions of the Agreement remain continuously in full force and effect, unamended, and shall be deemed to apply to this Amending Agreement.

5. This Amending Agreement, together with the Agreement, shall hereinafter constitute the entire agreement between the Parties with respect to the Services as further described in the Agreement, and supersedes any and all other agreements, understandings, discussions, negotiations, representations and correspondence which may have been made by or between the Parties respecting the same.

APPENDIX 1

SCHEDULE C

Ontario Energy Board *Rules of Practice and Procedure* Rule 13A

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

a. the expert's name, business name and address, and general area of expertise;
b. the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;
c. the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;
d. the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;
e. in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and
f. an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

a. in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and
b. at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

a. scope and timing;
b. the involvement of any expert engaged by the OEB;
c. the costs associated with the conduct of the activities;
d. the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of Rule **13A.04**; and
e. any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A.**

ScottMadden, Inc.
1900 West Part Drive, Suite 250
Westborough, MA 01581

Attention: Tim Lyons

Dear Sirs/Mesdames:

Re: Letter Agreement – Toronto Hydro-Electric System Limited – ScottMadden, Inc.

Torys LLP ("Torys" or "we") is engaged as legal counsel to Toronto Hydro-Electric System Limited ("Toronto Hydro") in connection with its planned 2025-2029 electricity distribution rate application (the "Application") to the Ontario Energy Board (the "Board").

On behalf of and to assist us in providing legal advice to Toronto Hydro in connection with the Application, Torys requests that you to provide independent consulting services to Torys, effective as of January 10, 2023 (the "Effective Date"). By signing back a copy of this letter (the "Letter Agreement"), which has been acknowledged and agreed to by Toronto Hydro below, you acknowledge and agree that (i) you have been engaged directly by Toronto Hydro to provide consulting services in respect of the Application, (ii) the consulting services you provide in respect of that engagement shall be as further described herein, including with respect to the agreed-upon scope of work, and (iii) the terms of this Letter Agreement shall further govern any consulting services or work product to be provided under the terms of your engagement with Toronto Hydro.

1. No Conflict

The Consultant does not have any conflict of interest or other constraints on its ability to provide expert advice in connection with the Application. You confirm that you are free to provide the consulting services in connection with Torys' representation of Toronto Hydro in the Application. You agree that during the engagement you will not provide, directly or indirectly, any services to any other party to the Application (except Toronto Hydro) in connection with the matters at issue in the Application.

2. Consultant Expertise

The Consultant will provide consulting services to Torys in connection with the Application as further described in Section 3 below. The sponsors of the work of the Consultant and the

persons who have the relevant expertise will be:

- Tim Lyons Partner

(collectively referred to as the "Sponsors").

3. **Scope of Services and Work Product**

The Consultant will:

(a) summarize key findings related electricity sector PBR frameworks and plans approved by regulators in other jurisdictions. The purpose of this work is to collect and analyze materials on how electric utilities with PBR plans – or similar ratemaking mechanisms – have used PBR approaches to address changes in cost and revenue drivers in the electric distribution industry, particularly related to the clean energy transition. Specific activities include:

- Review materials related to electricity sector PBR frameworks and plans in other jurisdictions
- Summarize treatment of costs & revenues under the PBR frameworks and plans reviewed
- Discern the regulatory principles that underlie the PBR frameworks and plans reviewed

(b) discuss the findings and preliminary results of the Study with Torys and Toronto Hydro on a date and at a location to be agreed upon (the "Discussion of Findings");

(c) if requested by Torys, produce draft and/or final written report(s) detailing the Study's methodology, analysis performed and the Consultant's findings and recommendations (the "Report(s)"), which (i) shall be delivered to Torys no later than: March 10, 2023 for the draft Report and March 24, 2023 for the final Report, unless otherwise agreed to by the parties, and (ii) may be filed by Torys with the Board in connection with the Application; and

(d) if requested by Torys, with the consent of Toronto Hydro pursuant to your engagement by Toronto Hydro, provide support during the hearing of Application, which may include:

(i) assistance in responding to interrogatories applicable to the Report;

(ii) appearance at a technical conference to respond to oral questions on the Report;

(iii) testifying about the Report as an expert witness either orally or in writing;

(iv) responding to undertakings (i.e., written questions during a technical conference or hearing) on the Report; and

(v) assistance in connection with the preparation of argument (oral or written) on the issues addressed in the Report.

4. Fees and Invoices

The Consultant acknowledges that the Consultant shall direct all invoices relating to services performed by it, including services performed pursuant to the terms of this Letter Agreement, to Toronto Hydro and that Torys LLP shall have no obligation whatsoever for the invoices rendered in this regard.

5. Confidentiality

This Letter Agreement and all work performed by the Consultant in connection with the consulting services, including all findings, opinions and conclusions the Consultant reaches in relation to the consulting services, and any communications relating thereto, are strictly privileged and confidential and shall not be disclosed to any other person or party without the prior written consent of Torys or Toronto Hydro. The Consultant agrees to designate all written communications and material accordingly. The Consultant further agrees to promptly notify Torys in the event that the Consultant receives a request to disclose information relating to this matter, and agrees to cooperate with Torys, to the fullest extent permitted by law, to prevent or limit the disclosure of such material or otherwise preserve the privileged and confidential status of such material.

The Consultant agrees to hold in confidence: (a) all information provided to the Consultant, and (b) the Consultant's opinions to Torys and to Toronto Hydro as they relate to the information, whether the information or opinions are documentary or oral (collectively, the "Confidential Information"). The Consultant will not disclose the Confidential Information to any person unless Torys or Toronto Hydro authorizes you in writing to do so. All documents given to the Consultant in connection with the consulting services remain the property of Torys or of Toronto Hydro and are held in trust by the Consultant as agent. The Consultant agrees to return these documents on request.

The Consultant will not refer to Torys or to Toronto Hydro, directly or indirectly, in connection with the promotion of its services, without obtaining the prior written consent of Torys or Toronto Hydro, as the case may be.

6. Intellectual Property

Nothing in this Letter Agreement shall be deemed to transfer, license, assign, permit the use of, or otherwise convey an interest in whole or in part to the Consultant of any intellectual property belonging to Toronto Hydro or any of its representatives or any third party whose intellectual property is in Toronto Hydro's custody or control, and the use by the Consultant of any such intellectual property shall be subject to the prior written approval of Toronto Hydro.

Torys and Toronto Hydro shall at all times have full rights and title to all works prepared, generated or created by the Consultant from the consulting services, including without limitation any reports or other documents created by the Consultant, and any related works,

modifications or additions thereto (the "Work Product"), and may at all times take possession of or use any completed or partially completed Work Product, notwithstanding any provision, express or implied, to the contrary. Without limiting the generality of the foregoing, Toronto Hydro shall own all intellectual property rights in all Work Product, and the Consultant hereby waives and assigns to Toronto Hydro any such rights and agrees to give Toronto Hydro and its representatives all assistance as may be reasonably required to perfect such rights including, without limitation, obtaining waiver of moral rights from any of the Consultant's employees, partners or other representatives. Notwithstanding the foregoing, the Consultant shall retain sole and exclusive ownership of any pre-existing Consultant tools, methodologies, proprietary research and data, together will all intellectual property rights therein (the "Consultant Property"). Consultant grants to Torys and Toronto Hydro a fully paid up, irrevocable, perpetual, non-exclusive, royalty-free license to use the Consultant Property contained within the Work Product for the purposes intended in this Letter Agreement.

The Consultant expressly warrants that the delivery, sale or use of the Consultant's services will not infringe any Canadian or foreign patents, trademarks, copyrights, industrial design or other intellectual property rights and the Consultant shall indemnify and save Toronto Hydro harmless from all claims, judgments and decrees that may be entered against Toronto Hydro or its representatives and against all damage, liability, costs and expenses (including legal fees and other attendant costs and expenses) Toronto Hydro incurs by reason of any infringement or claim thereof.

7. **Termination**

Torys may terminate this Letter Agreement at any time on written notice to the Consultant. If not otherwise terminated, this Letter Agreement shall be in effect from the Effective Date and shall expire on the date that is 60 days after a final decision of the Board has been issued on the Application. Upon the termination or expiration of this Letter Agreement, the Consultant shall return to Torys and delete any and all electronic copies the Consultant may have of all non-public documents and materials in its possession acquired from Torys or Toronto Hydro relating to the consulting services or this Letter Agreement, including all Confidential Information (defined above) and Work Product, whether completed or not. The Consultant shall, upon request, provide Torys with a certificate of an officer of the Consultant certifying such deletion of electronic copies.

8. **Independence**

By entering into this Letter Agreement, the Consultant acknowledges and agrees that the Sponsors have received a copy of Rule 13A of the Board's *Rules of Practice and Procedure* concerning expert evidence, and agree to accept the responsibilities that are or may be imposed on them by that rule with respect to testimony before the Board. A copy of the rule and the relevant form are attached as Schedules 'A' and 'B' hereto. When returning an executed copy of this Letter Agreement, the Consultant shall include signed copies of Schedule 'B' for each of the Sponsors.

9. **Responsibility Statement**

The Consultant agrees that the services provided for herein will be performed in a timely, competent, professional manner in accordance with recognized professional consulting standards for similar services to be performed by a leading consulting advisory firm, and that adequate

qualified personnel will be assigned for that purpose. If, during the performance of the services or prior to the Board's issuance of final, non-appealable order(s) disposing of all relevant relief sought in the Application, such services prove to be faulty or defective by reason of a failure to meet such standards, the Consultant agrees that upon prompt written notification from Torys, such faulty or defective portion of the services will be redone at no cost to Torys or Toronto Hydro, up to a maximum amount equivalent to the cost of the services rendered under this Retainer Agreement, or, at Torys' request, the Consultant will refund an amount equal to the amount paid for the faulty or defective portion of the services.

10. **Governing Law**

This Letter Agreement shall be construed and otherwise governed pursuant to the laws of the Province of Ontario and the federal laws of Canada applicable therein.

Sincerely,

TORYS LLP

SCHEDULE 'A'

Rule 13A of the Board's Rules of Practice and Procedure

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the Board impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

(a) the expert's name, business name and address, and general area of expertise;

(b) the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;

(c) the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;

(d) the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;

(e) in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and

(f) an acknowledgement of the expert's duty to the Board in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the Board may require two or more of the experts to:

(a) in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and

(b) at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the Board and others as permitted by the Board, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the Board, including as to:

(a) scope and timing;

(b) the involvement of any expert engaged by the Board;

(c) the costs associated with the conduct of the activities;

(d) the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of **Rule 13A.04**; and

(e) any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A**[1].

[1] Attached as Schedule 'B' herein.

SCHEDULE 'B'

FORM A

Proceeding: .....

ACKNOWLEDGMENT OF EXPERT'S DUTY

1. My name is ..... (*name)*. I live at ..... (*city)*, in the ..... (*province/state*) of .....

2. I have been engaged by or on behalf of ..... (*name of party/parties)* to provide evidence in relation to the above-noted proceeding before the Ontario Energy Board.

3. I acknowledge that it is my duty to provide evidence in relation to this proceeding as follows:

   (a) to provide opinion evidence that is fair, objective and non-partisan;

   (b) to provide opinion evidence that is related only to matters that are within my area of expertise; and

   (c) to provide such additional assistance as the Board may reasonably require, to determine a matter in issue.

4. I acknowledge that the duty referred to above prevails over any obligation which I may owe to any party by whom or on whose behalf I am engaged.

Signature

AGREEMENT FOR PROFESSIONAL CONSULTING SERVICES

THIS AGREEMENT is made as of the 31st day of October, 2022 between **Toronto Hydro-Electric System Limited** ("Toronto Hydro"), a corporation incorporated under the laws of the province of Ontario and **Guidehouse Canada Ltd.**, a corporation incorporated under the laws of Ontario (the "Consultant"), pursuant to which Toronto Hydro shall retain the Consultant to provide certain Services, and the Consultant shall provide such Services, during the Term, subject to the terms and conditions hereof;

NOW THEREFORE, in consideration of the mutual covenants set forth herein and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

1. INTERPRETATION

Unless otherwise indicated, all capitalized terms in this Agreement shall be as defined in SCHEDULE B and any reference to currency in this Agreement shall refer to lawful money of Canada.

2. RELATIONSHIP OF THE PARTIES

2.1 Retainer

Toronto Hydro hereby retains the Consultant to provide the Services, and the Consultant hereby agrees to provide the Services, during the Term, in accordance with the terms and conditions of this Agreement.

2.2 Independent Contractors

(a) Notwithstanding any provision hereof, this Agreement does not constitute and shall not be construed as constituting a partnership, joint venture, principal/agency relationship, or employer/employee relationship between the parties. The Consultant and Toronto Hydro shall at all times remain independent contractors of each other, and neither party shall represent itself to be an agent or employee of the other.

(b) Without limiting the generality of Subsection 00, the Consultant hereby acknowledges and agrees that neither it nor its Representatives shall be eligible or entitled, by reason of this Agreement, to participate in any employee-related program offered by Toronto Hydro or any of its Affiliates, including, without limitation, any benefit, insurance, compensation, health plan, bonus or retirement program.

(c) The Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities or claims whatsoever against Toronto Hydro or its Representatives resulting from or relating to the Consultant or its Representatives being deemed to be an employee of Toronto Hydro or any of its Affiliates.

(d) The Consultant hereby acknowledges and agrees that Toronto Hydro shall not be responsible for and shall not have control or charge of any means, methods, techniques, sequences or

procedures used for or in respect of the Services, or for the safety precautions or programs required for the Services or otherwise prescribed hereunder.

3. TERM

3.1 Term

Unless otherwise terminated in accordance with the provisions hereof, this Agreement shall be for a term of two (2) years and seven (7) months commencing on October 31, 2022 and terminating on May 30, 2025 (the "Term").

4. SERVICE REQUIREMENTS

4.1 Services

During the Term, the Consultant shall perform the Services as detailed in SCHEDULE A hereto.

4.2 Time and Availability

Unless otherwise directed in writing by Toronto Hydro, the Consultant shall have discretion in selecting the dates and times it performs the Services throughout the month, giving due regard to the needs of Toronto Hydro's business requirements and provided that any access to Toronto Hydro property shall be during regular business hours.

4.3 [Intentionally Deleted]

4.4 Revision to Services

(a) The Parties acknowledge and agree that the Services to be undertaken and completed by the Consultant under this Agreement may be subject to revision or amendment from time to time during the Term: (i) as required by Toronto Hydro to comply with the Guidelines; (ii) as required by Toronto Hydro to comply with the Applicable Laws or any order, instruction, directive or legal requirement of a Governmental Authority; or (iii) as required by Toronto Hydro to ensure that Toronto Hydro receives the expected funding and benefits with respect to the project to which the Services relate.

(b) Toronto Hydro agrees to provide the Consultant with written notice of any revision or amendment to the Services required pursuant to this Section 4.4, and subject to the terms of Subsection 4.40 below, the Consultant shall comply with all such directives.

(c) In the event that the Consultant fails to comply with a directive issued by Toronto Hydro pursuant to this Section 4.4, Toronto Hydro shall have the right, in addition to any other remedies which may be available to Toronto Hydro hereunder or otherwise at law, to terminate this Agreement by giving written notice of termination to the Consultant whereupon this Agreement shall terminate as at the effective date of termination specified in the notice and the provision of Section 7 shall apply.

(d) Notwithstanding Subsection 4.40, where a directive from Toronto Hydro results in a material change in the scope and/or implementation of the Services, then the Consultant shall have the right to terminate this Agreement by giving notice of termination to Toronto Hydro whereupon

the Agreement shall terminate as at the effective date of termination specified in the notice and the provisions of Section 7 shall apply.

4.5 Applicable Laws

(a) The Consultant shall, at its sole expense, obtain and maintain during the Term of this Agreement, all permits, licences and approvals required by all Applicable Laws to perform its obligations under this Agreement. The terms and conditions of this Agreement shall be carried out in strict compliance with all Applicable Laws and in the event of any conflict between any Applicable Laws, the Applicable Laws with the most stringent standard shall apply.

(b) Without limiting the generality of subsection 4.5(a) above, the Consultant shall comply with Rule 13A Expert Evidence of the Ontario Energy Board's *Rules of Practice and Procedure*, attached as SCHEDULE C hereto, and agree to accept the responsibilities that are or may be imposed on them by that rule with respect to any testimony before the Ontario Energy Board.

(c) Without limiting the generality of the foregoing, the Consultant shall comply with the *Municipal Freedom of Information Act* ("MFIPPA"), the *Personal Information Protection and Electronic Documents Act* (Canada) ("PIPEDA")and any other applicable privacy legislation (collectively, "Privacy Laws") with respect to any personal information collected, used or disclosed in connection with this Agreement and shall indemnify and hold harmless Toronto Hydro and its Representatives from and against any and all claims, demands, suits, losses, damages, causes of action, fines or judgments (including related expenses and legal costs) they may incur related to or arising out of any non-compliance therewith.

(d) Where any Development is subject to the approval or review of any authority, department, government or agency other than Toronto Hydro, such applications for approval or review shall, unless otherwise authorized by Toronto Hydro in writing, be prepared by the Consultant to be approved and submitted by and through the offices of Toronto Hydro, and the Consultant shall not have any direct dealings with the authority, department, government or agency in question with regards to the Development.

(e) The Consultant and the Consultant's personnel shall comply with all rules and direction of Toronto Hydro, whether specified in this Agreement or otherwise, while working on Toronto Hydro's facilities: Toronto Hydro's *Code of Business Conduct and Whistleblower Procedure*, Toronto Hydro's *Disclosure Policy,* Toronto Hydro's *Social Media and Digital Communication Policy,* Toronto Hydro's *Accessibility Policy,* Toronto Hydro's *Workplace Harassment Policy and Program,* Toronto Hydro's *Violence Prevention in the Workplace Policy,* Toronto Hydro's *Workplace Alcohol and Drug Policy*, Toronto Hydro's *Environmental Policy*, Toronto Hydro's *Occupational Health and Safety Policy*, Toronto Hydro's *Privacy Policy,* Toronto Hydro's *Cyber Security Policy*, Toronto Hydro's *Technology Use Guidelines*, Toronto Hydro's *External Supplier Access to Application Services Policy,* Toronto Hydro's *Physical Security Policy*, Toronto Hydro's *COVID-19 Vaccination Policy,* and the *Affiliate Relationships Code for Electricity Distributors and Transmitters* issued by the OEB (together, the "Guidelines"). The Consultant acknowledges that it has been provided with a copy of the Guidelines, has provided and will provide a copy of the Guidelines to each of its Representatives and that it agrees to comply with and to direct its Representatives to comply with such Guidelines, as amended.

4.6 Performance

(a) The Services shall be performed to the satisfaction of Toronto Hydro, and Toronto Hydro shall have the right at all reasonable times, to inspect or otherwise review the Services performed or being performed. The Consultant shall, upon the request of Toronto Hydro, provide Toronto Hydro with written reports of the status of the Developments and the Consultant's progress in providing the Services.

(b) In the event of any dispute between Toronto Hydro and the Consultant relating to the quality or acceptability or rate of progress of any of the Services, or relating to the interpretation of any instructions or specifications concerning the Services, the reasonable opinion of Toronto Hydro shall govern and be binding on the parties hereto.

4.7 Health and Safety

The Consultant shall be responsible for managing the health and safety of its own personnel and other Representatives. Neither Toronto Hydro, nor its Representatives, shall be liable for any loss, damages or claims arising directly or indirectly from the Consultant's access to or work in or around Toronto Hydro's facilities, and the Consultant hereby waives any claims to which it may become entitled for loss or damage and releases Toronto Hydro and its Representatives from any and all such claims.

4.8 [Intentionally Deleted]

4.9 Security

a) Vendor shall implement and comply with controls ("Security Controls") for the protection of Toronto Hydro's Representatives, customers, systems integrity, systems availability, Confidential Information and Toronto Hydro property, including Toronto Hydro Data, accessed, received or used by Consultant or its Personnel, or that otherwise comes into the possession of Consultant or its Personnel, in accordance with:

   i. the physical safeguards requirements set forth in Toronto Hydro's *Physical Security Policy* in section 4.5(e) of this Agreement ("Physical Security Controls");
   ii. the data security requirements set forth in Schedule D ("Cybersecurity Controls");
   iii. the public cloud requirements set forth in Schedule E ("Public Cloud Controls");

b) The Physical Security and the Cybersecurity Controls include the requirements for identifying, responding to, resolving and reporting on, Security Incidents.

c) A Security Incident is Confidential Information of Toronto Hydro subject to the requirements of this Agreement.

d) In the event of a Security Incident,

   i. Consultant shall promptly investigate such Security Incident and, if the Security Incident is a Cybersecurity Incident, it shall conduct such investigation as set out in Schedule D – Cybersecurity Controls; and
   ii. Consultant shall cooperate with Toronto Hydro in its efforts to (i) investigate the Security Incident, (ii) comply with statutory notice and other legal obligations

applicable to Toronto Hydro or its customers arising out of the Security Incident, and (iii) investigate or bring legal action against third parties in an effort to protect Toronto Hydro's rights. If a Security Incident involves any Personal Information, then if requested by Toronto Hydro, Consultant will assist Toronto Hydro in Toronto Hydro's communication with the media, any affected persons (by press release, telephone, letter, website or any other method of communication), and any Governmental Authorities. The content and method of any such communications will be reasonably determined by Toronto Hydro.

e) Consultant policies to be maintained by Consultant will include current and comprehensive written security policies detailing Consultant's security processes, programs and procedures that are in compliance with Applicable Law and the Security Controls (collectively, "Security Policies"). Upon Toronto Hydro's request, Consultant will provide to Toronto Hydro copies of the Security Policies. During the Term of this Agreement, Consultant shall not amend or modify any part of the Security Policies to diminish the Security Controls then in effect without Toronto Hydro's prior written consent.

f) Not more than once per calendar year, Toronto Hydro reserves the right, upon reasonable notice and at Toronto Hydro's expense, to review Consultant's compliance with the Security Policies and this Agreement. Toronto Hydro may exercise this right directly or use the services of a third party with recognized ability in the area to conduct such review. In the event of a Security Incident, the calendar limitation above shall not apply and Toronto Hydro may conduct such review at any time subsequent to such Security Incident.

5. REPRESENTATIONS, WARRANTIES, INDEMNITIES AND INSURANCE

5.1 Representations and Warranties

The Consultant hereby represents, warrants and agrees that:

(i) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has/have the necessary experience and qualifications to perform the Services;

(ii) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) will perform the Services in a diligent, expeditious and workmanlike manner, consistent with standards generally observed by reputable and competent members of the same industry providing similar services;

(iii) all Services shall be the Consultant's (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) original work and none of the Services or any invention, development, use, production, distribution or exploitation relating thereto will infringe, misappropriate or violate any intellectual property or other right of any person or entity;

(iv) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has the corporate power and authority to enter into this Agreement and to perform its obligations hereunder, and that this Agreement constitutes a legal, valid, and binding obligation of the Consultant, enforceable against the Consultant in accordance with its terms.

Save and except for all warranties set out in this Agreement, the foregoing warranties are in lieu of any other warranties, express or implied, of the Vendor and all such warranties are hereby disclaimed.

5.2 Indemnity

a) The Consultant shall be liable for and shall indemnify and hold harmless Toronto Hydro and its Representatives from all claims, demands, actions, penalties, damages, losses, judgments and settlements, liabilities, costs, expenses, including legal fees and other related costs and expenses arising out of, related to, or incident to, the Consultant or any of its Representatives' performance of the Services under this Agreement, including, without limitation:

   i. any breach, violation or non-performance by the Consultant or any of its Representatives of any terms, conditions, warranties, obligations or covenants contained in this Agreement;

   ii. any breach or violation by the Consultant or any of its Representatives of any Applicable Laws; and

   iii. any actions, omissions, negligence or wilful misconduct of the Consultant or any of its Representatives.

b) The Consultant's aggregate liability under this Agreement shall not exceed three times the value of all amounts paid or payable by Toronto Hydro under the Agreement.

c) Except for losses covered by insurance of the types and to the limits required in this Agreement, the liability of the Consultant is limited to direct damages only, and in no event shall the Consultant be liable for loss of profit or use and for any indirect, special, incidental or consequential damages of any nature or kind howsoever caused or arising.

d) No exclusion or limitation on liability for the Consultant shall apply to:
   i. gross negligence or intentional misconduct;
   ii. death, personal injury, or property damage;
   iii. breach of applicable law; or
   iv. intellectual property indemnity in Section 9.

e) However in case of breach of the confidentiality or privacy obligations as included in this Agreement, Consultant's aggregate liability shall not exceed a value of $5,000,000.

5.3 Insurance

(a) The Consultant shall, during the Term, and at its own expense, maintain and keep in full force and effect (and, when requested, provide Toronto Hydro with proof thereof) the following insurance:

   (i) commercial general liability insurance on an occurrence basis having a minimum inclusive coverage limit, including personal injury and property damage, of not less than two million dollars ($2,000,000) per occurrence with property damage deductible of not more than fifty thousand dollars ($50,000.00) which commercial general liability insurance shall be extended to cover contractual liability, products

and completed operations liability, contingent employer's liability, and owners/contractors protective liability;

(ii) Errors and Omissions Insurance (Professional Liability) in the amount of not less than five million dollars ($5,000,000.00);

(iii) Computer Security and Privacy Liability insurance covering actual or alleged acts, errors or omissions committed by the Vendor or its Representatives of not less than three million dollars ($3,000,000.00) in the aggregate, and which shall also extend to include the intentional, fraudulent or criminal acts of the Vendor or its Representatives. The policy shall expressly provide, but not be limited to, coverage for the following perils:

1) unauthorized use/access of a computer system

2) defense of any regulatory action involving a breach of privacy

3) failure to protect confidential information (personal and commercial information) from disclosure

4) notification costs, whether or not required by statute; and

(iv) automobile liability insurance on all owned and non-owned vehicles used in connection with this Agreement, with such automobile insurance coverage having a limit of not less than two million dollars ($2,000,000.00) per vehicle, in respect of bodily injury (including passenger hazard), property damage and mandatory accident benefits.

(b) All insurance coverages and limits required to be maintained by the Consultant shall be primary to any insurance maintained by Toronto Hydro, which shall be excess and non-contributory. Prior to the commencement of the delivery of the Services, the Consultant shall deliver to Toronto Hydro a certificate of insurance which evidences the Consultant's compliance with this section, and Consultant shall make best efforts to provide a thirty (30) day prior written notice of cancellation, non-renewal or adverse material change, to Toronto Hydro.

(c) The Consultant agrees that the insurance described herein does in no way limit the Consultant's liability pursuant to the indemnity provisions of this Agreement.

(d) A waiver of subrogation shall be provided by the insurer(s) to Toronto Hydro, except with respect to the error and omissions insurance policy.

6. FEES

6.1 Fees

(a) Subject to Subsections 00, 00 and 00, in exchange for the performance of the Services in accordance with the terms hereof, Toronto Hydro shall pay the Consultant the fees set out in SCHEDULE A (plus applicable taxes), (the "Fees"), subject to invoicing as outlined in Section 0.

(b) The Fee noted in subsection 00 shall be the only fee payable by Toronto Hydro under this Agreement. Without limiting the generality of the foregoing, the Consultant hereby agrees and acknowledges that all out-of-pocket expenses, travelling costs, and other disbursements shall be at the sole expense of the Consultant, except with the prior written approval from Toronto Hydro.

(c) Any disbursements for additional incidentals incurred by the Consultant in relation to this Agreement ("Disbursements") must be pre-approved by Toronto Hydro in writing.

(d) The Consultant shall not incur or submit Fees for any work outside the scope of the Services, or exceed the Fees listed in Subsection 6.10 without prior written approval from Toronto Hydro.

(e) The Consultant shall make all payment of taxes, employment insurance premiums, pension plan contributions and any other taxes or other payment of any nature, imposed by any authority in respect of the Fees paid by Toronto Hydro to the Consultant under this Agreement (together, the "Remittances"), and the Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities and claims whatsoever against Toronto Hydro or its Representatives, in any way arising out of or relating to any failure to deduct, withhold, or remit any Remittance.

(f) Without limiting the generality of Subsection 00, Toronto Hydro reserves the right to deduct any applicable non-resident withholding taxes from any Fees owing to the Consultant under this Agreement and remit such amounts to the applicable taxation authority.

6.2 Payment

The Consultant shall submit invoices to Toronto Hydro in accordance with SCHEDULE A of this Agreement containing:

(i) a detailed description of the Services performed during the invoice period;

(ii) the dates and the amount of time spent by the Consultant for the provision of the Services;

(iii) the Hourly Rate (if applicable); and

(iv) the total HST applicable to the Services during the invoice period, as well as the Consultant's HST registration number.

Unless otherwise provided in this Agreement, the Consultant shall invoice Toronto Hydro after final inspection and acceptance by Toronto Hydro of the Services performed and subject to receipt of all documents required by this Agreement. **Invoices must be sent electronically to: AP@torontohydro.com.** Subject to approval of the invoice by Toronto Hydro, receipt of all documents required by this Agreement, and final review by Toronto Hydro, Toronto Hydro shall make payment to the Consultant via electronic funds transfer not later than thirty (30) days following receipt of an acceptable invoice and the EFT Information (as set out below). **The Consultant must provide Toronto Hydro with, in the case of the first payment only, (i) a void cheque, pre-printed deposit slip or bank confirmation letter and (ii) the email address where the Consultant wishes to receive remittance information (together, "EFT Information"). EFT Information must be sent electronically to efthelp@torontohydro.com or to 14 Carlton Street, Toronto, ON, M5B 1K5, Attention: Treasury Department.** Toronto Hydro reserves the right to pay the Consultant through other payment methods.

Any objection to an invoice shall be made within sixty (60) days from the invoice date; lack of timely objection shall indicate Toronto Hydro's agreement to such invoiced amounts. If any amounts remain unpaid for sixty (60) or more days from the invoice date, the Consultant shall have the right to suspend services until payment in full is made.

7. SUSPENSION OR TERMINATION

7.1 Suspension or Termination

(a) Toronto Hydro may, at any time during the Term by notice in writing, suspend all or a portion of the Services. Upon receipt of such written notice, the Consultant shall perform no further work other than as directed by Toronto Hydro, and shall be entitled to payment for time spent in performing the Services up to the date of suspension.

(b) Either party may terminate this Agreement immediately upon written notice where the other party enters into liquidation, whether compulsory or voluntarily, or where a proceeding in receivership, bankruptcy or insolvency has been instituted by or against such party or its property.

(c) Toronto Hydro, at its sole discretion, may terminate this Agreement immediately upon written notice where the Consultant or any of its Representatives has been in default in the performance of its duties, obligations or undertakings under this Agreement, and has not taken immediate steps to remedy such default within five (5) Business Days following written notice of the specific default by Toronto Hydro. For the purposes of this section, a material default shall include, without limitation, a breach of any of the representations or warranties contained herein or the failure or refusal to provide the Services in accordance with the terms and conditions of this Agreement.

(d) Notwithstanding any other provision in this Agreement, Toronto Hydro, at its sole discretion, shall have the right to terminate this Agreement, for any reason, upon two (2) weeks written notice to the Consultant.

7.2 Effect of Termination

Upon the termination or expiration of this Agreement, the Consultant shall return to Toronto Hydro and delete any and all electronic copies the Consultant may have of all documents and materials in its possession relating to the Services or this Agreement, including all Confidential Information and all Developments, whether completed or not.

8. CONFIDENTIALITY

(a) In performing the Services required by this Agreement, the Consultant may be provided access to Confidential Information. The Consultant acknowledges and agrees that:

(i) the Consultant shall not disclose, permit access to, transmit, or transfer the Confidential Information to any third party without the prior written authorization of Toronto Hydro;

(ii) the Consultant shall protect the confidentiality of the Confidential Information in its possession by exercising the same security measures it normally exercises with respect to its own confidential information and at minimum a reasonable standard of care;

(iii) upon the request of Toronto Hydro, and in any event upon the expiration or termination of this Agreement for any reason, the Consultant shall return (or delete, in the case of

electronic documents) forthwith to Toronto Hydro all Confidential Information, including all copies and other materials containing the Confidential Information, which are in the possession or under the control of the Consultant;

(iv) the Consultant shall not use any Confidential Information for any purpose other than to perform the Services required by this Agreement. Without limiting the foregoing, the Consultant shall not, and shall not permit any of its Representatives to, use any Confidential Information in furtherance of its, or their, individual business or for its, or their, own benefit, profit or advantage, or for the benefit, profit or advantage of any other party; and

(v) Toronto Hydro is subject to MFIPPA and is governed by Governmental Authority such as the Independent Electricity System Operator ("IESO") and the Ontario Energy Board ("OEB") and shall have the right to disclose Confidential Information in accordance with the provisions of MFIPPA or as required by the IESO or the OEB.

(b) Notwithstanding the foregoing, the Consultant may disclose such Confidential Information:

(i) to any of the Representatives of the Consultant who agree to be bound by the obligations of confidentiality herein and who have a reasonable need to know such Confidential Information in the course of their duties for the Consultant but only for the purposes of the Consultant exercising its rights and obligations under this Agreement; and

(ii) in the event that the Consultant believes it is required by law to disclose, or is requested by a Governmental Authority to disclose, any Confidential Information to a Governmental Authority; provided that the Consultant shall, to the extent permitted by law, first inform Toronto Hydro of the request or requirement for disclosure to allow an opportunity for Toronto Hydro to apply for an order to prohibit or restrict such disclosure.

9. INTELLECTUAL PROPERTY

9.1 Use

Nothing in this Agreement shall be deemed to transfer, license, assign, permit the use of, or otherwise convey an interest in whole or in part to the Consultant of any Intellectual Property belonging to Toronto Hydro or any of its Representatives or any third party whose Intellectual Property is in Toronto Hydro's custody or control, and the use by the Consultant of any such Intellectual Property shall be subject to the prior written approval of Toronto Hydro.

9.2 Ownership

Toronto Hydro shall at all times have full rights and title to the Developments, and may at all times take possession of or use any completed or partially completed Developments, notwithstanding any provision, express or implied, to the contrary. Without limiting the generality of the foregoing, Toronto Hydro shall own all Intellectual Property rights in all Developments, and the Consultant hereby waives and assigns to Toronto Hydro any such rights, and agrees to give Toronto Hydro and its Representatives all assistance as may be reasonably required to perfect such rights including, without limitation and where the Consultant is a corporation or partnership, obtaining waiver of moral rights from any of the Consultant's employees, partners or other Representatives.

9.3 Intellectual Property Protection

The Consultant expressly warrants that the manufacture, delivery, sale or use of the Consultant's Services will not infringe any Canadian or foreign patents, trademarks, copyrights, industrial design or other intellectual property rights and the Consultant shall indemnify and save Toronto Hydro harmless from all claims, judgments and decrees that may be entered against Toronto Hydro or its Representatives and against all damage, liability, costs and expenses (including legal fees and other attendant costs and expenses**)** Toronto Hydro incurs by reason of any infringement or claim thereof.

9.4 Pre-Existing Intellectual Property

Any pre-existing Intellectual Proprietary ("Pre-Existing IP") of Consultant or its licensors used to perform Services, or included in any Development, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of the Consultant and its licensors (collectively, "Consultant Information"). To the extent that Consultant incorporates any Consultant Information into the Development(s), Consultant hereby grants to Toronto Hydro a fully paid up, royalty free, irrevocable and non-cancellable, non-exclusive, and non-transferable right to Use the Consultant Information solely for Toronto Hydro's internal business purposes and for any specific purposes identified in the Agreement. For the purpose of the foregoing, "Use" means one or more of the following rights to: use; translate; reproduce; copy; display; perform; communicate in any manner. All Developments and Services provided by the Consultant shall be only for Toronto Hydro's internal business purposes and for any specific purposes identified in the Agreement. Consultant shall have no liability to any third parties who rely on any of its Developments or Services. Consultant shall provide Toronto Hydro with a list of any freeware, shareware or open source software used in the Developments. Any pre-existing intellectual property of Toronto Hydro, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of Toronto Hydro.

10. MISCELLANEOUS

10.1 Survival

In addition to the terms in this Agreement that by their nature survive the expiry or termination of the Agreement, the terms of Section 5 (Representations, Warranties and Indemnities), Section 8 (Confidentiality), Section 9 (Intellectual Property), and Section 0 (Injunctive Relief) shall survive the expiry of this Agreement for a term of five (5) years.

10.2 Injunctive Relief

(a) The Consultant acknowledges and agrees that the terms of Section 8 (Confidentiality) and Section 9 (Intellectual Property) of this Agreement are reasonably necessary to protect the legitimate interests of Toronto Hydro, are reasonable in scope and duration, and are not unduly restrictive.

(b) The Consultant further acknowledges that a breach of any of the terms of Section 8 (Confidentiality) or Section 9 (Intellectual Property) would render irreparable harm to Toronto Hydro, and that a remedy at law for breach of these sections would be inadequate, and that Toronto Hydro shall therefore be entitled to any and all equitable relief, including, without limitation,

injunctive relief without proof of actual damages, and any other remedy that may be available at law or in equity.

10.3 Subcontracting

The Consultant may not subcontract the performance of any part of the Services without Toronto Hydro's prior written approval. Where Toronto Hydro provides its prior written approval to the Consultant to subcontract all or part of the Services, then the Consultant shall enter into agreements with such permitted subcontractor(s) to require the permitted subcontractor(s) to provide Services in accordance with all of the terms of this Agreement. Notwithstanding the foregoing, the Consultant shall remain liable for any and all acts or omissions of any subcontractor(s) as if such acts or omissions were those of Consultant.

10.4 Force Majeure

Either party will be relieved of liability for delays in performance of its obligations hereunder where such delay is a result of Force Majeure. The party affected by the Force Majeure shall give prompt notice thereof to the other party and, upon cessation of the Force Majeure, shall take all reasonable steps to resume the performance of its obligations hereunder. If a delay in performance by reason of Force Majeure extends beyond thirty (30) Business Days, then either party may terminate this Agreement by written notice.

10.5 Waiver

No delay on the part of either party in exercising any of its rights hereunder or failure to exercise the same, nor the acquiescence thereto shall operate as a waiver except in the specific instance for which it is given and where such waiver is provided in writing by the party waiving its rights.

10.6 Amendments

None of the terms, conditions or provisions of this Agreement shall be varied, modified or altered except by written agreement signed by an authorized representative of each parties.

10.7 Assignment

Save and except for Toronto Hydro's right to assign this Agreement to any of its Affiliates, neither party may assign this Agreement or any of their rights or obligations hereunder, without the prior written authorization of the other party.

10.8 Enurement

This Agreement shall enure to the benefit of, and be binding upon, the parties hereto and their respective successors and permitted assigns.

10.9 Severability

In the event that any provision or portion of this Agreement is determined to be invalid or unenforceable for any reason, the remaining provisions or portions of this Agreement will be unaffected and will remain in full force and effect to the fullest extent permitted by law.

10.10 Non-Exclusive Agreement

This Agreement will not be interpreted to grant to the Consultant exclusive rights to provide the Services or to bind Toronto Hydro in any way to an exclusive relationship with the Consultant with regards to the Services or any other service.

10.11 Neutral Construction

The parties to this Agreement agree that this Agreement was negotiated fairly between them at arm's length, that the final terms of this Agreement are the product of the parties' negotiations, and that this Agreement shall be deemed to have been jointly and equally drafted by them, and that the provisions thereof should not be construed against a party on the grounds that such party drafted the Agreement in whole or in part.

10.12 Entire Agreement

This Agreement constitutes the entire agreement between the parties relating to the subject matter hereof. This Agreement supersedes any and all prior correspondence, warranties, covenants, collateral undertakings, or agreements, oral or otherwise, express or implied, unless otherwise contained herein.

10.13 Notices

(a) All questions or other communications regarding this Agreement, including any notices required by this Agreement, are to be addressed to the following addresses:

SCHEDULE A

SERVICES

1. Services to be Performed

Toronto Hydro requires the Consultant to complete a lead lag study to determine the appropriate level of working capital for Toronto Hydro's 2025-2029 rate application, in accordance with OEB requirements. The final report will be filed with the OEB as expert evidence in Toronto Hydro's rate application in support of Working Capital Allowance. In preparing this report the Consultant shall examine probable future impacts on the working capital, and shall outline material changes compared to prior studies. The Consultant may be required to respond to interrogatories and/or testify before the OEB in relation to the study.

Use in Toronto Hydro's rate applications, OEB proceedings, and related matters shall be deemed a specific purpose of the Services and Developments for the purposes of Section 9.4 of the Agreement.

2. Specifications

The Consultant shall provide the Services to Toronto Hydro through the following two-phase work plan:

Phase 1: Draft Results
The Consultant shall create a preliminary working capital figure that Toronto Hydro can use for the purposes of preparing its regulatory application.

Task	Consultant Actions	Benefits/Outcomes Overview
Task 1: Project Mobilization	• Kick-off meeting • Complete data request templates • Identify key points of contact at Toronto Hydro	• Clear understanding of communication protocols, points of contact, timelines, and expectations
Task 2: Data Review & Confirmation	• Review data from Toronto Hydro • Populate initial model • Benchmark initial model outputs against past studies and peer utilities • Staff interviews to ensure understanding of data and initial results	• Team has a solid understanding of Toronto Hydro's data and drivers behind initial results • Initial model results are compared against multiple reference points to identify areas of improvement and potential points of contention
Task 3: Finalize Model & Present Initial Results	• Integrate Toronto Hydro staff feedback into the model • Complete independent QA/QC of the model • Present initial study results including comparison to previous study results	• Model is developed with robust processes to ensure an accurate reflection of utility operations • Results are reviewed by Toronto Hydro staff

		• Risks are identified early to help formulate regulatory strategy
Task 4: Preliminary Results	• Integrate Toronto Hydro staff feedback from initial study results into the model • Present, in person at Toronto Hydro offices, preliminary study results along with key underlying assumptions in PPT form	• Results and key underlying assumptions will be understood by Toronto Hydro staff

Phase 2: Draft and Final Reports
Based on the results of Phase 1 and feedback provided by Toronto Hydro, the Consultant shall prepare a final report.

Task	Consultant Actions	Benefits/Outcomes Overview
Task 5: Draft Reports	• Incorporate results of Phase 1 and Toronto Hydro feedback into first draft report • Submit to Toronto Hydro for feedback and create a second draft report. Submit second draft to Toronto Hydro for comment.	• Toronto Hydro staff has two opportunities to provide feedback
Task 6: Final Report	• Produce final report	• Multiple iterations of report ensures completeness and improves robustness for submission to OEB

3. Timetable / Developments

a) The Consultant shall provide the following Development as part of the Services:
   i. **Draft Results:** A preliminary working capital figure based on an initial study that Toronto Hydro can use for the purposes of preparing its regulatory application.
   ii. **Final Report**: Final report detailing the methodology and procedures used while conducting the study; assumptions (if any); calculations supporting the working capital amount; the final working capital amount.

b) The Services shall be completed on the following timeline:

Work Plan Stage	Completion Date:
Phase 1	10 weeks post-execution of this Agreement
Phase 2	8 weeks post-completion of Phase 1

The above timeline is conditional upon Toronto Hydro providing responses to data requests within a reasonable time period and feedback on draft reports within 10 business days.

4. Fees

Toronto Hydro shall pay the Consultant a fixed fee of [redacted] for the Services, exclusive of HST. The Consultant shall invoice Toronto Hydro in accordance with Section 6.2 of this Agreement and the following milestones:

Milestone	Invoice Amount
Completion of Task 2	[redacted]
Completion of Task 4	[redacted]
Delivery of Final Report (Task Six)	[redacted]

5. Additional Services

a) In addition to the Services as set out above in this SCHEDULE A, the Consultant shall further provide additional services (the "Additional Services") on an as-needed basis per the request of Toronto Hydro. Additional Services shall be billed on an hourly basis at the following Hourly Rates:

i. For general work outside of the scope of the Services described in sections 2 and 3 above, including any potential scenario or sensitivity analysis:

Level	[redacted]
Partner	
Director	
Associate Director	
Managing Consultant	
Senior Consultant	
Consultant	

ii. For work directly related to a regulatory application, including but not limited to responding to IRs and testifying:

Level	[redacted]
Partner	
Director	
Associate Director	
Managing Consultant	
Senior Consultant	
Consultant	

The Hourly Rates set out in this Section 4(a)(i) are subject to a 5% annual increase starting July 1, 2023.

b) The Consultant shall invoice Toronto Hydro on a monthly basis in accordance with Section 6 of this Agreement for all Additional Services provided.

SCHEDULE B

DEFINITIONS

In this Agreement, the following definitions shall apply:

“Additional Services”	has the meaning prescribed to it in SCHEDULE A;
"Affiliates"	has the meaning prescribed to it in the *Business Corporations Act* of Ontario, as amended from time to time;
"Agreement"	means this Agreement for Professional Consulting Services, including all recitals, schedules and attachments thereto;
"Anticipated Hours"	has the meaning prescribed in Section 0;
"Applicable Laws"	means all federal, provincial and municipal statutes, regulations, codes, by-laws, orders in council, directives, rules, guidelines and ordinances applicable to this Agreement, including without limitation all applicable OEB codes, rules or guidelines;
"Business Day"	means a day on which banks are open for business in the City of Toronto, Ontario, but does not include a Saturday, Sunday, or a civic or statutory holiday in the Province of Ontario;
"Confidential Information"	means the terms of this Agreement and any and all data or information relating to the business, management or affairs of Toronto Hydro, its customers, employees, or any of its Affiliates disclosed by Toronto Hydro to the Consultant pursuant to this Agreement, whether or not such Confidential Information is expressly identified as confidential. Notwithstanding the foregoing, Confidential Information does not include any information or data which: (a) information or data that is or becomes publicly known through no breach of the terms or conditions of this Agreement; (b) information or data that is independently developed without reference to Confidential Information and without breach of the terms and conditions of this Agreement; or (c) Confidential Information that is required by court order or other legal compulsion to be disclosed, in which case the Consultant shall give Toronto Hydro prior written notice of such disclosure, as permitted by law;
"Consultant"	means Guidehouse Canada Ltd.;
“Consultant Information”	has the meaning prescribed in Section 0;
“Cybersecurity Incident”	has the meaning prescribed to it in SCHEDULE D;
"Development"	means any and all works prepared, generated, created or designed by the Consultant pursuant to this Agreement, including without limitation all drawings, models, designs, formulae, methods, documents, reports,

	software, specifications, or source codes, and any related works, enhancements, modifications or additions thereto;
"Fees"	shall have the meaning as prescribed in Subsection 0;
"Force Majeure"	means any impediments beyond the control of the applicable party due, wholly or in part, directly or indirectly, to: strikes, lockouts, riots, epidemics, war, governmental regulations, fire, explosions, acts of God, or any other impediment beyond the control of the party affected;
"Governmental Authority"	means any government, legislature, municipality, regulatory authority, agency, commission, department, board or court or other law, regulation or rule-making public entity of similar authority, including, without limitation the OEB;
"Guidelines"	has the meaning prescribed in Subsection 0;
"Hourly Rate"	shall have the meaning prescribed in SCHEDULE A;
"HST"	means Harmonized Sales Tax;
"IESO"	means the Independent Electricity System Operator;
"Industry Standards"	means the then-current industry standards and best practices used or observed by leading Canadian and United States providers of services to companies similar to Toronto Hydro and which are the same or similar to the Services;
"Intellectual Property"	includes all trademarks, copyrights, patents, business names, trade secrets, proprietary software, analysis or techniques (whether or not patented or patentable), confidential or secret designs and processes, source codes, plans or devices, or other proprietary and intellectual property rights;
"MFIPPA"	means the *Municipal Freedom of Information Act;*
"OEB"	means the Ontario Energy Board;
"Personal Information"	means information from or about an individual (or any information that is combined with such information) including information that can be used to authenticate that individual, that is: (i) provided to Vendor by Toronto Hydro; or (ii) collected, accessed, used, stored or disclosed by Vendor on behalf of Toronto Hydro in connection with Consultant's obligations pursuant to the Agreement;

“PIPEDA”	means the *Personal Information Protection and Electronic Documents Act* (Canada);
“Pre-Existing IP”	has the meaning prescribed to it in Section 0;
"Privacy Laws"	has the meaning prescribed to it in Section 4.5;
"Representative"	in respect of a party, means such party’s directors, officers, employees, agents, contractors and advisors, the party’s Affiliates, and all such Affiliates’ respective directors, officers, employees, agents, contractors and advisors;
"Remittances"	has the meaning prescribed to it in Subsection 0;
“Security Incident”	means any set of facts or circumstances that would lead a reasonable person to conclude that there has been the loss of or improper, unauthorized or unlawful access to, use of, destruction of, or disclosure of Toronto Hydro Data, including, but not limited to, a Cybersecurity Incident;
"Services"	means all of the Developments, services and specifications to be provided, performed and met by the Consultant under this Agreement, as more particularly described in SCHEDULE A;
“Service Level”	means the standards for the performance of the Services and for Vendor’s management of Security Incidents, as more particularly set out in this Agreement;
“Specifications”	means for any Service, deliverable, vendor system or vendor facility, the technical, functional, physical or other relevant specification, documentation, or requirements set out in the Agreement, otherwise in identified in writing by the parties, or otherwise inherent or necessarily included as part of the specification or requirements specifically set out herein or therein, including any operating manuals or operating plans referenced in a SOW;
“System”	means any computer system, including any network, used in connection with the provision of the Services;
"Term"	has the meaning prescribed to it in Section **Error! Reference source not found.**;
"Toronto Hydro"	means Toronto Hydro-Electric System Limited; and
“Toronto Hydro Data”	means (i) Personal Information and (ii) any other related data that Consultant collects, uses, or stores pursuant to the Agreement that contains the confidential or proprietary information of Toronto Hydro.

SCHEDULE C

Ontario Energy Board *Rules of Practice and Procedure* Rule 13A

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

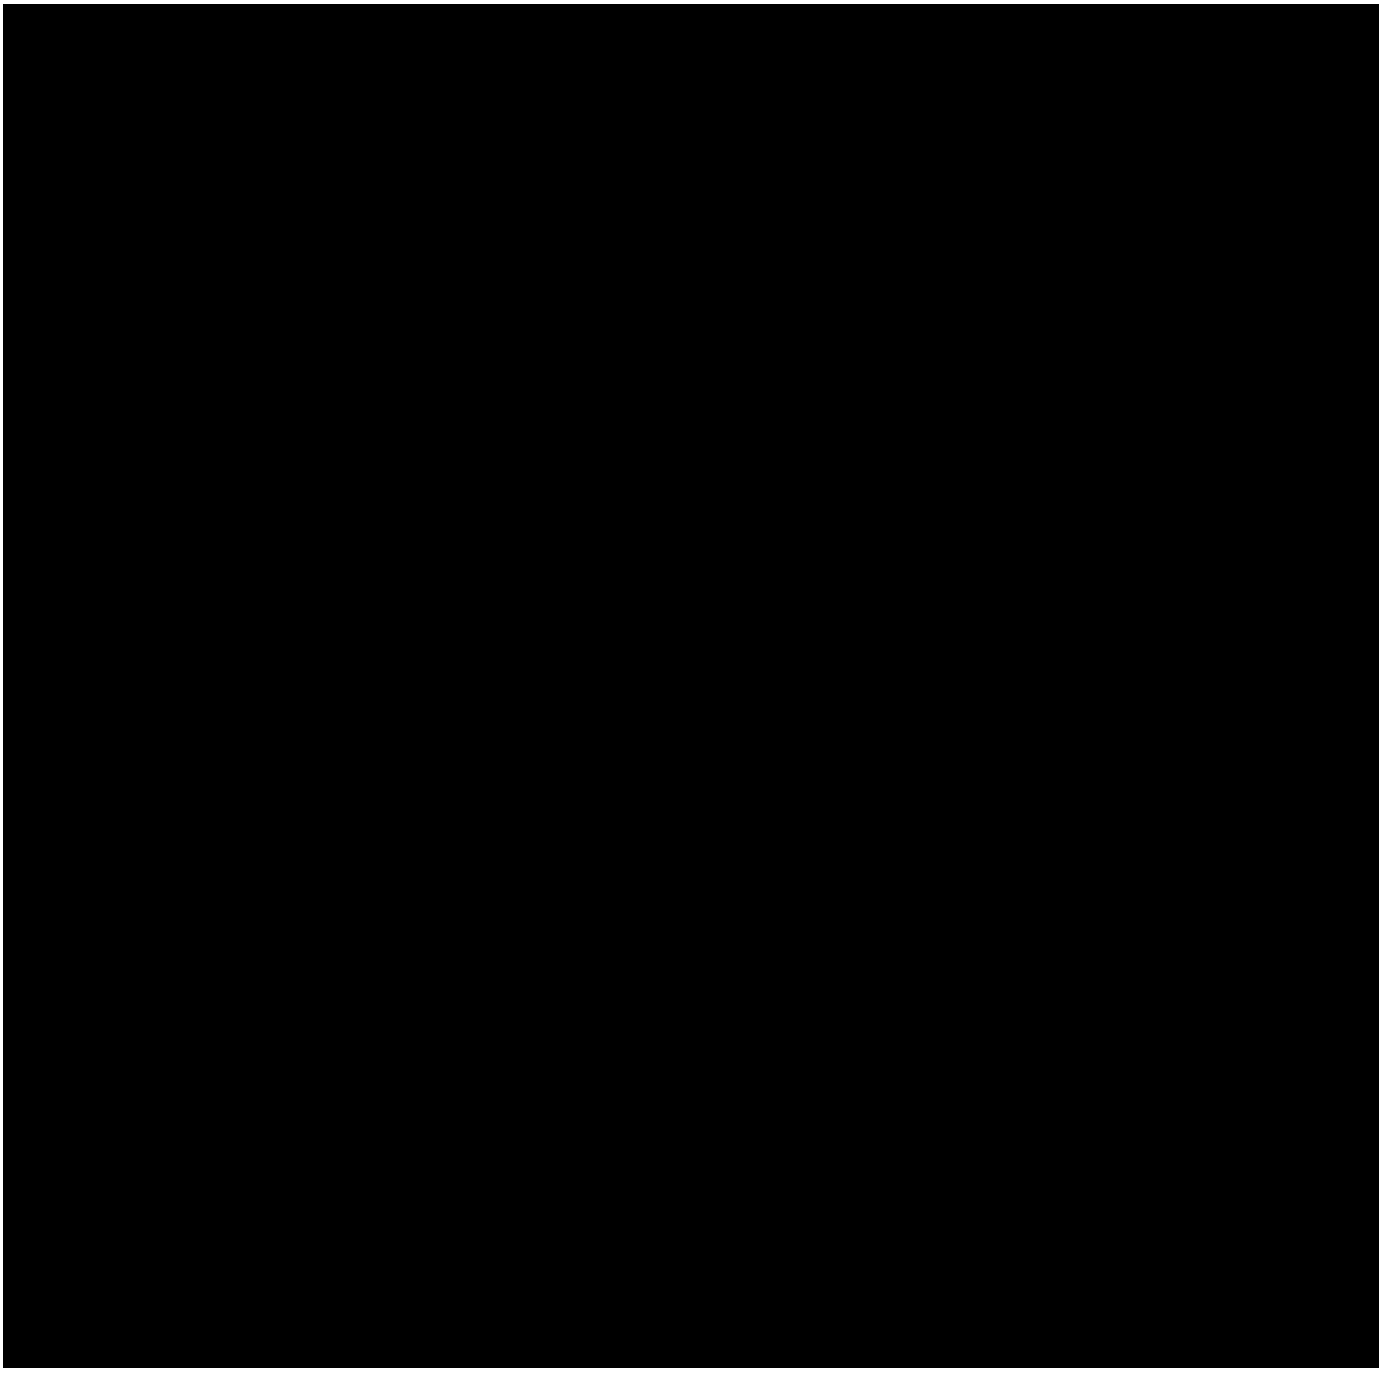
a. the expert's name, business name and address, and general area of expertise;
b. the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;
c. the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;
d. the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;
e. in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and
f. an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

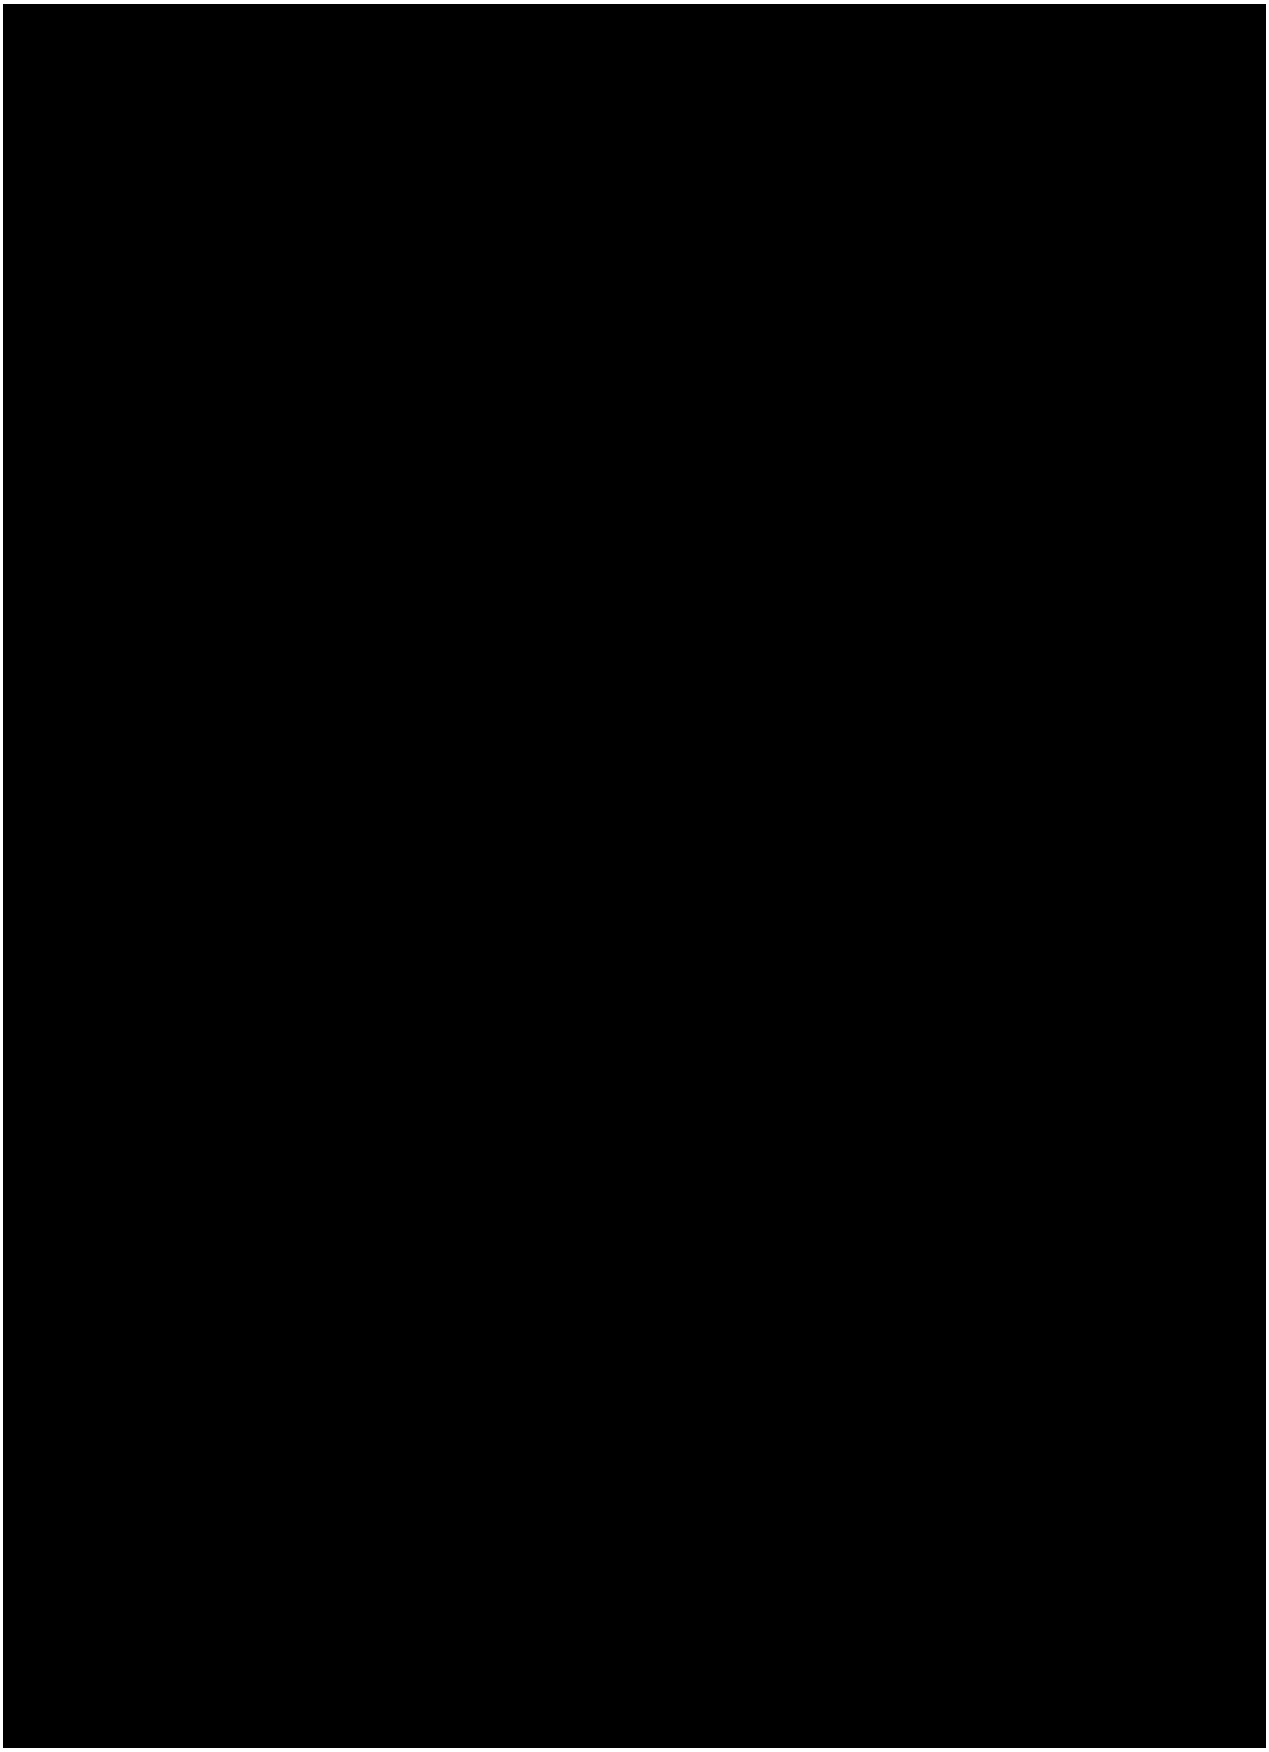
a. in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and
b. at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

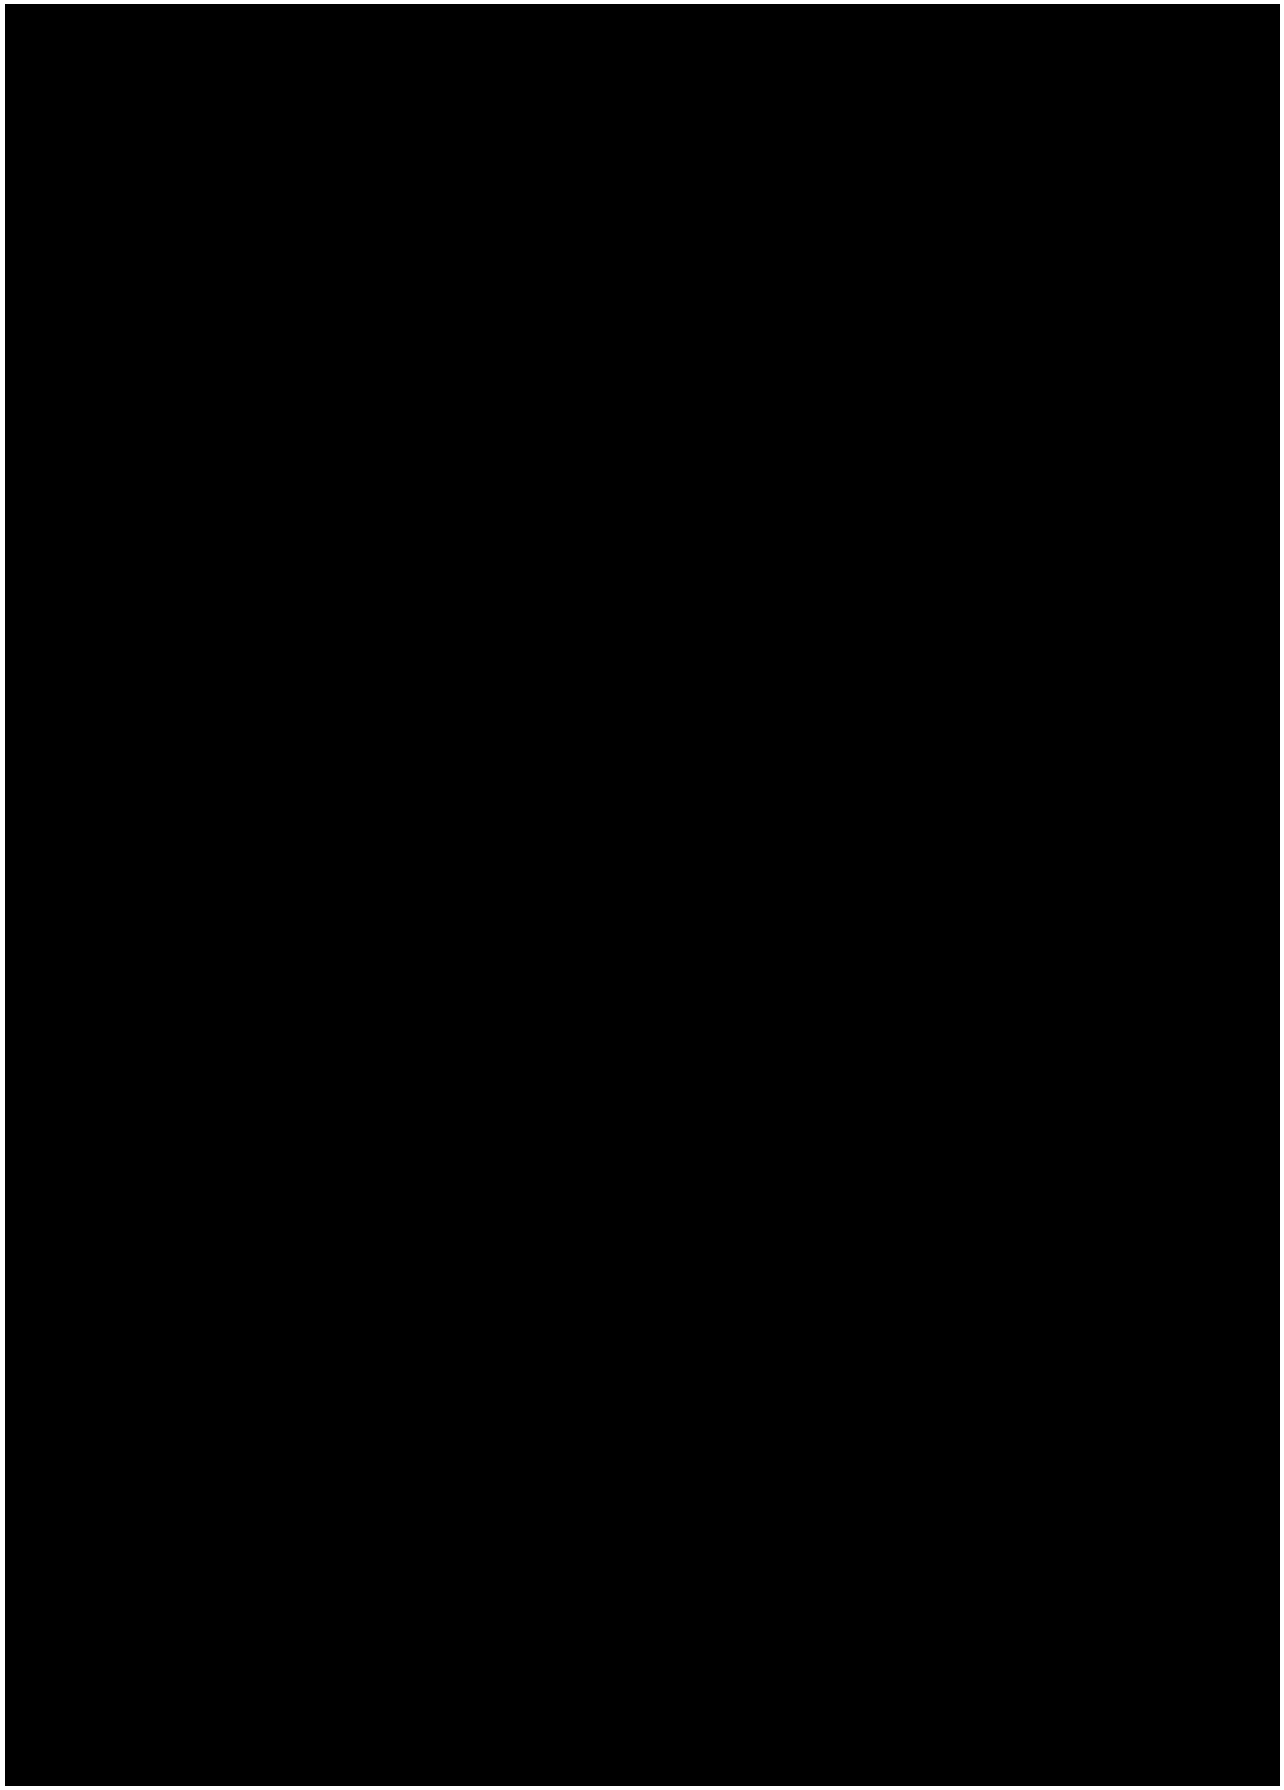
a. scope and timing;
b. the involvement of any expert engaged by the OEB;
c. the costs associated with the conduct of the activities;
d. the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of Rule **13A.04**; and
e. any issues in relation to confidentiality.



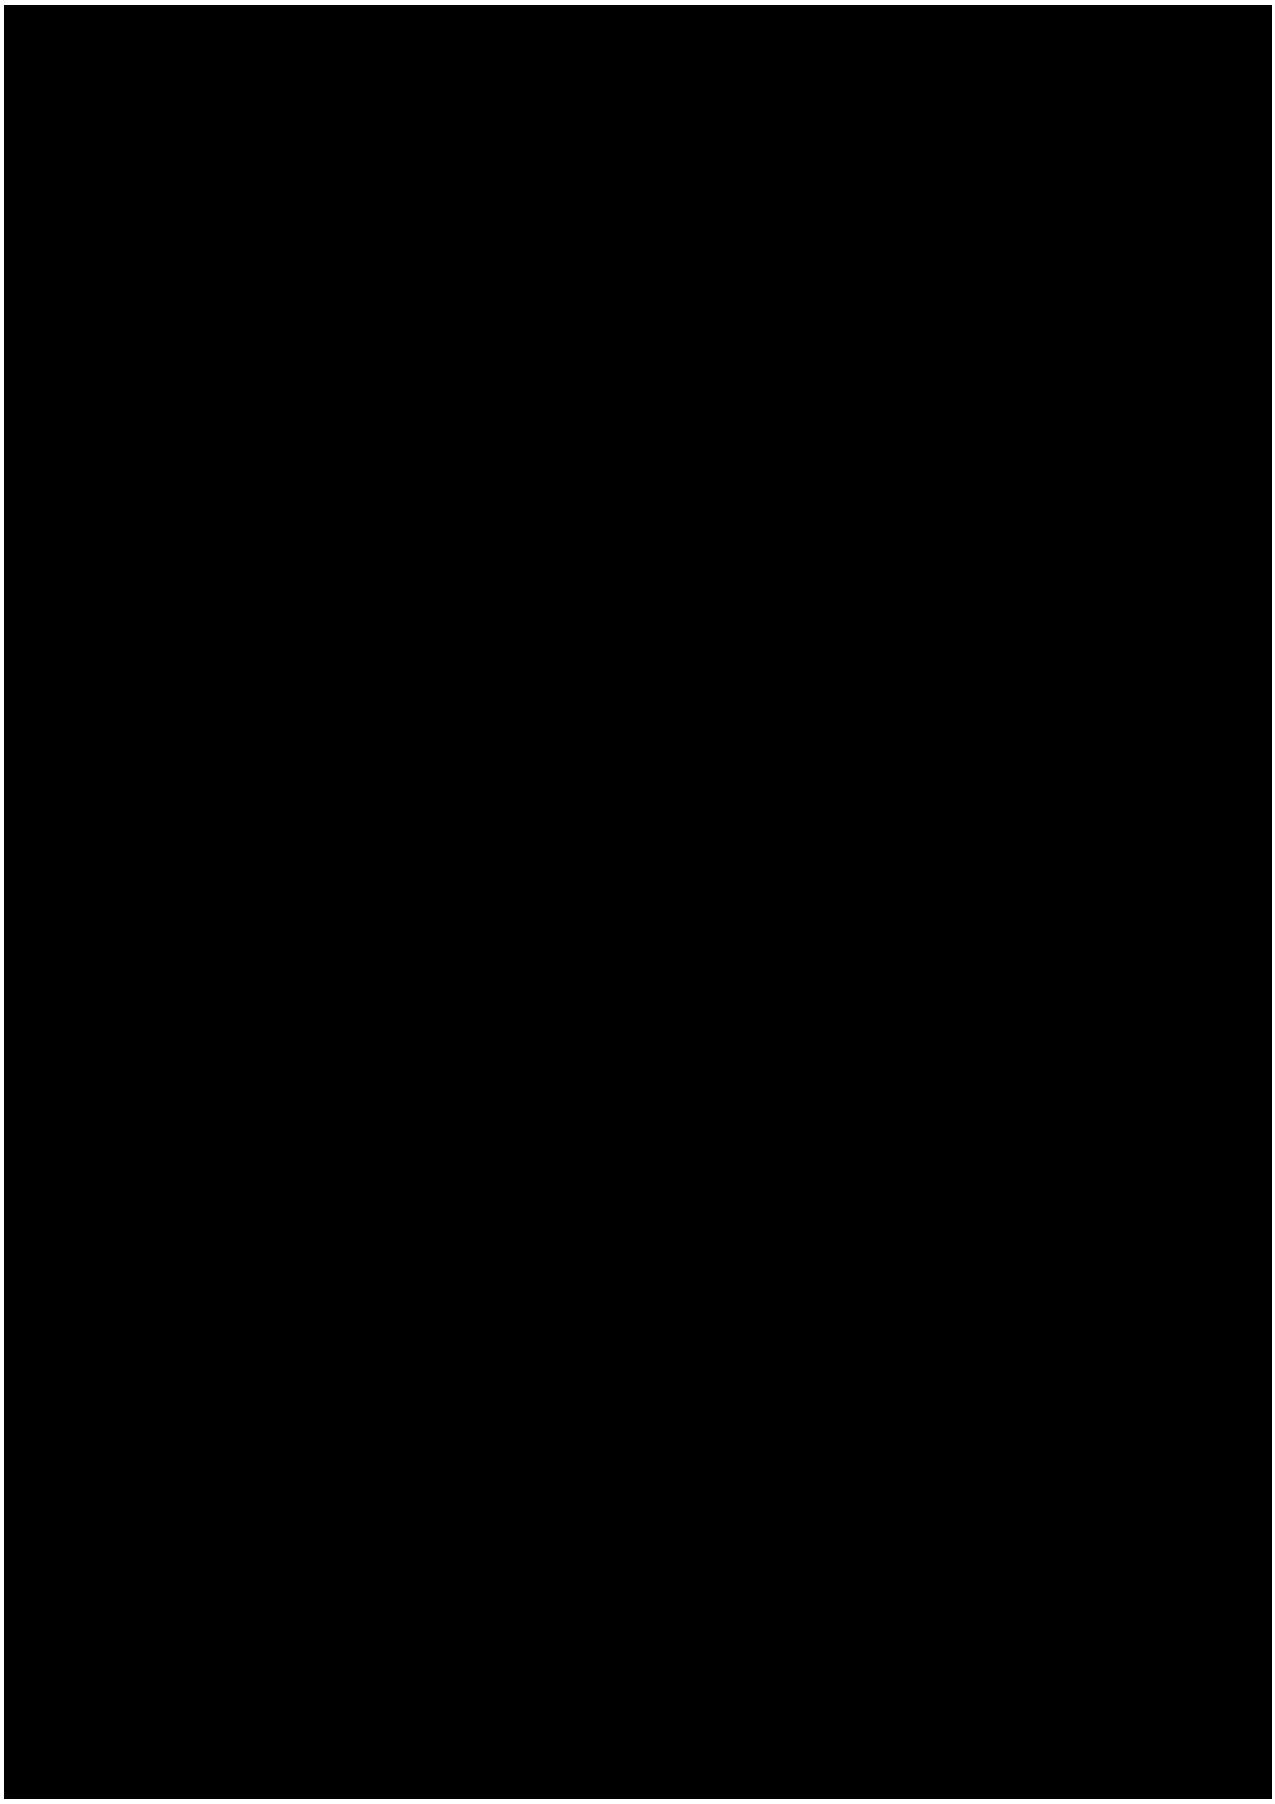
13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A**.



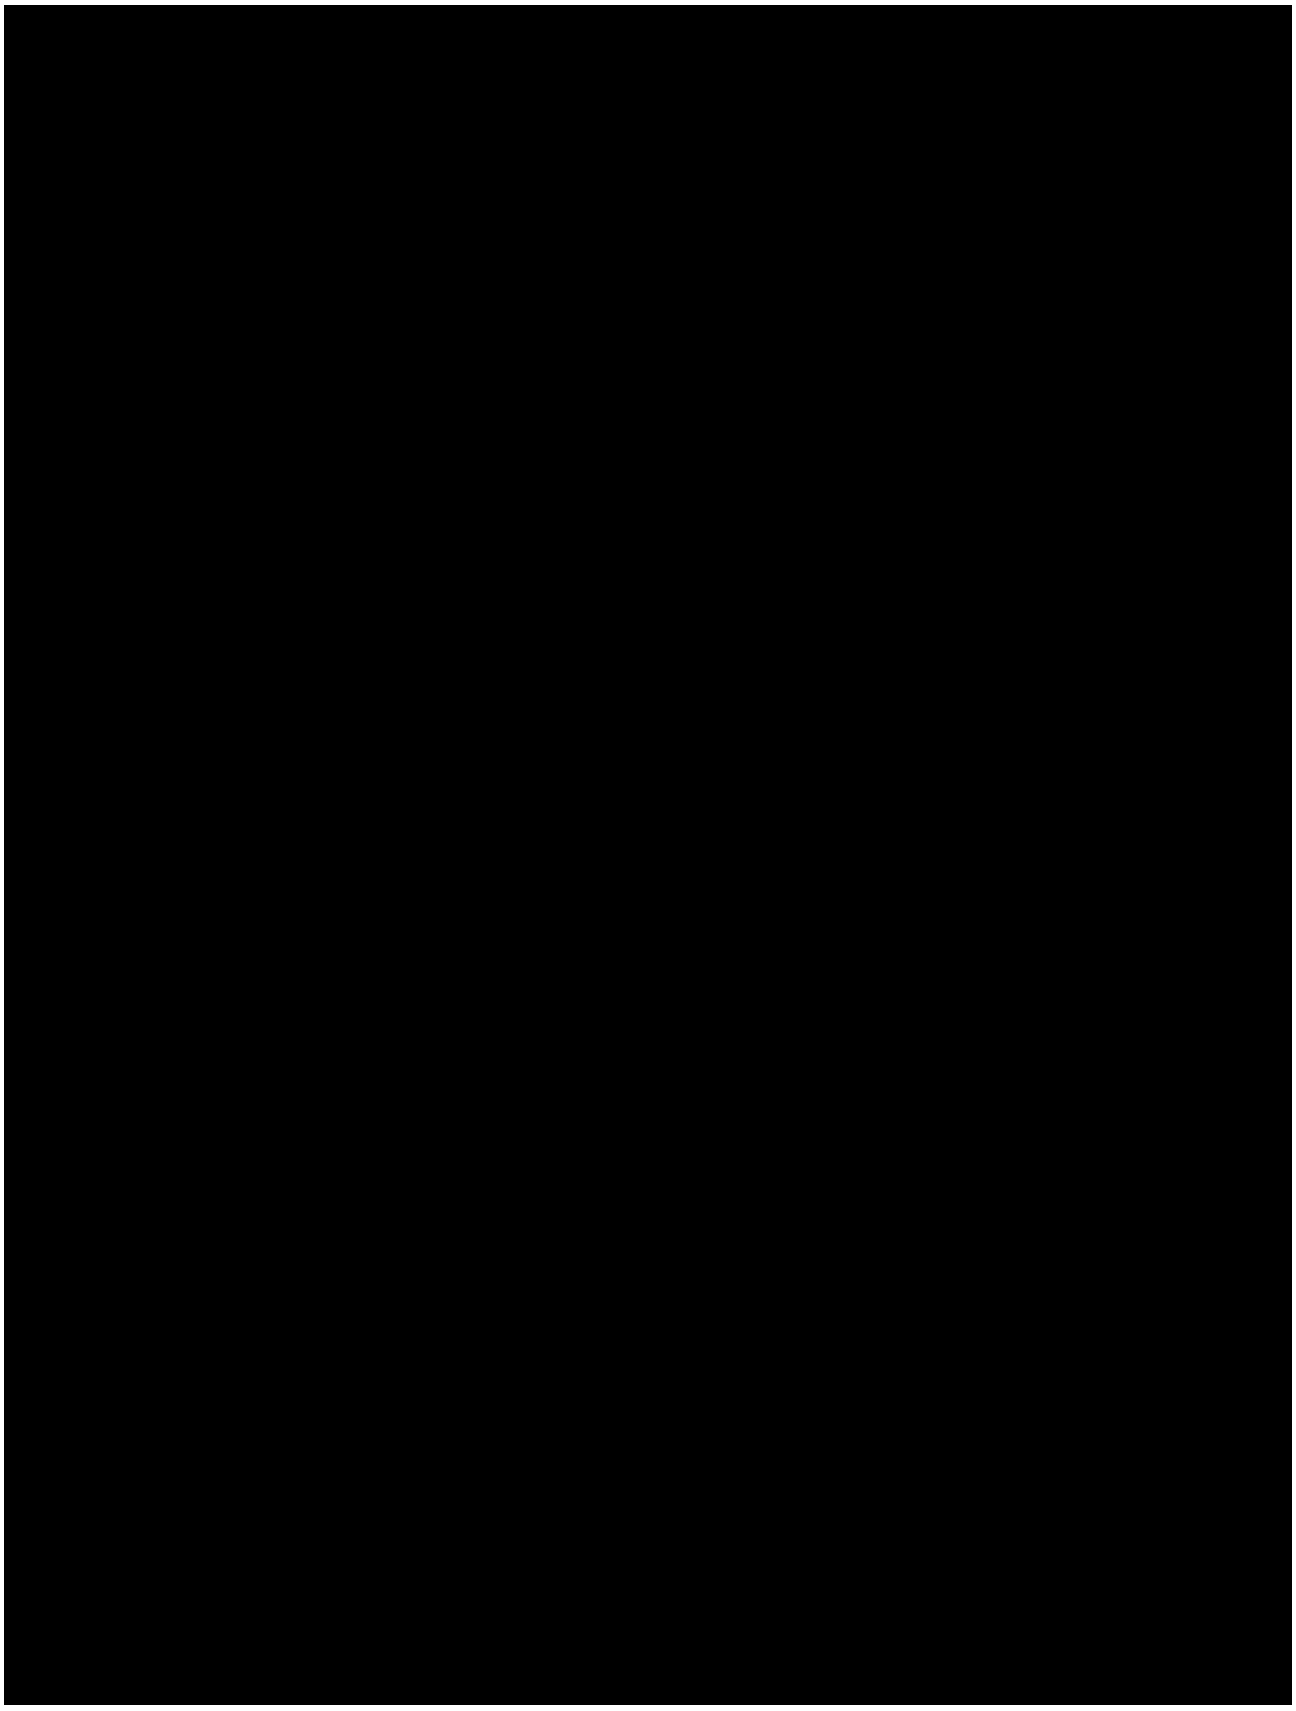
SCHEDULE D



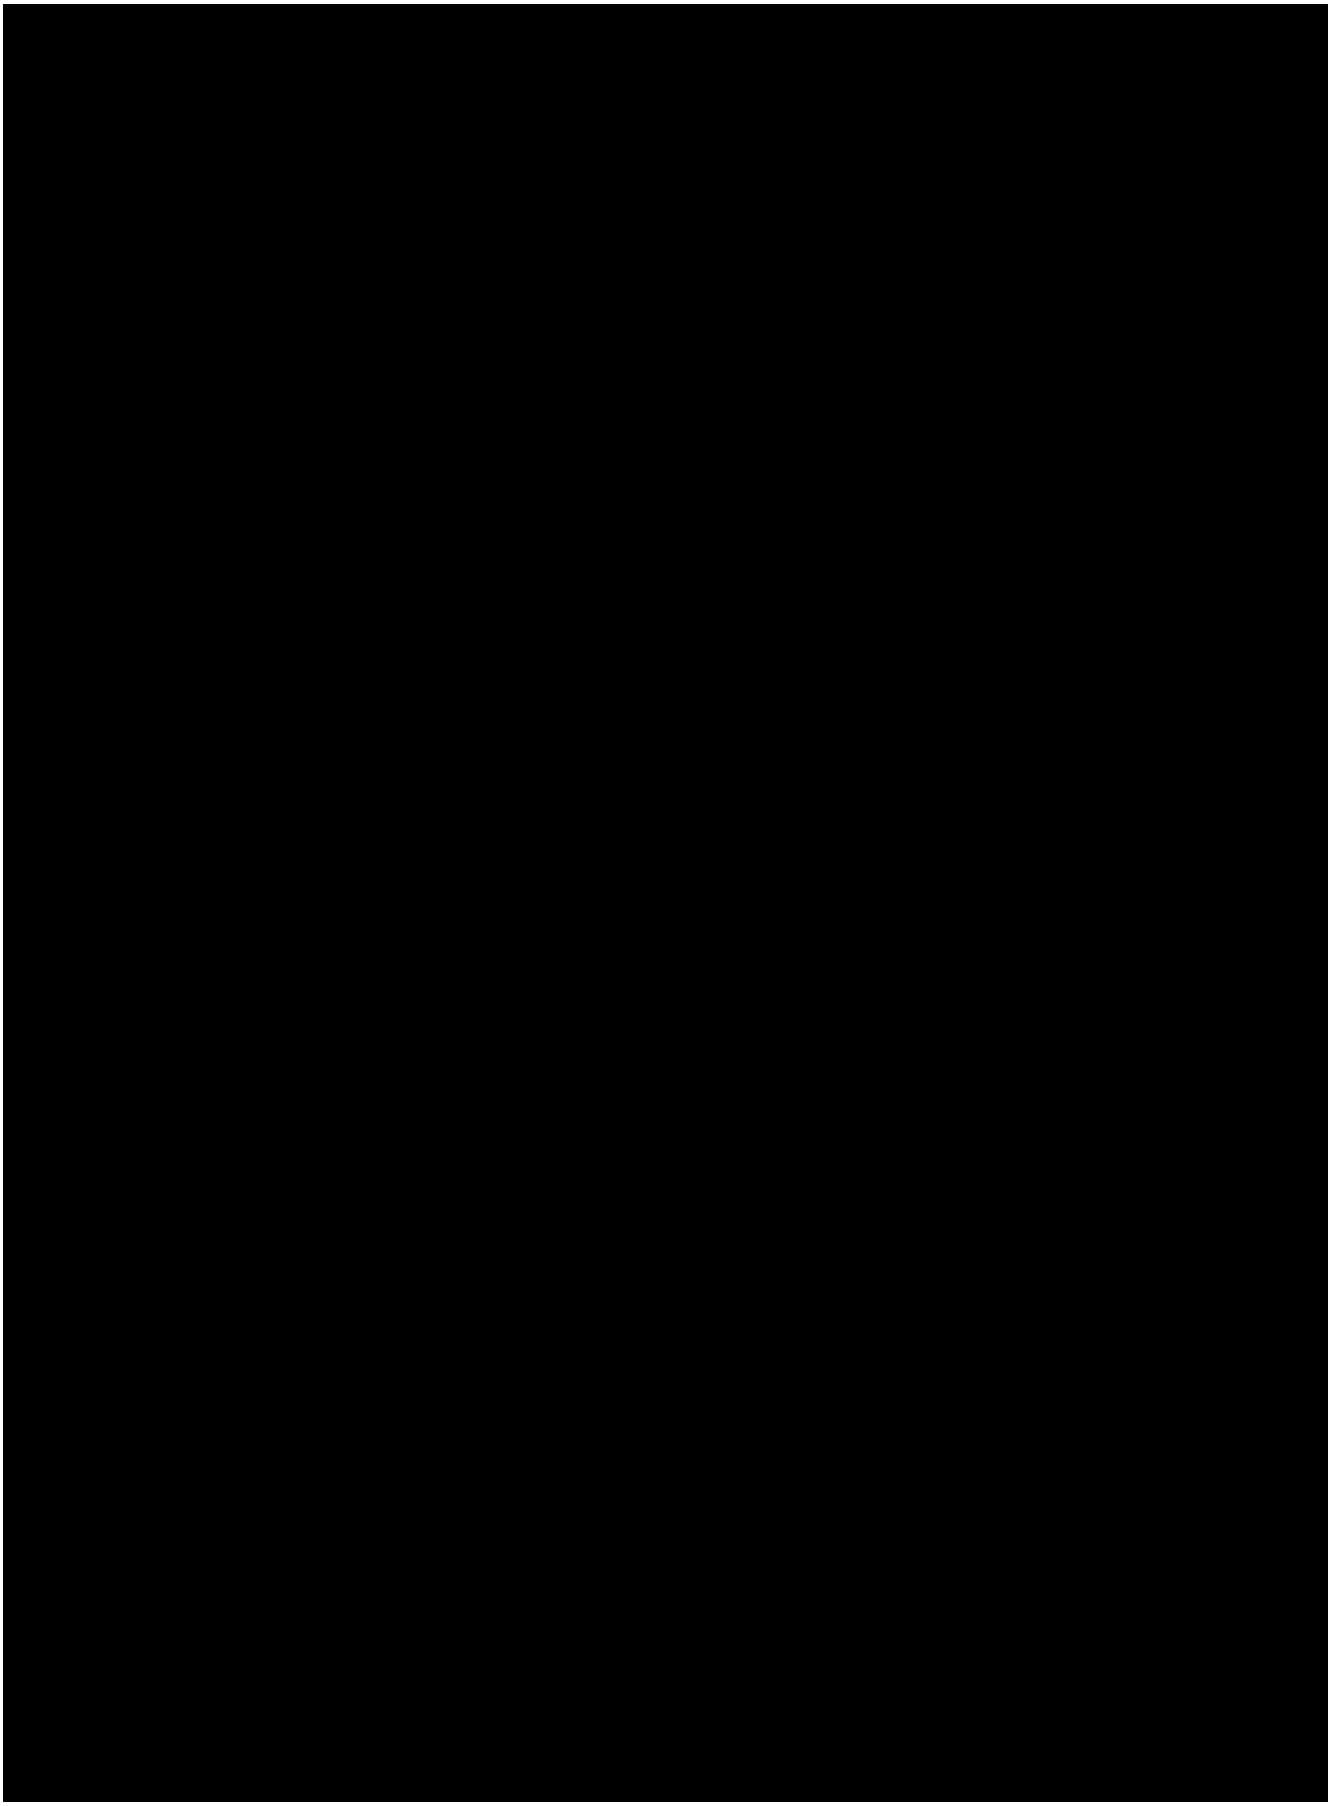
Cybersecurity Controls

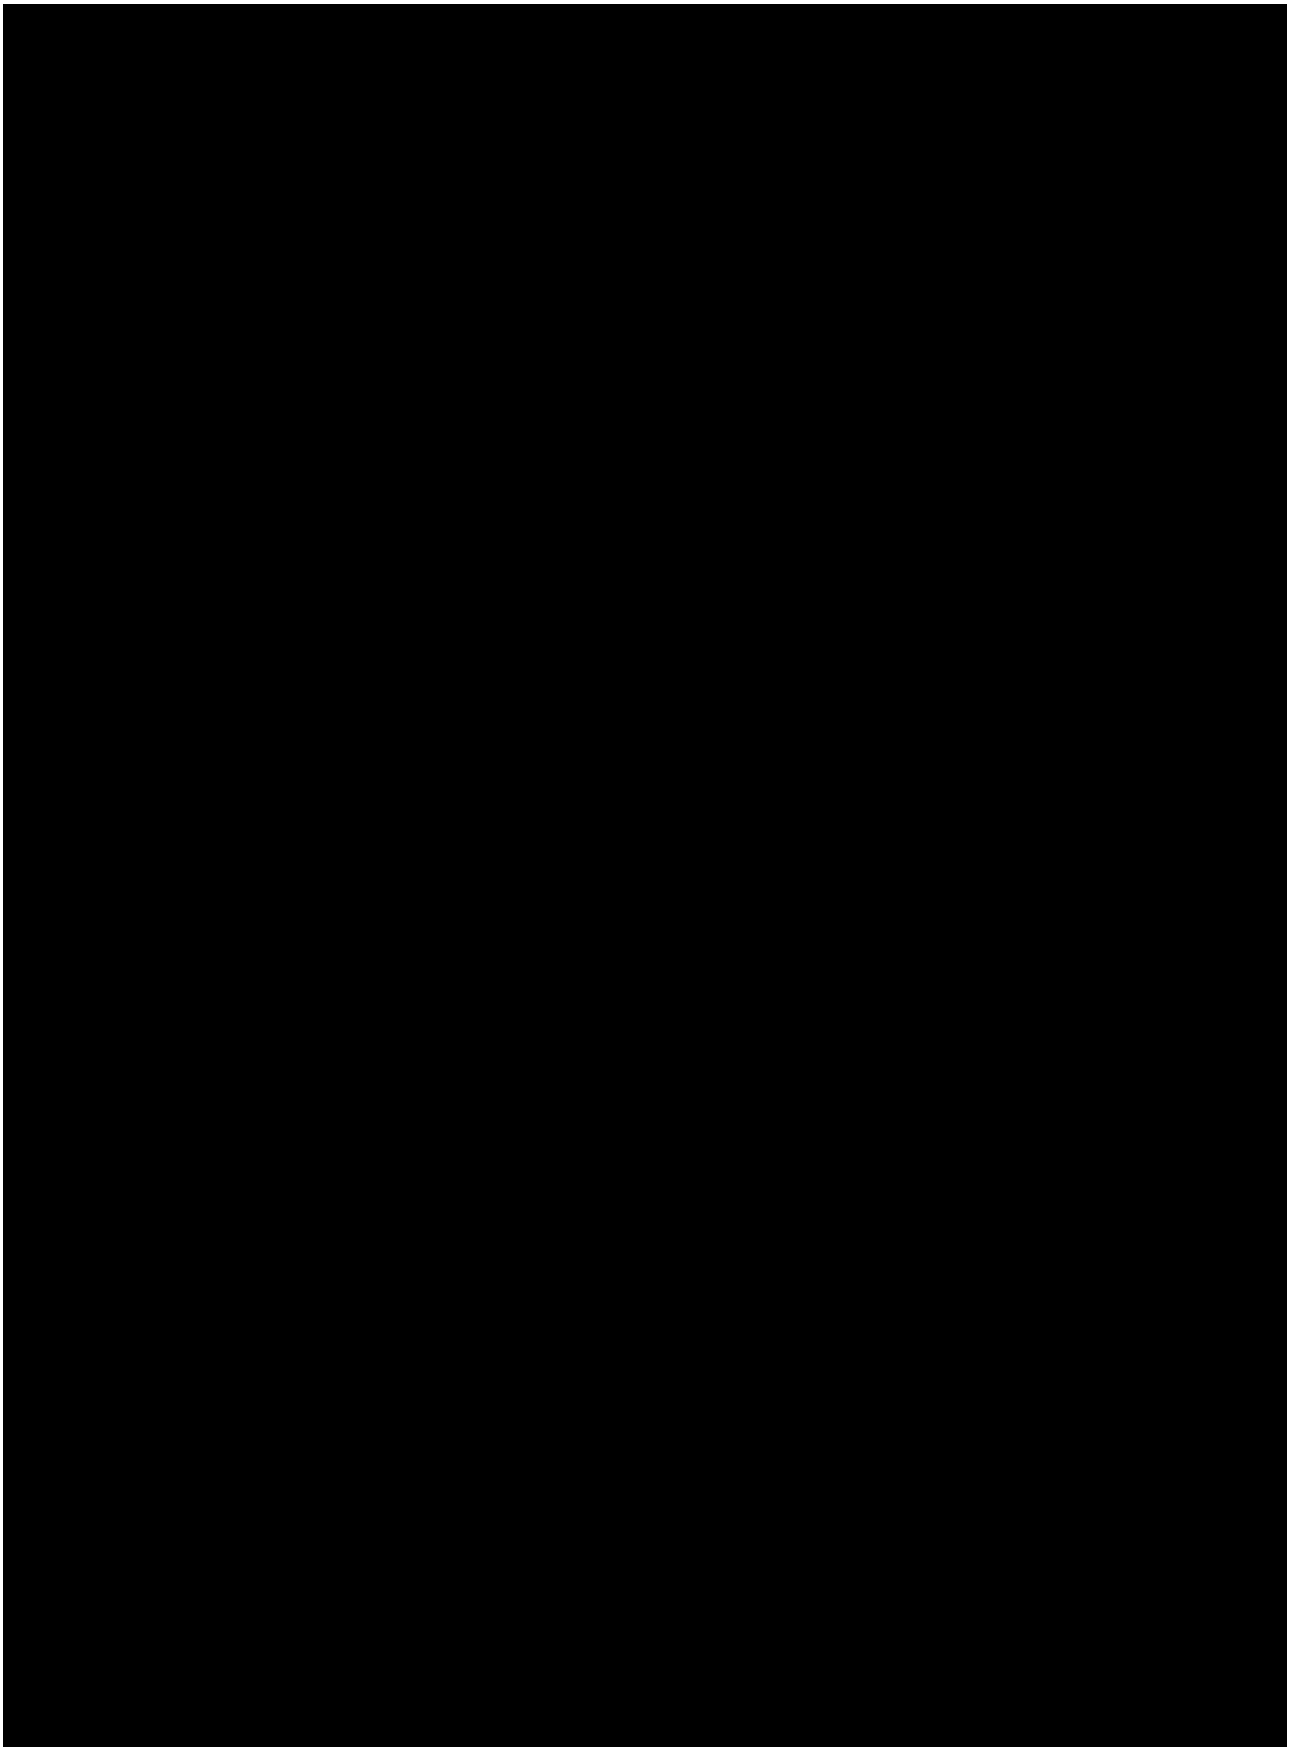


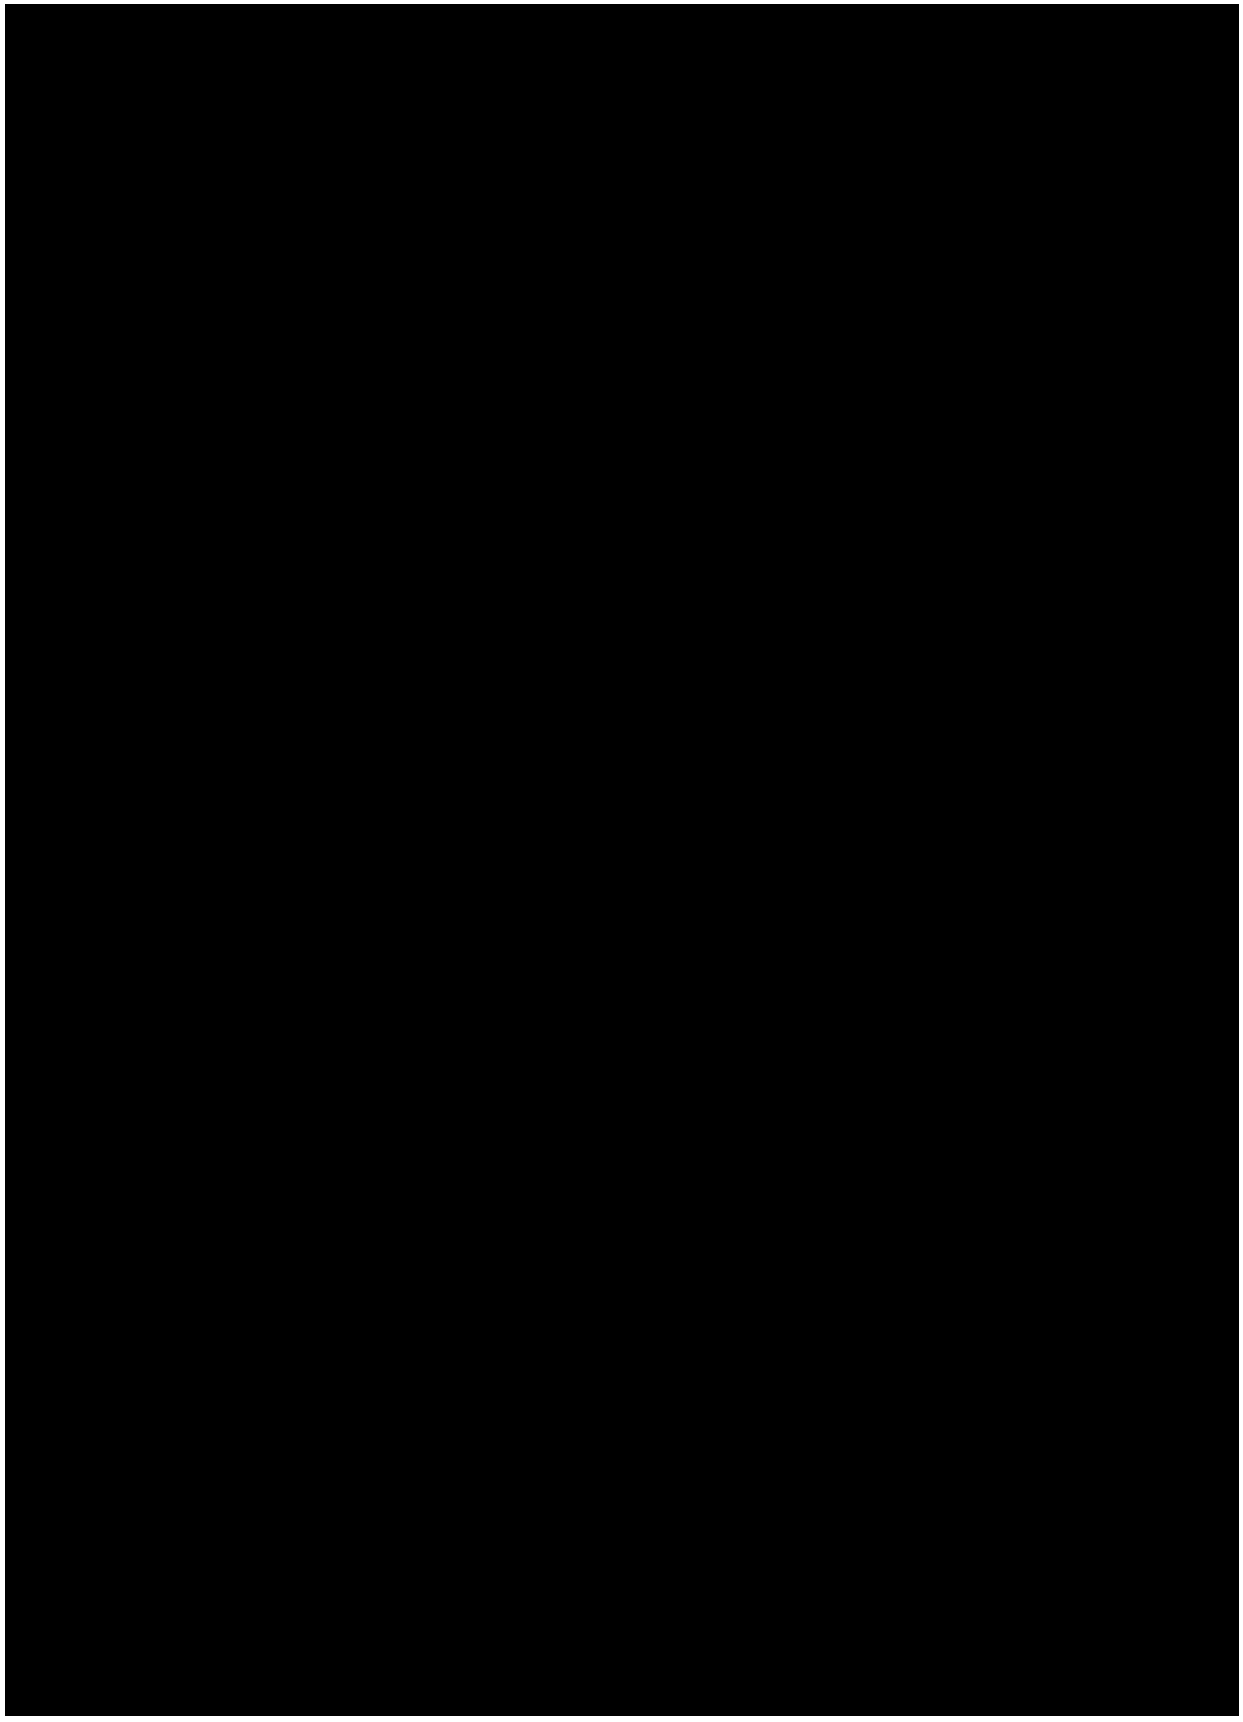
This Schedule D ("**Schedule**") is attached to, and made part of, the Agreement for Professional Consulting Services dated as of October 31, 2022 (the "**Agreement**") by and between Toronto Hydro-Electric System ("**Toronto Hydro**") and Guidehouse Canada Ltd. ("**Vendor**"). All capitalized terms used in this Schedule and not defined in this Schedule have the same meaning as set forth in the Agreement.

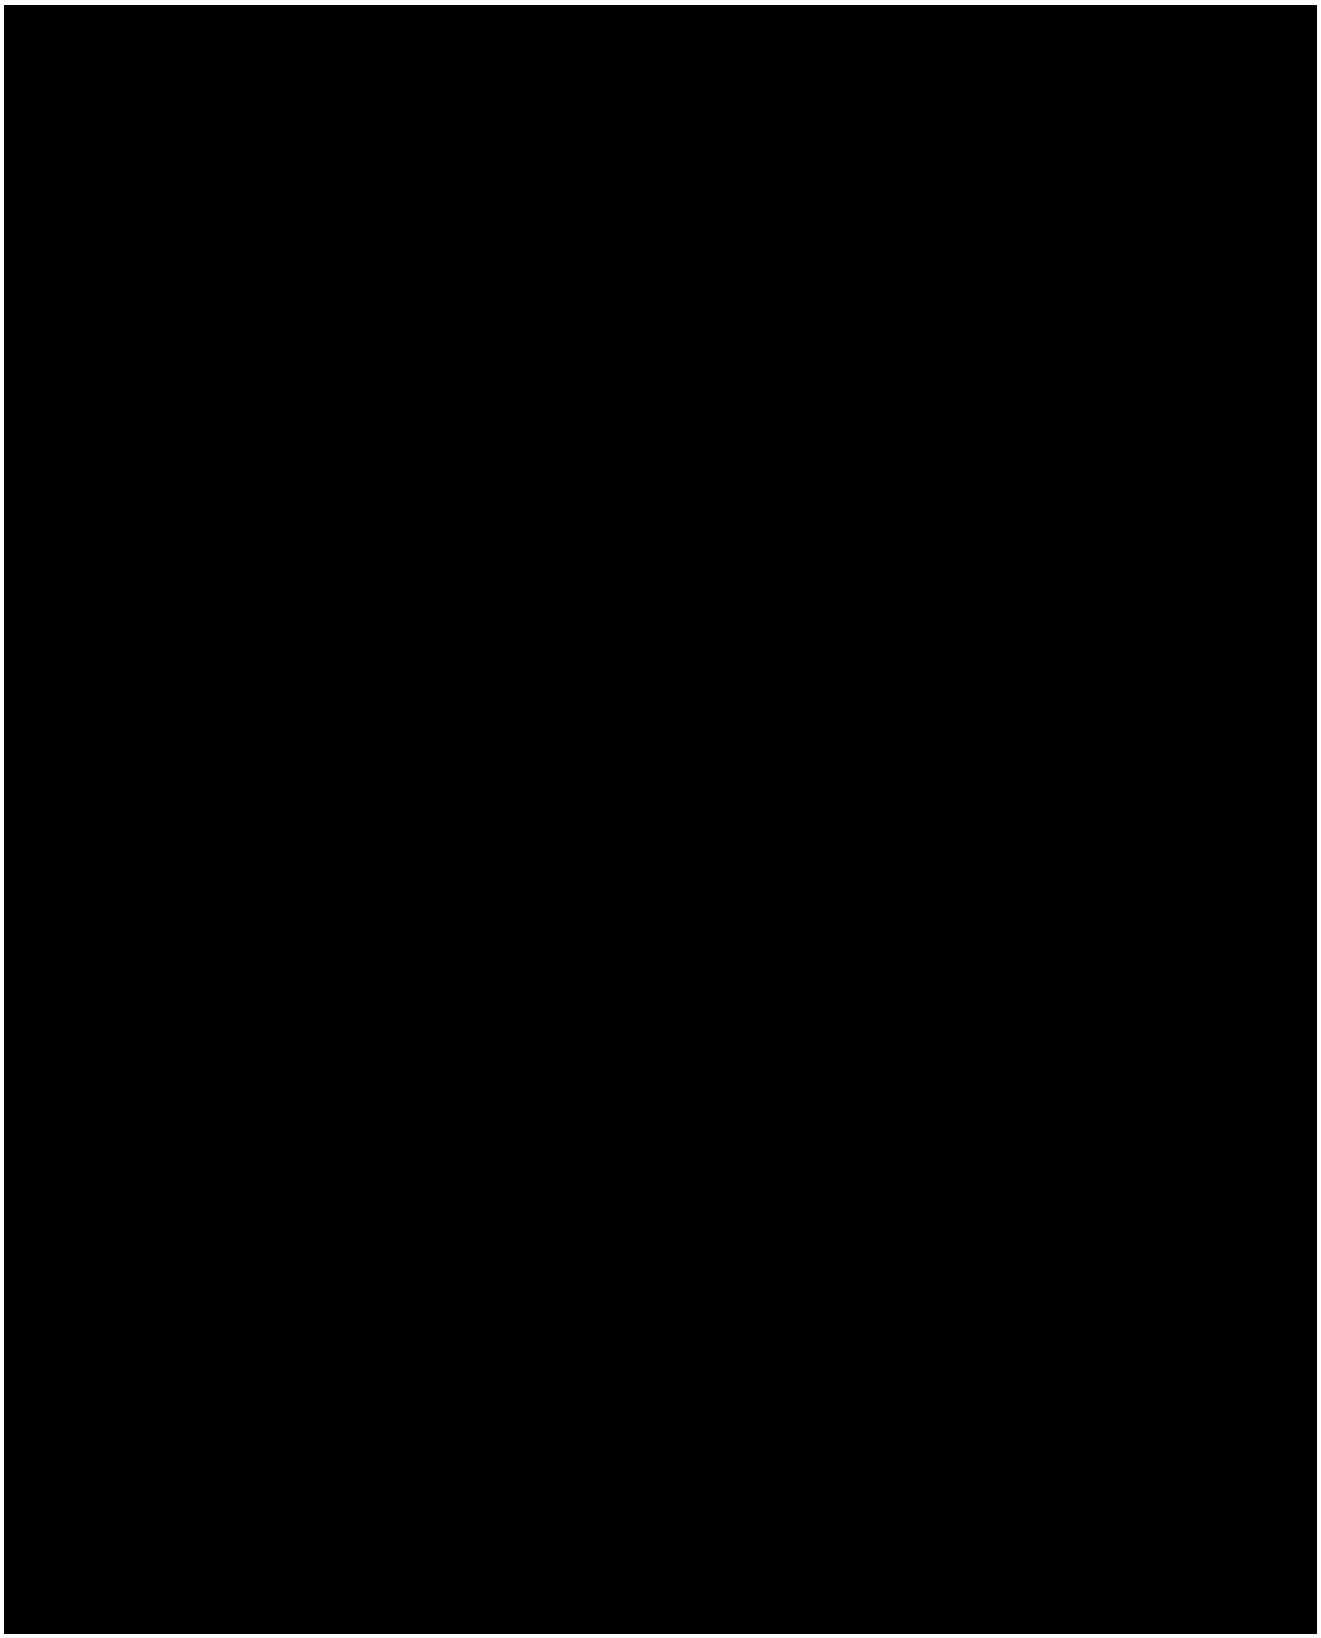


Vendor will provide Cybersecurity Controls in accordance with the requirements set forth in this Schedule.





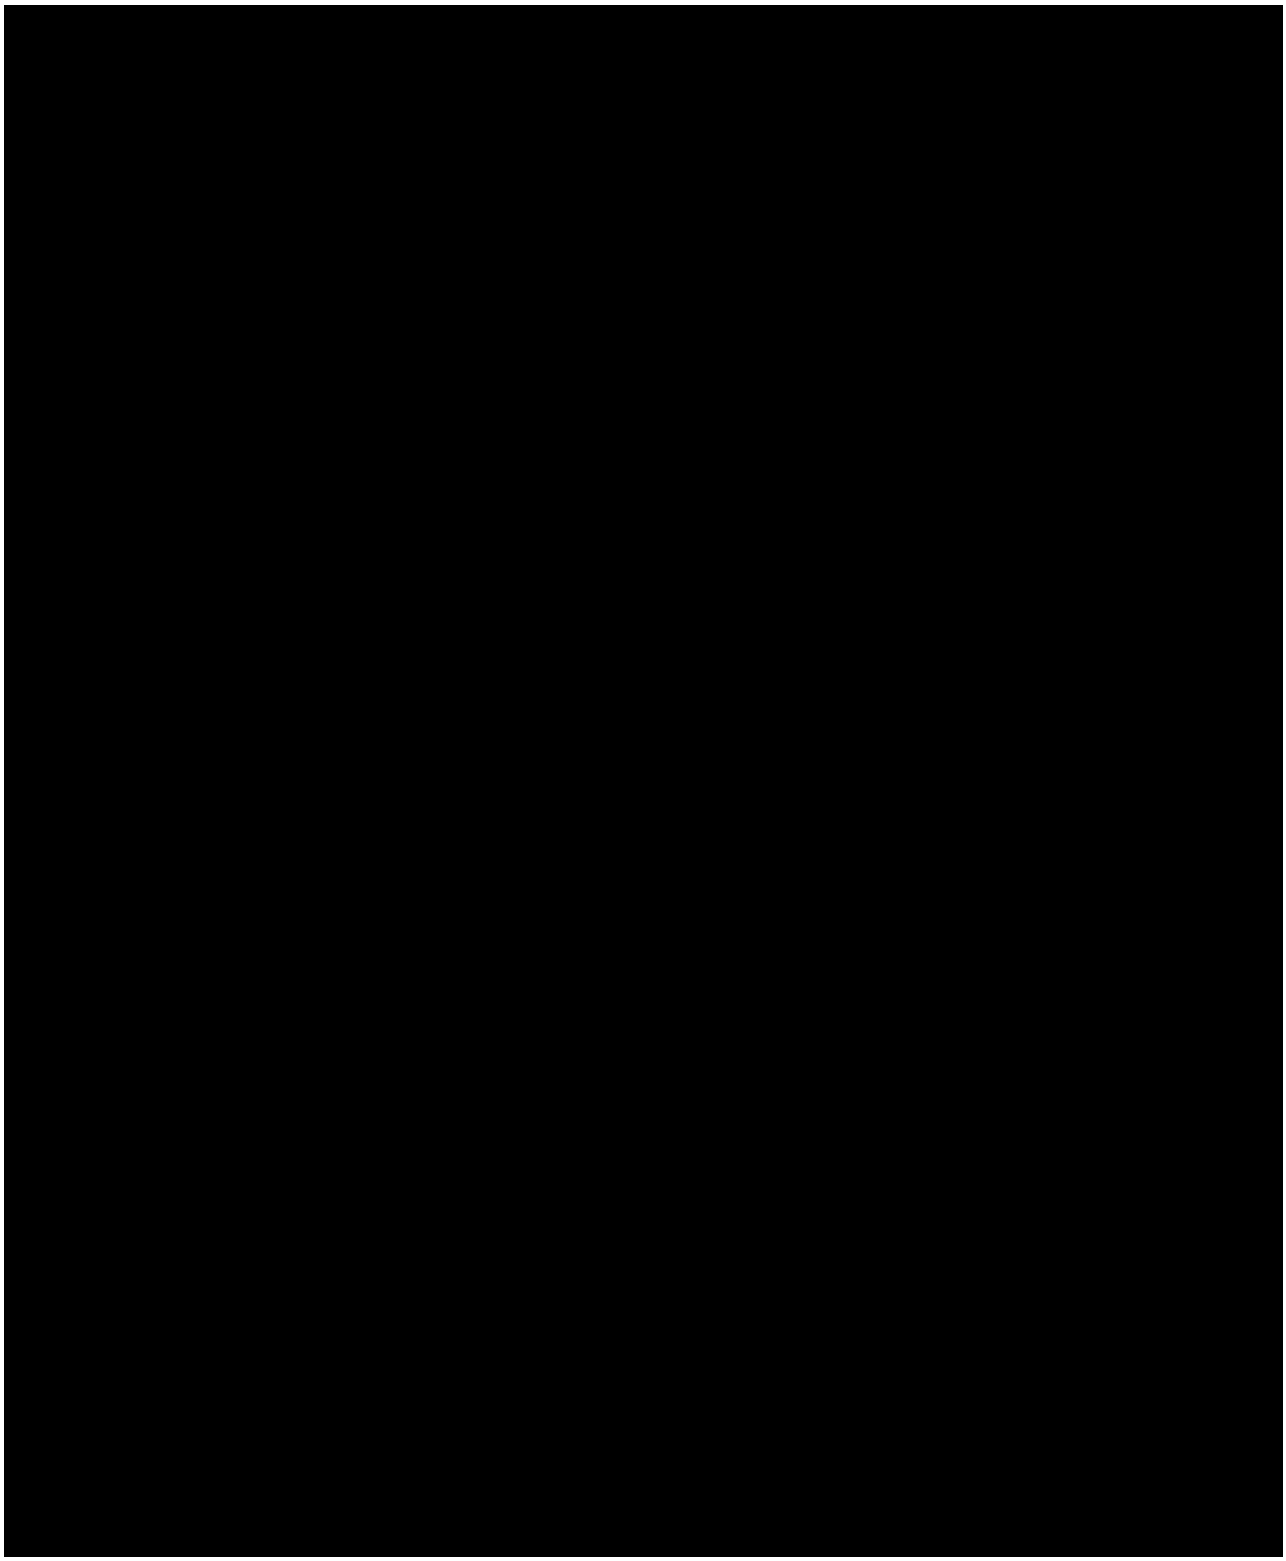


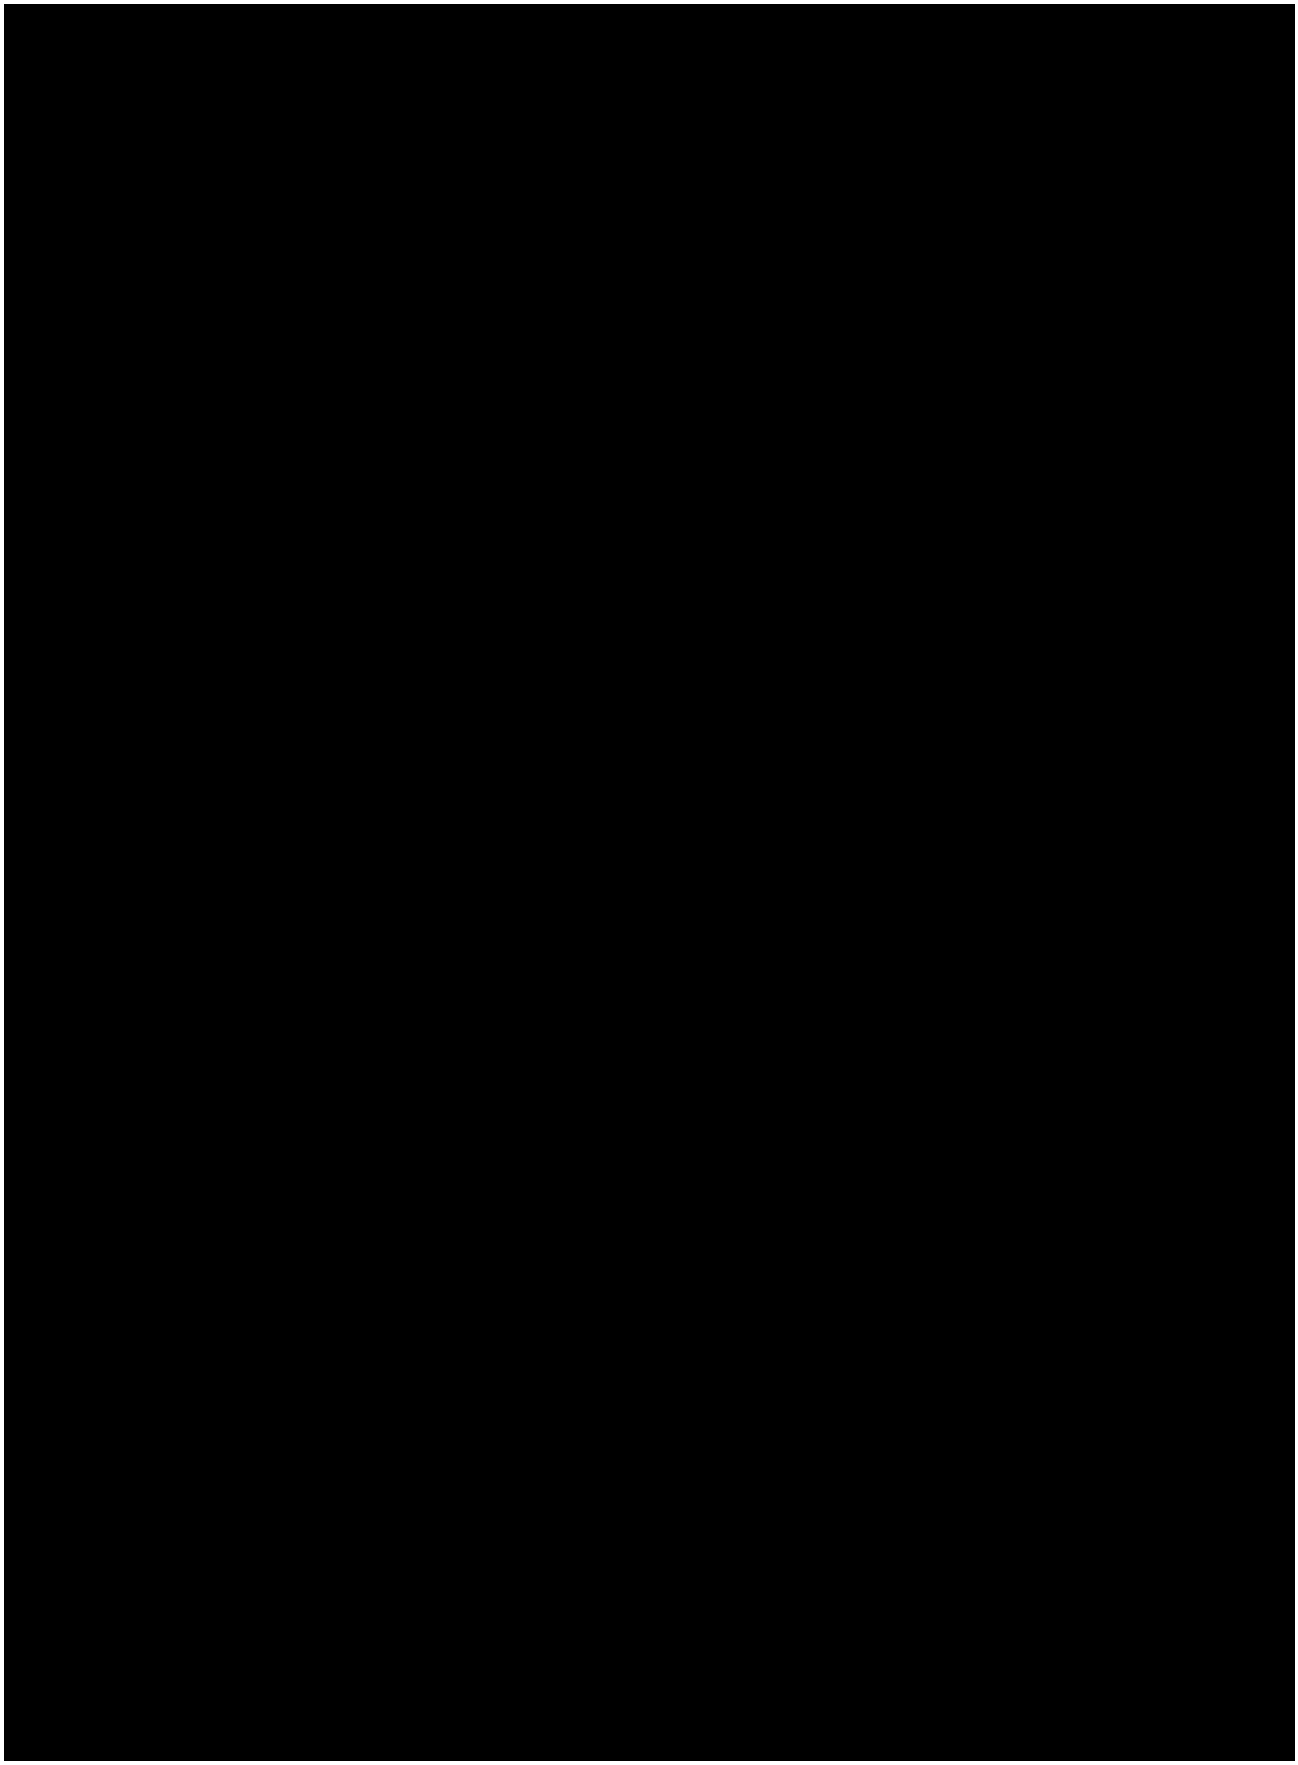


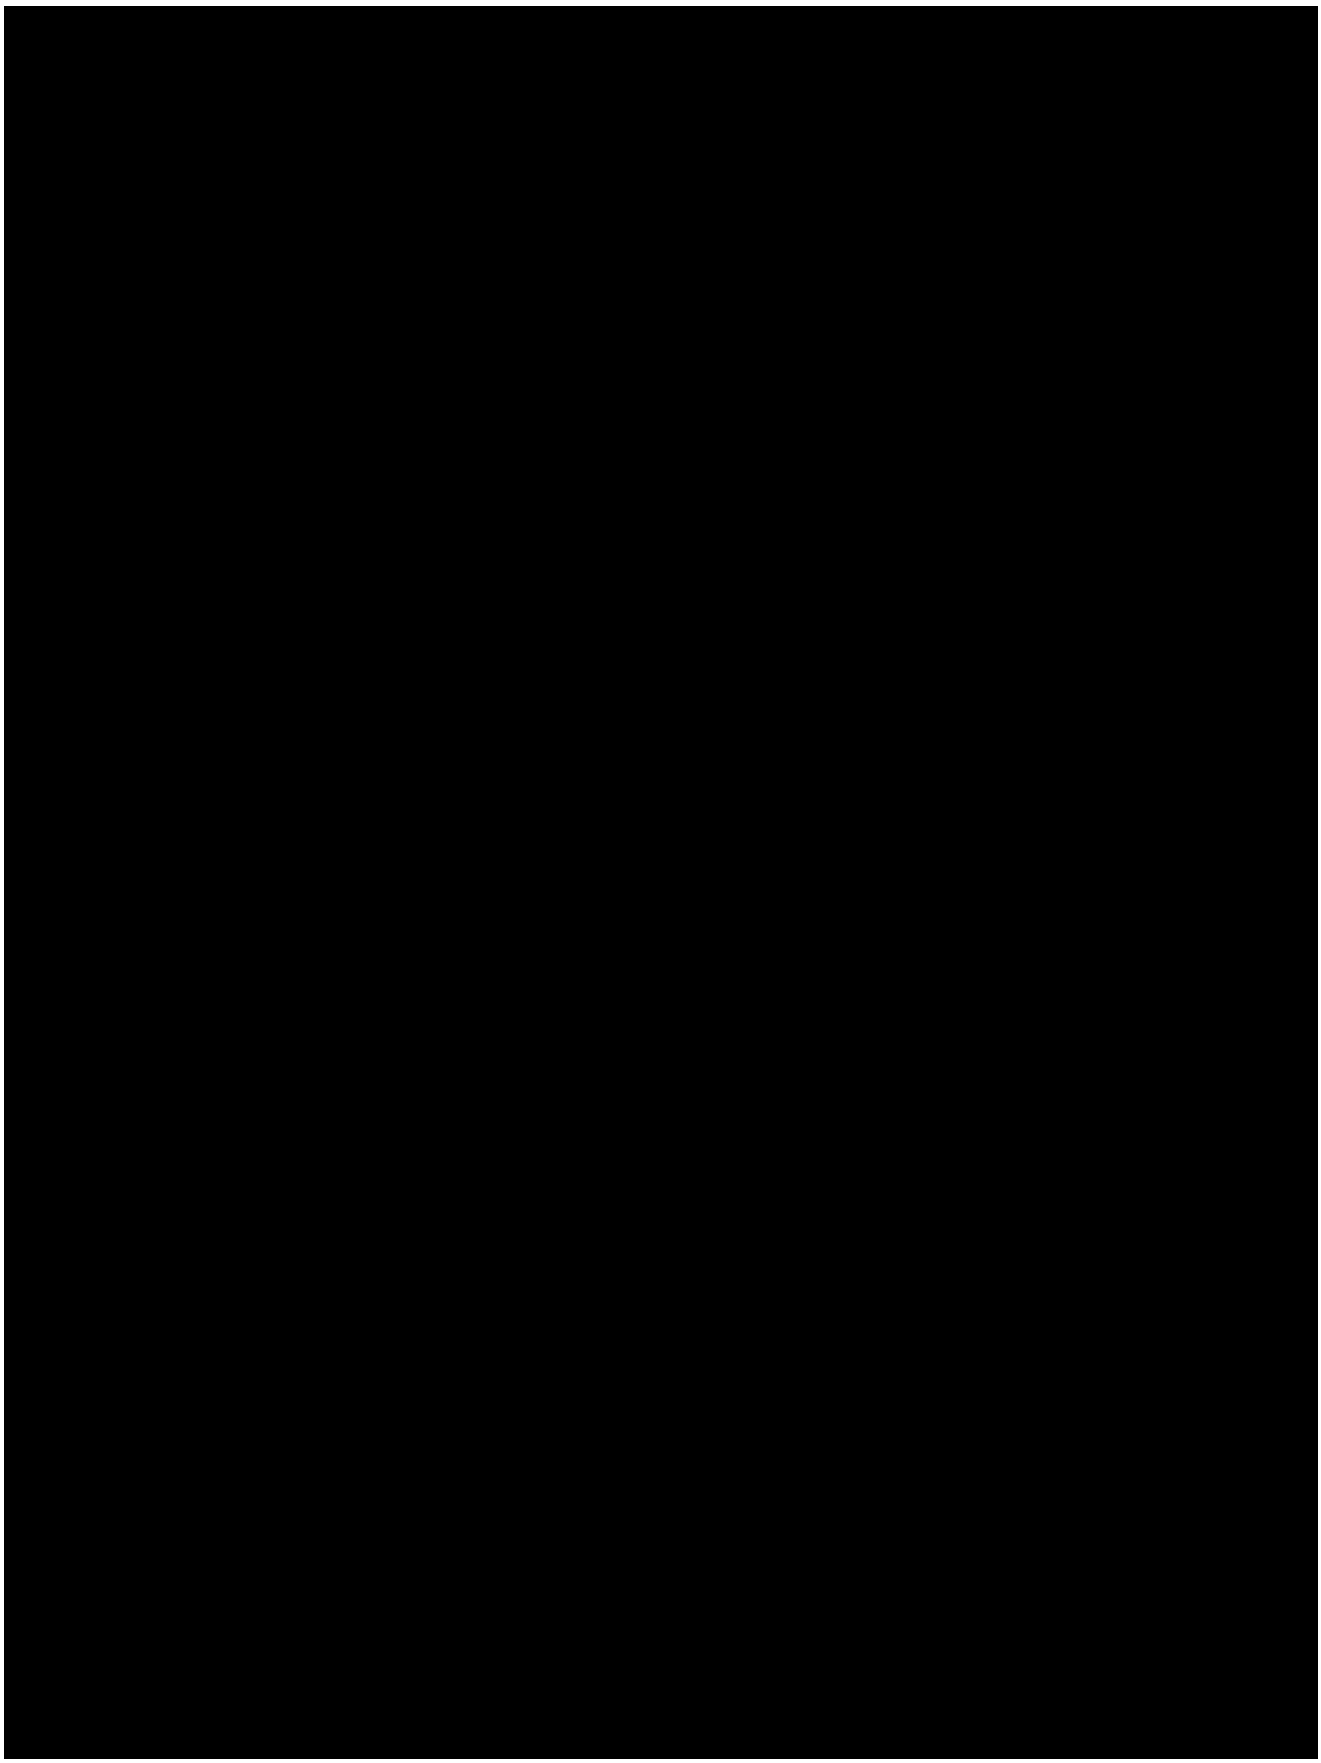
Appendix A to Schedule D Cybersecurity Controls

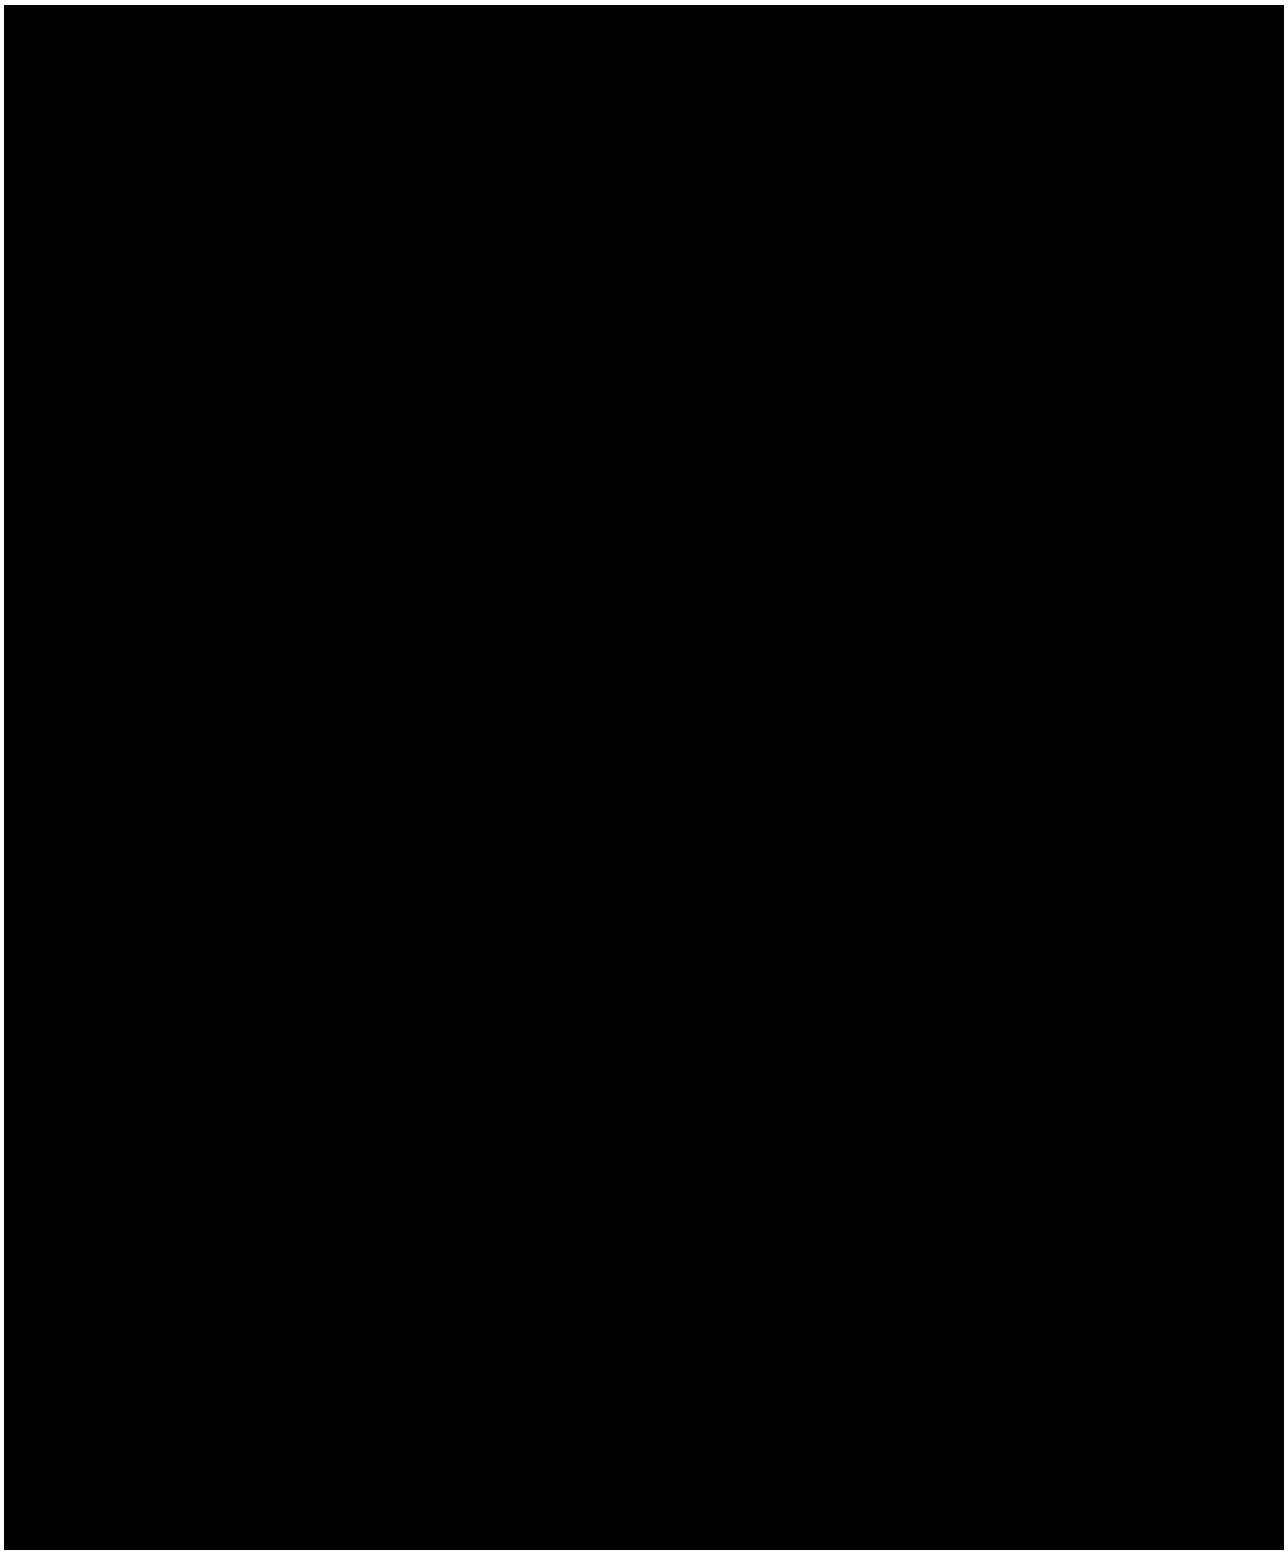
Vulnerability and Remediation Response

The vulnerability of the risk rating is determined by the CVSS score set forth below.









Appendix B to Schedule D Cybersecurity Controls

Cybersecurity Incident Response

Agreement for Professional Consulting Services

THIS AGREEMENT is made as of the 27th day of April, 2022 between **Toronto Hydro-Electric System Limited** ("Toronto Hydro"), a corporation incorporated under the laws of the province of Ontario and **Concentric Advisors ULC**, a corporation incorporated under the laws of the province of Alberta (the "Consultant"), pursuant to which Toronto Hydro shall retain the Consultant to provide certain Services, and the Consultant shall provide such Services, during the Term, subject to the terms and conditions hereof;

NOW THEREFORE, in consideration of the mutual covenants set forth herein and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

1. INTERPRETATION

Unless otherwise indicated, all capitalized terms in this Agreement shall be as defined in SCHEDULE B and any reference to currency in this Agreement shall refer to lawful money of Canada.

2. RELATIONSHIP OF THE PARTIES

2.1 Retainer

Toronto Hydro hereby retains the Consultant to provide the Services, and the Consultant hereby agrees to provide the Services, during the Term, in accordance with the terms and conditions of this Agreement.

2.2 Independent Contractors

(a) Notwithstanding any provision hereof, this Agreement does not constitute and shall not be construed as constituting a partnership, joint venture, principal/agency relationship, or employer/employee relationship between the parties. The Consultant and Toronto Hydro shall at all times remain independent contractors of each other, and neither party shall represent itself to be an agent or employee of the other.

(b) Without limiting the generality of paragraph 2.2(a), the Consultant hereby acknowledges and agrees that neither it nor its Representatives shall be eligible or entitled, by reason of this Agreement, to participate in any employee-related program offered by Toronto Hydro or any of its Affiliates, including, without limitation, any benefit, insurance, compensation, health plan, bonus or retirement program.

(c) The Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities or claims whatsoever against Toronto Hydro or its Representatives resulting from or relating to the Consultant or its Representatives being deemed to be an employee of Toronto Hydro or any of its Affiliates.

(d) The Consultant hereby acknowledges and agrees that Toronto Hydro shall not be responsible for and shall not have control or charge of any means, methods, techniques,

sequences or procedures used for or in respect of the Services, or for the safety precautions or programs required for the Services or otherwise prescribed hereunder.

2.3 Conflicts of Interest

The Parties acknowledge that there is potential for a conflict of interest based on services provided by the Consultant from time to time to Toronto Hydro. The Consultant agrees to take all such steps as Toronto Hydro deems necessary, acting reasonably, to remove, mitigate or minimize such conflict of interest.

3. TERM

3.1 Term

Unless otherwise terminated in accordance with the provisions hereof, this Agreement shall be for a term commencing on April 27, 2022 and terminating on April 26, 2025 (the "**Term**").

4. SERVICE REQUIREMENTS

4.1 Services

During the Term, the Consultant shall perform the Services as detailed in SCHEDULE A hereto.

4.2 Time and Availability

(a) Unless otherwise directed in writing by Toronto Hydro, the Consultant shall have discretion in selecting the dates and times it performs the Services throughout the month, giving due regard to the needs of Toronto Hydro's business requirements and provided that any access to Toronto Hydro property shall be during regular business hours.

4.3 Revision to Services

(a) The Parties acknowledge and agree that the Services to be undertaken and completed by the Consultant under this Agreement may be subject to revision or amendment from time to time during the Term: (i) as required by Toronto Hydro to comply with the Guidelines or other standards set out in section 4.4 below; (ii) as required by Toronto Hydro to comply with the Applicable Laws or any order, instruction, directive or legal requirement of a Governmental Authority; or (iii) as required by Toronto Hydro to ensure that Toronto Hydro receives the expected funding and benefits with respect to the project to which the Services relate.

(b) Toronto Hydro agrees to provide the Consultant with written notice of any revision or amendment to the Services required pursuant to this Section 4.3, and subject to the terms of Subsection 4.3(d) below, the Consultant shall comply with all such directives.

(c) In the event that the Consultant fails to comply with a directive issued by Toronto Hydro pursuant to this Section 4.3, Toronto Hydro shall have the right, in addition to any other remedies which may be available to Toronto Hydro hereunder or otherwise at law, to terminate this Agreement by giving written notice of termination to the Consultant whereupon this Agreement shall terminate as at the effective date of termination specified in the notice and the provision of Section 7 shall apply.

(d) Notwithstanding Subsection 4.3(b), where a directive from Toronto Hydro results in a material change in the scope and/or implementation of the Services, then the Consultant shall have the right to terminate this Agreement by giving notice of termination to Toronto Hydro whereupon the Agreement shall terminate as at the effective date of termination specified in the notice and the provisions of Section 7 shall apply.

4.4 Applicable Laws

(a) The Consultant shall, at its sole expense, obtain and maintain during the Term of this Agreement, all permits, licences and approvals required by all Applicable Laws to perform its obligations under this Agreement. The terms and conditions of this Agreement shall be carried out in strict compliance with all Applicable Laws and in the event of any conflict between any Applicable Laws, the Applicable Laws with the most stringent standard shall apply.

(b) Without limiting the generality of the foregoing, the Consultant shall comply with:

(i) the *Municipal Freedom of Information and Protection of Privacy Act* (Ontario) ("MFIPPA"), the *Personal Information Protection and Electronic Documents Act* (Canada) ("PIPEDA") and any other applicable privacy legislation (collectively, "Privacy Laws") with respect to any personal information collected, used or disclosed in connection with this Agreement and shall indemnify and hold harmless Toronto Hydro and its Representatives from and against any and all claims, demands, suits, losses, damages, causes of action, fines or judgments (including related expenses and legal costs) they may incur related to or arising out of any non-compliance therewith;

(ii) In its performance of the Services under this Agreement, the International Financial Reporting Standards (IFRS) including International Accounting Standards (IAS) and Interpretations thereto;

(c) Where any Deliverable is subject to the approval or review of any authority, department, government or agency other than Toronto Hydro, such applications for approval or review shall, unless otherwise authorized by Toronto Hydro in writing, be prepared by the Consultant to be approved and submitted by and through the offices of Toronto Hydro, and the Consultant shall not have any direct dealings with the authority, department, government or agency in question with regards to the Deliverable.

(d) The Consultant and the Consultant's personnel shall comply with all rules and direction of Toronto Hydro, whether specified in this Agreement or otherwise, while working on Toronto Hydro's premises or when accessing or connecting to Toronto Hydro's information technology systems, including rules and directions concerning health, safety, security and environmental protection, including without limitation, Toronto Hydro's *Code of Business Conduct and Whistleblower Procedure,* Toronto Hydro's *Disclosure Policy,* Toronto Hydro's *Social Media and Digital Communication Policy,* Toronto Hydro's *Accessibility Policy,* Toronto Hydro's *Workplace Harassment Policy and Program,* Toronto Hydro's *Violence Prevention in the Workplace Policy,* Toronto Hydro's *Workplace Alcohol and Drug Policy*, Toronto Hydro's *Environmental Policy,* Toronto Hydro's *Occupational Health and Safety Policy,* Toronto Hydro's *Privacy Policy,* Toronto Hydro's *Cyber Security Policy*, Toronto Hydro's *Technology Use Guidelines*, Toronto

Hydro's *Physical Security Policy*, Toronto Hydro's *COVID-19 Vaccination Policy,* and the *Affiliate Relationships Code for Electricity Distributors and Transmitters* issued by the OEB (together, the "Guidelines"). The Consultant agrees to comply with and to direct its Representatives to comply with such Guidelines, as amended.

4.5 Performance

(a) The Services shall be performed to the satisfaction of Toronto Hydro, and Toronto Hydro shall have the right, at all reasonable times, to inspect or otherwise review the Services performed or being performed. The Consultant shall, upon the request of Toronto Hydro, acting reasonably, provide Toronto Hydro with written reports of the status of the Deliverables and the Consultant's progress in providing the Services.

(b) In the event of any dispute between Toronto Hydro and the Consultant relating to the quality or acceptability or rate of progress of any of the Services, or relating to the interpretation of any instructions or specifications concerning the Services, Toronto Hydro and the Consultant shall, both acting reasonably, attempt to mutually reach a resolution in good faith.

5. REPRESENTATIONS, WARRANTIES, INDEMNITIES AND INSURANCE

5.1 Representations and Warranties

The Consultant hereby represents, warrants and agrees that:

(i) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has/have the necessary experience and qualifications to perform the Services;

(ii) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) will perform the Services in a diligent, expeditious and workmanlike manner, consistent with standards generally observed by reputable and competent members of the same industry providing similar services;

(iii) all Services shall be the Consultant's (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) original work and none of the Services or any invention, development, use, production, distribution or exploitation relating thereto will infringe, misappropriate or violate any intellectual property or other right of any person or entity.

(iv) If, during the performance of these Services or within six months following completion of the Services, such Services shall prove to be faulty or defective by reason of a failure to meet such standards, Consultant agrees that upon prompt written notification from Toronto Hydro prior to the expiration of the six month period following the completion of the Services containing any such fault or defect, such faulty portion of the Services shall be redone at no cost to Toronto Hydro up to a maximum amount equivalent to the cost of the Services rendered under this Agreement. The foregoing shall constitute

Consultant's sole liability with respect to the accuracy or completeness of the work and the activities involved in its preparation, but shall not limit or exclude the Consultant's obligations otherwise set out under this Agreement, including, but not limited to sections 5.2 and 9.3 below.

5.2 Indemnity

a) The Consultant shall be liable for and shall indemnify and hold harmless Toronto Hydro and its Representatives from all claims, demands, actions, penalties, damages, losses, judgments and settlements, liabilities, costs, expenses, including legal fees and other related costs and expenses arising out of, related to, or incident to, the Consultant's or any of its Representatives' performance of the Services under this Agreement, including, without limitation:

i. any breach, violation or non-performance by the Consultant or any of its Representatives of any terms, conditions, warranties, obligations or covenants contained in this Agreement;
ii. any breach or violation by the Consultant or any of its Representatives of any Applicable Laws; and
iii. any actions, omissions, negligence or wilful misconduct of the Consultant or any of its Representatives

except to the extent directly caused or contributed to by the negligence or wilful misconduct of Toronto Hydro or its Representatives.

b) In no event shall either party be liable for loss of profit or use or for any indirect, special, incidental or consequential damages of any nature or kind including but not limited to delays, loss of revenue, loss of use, loss of data, loss of product, costs of capital or costs or replacement power, even if that party has been advised of the possibility of such damages.

c) Subject to section 5.2(d), the Consultant's liability for a claim for damages shall be limited to three (3) times the amounts paid or payable by Toronto Hydro to the Consultant pursuant to this Agreement.

d) Notwithstanding the foregoing, no exclusion or limitation of liability shall apply to:

i. Breach of the confidentiality or privacy obligations in this Agreement
ii. Intentional misconduct or gross negligence;
iii. Breach of Applicable Law; or
iv. Breach of intellectual property indemnity in Section 9.

5.3 Insurance

(a) The Consultant shall, during the Term, and at its own expense, maintain and keep in full force and effect (and, when requested, provide Toronto Hydro with proof thereof):

(i) commercial general liability insurance on an occurrence basis having a minimum inclusive coverage limit, including personal injury and property damage, of not less than two (2) million dollars ($2,000,000) per occurrence, which commercial general liability insurance shall be extended to cover contractual liability, products and completed operations liability, and owners/contractors protective liability;

(ii) Automobile liability insurance on all hired and non-owned vehicles used in connection with this Agreement and such insurance coverage shall have a limit of not less than one (1) million dollars ($1,000,000.00) combined single limit, in respect of bodily injury (including passenger hazard) and property damage inclusive of any one accident and mandatory accident benefits;

(iii) Errors and Omissions Insurance (Professional Liability) in the amount of not less than two million dollars ($2,000,000);

(iv) Umbrella insurance coverage limit of not less than two million dollars ($2,000,000.00).

(b) All insurance coverages and limits required to be maintained hereunder shall: (i) be primary to any insurance maintained by Toronto Hydro, which insurance shall be excess and non-contributory; (ii) contain a cross liability clause and a severability of interest clause; and (iii) contain a thirty (30) day prior written notice to Toronto Hydro for any cancellation, non-renewal or adverse material change.

(c) The Consultant agrees that the insurance required hereunder in no way limits the Consultant's liability pursuant to the Liability and Indemnity provision in Section 5.3.A waiver of subrogation shall be provided by the insurer(s) to Toronto Hydro.

6. FEES

6.1 Fees

(a) Subject to paragraphs 6.1(b) - 6.1(e), in exchange for the performance of the Services in accordance with the terms hereof, Toronto Hydro shall pay the Consultant the amounts outlined in SCHEDULE A, not including HST (the "Fee")_, plus any reasonable out-of-pocket expenses or other disbursements made on the behalf of Toronto Hydro by the Consultant while on assignment for Toronto Hydro. Consultant shall be reimbursed for reasonable and customary travel expenses incurred on Toronto Hydro's behalf, provided that the prior authorization of Toronto Hydro has been obtained with respect to such expenses.

(b) Any disbursements for additional incidentals incurred by the Consultant in relation to this Agreement ("Disbursements") exceeding $500 CAD_must be pre-approved by Toronto Hydro in writing.

(c) The Consultant shall not incur or submit invoices for any work outside the scope of the Services without prior written approval from Toronto Hydro.

(d) The Consultant shall make all payment of taxes, employment insurance premiums, pension plan contributions and any other taxes or other payment of any nature, imposed by any authority in respect of the Fee paid by Toronto Hydro to the Consultant under this Agreement (together, the "Remittances"), and the Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities and claims whatsoever against Toronto Hydro or its Representatives, in

any way arising out of or relating to any failure to deduct, withhold, or remit any Remittance.

(e) Without limiting the generality of paragraph 6.1(a), Toronto Hydro reserves the right to deduct any applicable non-resident withholding taxes from any Fee owing to the Consultant under this Agreement and remit such amounts to the applicable taxation authority.

6.2 Payment

The Consultant shall submit invoices to Toronto Hydro on a monthly basis containing:

(i) a description of the Services performed during the invoice period;

(ii) the monthly payment amount;

(iii) the total HST applicable to the Services during the invoice period, as well as the Consultant's HST registration number; and

(iv) a detailed description of the Disbursements incurred around the invoice period, supported by documentation in a form acceptable to Toronto Hydro.

Unless otherwise provided in this Agreement, the Consultant shall invoice Toronto Hydro after final inspection and acceptance by Toronto Hydro of the Services performed and subject to receipt of all documents required by this Agreement. **Invoices must be sent electronically to: AP@torontohydro.com**. Subject to approval of the invoice by Toronto Hydro, receipt of all documents required by this Agreement, and final review by Toronto Hydro, Toronto Hydro shall make payment to the Consultant via electronic funds transfer not later than thirty (30) days following receipt of an acceptable invoice and the EFT Information (as set out below). **The Consultant must provide Toronto Hydro with, in the case of the first payment only, (i) a void cheque, pre-printed deposit slip or bank confirmation letter and (ii) the email address where the Consultant wishes to receive remittance information (together, "EFT Information"). EFT Information must be sent electronically to efthelp@torontohydro.com or to 14 Carlton Street, Toronto, ON, M5B 1K5, Attention: Treasury Department.** Toronto Hydro reserves the right to pay the Consultant through other payment methods.

7. SUSPENSION OR TERMINATION

7.1 Suspension or Termination

(a) Toronto Hydro may, at any time during the Term by notice in writing, suspend all or a portion of the Services. Upon receipt of such written notice, the Consultant shall perform no further work other than as directed by Toronto Hydro, and shall be entitled to payment for time spent in performing the Services up to the date of suspension, and, if applicable, the costs of returning Consultant personnel to home base and other reasonable costs and expenses incurred in the suspension of the Services.

(b) Either party may terminate this Agreement immediately upon written notice where the other party enters into liquidation, whether compulsory or voluntarily, or where a

proceeding in receivership, bankruptcy or insolvency has been instituted by or against such party or its property.

(c) Toronto Hydro, at its sole discretion, may terminate this Agreement immediately upon written notice where the Consultant or any of its Representatives has been in material default in the performance of its duties, obligations or undertakings under this Agreement, and has not taken immediate steps to remedy such default within two (2) Business Days following written notice of the specific default by Toronto Hydro. For the purposes of this section, a material default shall include, without limitation, a breach of any of the representations or warranties contained herein or the failure or refusal to provide the Services in accordance with the terms and conditions of this Agreement.

(d) Notwithstanding any other provision in this Agreement, Toronto Hydro, at its sole discretion, shall have the right to terminate this Agreement, for any reason, upon two (2) weeks written notice to the Consultant.

(e) In the event that this Agreement is terminated by Toronto Hydro in accordance with section 7.1(d), the Consultant shall be entitled to payment for time spent in performing the Services up to the date of termination, plus the costs of returning Consultant personnel to home base and other reasonable costs and expenses incurred in effecting termination and returning documents.

7.2 Effect of Termination

Upon the termination or expiration of this Agreement, upon Toronto Hydro's request, the Consultant shall return to Toronto Hydro and delete any and all electronic copies the Consultant may have of all documents and materials in its possession relating to the Services or this Agreement, including all Confidential Information and all Deliverables, whether completed or not.

8. CONFIDENTIALITY

8.1 Non-Disclosure

In performing the Services required by this Agreement, the Consultant may be provided access to Confidential Information. The Consultant acknowledges and agrees that:

(a) the Consultant shall not disclose, permit access to, transmit, or transfer the Confidential Information to any third party without the prior written authorization of Toronto Hydro;

(b) the Consultant shall protect the confidentiality of the Confidential Information in its possession by exercising the same security measures it normally exercises with respect to its own confidential information and at minimum a reasonable standard of care;

(c) upon the request of Toronto Hydro, and in any event upon the expiration or termination of this Agreement for any reason, the Consultant shall return (or delete, in the case of electronic documents) forthwith to Toronto Hydro all Confidential Information, including all copies and other materials containing the Confidential Information, which are in the possession or under the control of the Consultant; and

(d) the Consultant shall not use any Confidential Information for any purpose other than to perform the Services required by this Agreement. Without limiting the foregoing, the

Consultant shall not, and shall not permit any of its Representatives to, use any Confidential Information in furtherance of its, or their, individual business or for its, or their, own benefit, profit or advantage, or for the benefit, profit or advantage of any other party.

Notwithstanding the foregoing, the Consultant may disclose such Confidential Information to any of the Representatives of the Consultant who agree to be bound by the obligations of confidentiality herein and who have a reasonable need to know such Confidential Information in the course of their duties for the Consultant but only for the purposes of the Consultant exercising its rights and obligations under this Agreement; and in the event that the Consultant believes it is required by law to disclose, or is requested by a governmental authority to disclose, any Confidential Information to a governmental authority; provided that the Consultant shall, to the extent permitted by law, first inform Toronto Hydro of the request or requirement for disclosure to allow an opportunity for Toronto Hydro to apply for an order to prohibit or restrict such disclosure.

8.2 Non-Solicitation

Unless Toronto Hydro's Chief Executive Officer provides prior written consent, the Consultant hereby covenants and agrees that during the term of this Agreement and for a period of two (2) years following the termination of the Agreement, however caused, the Consultant will not directly or indirectly, either individually or in partnership or jointly or in conjunction with any other Person,

a) hire or otherwise engage any Protected Employee who is currently employed by Toronto Hydro;

b) hire or otherwise engage any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause;

c) solicit or attempt to solicit any Protected Employee who is currently employed by Toronto Hydro or encourage any such person to leave his/her employment with Toronto Hydro; and

d) solicit or attempt to solicit any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause.

Given the unique expertise and intimate knowledge that the employees have of the operations of Toronto Hydro the Consultant acknowledges and agrees that the restrictions contained in this Section 8.2 are reasonable and necessary to preserve the value of Toronto Hydro's business.

9. INTELLECTUAL PROPERTY

9.1 Use

Nothing in this Agreement shall be deemed to transfer, license, assign, permit the use of, or otherwise convey an interest in whole or in part to the Consultant of any Intellectual Property belonging to Toronto Hydro or any of its Representatives or any third party whose Intellectual Property is in Toronto Hydro's custody or control, and the use by the Consultant of any such Intellectual Property shall be subject to the prior written approval of Toronto Hydro. It is understood and agreed that Consultant's use of its proprietary computer software, methodology,

procedures, or other proprietary information in connection with an assignment shall not give Toronto Hydro any rights with respect to such proprietary computer software, methodology, procedures or other proprietary information. Consultant may retain and further use the technical content of its work hereunder.

Any Deliverables prepared for Toronto Hydro by Consultant pursuant to this Agreement that are reports or other written documentation shall be for Toronto Hydro's use consistent with the Services set out under this Agreement. For greater clarity, for the purposes of this section 9.1 only, "use" shall include, but is not limited to, the leveraging of such Deliverables and disclosure of such Deliverables to third parties as may be required for Toronto Hydro's disclosure obligations including, but not limited to, annual financial filings as well as disclosures to the Ontario Energy Board (OEB) as part of Toronto Hydro's utility rate application(s).

Notwithstanding the foregoing, Toronto Hydro shall refrain from using such Deliverables in connection with a public offering of securities or in connection with any other financing not directly related to Toronto Hydro's activities as a utility without Consultant's prior written consent, which shall not be unreasonably withheld or delayed.

9.2 Ownership

Toronto Hydro shall at all times have full rights and title to the Deliverables, and may at all times take possession of or use any completed or partially completed Deliverables, notwithstanding any provision, express or implied, to the contrary. Without limiting the generality of the foregoing, Toronto Hydro shall own all Intellectual Property rights in all Deliverables, and the Consultant hereby waives and assigns to Toronto Hydro any such rights, and agrees to give Toronto Hydro and its Representatives all assistance as may be reasonably required to perfect such rights including, without limitation and where the Consultant is a corporation or partnership, obtaining waiver of moral rights from any of the Consultant's employees, partners or other Representatives.

9.3 Intellectual Property Protection

The Consultant expressly warrants that the manufacture, delivery, sale or use of the Consultant's Services will not infringe any Canadian or foreign patents, trademarks, copyrights, industrial design or other intellectual property rights and the Consultant shall indemnify and save Toronto Hydro harmless from all claims, judgments and decrees that may be entered against Toronto Hydro or its Representatives and against all damage, liability, costs and expenses (including legal fees and other attendant costs and expenses) Toronto Hydro incurs by reason of any infringement or claim thereof.

9.4 Pre-Existing Intellectual Property

Any pre-existing Intellectual Proprietary ("Pre-Existing IP") of Consultant or its licensors used to perform Services, or included in any Deliverables, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of the Consultant and its licensors (collectively, "Consultant Information"). To the extent that Consultant incorporates any Consultant Information into the Deliverable(s), Consultant hereby grants to Toronto Hydro a fully paid up, royalty free, irrevocable and non-cancellable, non-exclusive, assignable and transferable right to Use the Consultant Information without restriction, except that any such Use must be in conjunction with the Deliverables in which the Consultant Information is incorporated and not as a separate item. For the purpose of the foregoing, "Use" means one or more of the following rights to: use; modify; adapt; translate; create changes, alterations, modifications,

improvements, adoptions, enhancements and derivative works based upon or derived from the Consultant Information; reproduce; copy; display; perform; communicate in any manner; license or sublicense. Consultant shall provide Toronto Hydro with a list of any freeware, shareware or open source software used in the Deliverables. Any pre-existing intellectual property of Toronto Hydro, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of Toronto Hydro.

10. HEALTH AND SAFETY

The Consultant shall be responsible for managing the health and safety of its own personnel and other Representatives. Neither Toronto Hydro, nor its Representatives, shall be liable for any loss, damages or claims arising directly or indirectly from the Consultant's access to or work in or around Toronto Hydro's facilities, and the Consultant hereby waives any claims to which it may become entitled for loss or damage and releases Toronto Hydro and its Representatives from any and all such claims.

11. MISCELLANEOUS

11.1 Survival

In addition to the terms in this Agreement that by their nature survive the expiry or termination of the Agreement, the terms of section 5 (Representations, Warranties and Indemnities), section 8 (Confidentiality), section 9 (Intellectual Property), and subsection 11.3 (Injunctive Relief) shall survive the expiry of this Agreement for a term of five (5) years.

11.2 Subcontracting

The Consultant may not subcontract the performance of any part of the Services without Toronto Hydro's prior written approval. Where Toronto Hydro provides its prior written approval to the Consultant to subcontract all or part of the Services, then the Consultant shall enter into agreements with such permitted subcontractor(s) to require the permitted subcontractor(s) to provide Services in accordance with all of the terms of this Agreement. Notwithstanding the foregoing, the Consultant shall remain liable for any and all acts or omissions of any subcontractor(s) as if such acts or omissions were those of Consultant.

Toronto Hydro reserves the right to remove or add any subcontractors that are involved in Toronto Hydro projects at sole discretion.

11.3 Injunctive Relief

(a) The Consultant acknowledges and agrees that the terms of section 8 (Confidentiality) and section 9 (Intellectual Property) of this Agreement are reasonably necessary to protect the legitimate interests of Toronto Hydro, are reasonable in scope and duration, and are not unduly restrictive.

(b) The Consultant further acknowledges that a breach of any of the terms of section 8 (Confidentiality) or section 9 (Intellectual Property) would render irreparable harm to Toronto Hydro, and that a remedy at law for breach of these sections would be inadequate, and that Toronto Hydro shall therefore be entitled to any and all equitable relief, including,

without limitation, injunctive relief, and any other remedy that may be available at law or in equity.

11.4 Force Majeure

Either party will be relieved of liability for delays in performance of its obligations hereunder where such delay is a result of Force Majeure. The party affected by the Force Majeure shall give prompt notice thereof to the other party and, upon cessation of the Force Majeure, shall take all reasonable steps to resume the performance of its obligations hereunder. If a delay in performance by reason of Force Majeure extends beyond thirty (30) Business Days, then either party may terminate this Agreement by written notice.

11.5 Non-Exclusive Agreement

This Agreement will not be interpreted to grant to the Consultant exclusive rights to provide the Services or to bind Toronto Hydro in any way to an exclusive relationship with the Consultant with regards to the Services or any other service.

11.6 Waiver

No delay on the part of either party in exercising any of its rights hereunder or failure to exercise the same, nor the acquiescence thereto shall operate as a waiver except in the specific instance for which it is given and where such waiver is provided in writing by the party waiving its rights.

11.7 Amendments

None of the terms, conditions or provisions of this Agreement shall be varied, modified or altered except by written agreement signed by an authorized representative of each parties.

11.8 Assignment

Save and except for Toronto Hydro's right to assign this Agreement to any of its Affiliates, neither party may assign this Agreement or any of their rights or obligations hereunder, without the prior written authorization of the other party, acting reasonably.

11.9 Enurement

This Agreement shall enure to the benefit of, and be binding upon, the parties hereto and their respective successors and permitted assigns.

11.10 Severability

In the event that any provision or portion of this Agreement is determined to be invalid or unenforceable for any reason, the remaining provisions or portions of this Agreement will be unaffected and will remain in full force and effect to the fullest extent permitted by law.

11.11 Neutral Construction

The parties to this Agreement agree that this Agreement was negotiated fairly between them at arm's length, that the final terms of this Agreement are the product of the parties' negotiations, and that this Agreement shall be deemed to have been jointly and equally drafted by them, and that the

provisions thereof should not be construed against a party on the grounds that such party drafted the Agreement in whole or in part.

11.12 Entire Agreement

This Agreement constitutes the entire agreement between the parties relating to the subject matter hereof. This Agreement supersedes any and all prior correspondence, warranties, covenants, collateral undertakings, or agreements, oral or otherwise, express or implied, unless otherwise contained herein.

11.13 Notices

(a) All questions or other communications regarding this Agreement, including any notices required by this Agreement, are to be addressed to the following addresses:

to Toronto Hydro:

Name:	Leslie Armstrong
Title:	Manager, Capital Planning & Reporting

SCHEDULE A

SERVICES AND RATES

1. Services to be Performed

(a) The Consultant will complete a depreciation study based on available Toronto Hydro asset data and drawing on the knowledge and experience of relevant Toronto Hydro subject matter experts (SMEs). The study will need to be completed in accordance with International Financial Reporting Standards (IFRS), Ontario Energy Board (OEB) requirements and expectations, and any relevant industry standards. It will need to determine financial useful lives (i.e. to be used for rate making and in financial reporting) for existing asset classes, including both distribution and non-distribution (facilities, fleet, IT). The study shall assess whether current componentization is sufficient and in line with IFRS standards, and if not, recommend where to further componentize to be in line with IFRS and industry standards. The study should include support for the rationale of the proposed asset useful lives in accordance with International Accounting Standard (IAS) 16, "Property, Plant and Equipment". An important consideration is alignment, as appropriate, with any other Toronto Hydro asset analyses and its asset management practices. As per the OEB Rate Handbook, "the study must be supported by high quality evidence and a thorough analysis that can be rigorously tested."

(b) The Consultant shall review the current and past asset classification documents for non-distribution facilities assets during the analysis process. The Consultant will be responsible to determine the most appropriate asset category, threshold and useful life; based on industry knowledge and best practices and apply this new asset classification to the existing facilities asset base.

(c) Toronto Hydro requires a final report on the depreciation study with a draft report provided for review prior to issuance of the final report. The final report will need to include the following (naming conventions, ordering, and grouping are a draft proposal, can all be adjusted in accordance with consultant's best practices):

- Executive Summary
- Credentials of the Consultant
- Objective and Scope of Work
    - Scope: All asset classes which fall under the regulated entity
- Execution Process / Study Procedure
- Methodology
- For each asset or component – detailed derivations of useful lives by asset class, including:
    - Survivor Curves or Failure Curves and summary of any adjustments or special treatment of data
    - Details on Methodology used, assumptions and key considerations
    - Commentary to support the accuracy of existing componentization or provide support and rationale for any changes to componentization where applicable in accordance with IFRS standards and IAS 16Recommended Useful Life and upper/lower values
    - Clear explanations and rationale provided for any deviations of recommended useful life from the Asset Depreciation Study prepared for the Ontario Energy Board by Kinectrics Inc (Report No: K-418033-RA-011-R000)

- Clear explanations and rationale provided for any deviations of recommended useful life from the existing Toronto Hydro Electric System Useful Life of Assets Report by Kinectrics Inc (Report No: K-418021-RA-0001-R002) (e.g. changes in industry standards since initial report was issued)
- Clear explanations and rationale provided for any deviations from useful lives used for asset management decision making

- Summary of Results and Findings, including:
  - Demonstration that all asset classes covered
  - Quantification of impact of the recommended, high, and low-end changes on the existing net asset base for rate making as of December 31, 2021 (which is projected to be $4.6B) (comparison of current and recommended depreciation rates and accruals); SAP Experience will be preferred/beneficial
    - Gross Depreciation Impact on 2023 and 2024 Test Years; as well as 2025-2029 Test Years
    - Breakdown of impacts associated with 2020-2021 asset additions vs. pre-2020 asset additions (regulatory reporting requirements)
    - Other Revenue Amortization Impact (from Capital Contribution Assets) on 2023 and 2024 Test Years; as well as 2025-2029 Test Years
    - Breakdown of impacts associated with 2020-2021 asset additions vs. pre-2020 asset additions (regulatory reporting requirements)
    - Exclusion of assets that have been appropriately assessed as having a unique useful life compared to the existing standard
    - Inclusion of impact of any new componentization splitting to existing asset base

- Conclusions

(d) The Consultant shall also provide an updated report, subsequent to December 31, 2022 year end, to update any quantifications to reflect the impact of new additions in between January 1, 2022 and December 31, 2022.

(e) The Consultant shall also provide related support as needed for auditor queries and Toronto Hydro's 2025 rebasing application proceeding (details to be determined but could include for example responding to interrogatories and undertakings and providing support ahead of and during hearings). The level of application support required will depend on the degree of OEB Staff and intervenor interest in the depreciation study. The financial statement auditors may have clarifying questions as part of their quarterly and/or annual testing procedures (could include clarifications around componentization decisions, walkthroughs of process and/or quantifications, sample testing, etc). In written or oral format (i.e. acting as a witness for Toronto Hydro in a technical conference or oral hearing for the application), the Consultant must be able to answer clarifying questions regarding the study and explain and defend the methodology, assumptions, and choices made (written responses generally expected to be provided under tight timelines).

(f) The Consultant shall, prior to commencement of the Services, provide a proposed schedule and comprehensive and detailed project management plan including start date, breakdown into stages and milestones with corresponding timing and roles of respondent and Toronto Hydro resource requirements as well as required utility inputs and approximate personnel time commitments. Include any risks to meeting the timeframes that are deemed relevant, and how the respondent will mitigate them.

There are two phases of services required:

Study:

Kick-off early 2022 with biweekly updates/touchpoints until delivery of Final Report
Draft Report to be submitted no later than Aug. 1, 2022.
Final report to be submitted no later than Nov. 1, 2022.
Subsequent report update no later than March 31, 2023 (to reflect additional impact of 2022 additions).

Support:

Specific timing to be confirmed
Audit Queries: Q4 2022 to Q1 2024; turn around time of 2-3 business days
Application Support: ~Q3 2023 to Q4 2024; Interrogatory response draft turnaround time of ~ 1 week, Undertaking response draft turnaround time of 24 hours. Hearing time – as general support and/or in the hearing room as a witness – to be decided

(g) Toronto Hydro to provide asset data to the Consultant and make Toronto Hydro subject matter experts available for surveys/interviews.

2. Rates

In exchange for Consultant's provision of the Services under this Agreement, Toronto Hydro shall pay Consultant Fees at a time and materials basis at the rates indicated below, up to a maximum of [redacted] (the "Anticipated Fees"). Consultant shall not exceed the Anticipated Fees, nor commence any Services in excess of the Anticipated Fees, without the prior express written consent of Toronto Hydro.

Ad Hoc Services	Rate
All post study support (excludes update to the report in 2023) including:	As per below chart
Responding to audit queries	As per below chart
Responding to application interrogatories	As per below chart
Application hearing support including responses to undertakings and any time spent preparing for and acting as witness.	As per below chart

SCHEDULE B

DEFINITIONS

In this Agreement, the following definitions shall apply:

"Affiliates"	has the meaning prescribed to it in the *Business Corporations Act* of Ontario, as amended from time to time;
"Agreement"	means this Agreement for Professional Consulting Services, including all recitals, schedules and attachments thereto;
"Applicable Laws"	means all federal, provincial and municipal statutes, regulations, codes, by-laws, orders in council, directives, rules, guidelines and ordinances applicable to this Agreement, including without limitation all applicable OEB codes, rules or guidelines;
"Business Day"	means a day on which banks are open for business in the City of Toronto, Ontario, but does not include a Saturday, Sunday, or a civic or statutory holiday in the Province of Ontario;
"Confidential Information"	means the terms of this Agreement and any and all data or information relating to the business, management or affairs of Toronto Hydro, its customers, employees, or any of its Affiliates disclosed by Toronto Hydro to the Consultant pursuant to this Agreement, whether or not such Confidential Information is expressly identified as confidential. Notwithstanding the foregoing, Confidential Information does not include any information or data which: (a) information or data that is or becomes publicly known through no breach of the terms or conditions of this Agreement; (b) information or data that is independently developed without reference to Confidential Information and without breach of the terms and conditions of this Agreement; or (c) Confidential Information that is required by court order or other legal compulsion to be disclosed, in which case the Consultant shall give Toronto Hydro prior written notice of such disclosure, as permitted by law;
"Consultant"	means Concentric Advisors ULC;
"Deliverable"	means any and all works prepared, generated, created or designed by the Consultant pursuant to this Agreement, including without limitation all drawings, models, designs, formulae, methods, documents, reports, software, specifications, or source codes, and any related works, enhancements, modifications or additions thereto;
"Disbursements"	shall have the meaning as prescribed in paragraph 6.1(b);
"Fees"	shall have the meaning as prescribed in paragraph 6.1(a);

"Force Majeure"	means any impediments beyond the control of the applicable party due, wholly or in part, directly or indirectly, to: strikes, lockouts, riots, epidemics, war, governmental regulations, fire, explosions, acts of God, or any other impediment beyond the control of the party affected;
"Hourly Rate"	shall have the meaning prescribed in paragraph 6.1(a);
"HST"	means Harmonized Sales Tax;
"Guidelines"	has the meaning prescribed in paragraph 4.4(d);
"Intellectual Property"	includes all trademarks, copyrights, patents, business names, trade secrets, proprietary software, analysis or techniques (whether or not patented or patentable), confidential or secret designs and processes, source codes, plans or devices, or other proprietary and intellectual property rights;
"Intervenor"	means any interested group or individual who participates actively in an OEB proceeding either by submitting evidence, arguments or interrogatories (written questions) or by cross-examining a witness or witnesses at an oral hearing;
"Person"	means any individual, firm, corporation, unlimited liability company, partnership, limited liability partnership, joint venture, trust, unincorporated association, unincorporated syndicate, any governmental authority and any other legal or business entity.
"Protected Employee"	means any individual who, during the course of their employment with Toronto Hydro, was directly or indirectly involved in: i. the procurement of the Services of the Consultant on behalf of Toronto Hydro; ii. the negotiation of the Consultant's Agreement on behalf of Toronto Hydro; and/or the awarding and/or approval of the Consultant's Agreement on behalf of Toronto Hydro.
"Remittances"	has the meaning prescribed to it in paragraph 6.1(d);
"Term"	has the meaning prescribed to it in subsection 3.1; and
"Toronto Hydro"	means Toronto Hydro-Electric System Limited.

AMENDING AGREEMENT

THIS AMENDING AGREEMENT (the "Amending Agreement") is made effective as of June 1, 2023 (the "Effective Date") between **CONCENTRIC ADVISORS ULC.** ("Consultant") and **TORONTO HYDRO-ELECTRIC SYSTEM LIMITED** ("Toronto Hydro") (collectively, the "Parties").

WHEREAS:

1. Toronto Hydro and Consultant entered into an agreement for professional consulting services dated April 27, 2022 (the "Agreement") pursuant to which the Consultant shall provide a depreciation study and related services (the "Services"); and

2. The Parties wish to amend the Agreement by attaching the Ontario Energy Board's *Rules of Practice and Procedure* Rule 13A, and make associated amendments related to the Consultant's participation in Toronto Hydro's upcoming rate application, as provided herein.

NOW THEREFORE, THIS AMENDING AGREEMENT WITNESSES that in consideration of the mutual covenants contained herein and for other valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Toronto Hydro and Consultant agree as follows:

1. Any capitalized terms used but not defined herein shall be as defined in the Agreement. The recitals above are agreed by the Parties to be true and deemed to form part of this Amending Agreement as if specifically restated herein.

2. Section 4.4 of the Agreement is amended by adding the following subsection (e) immediately following subsection 4.4(d):

   (e) Without limiting the generality of subsection 4.4(a) above, the Consultant shall comply with Rule 13A Expert Evidence of the OEB's *Rules of Practice and Procedure*, attached as SCHEDULE C hereto, in the course of providing the Services and agrees to accept the responsibilities that are or may be imposed on them by that rule.

3. The Parties agree to add a new SCHEDULE C to the Agreement, attached hereto as Appendix 1 to this Amending Agreement.

4. All other terms and conditions of the Agreement remain continuously in full force and effect, unamended, and shall be deemed to apply to this Amending Agreement.

5. This Amending Agreement, together with the Agreement, shall hereinafter constitute the entire agreement between the Parties with respect to the Services as further described in the Agreement, and supersedes any and all other agreements, understandings, discussions, negotiations, representations and correspondence which may have been made by or between the Parties respecting the same.

APPENDIX 1

SCHEDULE C

Ontario Energy Board *Rules of Practice and Procedure* Rule 13A

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

a. the expert's name, business name and address, and general area of expertise;
b. the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;
c. the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;
d. the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;
e. in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and
f. an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

a. in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and
b. at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

a. scope and timing;
b. the involvement of any expert engaged by the OEB;
c. the costs associated with the conduct of the activities;
d. the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of Rule **13A.04**; and
e. any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A.**

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

AGREEMENT FOR PROFESSIONAL CONSULTING SERVICES

THIS AGREEMENT is made as of the 10th day of May, 2023 (the "Effective Date") between **Toronto Hydro-Electric System Limited** ("Toronto Hydro"), a corporation incorporated under the laws of the province of Ontario and **EA Technology LLC,** a corporation incorporated under the laws of the State of New Jersey (the "Consultant"), pursuant to which Toronto Hydro shall retain the Consultant to provide certain Services, and the Consultant shall provide such Services, during the Term, subject to the terms and conditions hereof;

NOW THEREFORE, in consideration of the mutual covenants set forth herein and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

1. INTERPRETATION

Unless otherwise indicated, all capitalized terms in this Agreement shall be as defined in SCHEDULE B and any reference to currency in this Agreement shall refer to lawful money of Canada.

2. RELATIONSHIP OF THE PARTIES

2.1 Retainer

Toronto Hydro hereby retains the Consultant to provide the Services, and the Consultant hereby agrees to provide the Services, during the Term, in accordance with the terms and conditions of this Agreement.

2.2 Independent Contractors

(a) Notwithstanding any provision hereof, this Agreement does not constitute and shall not be construed as constituting a partnership, joint venture, principal/agency relationship, or employer/employee relationship between the parties. The Consultant and Toronto Hydro shall at all times remain independent contractors of each other, and neither party shall represent itself to be an agent or employee of the other.

(b) Without limiting the generality of Subsection 2.2(a), the Consultant hereby acknowledges and agrees that neither it nor its Representatives shall be eligible or entitled, by reason of this Agreement, to participate in any employee-related program offered by Toronto Hydro or any of its Affiliates, including, without limitation, any benefit, insurance, compensation, health plan, bonus or retirement program.

(c) The Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities or claims whatsoever against Toronto Hydro or its Representatives resulting from or relating to the Consultant or its Representatives being deemed to be an employee of Toronto Hydro or any of its Affiliates.

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

(d) The Consultant hereby acknowledges and agrees that Toronto Hydro shall not be responsible for and shall not have control or charge of any means, methods, techniques, sequences or procedures used for or in respect of the Services, or for the safety precautions or programs required for the Services or otherwise prescribed hereunder.

3. TERM

3.1 Term

Unless otherwise terminated in accordance with the provisions hereof, this Agreement shall be for a term commencing on the Effective Date and terminating two (2) years thereafter (the "Term").

4. SERVICE REQUIREMENTS

4.1 Services

During the Term, the Consultant shall perform the Services as detailed in SCHEDULE A hereto.

4.2 Time and Availability

Unless otherwise directed in writing by Toronto Hydro, the Consultant shall have discretion in selecting the dates and times it performs the Services throughout the month, giving due regard to the needs of Toronto Hydro's business requirements and provided that any access to Toronto Hydro property shall be during regular business hours.

4.3 Key Employee

[Intentionally deleted].

4.4 Revision to Services

(a) The Parties acknowledge and agree that the Services to be undertaken and completed by the Consultant under this Agreement may be subject to revision or amendment from time to time during the Term: (i) as required by Toronto Hydro to comply with the Guidelines; (ii) as required by Toronto Hydro to comply with the Applicable Laws or any order, instruction, directive or legal requirement of a Governmental Authority; or (iii) as required by Toronto Hydro to ensure that Toronto Hydro receives the expected funding and benefits with respect to the project to which the Services relate.

(b) Toronto Hydro agrees to provide the Consultant with written notice of any revision or amendment to the Services required pursuant to this Section 4.4, and subject to the terms of Subsection 4.4(d) below, the Consultant shall comply with all such directives.

(c) In the event that the Consultant fails to comply with a directive issued by Toronto Hydro pursuant to this Section 4.4, Toronto Hydro shall have the right, in addition to any other remedies which may be available to Toronto Hydro hereunder or otherwise at law, to terminate this Agreement by giving written notice of termination to the Consultant whereupon this Agreement shall terminate as at the effective date of termination specified in the notice and the provision of Section 7 shall apply.

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

(d) Notwithstanding Subsection 4.4(b), where a directive from Toronto Hydro results in a material change in the scope and/or implementation of the Services, then the Consultant shall have the right to terminate this Agreement by giving notice of termination to Toronto Hydro whereupon the Agreement shall terminate as at the effective date of termination specified in the notice and the provisions of Section 7 shall apply.

4.5 Applicable Laws

(a) The Consultant shall, at its sole expense, obtain and maintain during the Term of this Agreement, all permits, licences and approvals required by all Applicable Laws to perform its obligations under this Agreement. The terms and conditions of this Agreement shall be carried out in strict compliance with all Applicable Laws and in the event of any conflict between any Applicable Laws, the Applicable Laws with the most stringent standard shall apply.

(b) Without limiting the generality of the foregoing, the Consultant shall comply with the *Municipal Freedom of Information Act* ("MFIPPA"), the *Personal Information Protection and Electronic Documents Act* (Canada) ("PIPEDA")and any other applicable privacy legislation (collectively, "Privacy Laws") with respect to any personal information collected, used or disclosed in connection with this Agreement and shall indemnify and hold harmless Toronto Hydro and its Representatives from and against any and all claims, demands, suits, losses, damages, causes of action, fines or judgments (including related expenses and legal costs) they may incur related to or arising out of any non-compliance therewith.

(c) Without limiting the generality of subsection 13(a) above, the Vendor shall comply with Rules 13 and 13A Expert Evidence of the OEB's *Rules of Practice and Procedure*, attached as APPENDIX A.1 hereto, in the course of providing the Services and agrees to accept the responsibilities that are or may be imposed on them by that rule.

(d) Where any Development is subject to the approval or review of any authority, department, government or agency other than Toronto Hydro, such applications for approval or review shall, unless otherwise authorized by Toronto Hydro in writing, be prepared by the Consultant to be approved and submitted by and through the offices of Toronto Hydro, and the Consultant shall not have any direct dealings with the authority, department, government or agency in question with regards to the Development.

(e) The Consultant and the Consultant's personnel shall comply with all rules and direction of Toronto Hydro, whether specified in this Agreement or otherwise, while working on Toronto Hydro's facilities: Toronto Hydro's *Code of Business Conduct and Whistleblower Procedure*, Toronto Hydro's *Disclosure Policy,* Toronto Hydro's *Social Media and Digital Communication Policy,* Toronto Hydro's *Accessibility Policy*, Toronto Hydro's *Workplace Harassment Policy and Program*, Toronto Hydro's *Violence Prevention in the Workplace Policy,* Toronto Hydro's *Workplace Alcohol and Drug Policy*, Toronto Hydro's *Environmental Policy,* Toronto Hydro's *Occupational Health and Safety Policy*, Toronto Hydro's *Privacy Policy,* Toronto Hydro's *Cyber Security Policy*, Toronto Hydro's *Technology Use Guidelines*, Toronto Hydro's *External Supplier Access to Application Services Policy,* Toronto Hydro's *Physical Security Policy,* and the *Affiliate Relationships Code for Electricity Distributors and Transmitters* issued by the OEB (together, the "Guidelines"). The Consultant acknowledges that it has been provided with a copy of the Guidelines, has provided and will provide a copy of the Guidelines to each of its Representatives and that it agrees to comply with and to direct its Representatives to comply with such Guidelines, as amended.

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

4.6 Performance

(a) The Services shall be performed to the satisfaction of Toronto Hydro, and Toronto Hydro shall have the right at all reasonable times, to inspect or otherwise review the Services performed or being performed. The Consultant shall, upon the request of Toronto Hydro, provide Toronto Hydro with written reports of the status of the Developments and the Consultant's progress in providing the Services.

(b) In the event of any dispute between Toronto Hydro and the Consultant relating to the quality or acceptability or rate of progress of any of the Services, or relating to the interpretation of any instructions or specifications concerning the Services, the reasonable opinion of Toronto Hydro shall govern and be binding on the parties hereto.

4.7 Health and Safety

The Consultant shall be responsible for managing the health and safety of its own personnel and other Representatives. Neither Toronto Hydro, nor its Representatives, shall be liable for any loss, damages or claims arising directly or indirectly from the Consultant's access to or work in or around Toronto Hydro's facilities, and the Consultant hereby waives any claims to which it may become entitled for loss or damage and releases Toronto Hydro and its Representatives from any and all such claims.

5. REPRESENTATIONS, WARRANTIES, INDEMNITIES AND INSURANCE

5.1 Representations and Warranties

The Consultant hereby represents, warrants and agrees that:

(i) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has/have the necessary experience and qualifications to perform the Services;

(ii) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) will perform the Services in a diligent, expeditious and workmanlike manner, consistent with standards generally observed by reputable and competent members of the same industry providing similar services;

(iii) all Services shall be the Consultant's (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) original work and none of the Services or any invention, development, use, production, distribution or exploitation relating thereto will infringe, misappropriate or violate any intellectual property or other right of any person or entity;

(iv) it (or, where the Consultant is a corporation or partnership, its Representatives performing the Services) has the corporate power and authority to enter into this Agreement and to perform its obligations hereunder, and that this Agreement constitutes a legal, valid, and binding obligation of the Consultant, enforceable against the Consultant in accordance with its terms.

5.2 Indemnity

The Consultant shall be liable for and shall indemnify and hold harmless Toronto Hydro and its Representatives from all claims, demands, actions, penalties, damages, losses, judgments and settlements,

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

liabilities, costs, expenses, including legal fees and other related costs and expenses arising out of, related to, or incident to, the Consultant or any of its Representatives' performance of the Services under this Agreement, including, without limitation:

a) any breach, violation or non-performance by the Consultant or any of its Representatives of any terms, conditions, warranties, obligations or covenants contained in this Agreement;

b) any breach or violation by the Consultant or any of its Representatives of any Applicable Laws; and

c) any actions, omissions, negligence or wilful misconduct of the Consultant or any of its Representatives.

5.3 Insurance

(a) The Consultant shall, during the Term, and at its own expense, maintain and keep in full force and effect (and, when requested, provide Toronto Hydro with proof thereof) the following insurance:

(i) commercial general liability insurance on an occurrence basis having a minimum inclusive coverage limit, including personal injury and property damage, of not less than two million dollars ($2,000,000.00) per occurrence with property damage deductible of not more than fifty thousand dollars ($50,000.00), which commercial general liability insurance shall be extended to cover contractual liability, products and completed operations liability, contingent employer's liability, and owners/contractors protective liability;

(ii) automobile liability insurance on all owned and non-owned vehicles used in connection with this Agreement, with such automobile insurance coverage having a limit of not less than two million dollars ($2,000,000.00) per vehicle, in respect of bodily injury (including passenger hazard), property damage and mandatory accident benefits.

(b) All insurance coverages and limits required to be maintained by the Consultant shall be primary to any insurance maintained by Toronto Hydro, which shall be excess and non-contributory. Prior to the commencement of the delivery of the Services, the Consultant shall deliver to Toronto Hydro a certificate of insurance which evidences the Consultant's compliance with this section, including the provision of a thirty (30) day prior written notice of cancellation, non-renewal or adverse material change, to Toronto Hydro.

(c) The Consultant agrees that the insurance described herein does in no way limit the Consultant's liability pursuant to the indemnity provisions of this Agreement.

(d) A waiver of subrogation shall be provided by the insurer(s) to Toronto Hydro.

6. <u>FEES</u>

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

6.1 Fees

(a) Subject to Subsections 6.1(d), 6.1(e) and 6.1(f), in exchange for the performance of the Services in accordance with the terms hereof, Toronto Hydro shall pay the Consultant [redacted] (plus applicable taxes), (the "Fees"), subject to invoicing as outlined in Section 6.2.

(b) The Fee noted in subsection 6.1(a) shall be the only fee payable by Toronto Hydro under this Agreement. Without limiting the generality of the foregoing, the Consultant hereby agrees and acknowledges that all out-of-pocket expenses, travelling costs, and other disbursements shall be at the sole expense of the Consultant, except with the prior written approval from Toronto Hydro.

(c) Any disbursements for additional incidentals incurred by the Consultant in relation to this Agreement ("Disbursements") must be pre-approved by Toronto Hydro in writing.

(d) The Consultant shall not incur or submit Fees for any work outside the scope of the Services, or exceed the Fees listed in Subsection 6.1(a) without prior written approval from Toronto Hydro.

(e) The Consultant shall make all payment of taxes, employment insurance premiums, pension plan contributions and any other taxes or other payment of any nature, imposed by any authority in respect of the Fees paid by Toronto Hydro to the Consultant under this Agreement (together, the "Remittances"), and the Consultant hereby covenants and agrees to indemnify and save harmless Toronto Hydro and its Representatives from and against all costs, liabilities and claims whatsoever against Toronto Hydro or its Representatives, in any way arising out of or relating to any failure to deduct, withhold, or remit any Remittance.

(f) The Consultant acknowledges that it is a non-resident of Canada for income tax purposes and agrees that Toronto Hydro shall withhold any applicable non-resident withholding taxes from any amount owing hereunder and remit such taxes to the applicable federal taxing authority without provision for gross-up. Services provided in Canada should be detailed and separated from Services provided outside of Canada on invoices issued for payment.

6.2 Payment

The Consultant shall submit invoices to Toronto Hydro monthly (with respect to the Services set out under subsection 4(c) of SCHEDULE A) or on acceptance of the Developments hereunder containing:

(i) a detailed description of the Services performed during the invoice period; and

(ii) the dates and the amount of time spent by the Consultant for the provision of the Services;

All Services under this Agreement shall be performed outside of Canada. The Consultant acknowledges that it is not an HST registrant and it is not required to register for HST under Canadian tax law.

Unless otherwise provided in this Agreement, the Consultant shall invoice Toronto Hydro after final inspection and acceptance by Toronto Hydro of the Services performed and subject to receipt of all documents required by this Agreement. **Invoices must be sent electronically to: AP@torontohydro.com.** Subject to approval of the invoice by Toronto Hydro, receipt of all documents required by this Agreement, and final review by Toronto Hydro, Toronto Hydro shall

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

make payment to the Consultant via electronic funds transfer not later than thirty (30) days following receipt of an acceptable invoice and the EFT Information (as set out below). **The Consultant must provide Toronto Hydro with, in the case of the first payment only, (i) a void cheque, pre-printed deposit slip or bank confirmation letter and (ii) the email address where the Consultant wishes to receive remittance information (together, "EFT Information"). EFT Information must be sent electronically to efthelp@torontohydro.com or to 14 Carlton Street, Toronto, ON, M5B 1K5, Attention: Treasury Department.** Toronto Hydro reserves the right to pay the Consultant through other payment methods.

7. SUSPENSION OR TERMINATION

7.1 Suspension or Termination

(a) Toronto Hydro may, at any time during the Term by notice in writing, suspend all or a portion of the Services. Upon receipt of such written notice, the Consultant shall perform no further work other than as directed by Toronto Hydro, and shall be entitled to payment for time spent in performing the Services up to the date of suspension.

(b) Either party may terminate this Agreement immediately upon written notice where the other party enters into liquidation, whether compulsory or voluntarily, or where a proceeding in receivership, bankruptcy or insolvency has been instituted by or against such party or its property.

(c) Toronto Hydro, at its sole discretion, may terminate this Agreement immediately upon written notice where the Consultant or any of its Representatives has been in default in the performance of its duties, obligations or undertakings under this Agreement, and has not taken immediate steps to remedy such default within five (5) Business Days following written notice of the specific default by Toronto Hydro. For the purposes of this section, a material default shall include, without limitation, a breach of any of the representations or warranties contained herein or the failure or refusal to provide the Services in accordance with the terms and conditions of this Agreement.

(d) Notwithstanding any other provision in this Agreement, Toronto Hydro, at its sole discretion, shall have the right to terminate this Agreement, for any reason, upon two (2) weeks written notice to the Consultant.

7.2 Effect of Termination

Upon the termination or expiration of this Agreement, the Consultant shall return to Toronto Hydro and delete any and all electronic copies the Consultant may have of all documents and materials in its possession relating to the Services or this Agreement, including all Confidential Information and all Developments, whether completed or not.

8. CONFIDENTIALITY

(a) In performing the Services required by this Agreement, the Consultant may be provided access to Confidential Information. The Consultant acknowledges and agrees that:

(i) the Consultant shall not disclose, permit access to, transmit, or transfer the Confidential Information to any third party without the prior written authorization of Toronto Hydro;

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

(ii) the Consultant shall protect the confidentiality of the Confidential Information in its possession by exercising the same security measures it normally exercises with respect to its own confidential information and at minimum a reasonable standard of care;

(iii) upon the request of Toronto Hydro, and in any event upon the expiration or termination of this Agreement for any reason, the Consultant shall return (or delete, in the case of electronic documents) forthwith to Toronto Hydro all Confidential Information, including all copies and other materials containing the Confidential Information, which are in the possession or under the control of the Consultant;

(iv) the Consultant shall not use any Confidential Information for any purpose other than to perform the Services required by this Agreement. Without limiting the foregoing, the Consultant shall not, and shall not permit any of its Representatives to, use any Confidential Information in furtherance of its, or their, individual business or for its, or their, own benefit, profit or advantage, or for the benefit, profit or advantage of any other party; and

(v) Toronto Hydro is subject to MFIPPA and is governed by Governmental Authority such as the Independent Electricity System Operator ("IESO") and the Ontario Energy Board ("OEB") and shall have the right to disclose Confidential Information in accordance with the provisions of MFIPPA or as required by the IESO or the OEB.

(b) Notwithstanding the foregoing, the Consultant may disclose such Confidential Information:

(i) to any of the Representatives of the Consultant who agree to be bound by the obligations of confidentiality herein and who have a reasonable need to know such Confidential Information in the course of their duties for the Consultant but only for the purposes of the Consultant exercising its rights and obligations under this Agreement; and

(ii) in the event that the Consultant believes it is required by law to disclose, or is requested by a Governmental Authority to disclose, any Confidential Information to a Governmental Authority; provided that the Consultant shall, to the extent permitted by law, first inform Toronto Hydro of the request or requirement for disclosure to allow an opportunity for Toronto Hydro to apply for an order to prohibit or restrict such disclosure.

9. INTELLECTUAL PROPERTY

9.1 Use

Nothing in this Agreement shall be deemed to transfer, license, assign, permit the use of, or otherwise convey an interest in whole or in part to the Consultant of any Intellectual Property belonging to Toronto Hydro or any of its Representatives or any third party whose Intellectual Property is in Toronto Hydro's custody or control, and the use by the Consultant of any such Intellectual Property shall be subject to the prior written approval of Toronto Hydro.

9.2 Ownership

Toronto Hydro shall at all times have full rights and title to the Developments, and may at all times take possession of or use any completed or partially completed Developments, notwithstanding any provision, express or implied, to the contrary. Without limiting the generality of the foregoing, Toronto Hydro shall own all Intellectual Property rights in all Developments, and the Consultant hereby waives and assigns to Toronto Hydro any such rights, and agrees to give Toronto Hydro

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

and its Representatives all assistance as may be reasonably required to perfect such rights including, without limitation and where the Consultant is a corporation or partnership, obtaining waiver of moral rights from any of the Consultant's employees, partners or other Representatives.

9.3 Intellectual Property Protection

The Consultant expressly warrants that the manufacture, delivery, sale or use of the Consultant's Services will not infringe any Canadian or foreign patents, trademarks, copyrights, industrial design or other intellectual property rights and the Consultant shall indemnify and save Toronto Hydro harmless from all claims, judgments and decrees that may be entered against Toronto Hydro or its Representatives and against all damage, liability, costs and expenses (including legal fees and other attendant costs and expenses**)** Toronto Hydro incurs by reason of any infringement or claim thereof.

9.4 Pre-Existing Intellectual Property

Any pre-existing Intellectual Proprietary ("Pre-Existing IP") of Consultant or its licensors used to perform Services, or included in any Development, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of the Consultant and its licensors (collectively, "Consultant Information"). To the extent that Consultant incorporates any Consultant Information into the Development(s), Consultant hereby grants to Toronto Hydro a fully paid up, royalty free, irrevocable and non-cancellable, non-exclusive, assignable and transferable right to Use the Consultant Information without restriction, except that any such Use must be in conjunction with the Developments in which the Consultant Information is incorporated and not as a separate item. For the purpose of the foregoing, "Use" means one or more of the following rights to: use; modify; adapt; translate; create changes, alterations, modifications, improvements, adoptions, enhancements and derivative works based upon or derived from the Consultant Information; reproduce; copy; display; perform; communicate in any manner; license or sublicense. Consultant shall provide Toronto Hydro with a list of any freeware, shareware or open source software used in the Developments. Any pre-existing intellectual property of Toronto Hydro, including but not limited to software, appliances, methodologies, code, templates, tools, policies, records, working papers, know-how, data or other intellectual property, written or otherwise shall remain the exclusive property of Toronto Hydro.

10. <u>MISCELLANEOUS</u>

10.1 Survival

In addition to the terms in this Agreement that by their nature survive the expiry or termination of the Agreement, the terms of Section 5 (Representations, Warranties and Indemnities), Section 8 (Confidentiality), Section 9 (Intellectual Property), and Section 10.2 (Injunctive Relief) shall survive the expiry of this Agreement for a term of five (5) years.

10.2 Injunctive Relief

(a) The Consultant acknowledges and agrees that the terms of Section 8 (Confidentiality) and Section 9 (Intellectual Property) of this Agreement are reasonably necessary to protect the legitimate interests of Toronto Hydro, are reasonable in scope and duration, and are not unduly restrictive.

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

(b) The Consultant further acknowledges that a breach of any of the terms of Section 8 (Confidentiality) or Section 9 (Intellectual Property) would render irreparable harm to Toronto Hydro, and that a remedy at law for breach of these sections would be inadequate, and that Toronto Hydro shall therefore be entitled to any and all equitable relief, including, without limitation, injunctive relief without proof of actual damages, and any other remedy that may be available at law or in equity.

10.3 Subcontracting

The Consultant may not subcontract the performance of any part of the Services without Toronto Hydro's prior written approval. Where Toronto Hydro provides its prior written approval to the Consultant to subcontract all or part of the Services, then the Consultant shall enter into agreements with such permitted subcontractor(s) to require the permitted subcontractor(s) to provide Services in accordance with all of the terms of this Agreement. Notwithstanding the foregoing, the Consultant shall remain liable for any and all acts or omissions of any subcontractor(s) as if such acts or omissions were those of Consultant.

10.4 Force Majeure

Either party will be relieved of liability for delays in performance of its obligations hereunder where such delay is a result of Force Majeure. The party affected by the Force Majeure shall give prompt notice thereof to the other party and, upon cessation of the Force Majeure, shall take all reasonable steps to resume the performance of its obligations hereunder. If a delay in performance by reason of Force Majeure extends beyond thirty (30) Business Days, then either party may terminate this Agreement by written notice.

10.5 Waiver

No delay on the part of either party in exercising any of its rights hereunder or failure to exercise the same, nor the acquiescence thereto shall operate as a waiver except in the specific instance for which it is given and where such waiver is provided in writing by the party waiving its rights.

10.6 Amendments

None of the terms, conditions or provisions of this Agreement shall be varied, modified or altered except by written agreement signed by an authorized representative of each parties.

10.7 Assignment

Save and except for Toronto Hydro's right to assign this Agreement to any of its Affiliates, neither party may assign this Agreement or any of their rights or obligations hereunder, without the prior written authorization of the other party.

10.8 Enurement

This Agreement shall enure to the benefit of, and be binding upon, the parties hereto and their respective successors and permitted assigns.

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

10.9 Severability

In the event that any provision or portion of this Agreement is determined to be invalid or unenforceable for any reason, the remaining provisions or portions of this Agreement will be unaffected and will remain in full force and effect to the fullest extent permitted by law.

10.10 Non-Exclusive Agreement

This Agreement will not be interpreted to grant to the Consultant exclusive rights to provide the Services or to bind Toronto Hydro in any way to an exclusive relationship with the Consultant with regards to the Services or any other service.

10.11 Neutral Construction

The parties to this Agreement agree that this Agreement was negotiated fairly between them at arm's length, that the final terms of this Agreement are the product of the parties' negotiations, and that this Agreement shall be deemed to have been jointly and equally drafted by them, and that the provisions thereof should not be construed against a party on the grounds that such party drafted the Agreement in whole or in part.

10.12 Entire Agreement

This Agreement constitutes the entire agreement between the parties relating to the subject matter hereof. This Agreement supersedes any and all prior correspondence, warranties, covenants, collateral undertakings, or agreements, oral or otherwise, express or implied, unless otherwise contained herein.

10.13 Notices

(a) All questions or other communications regarding this Agreement, including any notices required by this Agreement, are to be addressed to the following addresses:

to Toronto Hydro:

SCHEDULE A

SERVICES

1. Services to be Performed

Toronto Hydro requires the Consultant to perform a review of asset condition assessments and condition-based risk management (CBRM) enhancements and customisations Toronto Hydro has implemented since 2018 (collectively, the "Services"). The Services shall include consideration of the general outputs of Toronto Hydro's Asset Condition Assessment (ACA) model, alignment with the core principles of the CBRM methodology, and generally accepted industry practices for condition and risk-based asset management.

2. Specifications

The Consultant shall carry out the following tasks with respect to the Services:

a) Review changes and enhancements Toronto Hydro has made to its health score methodologies since 2018.

A high-level review of the changes that have been implemented since 2018 to determine whether the assumptions are reasonable and appropriate.

The review will cover:

- Updates to calibration values (factors and condition caps and collars).
- Inclusion of additional inputs, e.g. flood plains, distance to roads, salt usage in location factor, etc.

Toronto Hydro shall provide the following to the Consultant to enable performance of this component of the Services:

- Summary of additional inputs (if any) that have been included in the models since 2018.
- Summary of changes to factors, caps and collars that have been implemented since 2018 and rationale for the changes.

Consultant shall ensure this review will be carried out by considering groups of asset classes together, where appropriate. For example, it is anticipated that calibration values for some transformer asset classes can be considered together.

b) Review the Current and Future Health Score outputs for all applicable asset classes.

Review the outputs (health index profiles) to examine if the results are reasonable for the calibrations used for two asset classes to be selected by Toronto Hydro.

Toronto Hydro shall provide the following to the Consultant to enable performance of this component of the Services:

- Current and future health index profiles for both asset classes selected.

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

- Summary of the inputs to the current health score (initial health score, observed condition factors and measured condition factors, reliability factor) on a per asset basis for both asset classes selected.

c) Review Toronto Hydro's implementation of additional CBRM components, including Probability of Failure, Consequence of Failure, asset criticality, and risk.

Review how Toronto Hydro have set the different consequence of failure, asset criticalities and probability of failure values to determine whether the implementation is reasonable and aligned with generally accepted industry practices. In addition, review Toronto Hydro's adoption of consequence of failure from their broader Value Framework to assess reasonable application and alignment with the CBRM approach.

Toronto Hydro shall provide the following to the Consultant to enable performance of this component of the Services:

- Details of how the consequence of failure values have been selected.
- Definitions of failure modes and categorisation of failures.

3. Timetable / Developments

The Consultant shall provide to Toronto Hydro the following Developments:

- Report(s) outlining its review, findings, and conclusions with respect to the Services tasks outlined in section 2 of this SCHEDULE A above.

Consultant shall provide a draft version of the above-noted Development(s) for Toronto Hydro's review prior to acceptance by Toronto Hydro and finalisation by the Consultant. Consultant may provide a portion of the Development(s) responsive to each task separately for Toronto Hydro's review.

Consultant hereby warrants that the Development(s) will meet all applicable specifications and shall correct any deficiencies discovered by Toronto Hydro for a period of thirty (30) days after final acceptance/receipt of the Development(s) by Toronto Hydro (the "**Warranty Period**").

Notwithstanding anything to the contrary in this Agreement, the Consultant shall provide the final version of the Deliverables to Toronto Hydro no later than June 30, 2023.

4. Services Conditions

The following additional conditions shall apply to the performance of the Services:

a) The Services shall be performed remotely.

b) All meetings between Toronto Hydro and the Consultant shall be facilitated via Webex or similar web-based platforms.

c) The Consultant acknowledges that the Development may be implemented by Toronto Hydro in its filings to a Governmental Authority. The Consultant shall further be available to speak to the Services in a regulatory proceeding as required by Toronto Hydro and/or the Ontario Energy Board relating to Toronto Hydro's 2025 rate application.

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

The degree of Consultant's participation shall be dependent on the degree of interest in the Services by OEB staff or any intervenors. Consultant's participation in such proceeding may entail, but is not limited to, preparation of expert report(s), responding to interrogatories and undertakings, provision of support prior to and during any hearings required by the OEB, and answers to any questions regarding the form, methodology, assumptions, and choices made in the provision of the Services, in either written or oral format (the latter in acting as a witness for Toronto Hydro).

The Consultant shall further comply with the requirements and agrees to accept the responsibilities set out in Rules 13 and 13A of the OEB's Rules of Practice and Procedure, attached as APPENDIX A.1 to this Agreement, when providing any Services relating to Toronto Hydro's 2025 rate application.

5. Fees

In exchange for the Services and Developments set out under this Agreement, Toronto Hydro shall pay to the Consultant a fixed fee in the amount of [redacted] on delivery of the Developments set out in section 2 of this SCHEDULE A above. Consultant shall invoice for the Services in accordance with section 6.2 of this Agreement.

With respect to the component of the Services set out under subsection 4(c) of this SCHEDULE A above, Toronto Hydro shall pay to the Consultant on a time and materials basis according to the Consultant's then-current rates as of the Effective Date of this Agreement, or as may otherwise be agreed upon by the parties in writing via an amendment to this Agreement.

EXCERPTED OEB RULES OF PRACTICE AND PROCEDURE

[please see attached]

APPENDIX A.1.pdf

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

12. Affidavits

12.01 An affidavit shall be confined to the statement of facts within the personal knowledge of the person making the affidavit unless the facts are clearly stated to be based on the information and belief of the person making the affidavit.

12.02 Where a statement is made on information and belief, the source of the information and the grounds on which the belief is based shall be set out in the affidavit.

12.03 An exhibit that is referred to in an affidavit shall be marked as such by the person taking the affidavit, and the exhibit shall be attached to and filed with the affidavit.

12.04 The OEB may require the whole or any part of a document filed to be verified by affidavit.

13. Written Evidence

13.01 Other than oral evidence given at the hearing, where a party intends to submit evidence, or is required to do so by the OEB, the evidence shall be in writing and in a form approved by the OEB.

13.02 The written evidence shall include a statement of the qualifications of the person who prepared the evidence or under whose direction or control the evidence was prepared.

13.03 Where a party is unable to submit written evidence as directed by the OEB, the party shall:

(a) file such written evidence as is available at that time;

(b) identify the balance of the evidence to be filed; and

(c) state when the balance of the evidence will be filed.

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

(a) the expert's name, business name and address, and general area of expertise;

(b) the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;

(c) the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;

(d) the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;

(e) in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and

(f) an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

(a) in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and

(b) at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

(a) scope and timing;

(b) the involvement of any expert engaged by the OEB;

(c) the costs associated with the conduct of the activities;

(d) the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of **Rule 13A.04**; and

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

(e) any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A**.

14. Disclosure

14.01 A party who intends to rely on or refer to any document that has not already been filed in a proceeding shall file and serve the document 24 hours before using it in the proceeding, unless the OEB directs otherwise.

14.02 Any party who fails to comply with **Rule 14.01** shall not put the document in evidence or use it in the cross-examination of a witness, unless the OEB otherwise directs.

14.03 Where the good character, propriety of conduct or competence of a party is an issue in the proceeding, the party is entitled to be furnished with reasonable information of any allegations at least 15 calendar days prior to the hearing.

SCHEDULE B

DEFINITIONS

In this Agreement, the following definitions shall apply:

"Affiliates"	has the meaning prescribed to it in the *Business Corporations Act* of Ontario, as amended from time to time;
"Agreement"	means this Agreement for Professional Consulting Services, including all recitals, schedules and attachments thereto;
"Anticipated Hours"	has the meaning prescribed in Section 4.2;
"Applicable Laws"	means all federal, provincial and municipal statutes, regulations, codes, by-laws, orders in council, directives, rules, guidelines and ordinances applicable to this Agreement, including without limitation all applicable OEB codes, rules or guidelines;
"Business Day"	means a day on which banks are open for business in the City of Toronto, Ontario, but does not include a Saturday, Sunday, or a civic or statutory holiday in the Province of Ontario;
"Confidential Information"	means the terms of this Agreement and any and all data or information relating to the business, management or affairs of Toronto Hydro, its customers, employees, or any of its Affiliates disclosed by Toronto Hydro to the Consultant pursuant to this Agreement, whether or not such Confidential Information is expressly identified as confidential. Notwithstanding the foregoing, Confidential Information does not include any information or data which: (a) information or data that is or becomes publicly known through no breach of the terms or conditions of this Agreement; (b) information or data that is independently developed without reference to Confidential Information and without breach of the terms and conditions of this Agreement; or (c) Confidential Information that is required by court order or other legal compulsion to be disclosed, in which case the Consultant shall give Toronto Hydro prior written notice of such disclosure, as permitted by law;
"Consultant"	Means EA Technology LLC;
“Consultant Information”	has the meaning prescribed in Section 9.4;
"Development"	means any and all works prepared, generated, created or designed by the Consultant pursuant to this Agreement, including without limitation all drawings, models, designs, formulae, methods, documents, reports, software, specifications, or source codes, and any related works, enhancements, modifications or additions thereto;
"Fees"	shall have the meaning as prescribed in Subsection 6.1(a);

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

"Force Majeure"	means any impediments beyond the control of the applicable party due, wholly or in part, directly or indirectly, to: strikes, lockouts, riots, epidemics, war, governmental regulations, fire, explosions, acts of God, or any other impediment beyond the control of the party affected;
"Governmental Authority"	means any government, legislature, municipality, regulatory authority, agency, commission, department, board or court or other law, regulation or rule-making public entity of similar authority, including, without limitation the OEB;
"Guidelines"	has the meaning prescribed in Subsection 4.5(e);
"HST"	means Harmonized Sales Tax;
"IESO"	means the Independent Electricity System Operator;
"Industry Standards"	means the then-current industry standards and best practices used or observed by leading Canadian and United States providers of services to companies similar to Toronto Hydro and which are the same or similar to the Services;
"Initial Term"	has the meaning prescribed to it in Section 3.1;
"Intellectual Property"	includes all trademarks, copyrights, patents, business names, trade secrets, proprietary software, analysis or techniques (whether or not patented or patentable), confidential or secret designs and processes, source codes, plans or devices, or other proprietary and intellectual property rights;
"MFIPPA"	means the *Municipal Freedom of Information Act;*
"OEB"	means the Ontario Energy Board;
"PIPEDA"	means the *Personal Information Protection and Electronic Documents Act* (Canada);
"Pre-Existing IP"	has the meaning prescribed to it in Section 9.4;
"Privacy Laws"	has the meaning prescribed to it in Section 4.5;
"Representative"	in respect of a party, means such party's directors, officers, employees, agents, contractors and advisors, the party's Affiliates, and all such Affiliates' respective directors, officers, employees, agents, contractors and advisors;
"Remittances"	has the meaning prescribed to it in Subsection 6.1(e);

DocuSign Envelope ID: 2A171E83-C8E0-490F-A7FC-875BE15912EB

"Services"	means all of the Developments, services and specifications to be provided, performed and met by the Consultant under this Agreement, as more particularly described in SCHEDULE A;
"Term"	has the meaning prescribed to it in Section 3.1; and
"Toronto Hydro"	Means Toronto Hydro-Electric System Limited.

DocuSign Envelope ID: 1F84A2E3-C5BA-4E50-9DE1-A3C418442CF4

SECOND AMENDING AGREEMENT

THIS SECOND AMENDING AGREEMENT (the "Amending Agreement") is made effective as of November 19, 2022 (the "Effective Date") between **ELEMENT ENERGY LIMITED** (the "Consultant") and **TORONTO HYDRO-ELECTRIC SYSTEM LIMITED** ("Toronto Hydro").

WHEREAS:

1. Toronto Hydro and the Consultant (each a "Party" and collectively, the "Parties") previously entered into an agreement for professional consulting services dated February 7, 2022 (the "Consulting Agreement"), pursuant to which the Consultant would develop a future energy scenarios model (the "FES Model"), as well as related services related to maintenance of the model, stakeholder engagement on behalf of Toronto Hydro, and weather correction of network data (the "Services");

2. The parties subsequently entered into a renewal and amending agreement dated June 1, 2022 to clarify scoping requirements related to the FES Model, implementing a change request process, set out changes relating to the applicable Fees, and renewing the Term of the Consulting Agreement for one (1) additional year (the "First Amending Agreement" and, together with the Consulting Agreement, the "Agreement"); and

3. The Parties hereto wish to further amend the Agreement to clarify the requirements of the Consultant's obligations as applicable to the Consultant's submissions to the Ontario Energy Board (OEB), as more particularly set out herein;

NOW THEREFORE, THIS AMENDING AGREEMENT WITNESSES that in consideration of the mutual covenants contained herein and for other valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Toronto Hydro and the Consultant agree as follows:

1. Any capitalized terms used but not defined herein shall be as defined in the Agreement, where applicable. The recitals above are agreed by the Parties to be true and deemed to form part of this Amending Agreement as if specifically restated herein.

2. Subsection 1(g) of SCHEDULE A to the Agreement is hereby deleted and replaced with the following:

(g) Participation in Toronto Hydro's Regulatory Application Process

The Consultant shall be available to provide information and documentation regarding the work carried out by the Consultant as part of the FES Report and all related Services for Toronto Hydro and the Consultant shall participate in a regulatory proceeding as required by the Ontario Energy Board as related to Toronto Hydro's 2025 rate application, provided that Toronto Hydro shall, to commercially reasonable efforts, request that the Ontario Energy Board meet the following accommodations:

i. The Consultant shall be given reasonable notice to participate in such proceeding.
ii. Any communication with the OEB shall be in English.
iii. The Consultant may attend the hearings of the OEB remotely (e.g. via Teams, Zoom or another similar teleconference facility), unless otherwise required by Toronto Hydro to attend the proceedings in person.
iv. The attendance by the Consultant shall take place, where feasible, during its working hours (between 9:00 – 18:00 UK time).

DocuSign Envelope ID: 1F84A2E3-C5BA-4E50-9DE1-A3C418442CF4

Notwithstanding the foregoing, the Consultant acknowledges and agrees that the OEB is a Governmental Authority and a regulator of Toronto Hydro. Toronto Hydro cannot direct the OEB to comply with any requests for accommodation on the part of the Consultant nor can Toronto Hydro exercise any binding authority over its own regulator.

If the OEB does not meet the above requested accommodations, Toronto Hydro shall reimburse to the Consultant its reasonable costs required for travel and attendance.

If the Consultant is not given reasonable notice to participate in such proceeding, it shall not be liable to Toronto Hydro for failure to participate in a regulatory proceeding. Notwithstanding the foregoing, the Consultant shall, in all circumstances, make commercially reasonable efforts to participate in all proceedings where requested by Toronto Hydro or a Governmental Authority, regardless of the timing of such notice.

The degree of Consultant's participation shall be dependent on the degree of interest in the FES Report by OEB staff and any intervenors. Consultant's participation in such proceeding may entail, but is not limited to, response to interrogatories and undertakings, provision of support prior to and during any hearings required by the OEB, and answers to any questions regarding the FES Report's form, methodology, assumptions, and choices made, in either written or oral format (the latter in acting as a witness for Toronto Hydro). Where the Consultant is required to testify or otherwise provide evidence at a hearing before the OEB, the Consultant shall comply with the requirements set out in rules 13 and 13A of the OEB's Rules of Practice and Procedure, appended hereto as APPENDIX A.3 to this SCHEDULE A.

Toronto Hydro shall, in exchange for its provision of the Services under this section 1(g), pay to the Consultant fees on an hourly basis at the rates set out in section 2(c) of this SCHEDULE A

3. The document attached hereto as Appendix 1 to this Amending Agreement is hereby appended as APPENDIX A.3 – OEB Rules of Evidence to SCHEDULE A of the Agreement. For greater clarity, APPENDIX A.3 shall form part of SCHEDULE A to the Agreement and shall not constitute an independent schedule.

4. All other terms and conditions of the Agreement remain continuously in full force and effect, unamended and shall be deemed to apply to this Amending Agreement.

[remainder of this page intentionally left blank]

DocuSign Envelope ID: 1F84A2E3-C5BA-4E50-9DE1-A3C418442CF4

5. This Amending Agreement, together with the Agreement, shall hereinafter constitute the entire agreement between the Parties with respect to the Services as further described in the Agreement, and supersedes any and all other agreements, understandings, discussions, negotiations, representations and correspondence which may have been made by or between the Parties respecting the same.

IN WITNESS WHEREOF the Parties hereto have executed this Amending Agreement as of the date first written above.

APPENDIX A.3 – OEB Rules of Evidence

[please see attached]

DocuSign Envelope ID: 1F84A2E3-C5BA-4E50-9DE1-A3C418442CF4

12. Affidavits

12.01 An affidavit shall be confined to the statement of facts within the personal knowledge of the person making the affidavit unless the facts are clearly stated to be based on the information and belief of the person making the affidavit.

12.02 Where a statement is made on information and belief, the source of the information and the grounds on which the belief is based shall be set out in the affidavit.

12.03 An exhibit that is referred to in an affidavit shall be marked as such by the person taking the affidavit, and the exhibit shall be attached to and filed with the affidavit.

12.04 The OEB may require the whole or any part of a document filed to be verified by affidavit.

13. Written Evidence

13.01 Other than oral evidence given at the hearing, where a party intends to submit evidence, or is required to do so by the OEB, the evidence shall be in writing and in a form approved by the OEB.

13.02 The written evidence shall include a statement of the qualifications of the person who prepared the evidence or under whose direction or control the evidence was prepared.

13.03 Where a party is unable to submit written evidence as directed by the OEB, the party shall:

(a) file such written evidence as is available at that time;

(b) identify the balance of the evidence to be filed; and

(c) state when the balance of the evidence will be filed.

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

DocuSign Envelope ID: 1F84A2E3-C5BA-4E50-9DE1-A3C418442CF4

(a) the expert's name, business name and address, and general area of expertise;

(b) the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;

(c) the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;

(d) the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;

(e) in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and

(f) an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

(a) in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and

(b) at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

(a) scope and timing;

(b) the involvement of any expert engaged by the OEB;

(c) the costs associated with the conduct of the activities;

(d) the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of **Rule 13A.04**; and

DocuSign Envelope ID: 1F84A2E3-C5BA-4E50-9DE1-A3C418442CF4

(e) any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A**.

14. Disclosure

14.01 A party who intends to rely on or refer to any document that has not already been filed in a proceeding shall file and serve the document 24 hours before using it in the proceeding, unless the OEB directs otherwise.

14.02 Any party who fails to comply with **Rule 14.01** shall not put the document in evidence or use it in the cross-examination of a witness, unless the OEB otherwise directs.

14.03 Where the good character, propriety of conduct or competence of a party is an issue in the proceeding, the party is entitled to be furnished with reasonable information of any allegations at least 15 calendar days prior to the hearing.

Master Client Agreement – Gartner Canada Co.

This **MASTER CLIENT AGREEMENT** (the "**MCA**") for subscription-based research and related services, dated April 20, 2022 (the "Effective Date"), is between Gartner Canada Co. of 5000 Yonge Street, 14th Floor, Suite 1402, M2N 7E9, Toronto ("**Gartner**") and Toronto Hydro-Electric System Limited of 14 Carlton Street Toronto, ON ("**Client**"), and sets forth the general terms applicable to the use of Gartner products and services (the "**Services**") provided to Client or any of its Affiliates. For purposes of the MCA, "**Affiliates**" means any entity that, directly or indirectly, controls, is controlled by, or is under common control of that party. "**Control**" means direct or indirect ownership of 50% or more of the stock or other interests entitled to vote for the election of the board of directors or other governing body of the entity.

1) ***Service Agreements***. Service Agreements set forth the Service(s) to be provided by Gartner (as more fully described in one or more "**Service Descriptions**"), the term of Client's license for such Services, and the fees payable by Client. Service Agreements are non-cancellable, and may be terminated only for material breach by either party, upon 30 days prior written notice, if the breach is not cured within the notice period. In the event of an inconsistency between any provision of this MCA and a provision of a Service Agreement, the Service Agreement shall control during its term.

2) ***Ownership and Use of the Services***. Gartner owns and retains all rights to the Services not expressly granted to Client. Only the individuals named in the Service Agreement (each a "**Licensed User**") may access the Services. Each Licensed User will be issued a unique password, which may not be shared. Client agrees to review and comply with the *Gartner Usage Policy* which is accessible to all Licensed Users via the "Policies" section of gartner.com. Among other things, the *Gartner Usage Policy* describes how Client may substitute Licensed Users, excerpt from and/or share Gartner research documents within the Client organisation, and quote or excerpt from the Services externally.

3) ***Warranty and DISCLAIMER OF WARRANTIES.*** Gartner warrants that the Services, in the form provided by Gartner to Client, and Client's use of the Services in accordance with this MCA will not infringe on any intellectual property rights of a third party. THE SERVICES ARE PROVIDED ON AN "AS IS" BASIS, AND GARTNER EXPRESSLY DISCLAIMS ALL OTHER WARRANTIES EXCEPT AS EXPLICITLY SET OUT IN THIS AGREEMENT, WHETHER SUCH WARRANTIES ARE EXPRESS OR IMPLIED, STATUTORY OR OTHERWISE, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, AND WARRANTIES AS TO ACCURACY, COMPLETENESS OR ADEQUACY OF INFORMATION. CLIENT RECOGNISES THE UNCERTAINTIES INHERENT IN ANY ANALYSIS OR INFORMATION THAT MAY BE PROVIDED AS PART OF THE SERVICES, AND ACKNOWLEDGES THAT THE SERVICES ARE NOT A SUBSTITUTE FOR ITS OWN INDEPENDENT EVALUATION AND ANALYSIS AND SHOULD NOT BE CONSIDERED A RECOMMENDATION TO PURSUE ANY COURSE OF ACTION. GARTNER SHALL NOT BE LIABLE FOR ANY ACTIONS OR DECISIONS THAT CLIENT MAY TAKE BASED ON THE SERVICES OR ANY INFORMATION OR DATA CONTAINED THEREIN. CLIENT UNDERSTANDS THAT IT ASSUMES THE ENTIRE RISK WITH RESPECT TO THE USE OF THE SERVICES.

4) ***Client Confidential Information.*** Gartner agrees to keep confidential any Client-specific information communicated by Client to Gartner in connection with this MCA that is (i) clearly marked confidential if provided in written form, or (ii) preceded by a statement that such information is confidential, if provided in oral form, and such statement is confirmed in writing within 30 days of its initial disclosure. This obligation of confidence shall not apply to any information that: (1) is in the public domain at the time of its communication; (2) is independently developed by Gartner; (3) entered the public domain through no fault of Gartner subsequent to Client's communication to Gartner; (4) is in Gartner's possession free of any obligation of confidence at the time of Client's communication to Gartner; or (5) is communicated by the Client to a third party free of any obligation of confidence. Additionally, Gartner may disclose such information to the extent required by legal process provided that Gartner shall, to the extent permitted by applicable law, notify Client prior to such disclosure to permit Client to seek remedy to prevent such disclosure.

5) ***Data Protection.*** In performing its obligations under this MCA, Gartner and Client will each comply with all applicable data protection legislation. In providing the services Gartner shall comply with its global privacy policy available at gartner.com/privacy.

6) ***Pricing.*** Notwithstanding anything to the contrary in this MCA or in any Service Agreement, the pricing quoted for the applicable Services under a Service Agreement will be consistent with the Gartner's fee categories then in-effect based on the Service(s) ordered, duration, and purchasing terms of the Service Agreement. The pricing quoted to a provincial crown corporation client will be consistent with Gartner's local government public sector fees for the services ordered.

7) ***Miscellaneous***

a) ***Assignability.*** This MCA and the rights granted to Client hereunder or under any Service Agreement may not be assigned, sublicensed or transferred, in whole or in part, by either party without the prior written consent of the other party, except to a successor to substantially all of the business or assets of a party by merger or acquisition. Where consent is required, it will not be unreasonably withheld.

DS
AB

b) ***Dispute Resolution.*** Any unresolved dispute arising out of or in connection with this MCA shall be decided by a single arbitrator appointed by and under the International Arbitration Rules of ADR Chambers International or the parties may agree on a sole arbitrator or, failing such agreement, a party may apply to a competent court in the Province of Ontario for the appointment of an arbitrator in accordance with the International Commercial Arbitration Act, R.S.O. 1990, Chapter I-9. The arbitration hearing shall take place in Toronto, Ontario, Canada, unless otherwise agreed by the parties or ordered by the arbitrator. The decision of the arbitrator shall be final and binding, and the award may be entered in any court having jurisdiction over the parties. The parties consent to the jurisdiction of the courts of the Province of Ontario. If a party seeks recognition and enforcement of an arbitration award in Quebec, such an award will be homologated in accordance with the Code of Civil Procedure of Quebec. Gartner shall have the right to obtain injunctive relief in any court of competent jurisdiction in the event of a breach of Section 2. The prevailing party in any arbitration shall be entitled to its reasonable attorneys' fees and costs, in addition to any award of damages or other relief. Notwithstanding the foregoing, a breach of sections 2, 3, 4, and 5 of this MCA or a breach by either party of any applicable law shall be excluded from the dispute resolution provisions set forth in this section 6 b), and the applicable party may take all steps it deems fit at law or equity or as otherwise prescribed in this MCA in the event of either event.

c) ***Applicable Law.*** This MCA shall be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein.

d) ***Use of Name, Trademark, and Logo***. Absent the prior written consent of the other party, neither party shall use the name, trademarks, or logo of the other in promotional materials, publicity releases, advertising, or any other similar publications or communications.

e) ***No Third Party Beneficiaries***. Subject to any permitted assignments pursuant to Section 6(a) above, this MCA is for the benefit of the parties only.

f) ***Surviving Clauses***. Sections 3, 4, 5 and 7 (b), (c), (d), (e), (f) and (g) shall survive the expiration or termination of this MCA.

g) ***Entire Agreement.*** This MCA, together with any Service Agreements, sets forth the entire agreement between the parties with respect to the subject matter hereof. This MCA supersedes any previous agreements between the parties and shall not be effective until countersigned by Gartner. No modifications may be made except in writing signed by both parties.

h) ***Term.*** This MCA shall remain in effect for a period of five (5) years from the Effective Date and may be terminated by either party, for any reason, upon written notice to the other party provided, however, that the MCA shall continue to govern any active Service Agreement through its term that was entered into between the parties before the MCA termination.

Consulting Services Supplement to the Master Client Agreement - Gartner Canada Co.

This Consulting Services Supplement ("Supplement") to the Master Client Agreement effective October 31, 2022 ("MCA") between Gartner Canada Co. located at 5000 Yonge Street, 14th Floor, Suite 1402, M2N 7E9, Toronto, ("Gartner") and TORONTO HYDRO-ELECTRIC SYSTEM LIMITED located at 14 CARLTON STREET, TORONTO, Ontario, M5B1K5 ("Client") amends the terms of the current MCA between Gartner and Client, and shall apply to all Consulting and/or Benchmarking Services ("Services") ordered by Client or its Affiliates from Gartner or its Affiliates. All other terms of the MCA shall remain in full force and effect. In the event of any conflict between the MCA and this Supplement, this Supplement shall prevail solely with respect to the subject matter hereto. The specific engagement and related fees shall be set forth in separate Statements of Work ("SOW"). For purposes of this Supplement, "Affiliates" shall mean any entity that, directly or indirectly, controls, is controlled by, or is under common control of that party. "Control" shall mean direct or indirect ownership of 50% or more of the stock or other interests entitled to vote for the election of the board of directors or other governing body of the entity. "Deliverable" means the written work product Gartner is to supply, or make available to Toronto Hydro as contemplated by this Supplement and set out and described in a SOW.

1. ***Intellectual Property.*** Client shall retain all right, title and interest in any proprietary materials supplied to Gartner ("Client Materials"), and grants Gartner all necessary rights and licenses for Gartner to fulfill its obligations under each SOW. Excluding any Client Materials, Gartner shall retain sole and exclusive ownership of the Deliverable(s), Gartner tools, methodologies, questionnaires, responses, and proprietary research and data generated in the course of performing the Services, together with all intellectual property rights therein (the "Gartner Materials"). Gartner grants Client a perpetual, non-exclusive, royalty-free license to use the Deliverables, subject to the limitations set forth in Section 3 (Use of Deliverables). Gartner shall not be restricted in its use of ideas, concepts, know-how, data and techniques acquired or learned in the course of performing the Services, provided that Gartner shall not use or disclose any of Client's confidential or proprietary information, as further defined in Section 4 (Confidentiality).

2. ***Benchmarking Services.*** With respect to any benchmarking services performed by Gartner, Gartner will only use Client's data in an aggregate and anonymous format and represents to Client that Client's data will not be capable of being de-aggregated or re-identified. Client acknowledges that the contents of the benchmarking Deliverables are based upon information which is proprietary to Gartner and contained in Gartner's database. Client's data will become part of the database. The database will be used by Gartner in future consulting and benchmarking engagements, provided that Gartner shall not, at any time, de-aggregate or re-identify Client's data or disclose such data to other existing Gartner clients, and Gartner acknowledges and agrees that Client's data shall remain the confidential property of Client.

3. ***Use of Deliverables.*** Subject to payment in full of the applicable fees, Gartner grants to Client, for internal purposes only, a worldwide, royalty-free, perpetual license to use, reproduce, display, distribute copies of, and prepare derivative works of the Deliverables. Unless the Deliverable is identified in a SOW as intended for external distribution by Client such as a Request for Proposal or similar document, Client shall not make the Deliverables available, in whole or in part, to anyone outside of Client, or quote excerpts from the Deliverables to the public. Notwithstanding the foregoing, Client may share the Deliverables with (i) its outside auditors and/or accountants, (ii) third parties who have signed appropriate confidentiality agreements with Client who are engaged by Client to review or implement suggestions or to further research the issues contained in the Deliverables, (iii) governmental or regulatory bodies as required by law, (iv) with Client's Affiliates provided that its Affiliates are made aware of the obligations under this Section and that Client remains liable for the use made of the Deliverables by its Affiliates.

4. ***Confidentiality & Data Protection***.
(a) The parties agree to keep confidential and not to use or disclose to any third parties any information of the other party learned or disclosed in connection with each SOW, including the Gartner Materials, regardless of

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7

whether such information is clearly marked as confidential. The obligation of the parties with respect to the confidential information shall terminate with respect to any particular portion of the confidential information if and when: (i) it is in the public domain at the time of its communication; (ii) it is developed independently by the receiving party without use of any confidential information; (iii) it enters the public domain through no fault of the receiving party subsequent to the time of the disclosing party's communication to the receiving party; (iv) it is in the receiving party's possession free of any obligation of confidence at the time of the disclosing party's communication; (v) it is communicated by the disclosing party to a third party free of any obligation of confidence; or (vi) the receiving party has the disclosing party's written permission.

(b) Each party shall provide notice to the other of any demand made upon it under lawful process to disclose or provide any of the other party's confidential information. The receiving party agrees to cooperate with the disclosing party, at the disclosing party's expense, if the disclosing party elects to seek reasonable protective arrangements or oppose such disclosure. Any confidential information disclosed pursuant to such lawful process shall continue to be confidential information.

(c) In performing its obligations under this Supplement, each of Gartner and Client will comply with all applicable data protection legislation. In the event that any personal data is exchanged under this Supplement or any SOW, the parties shall treat such personal data in accordance with their respective privacy policies and, in the case of Gartner, its global privacy policy and its obligations at section 5 of the MCA.

5. ***Limitation of Liability.*** Neither party shall be liable for any consequential, indirect, special or incidental damages, including but not limited to, lost profits, business failure or loss of use, arising out of use of the Deliverables or the Services, whether or not advised of the possibility of such damages. Except for liability for personal injury or death or for damage to property caused by the negligence or willful misconduct of a party or its employees, or a party's breach of its confidentiality, privacy, or intellectual property obligations under this Supplement, each party's total liability arising out of this Supplement and the provision of the Services shall be limited to three times (3x) the fees paid or payable by Client under the SOW under which such liability arises.

6. ***Fees and Expenses.*** The fees due to Gartner in connection with each SOW are set forth in the SOW and are exclusive of any applicable taxes. All taxes are the responsibility of the party to which those taxes apply. Client agrees to pay all reasonable travel-related expenses incurred by Gartner in connection with the consulting services. Out-of-pocket expenses related to travel and subsistence will be billed at the actual amount incurred, and are not included in the professional fee applicable to each SOW.

7. ***Acceptance of Deliverables.*** All Deliverables provided by Gartner to Client shall be deemed to be accepted within 15 days of receipt by Client unless Gartner receives written notice of non-acceptance within 15 days after delivery. Any notice of non-acceptance must state in reasonable detail how the Deliverables did not conform to the SOW and Gartner shall use its reasonable business efforts to correct any deficiencies in the Deliverables so that they conform to the SOW.

8. ***No Third-Party Beneficiaries.*** This Supplement is for the benefit of the parties only. None of the provisions of this Supplement are for the benefit of, or enforceable by, any third party. The parties agree that no third party shall have the right to (i) rely on the consulting services provided by Gartner, or (ii) seek to impose liability on Gartner as a result of the consulting services or any Deliverables furnished to Client.

9. ***Survival.*** Sections 1-5, 7, 8 10, and 11 shall survive any expiration or termination of this Supplement.

10. In addition to all other representations made in the MCA or this Supplement, Gartner further warrants that:

    a. The Services and Deliverables shall be provided in accordance with the specifications more particularly described in an applicable SOW;

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7

b. The Services shall be performed in a timely, professional, diligent and competent manner by personnel appropriately trained in the performance of such Services, and shall meet or exceed those standards generally observed by reputable and competent members of the same industry providing similar services;
c. in the course of performing the Services, Gartner shall comply with applicable law;
d. it has the corporate power and authority to enter into this Supplement and to perform its obligations hereunder, and that this Supplement constitutes a legal, valid, and binding obligation of Gartner, enforceable against Gartner in accordance with its terms;
e. all Deliverables are and will be free and clear of any pledges, liens, charges, security interests, restrictions, title defects, or encumbrances of any kind or character whatsoever such that title to the Deliverables and all media, materials and supplies housing the Deliverables delivered hereunder shall pass to Toronto Hydro in accordance with the terms hereof free and clear of all liens and encumbrances; and
f. it is a registrant for purposes of the Excise Tax Act and the regulations thereunder, each as amended.

11. ***Indemnification.*** Gartner warrants that the Services and/or Deliverables, in the form provided by Gartner to Client and Client's use of the Services and/or Deliverables will not infringe on any intellectual property rights of a third party, and Gartner has the full unencumbered right and entitlement to license and/or assign all intellectual property rights in the Deliverables to Toronto Hydro, where so required.

Gartner agrees to indemnify, defend and hold Client, its officers, directors, agents and employees harmless from and against any and all liabilities, damages, losses, expenses, claims, demands, suits, fines, penalties (whether civil or criminal) or judgments, including reasonable attorneys' fees, costs arising from or relating to a claim by a third party that the Services infringe upon any third party intellectual property right. Client shall: 1) promptly notify Gartner in writing of any such claim; 2) permit Gartner to control the defense or settlement of such claim, and 3) reasonably cooperate with Gartner in such defense or settlement. Gartner shall have no obligation under this section for a claim of infringement to the extent it is based on any unauthorized modification or use of the Services by Client.

This Supplement shall be subject to the terms and conditions of Gartner's Master Client Agreement, which is incorporated herein by this reference, and together with the applicable SOW for the services shall constitute the entire legal agreement for such services. This Supplement may be executed in counterparts.

The parties have caused this Supplement to be executed by their authorized representatives.

1.0 Scope, Objectives and Outcomes

Toronto Hydro-Electric System Limited ("Toronto Hydro") requires an independent and objective expert assessment of process maturity of its IT functional areas and to establish a reliable baseline of its overall IT spend and staffing positions relative to comparable peer organizations in the utility industry.

In the short-term, these maturity and cost baseline assessments will provide a fact-based action plan for the organization's regulatory filing and catalyze a roadmap of initiatives that Toronto Hydro's IT Leaders will drive to advance maturity and efficiency levels consistent with Toronto Hydro's Business and IT strategic objectives.

Longer term, these maturity and cost baseline assessments will form the basis for a transformational strategy as a result of the current state baseline and recommendations of this effort.

Gartner Canada Co. ("Gartner")'s insights and recommendations will highlight IT capabilities needed for Toronto Hydro to align to existing organizational strategies, increase the pace of value being brought to the business, and enable the possibility for future transformational aspirations.

- Gartner will combine several unique and proprietary Gartner assets and capabilities that will give Toronto Hydro a fact-based, objective starting point for its ongoing strategic direction. These capabilities include:
    - Gartner Research maturity models aligned to key capability areas that integrate Gartner Research insights and industry leading frameworks to support maturation objectives.
    - Gartner's world-leading IT Benchmark database to support a fact-based comparison, using a custom-built peer group to Toronto Hydro's environment, to anchor the current state in key IT enterprise-level cost and staffing measures.
- Outcomes of the engagement will include:
    - A current state summary of Toronto Hydro's maturity across the Utility Industry.
    - A current state summary of Toronto Hydro's IT spend and staffing levels relative to peers with a comparable environment that will identify optimization opportunities to focus future strategic efforts. The analysis will include, but not be limited to, the following metrics:
        - IT Spending as a Percentage of Revenue
        - IT Spending as a Percentage of Operating Expense
        - IT Spending per Company Employee
        - Capital vs Operational Spending
        - Run vs Grow vs Transform Spending
        - Distribution of IT Spending by Category (Hardware, Software, Personnel etc.)
        - Distribution of IT Spending by Domain (Apps Development, App Support etc)

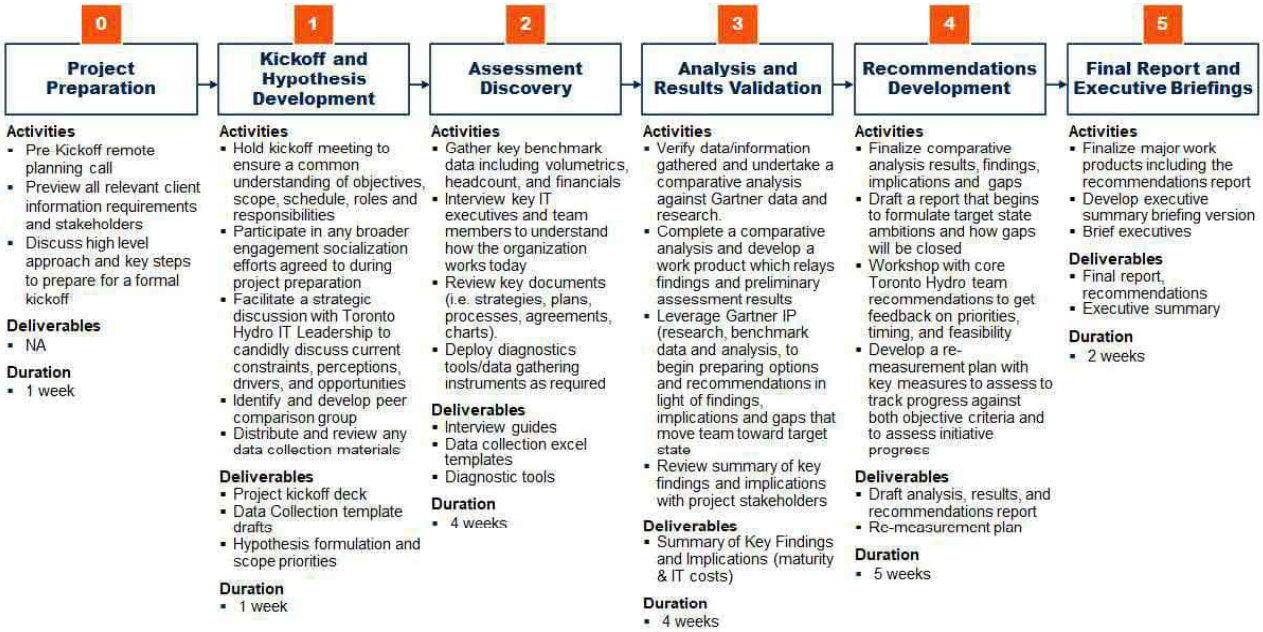
For RESTRICTED use of Toronto Hydro only.

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7



- Revenue Per Employee
- IT Staff as a Percentage of Company Employees
- IT Contractor Usage
- Distribution of IT Staff by Domain
- Other broad spending measures as mutually agreed

- A set of prioritized recommendations based on the comparative analysis that will advance Toronto Hydro in areas directly impactful to the IT and business objectives.
- Guidance on appropriate re-measurement periods and the foundation to measure progress objectively.

1.1 Overall Approach and Methodology

1.1.1 Overall Approach

Gartner will utilize its knowledge and experience in working with Utilities and Ontario Government and other public sector organizations which engage in similar enterprise IT benchmarks and maturity assessments to document the spending and capability maturity compared to peers. Gartner will use its Research, IT Optimization and Consulting IP to inform this activity, and we will also apply our best practices in conducting such benchmarks and assessments.

1.1.2 Methodology Detail

Table 1. Gartner Task Descriptions

Step 0. Project Preparation	
Objective	• Set the foundation for a successful project that is delivered on time, within budget and meets Toronto Hydro's objectives
Activities Performed by Gartner	• Pre-Kickoff remote planning call • Preview all relevant client information requirements and stakeholders • Discuss high level approach and key steps to prepare for a formal kickoff
Toronto Hydro's Responsibilities	• Ensure attendance at (1 hour teleconference) kickoff meeting by Project Executive Sponsor, Project Core team and key stakeholders, as determined prior to kickoff • Provide relevant context and/or early documentation
Deliverable(s)	• None
Time Frame	• 1-2 Days

Step 1. Project Kickoff and Approach Refinement	
Objective	• Work closely with Toronto Hydro to refine the scope of the project, ensuring that design principles are identified for the relevant design domains /groupings
Activities Performed by Gartner	• Hold kickoff meeting to ensure a shared understanding of objectives, scope, schedule, roles and responsibilities • Participate in any broader engagement socialization efforts agreed to during project preparation • Facilitate a strategic discussion with Toronto Hydro IT Leadership to discuss current constraints, perceptions, drivers, and opportunities • Distribute and review any data collection materials • Discuss and agree on key stakeholders to participate in Step 2
Toronto Hydro's Responsibilities	• Ensure attendance at (2-3 hr) project kickoff Executive Sponsor, Project Core team and key stakeholders, as required
Deliverable(s)	• Project kickoff deck • Data Collection template drafts • Hypothesis formulation and scope priorities

Gartner

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7

Time Frame	• 1 Week

Step 2. Assessment Discovery

Objective	• Gather sufficient information and insight to develop an understanding of the current state of IT at Toronto Hydro across in-scope areas, as well the current spend and staffing posture; model preliminary benchmark peers
Activities Performed by Gartner	• Gather key benchmark data including volumetrics, headcount, and financials • Interview key IT resources across functional areas • Review key documents (i.e. strategies, plans, processes, agreements, charts). • Deploy diagnostics tools/data gathering instruments as required
Toronto Hydro's Responsibilities	• Coordinate meetings with Toronto Hydro personnel • Attend interviews to provide input and identify opportunities & challenges • Provide relevant documentation as required • Complete data gathering templates as required
Deliverable(s)	• Interview guides; Data collection excel templates; Diagnostic tools • Ongoing Project Status Reports to convey progress
Time Frame	• 4 Weeks

Step 3. Analysis and Results Validation

Objective	• Complete an iterative comparative analysis of maturity against industry standards and best practices, as well as analysis of the benchmark data gathered vs. the custom peer group selected.
Activities Performed by Gartner	• Verify data/information gathered and undertake a comparative analysis against Gartner data and research. • Provide key observations for Toronto Hydro's performance against it's peer group. • Complete a comparative analysis and develop a work product which relays findings and preliminary assessment results. • Leverage Gartner IP (research, benchmark data and analysis) to begin preparing options and recommendations in light of findings, implications and gaps that move team toward target state. • Review summary of key findings and implications with project stakeholders to present key themes emerging from the comparative analysis, from which recommendations can be made.

For RESTRICTED use of Toronto Hydro only.

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7

Toronto Hydro's Responsibilities	• Support ongoing questions, or requests for information • Attend workshop to review preliminary results and provide feedback on the analysis
Deliverable(s)	• Draft Findings, Analysis, and Benchmark Results
Time Frame	• 4 Weeks

Step 4. Recommendations Development

Objective	• Based on nuanced context to support Toronto Hydro's IT Strategic Objectives and the results of the assessment, develop and prioritize specific recommendations and provide a strategic roadmap to advance Toronto Hydro IT
Activities Performed by Gartner	• Finalize comparative analysis results, findings, implications and gaps. • Draft a report that begins to formulate target state ambitions and how gaps will be closed across all in scope areas, advancing both strengthening operations and supporting efficiency objectives • Workshop with core Toronto Hydro team recommendations to get feedback on priorities, timing, and feasibility • Develop a re-measurement plan with key measures to assess to track progress against both objective criteria and to assess initiative progress
Toronto Hydro's Responsibilities	• Participate in (2-3 hour) recommendations and priorities workshop
Deliverable(s)	• Draft analysis, results, and recommendations report • Re-measurement plan and measures
Time Frame	• 5 Weeks

Step 5. Final Report and Executive Briefing

Objective	• Finalize report, brief executives, and support execution momentum
Activities Performed by Gartner	• Finalize major work products including the recommendations report. • Develop executive summary briefing version. • Brief executives • Provide inputs and support in preparation for the regulatory filing, drafting responses to Interrogatory questions etc. (up to a maximum of 25 hours of effort)
Toronto Hydro's Responsibilities	• Review report and provide feedback
Deliverable(s)	• Final Report

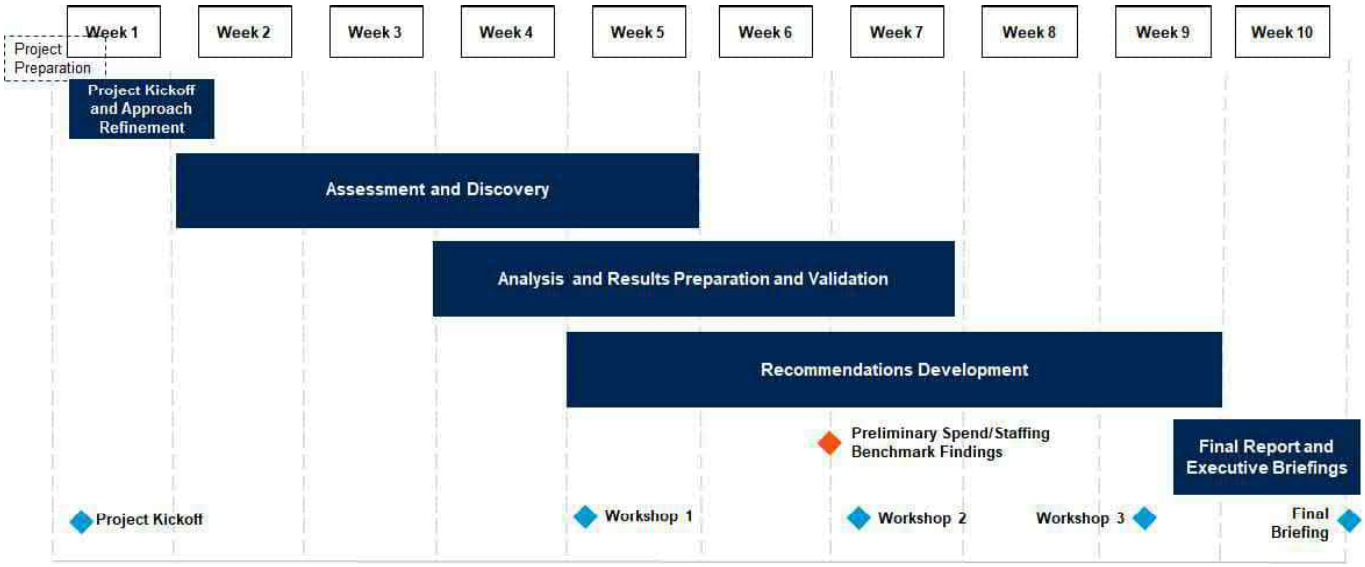
- Executive Summary Briefing
- Interrogatory responses (where applicable)



Time Frame

- 2 Weeks

1.1.3 Project Plan and Schedule

Gartner anticipates completion of each annual benchmark within 10 weeks, as detailed in the following figure. This schedule is dependent on the assumptions included in this Statement of Work (SOW). Actual start date is indicative and will be confirmed upon authorization of SOW.

Figure 1. Estimated Engagement Schedule

© 2022 Gartner, Inc. and/or its affiliates. All rights reserved.
For RESTRICTED use of Toronto Hydro only.

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7

2.0 Assumptions

The deliverables, schedule and pricing in this SOW are based on the following assumptions:

Toronto Hydro Participation:

- Toronto Hydro will designate a project manager to act as the primary point of contact for this project. The Toronto Hydro project manager will be expected to work closely with the Gartner employees as needed and will: (a) approve project priorities, detailed step plans and schedules; (b) facilitate the scheduling of Gartner interviews with appropriate client personnel; (c) notify Gartner in writing of any project or performance issues; and (d) assist in resolving project issues that may arise
- The work effort described in this SOW assumes Toronto Hydro IT personnel are available to assist in the manner defined in this SOW. In the event that Toronto Hydro personnel are not available, a change request may be necessary if there is an impact on scope, schedule or other key parameters.
- Toronto Hydro will review and approve documents within five business days. If no formal approval or rejection is received within that time, the deliverable is considered to be accepted by Toronto Hydro
- Toronto Hydro will schedule Toronto Hydro resources for project activities and provide meeting facilities as necessary
- Toronto Hydro personnel will be available per the final project schedule
- Gartner will formally capture feedback on your overall experience via our client survey. This allows us to quantify our performance on this project and to ensure a culture of continuous improvement of process and best practice

Data Collection:

- The due diligence (as-is) data are reasonably available via interviews and documentation review
- Toronto Hydro will provide timely access to all appropriate personnel to be interviewed. These personnel will provide data necessary to complete this project, answer questions, provide existing documentation and attend working sessions
- Project pricing assumes that Gartner will conduct 15 – 20 interviews/consultations and that Toronto Hydro will arrange all sessions with Toronto Hydro IT Personnel
- All data collection and interviews/workshops will take place via telephone or web conference

Key Personnel:

- Resumes of key personnel provided in this SOW are representative resumes of Gartner team members that deliver these types of engagements.
- Where it is indicated in this SOW, that a proposed project team member is a sub-contractor to Gartner, Toronto Hydro agrees to the inclusion of that individual as a member of the project team so long as the sub-contractor is suitably qualified to provide the services. In the event that such inclusion is not reasonably acceptable to Toronto Hydro, Gartner will be informed at the earliest opportunity and requested to find an alternative team member

© 2022 Gartner, Inc. and/or its affiliates. All rights reserved.
For RESTRICTED use of Toronto Hydro only.

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7

Place of Performance:

- All Gartner services will be performed at Gartner locations.

Deliverables and Change to Scope:

- Any requests for additional information or resource (beyond the details described in the steps above) that are made by Toronto Hydro will be considered a change in scope for this project and will be handled accordingly (see Changes to Scope section of this SOW)
- All deliverables will be developed using Microsoft products (e.g., Word and PowerPoint) and will be produced in English only.

Gartner Independence and Objectivity:

- Gartner Research and Consulting recommendations are produced independently by the Company's analysts and consultants, respectively, without the influence, review or approval of outside investors, shareholders or directors. For further information on the independence and integrity of Gartner Research, see "Guiding Principles on Independence and Objectivity" on our website, gartner.com or contact the Office of the Ombuds at ombuds@gartner.com or +1 203 316 3334.
- Notwithstanding anything to the contrary, Gartner shall further, with respect to the Services under this Statement of Work, comply with Rule 13A Expert Evidence of the Ontario Energy Board's Rules of Practice and Procedure, and agrees to accept the responsibilities imposed on them by that rule with respect to any testimony before the Ontario Energy Board

Timeline

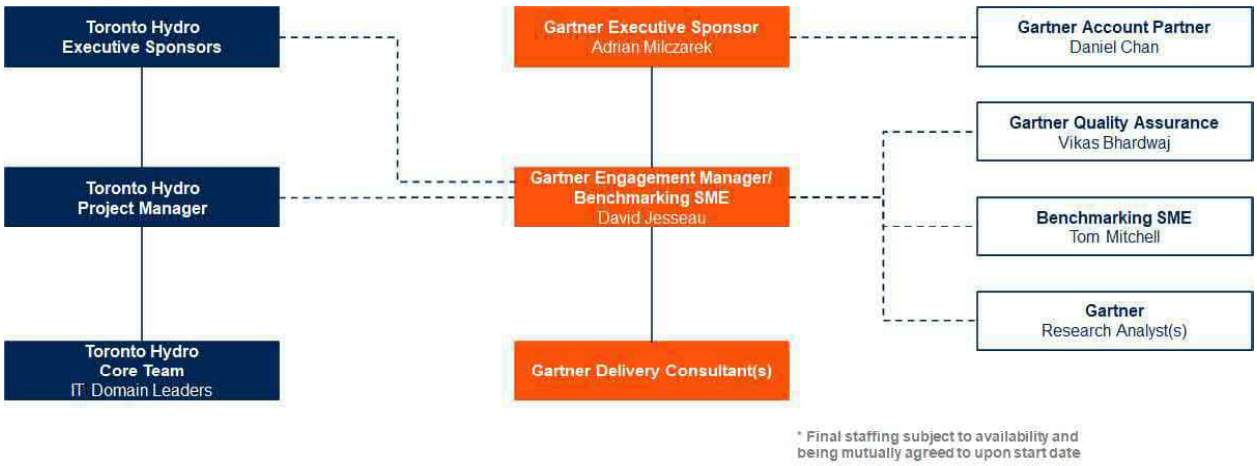
- Notwithstanding anything to the contrary in this SOW, Gartner shall complete all services and deliver all Deliverables no later than ten (10) weeks from the execution of this SOW by both parties, ***provided that,*** Toronto Hydro promptly completes its duties and/or obligations set forth in this SOW.

Intellectual Property

- Notwithstanding anything to the contrary in this SOW, the Master Client Agreement, or the Consulting Services Supplement to the Master Client Agreement between the parties, the parties acknowledge and agree that Toronto Hydro shall, at all times, have full rights and title to the Deliverables generated by Gartner under this SOW, including without limitation any reports any related modifications, or additions thereto (collectively, the "SOW Work Product"), and may at all times take possession of or any use of any completed SOW Work Product, notwithstanding any provision, express or implied, to the contrary. Without limiting the generality of the foregoing, Toronto Hydro shall own all intellectual property rights in all SOW Work Product, and Gartner hereby waives and assigns to Toronto Hydro any such rights, and agrees to give Toronto Hydro and its representatives all assistance as may be reasonably required to perfect such rights including, without limitation, obtaining waiver of moral rights from any of Gartner's employees, partners, or other representatives.

© 2022 Gartner, Inc. and/or its affiliates. All rights reserved.
For RESTRICTED use of Toronto Hydro only.

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7



Notwithstanding the foregoing, Gartner shall retain sole and exclusive ownership of any pre-existing Gartner tools, methodologies, questionnaires, responses, and proprietary research and data, together with all intellectual property rights therein (the "Gartner Materials"). Gartner grants to Toronto Hydro a fully paid up, perpetual, non-exclusive, royalty-free, non-assignable license to the Gartner Materials contained within the SOW Work Product. For the avoidance of any doubt, Toronto Hydro may share the SOW Work Product and any embedded Gartner Materials with the Ontario Energy Board (OEB).

3.0 Gartner Project Team Overview and Experience

Gartner is proposing a team that is highly qualified in the areas of IT Benchmarks and capability maturity assessments. This section details the proposed team, brief description of their roles, responsibilities and expertise, and organizational chart.

Gartner has created an organization structure for this engagement that ensures high-level sponsorship and quality assurance, strong day-to-day project management, a focused team of project consultants, and deep subject matter expertise. The key roles and proposed individuals for the Gartner team are shown in Figure 2 below.

Figure 2. Gartner Project Team for Toronto Hydro

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7

Functional Role	Responsibilities
Executive Sponsor	▪ Ensure that Gartner activities support Toronto Hydro's goals. ▪ Build and maintain a long-standing relationship with Toronto Hydro. ▪ Provide high-level oversight to the engagement and become more heavily involved should any issue resolution be necessary.
Gartner Engagement Manager	▪ Be responsible for the day-to-day management of engagement initiatives. ▪ Ensure that deliverables are completed on time and meet the Gartner quality standards. ▪ Act as the primary point of contact for the Gartner team. ▪ Work closely with Toronto Hydro to ensure that Gartner is meeting its needs.
Project Consultant(s) and SME(s)	▪ Provide day-to-day consulting support for project steps. ▪ Provide support for data collection, data analysis and recommendations for activities. ▪ Participate in deliverable creation, deliverable review and client presentations as needed. ▪ Present results to Toronto Hydro as needed.
Quality Assurance	▪ Provide quality assurance review of Gartner project plan and Gartner deliverables throughout the engagement. ▪ Ensure value through use of the Gartner Project Management Life Cycle detailed in this document. ▪ Provide team with deep industry advisory and oversight ▪ Verify industry best practices and provide industry insights
Research Analyst(s)	▪ Support the core project team by providing a context-sensitive perspective to issues specific to Toronto Hydro based on Gartner industry-leading research. ▪ Participate in analysis and comparisons, and review deliverables as needed.

Role	Responsibilities
Executive Sponsor(s)	The Sponsors are responsible for the overall conduct of all phases of the project. The Sponsors: ▪ Provide executive level sponsorship. ▪ Appoint members to the Steering Committee. ▪ Approve the charter. ▪ Authorize project expenditures within the approved project budget.
Toronto Hydro Project Manager	The Project Manager works closely with the Proponent Project Manager to execute the project and is jointly accountable for project delivery and success. ▪ Manages Toronto Hydro's activities of the project within the approved plans and budget and oversees the overall project plan ▪ Plans, schedules and assigns Toronto Hydro project resources as required. ▪ Ensures all Proponent deliverables are meeting Toronto Hydro's scope, quality, timeline and budgetary requirements. ▪ Initiates corrective action for deviations from the approved plans. ▪ Drives the overall project to meet milestone & completion dates. ▪ Controls scope of the overall project to ensure on-time, on-budget delivery. ▪ Manages day-to-day tasks, issues, budgets and risks.
Toronto Hydro Extended Project Team	▪ Performs work as directed by Toronto Hydro's Project Manager.

4.0 Changes to Scope

- The scope of this engagement is defined by this SOW. All Toronto Hydro requests for changes to the SOW must be in writing and must set forth with specificity the requested changes. As soon as practicable, Gartner shall advise Toronto Hydro of the cost and schedule implications of the requested changes and any other necessary details to allow both parties to make an informed decision as to whether they will proceed with the requested changes. The parties shall agree in writing upon any requested changes prior to Gartner commencing work.
- As used herein, "changes" are defined as work activities or work products not originally planned for or specifically defined by this SOW. By way of example and not limitation, changes may include the following:
  - Any activities not specifically set forth in this SOW

© 2022 Gartner, Inc. and/or its affiliates. All rights reserved.
For RESTRICTED use of Toronto Hydro only.

Gartner

DocuSign Envelope ID: F34C0BF2-80F2-41EE-85C6-7355C6D858F7

- Providing or developing any deliverables not specifically set forth in this SOW
- Any material change in the respective responsibilities of Gartner and Toronto Hydro, including any reallocation or any changes in engagement or project manager staffing
- Any rework of completed activities or Deliverables following acceptance of such Deliverables by Toronto Hydro
- Any additional work caused by a material change in the assumptions set forth in this SOW
- Any material delays in deliverable caused by modification of acceptance criteria in this SOW

i. Any changes to Research Analysts' time or resources

5.0 Investment Summary: Fees and Expenses

Gartner will conduct the steps outlined in this SOW for a firm-fixed price of $275,000 CAD, exclusive of any applicable taxes.

Billing:

- Gartner will conduct the steps as outlined in this SOW for the firm-fixed price defined above.
- Gartner will bill for 50% of the professional fees upon execution of this SOW by both parties, followed by the balance of 50% upon completion of the final report, approved by Toronto Hydro

i. This includes pre-payment of 25 hours towards Regulatory Filing support, per Step 5 in section 1.1.2

Invoicing:

- All invoices are payable net 30 days from the date of invoice. While we do not itemize billing for services, we agree and will comply with any reasonable requests for records substantiating our invoices.
- If Toronto Hydro requires a purchase order (PO) number, please specify the PO number in the Authorization section and forward a copy of the PO, with this agreement, to name/address or fax of appropriate individual. Ensure that the PO includes all labor and travel expenses quoted in this SOW. Any pre-printed terms on the PO that are in addition to or in contradiction of the terms of this agreement shall be inapplicable.

6.0 Authorization

- This SOW is submitted under the terms and conditions of the Master Client Agreement dated April 20, 2022 and the Consulting Services Supplement to the Master Client Agreement dated October 31, 2022 each between Gartner Canada Co. and Toronto Hydro-Electric System Limited.

Agreement for Purchase of Services

THIS AGREEMENT is made this 1st day of October, 2020,

BETWEEN:

Toronto Hydro-Electric System Limited.,

a corporation incorporated under the laws of Ontario

(hereinafter called "Toronto Hydro")

and

Stantec Consulting Ltd.

a corporation incorporated under the laws of Canada

(hereinafter called the "Vendor")

WHEREAS:

A. Toronto Hydro requires the supply of engineering services including the design, development, and drafting of construction standards, technical support for distributed energy resources connections and protection, systems planning and market analysis, program and project management services, data science and analytics, and enterprise asset management (EAM) for ERP, as detailed in SCHEDULE A (collectively, the "Services");

B. the Vendor carries on the business of providing these engineering and related services and has indicated to Toronto Hydro that it has the skill and expertise to provide the Services on the terms and conditions set forth herein;

C. the Vendor has agreed to provide the Services to Toronto Hydro and Toronto Hydro has agreed to purchase the Services, upon the terms and conditions as set forth below; and

D. this Agreement is issued in connection with RFP 20P-0448 dated March 9, 2020 (the, including any schedules, attachments, amendments, supplements or addenda thereto and the Vendor's submission in response thereto dated April 20, 2020.

NOW THEREFORE, in consideration of the mutual covenants contained herein and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

1. Interpretation

a) All capitalized terms in this Agreement shall have the meaning as defined in SCHEDULE C;

b) The recitals hereto shall form an integral part of this Agreement as if specifically restated herein;

c) Words denoting the singular include the plural and vice versa and words denoting any gender include all genders;

d) The word "including" shall mean "including without limitation";

e) Any reference to a statute shall mean the statute in force as of the date hereof, together with all regulations promulgated thereunder as may be amended, re-enacted, consolidated and/or replaced, from time to time, and any successor statute thereto, unless otherwise provided;

f) When calculating a period of time within which or following which any act is to be done or step taken, the date which is the reference day in calculating such period shall be excluded, and if the last day of such period is a Saturday, Sunday or statutory holiday, the period shall end on the next Business Day;

g) All dollar amounts in this Agreement are expressed in Canadian dollars, unless otherwise stated;

h) The division of this Agreement into separate articles, sections, subsections and Schedules and the insertion of headings is for convenience of reference only and shall not affect the construction or interpretation of this Agreement; and

i) Save and except as otherwise expressly defined within the body of this Agreement or in SCHEDULE C hereto, words or abbreviations which have well known or trade meanings are used herein in accordance with their recognized meanings.

2. Schedules, Exhibits and Appendices

The following schedules and appendices are attached to and form part of this Agreement:

a) SCHEDULE A –Services Required
    i. Appendix 1 – Project Work Order

b) SCHEDULE B – Purchase Price

c) SCHEDULE C – Defined Terms

d) SCHEDULE D – Supplier Quality Manual

In the event of a conflict between the terms of any schedule, exhibit or appendix and the terms of this Agreement, the terms of this Agreement shall govern.

3. Purchase and Sale

Subject to the terms and conditions of this Agreement, and in reliance on the representations, warranties and conditions set forth in this Agreement, Toronto Hydro agrees to purchase the Services from the Vendor and the Vendor agrees to supply the Services to Toronto Hydro during the Term of this Agreement.

4. Term

a) Subject to any termination rights herein, this Agreement shall be for a term of 3 years, from October 1, 2020 to October 1, 2023 (the "Initial Term").

b) Toronto Hydro may, at its sole option, elect to renew this Agreement for three (3) additional 1 year terms (each a "Renewal Term") by giving written notice to the Vendor at least sixty (60) days before the end of the Initial Term or the first Renewal Term, as applicable. The same terms and conditions contained herein shall apply during the Renewal Term, save and except as amended in writing by the parties.

c) The Initial Term and the Renewal Term, if any, shall hereinafter together be referred to as the "Term".

5. Price and Payment

a) The prices for the Services shall be as specified in SCHEDULE B hereto and, except as otherwise provided, shall be in Canadian dollars DDP Toronto Hydro's location (INCOTERMS 2010), and shall represent the total cost to Toronto Hydro, excluding any value added taxes (including HST) but including without limitation all other applicable taxes, duties, packaging, handling and delivery costs. Toronto Hydro shall withhold any applicable non-resident withholding taxes from any amount owing in this Agreement and remit such taxes to the appropriate federal taxing authority. If no price is stipulated in this Agreement, the price must not exceed the last previous quotation made by the Vendor to Toronto Hydro for the same Services.

b) Unless otherwise provided in this Agreement, the Vendor shall invoice Toronto Hydro after final inspection and acceptance by Toronto Hydro of the Services performed and subject to receipt of all documents required by this Agreement. **Invoices must be sent electronically to: AP@torontohydro.com.** Subject to approval of the invoice by Toronto Hydro, receipt of all documents required by this Agreement, and final review by Toronto Hydro, Toronto Hydro shall make payment to the Vendor via electronic funds transfer not later than thirty (30) days following receipt of an acceptable invoice and the EFT Information (as set out below). **The Vendor must provide Toronto Hydro with, in the case of the first payment only, (i) a void cheque, pre-printed deposit slip or bank confirmation letter and (ii) the email address where the Vendor wishes to receive remittance information (together, "EFT Information"). EFT Information must be sent electronically to efthelp@torontohydro.com or to 14 Carlton Street, Toronto, ON, M5B 1K5, Attention: Treasury Department.** Toronto Hydro reserves the right to pay the Vendor through other payment methods.

6. Delivery of Services

a) All Services shall be performed in accordance with the terms, specifications and schedules included in SCHEDULE A. The Vendor shall immediately notify Toronto Hydro, in writing, of any circumstances known or suspected that may cause delay in performance of the Services.

b) In the event of any question, dispute, disagreement or difference of opinion between Toronto Hydro and the Vendor relating to the quality or acceptability or rate of progress of any Services or relating to the interpretation of the specifications in SCHEDULE A or the performance of this Agreement,

the opinion of Toronto Hydro or its authorized Representative shall govern and be binding on the parties hereto.

7. Invoice Requirements

The Vendor shall submit invoices to Toronto Hydro in accordance with Section 5 of this Agreement and the payment terms as set out in SCHEDULE B. Each invoice shall contain:

a) a detailed description of the Services performed during the invoice period;

b) the dates and the amount of time spent by the Vendor for the provision of the Services;

c) the hourly rates;

d) the total HST applicable to the Services during the invoice period, as well as the Vendor's HST registration number; and

e) a detailed description of any applicable disbursements incurred around the invoice period, supported by documentation in a form acceptable to Toronto Hydro.

8. Inspection

All Services performed will be subject to final inspection and approval by Toronto Hydro after performance, notwithstanding any prior payment. In the event that Services are performed which are not in conformity with the terms and conditions and specifications of this Agreement, Toronto Hydro may, at its option:

a) reject the Services and require the Vendor to immediately re-perform the Services;

b) negotiate with the Vendor an agreeable reduction in the price of the delivered, non-conforming Services;

c) rework, or cause to be reworked, the delivered, non-conforming Services, at the Vendor's expense, which expense shall constitute a proper set-off by Toronto Hydro against amounts otherwise due to the Vendor under this Agreement; or

d) reject the Services and require a repayment of applicable amounts for such deliverables.

9. Representations, Warranties and Covenants

The Vendor represents and warrants to Toronto Hydro that:

a) it has the corporate power and authority to enter into this Agreement and to perform its obligations hereunder, and that this Agreement constitutes a legal, valid, and binding obligation of the Vendor, enforceable against the Vendor in accordance with its terms;

b) the Vendor, after conducting due diligence, is not aware of any actions, suits or other legal proceedings which may affect its ability to perform this Agreement;

c) the Services shall be performed in a professional, diligent and competent manner and shall meet those standards generally observed by reputable and competent members of the same industry providing similar services;

d) it is an expert, trained, equipped and capable in providing the Services and shall only use reliable, qualified and Competent Persons to perform the Services;

e) it is in compliance with and has paid, and will continue to pay, all assessments and other amounts owing pursuant to the WSIA; and

f) it is satisfied with the conditions under which the Services will be performed, and shall assume full responsibility for understanding the conditions of supply, operations, and service.

10. Warranty

All Services shall be provided in compliance with Applicable Laws in a professional, diligent, and competent manner using fully qualified, professionally and technically, personnel entitled to legally work in the Ontario, Canada exercising the level of skill and diligence required of a qualified and reasonable contractor. The Services will conform to the descriptions as specified in SCHEDULE A hereto. This warranty is in addition to all other warranties specified in SCHEDULE A or implied by law and shall survive acceptance and payment.

11. Personnel

The Vendor shall inform Toronto Hydro of turnover of all personnel within its organization that are connected to the Services being provided by the Vendor to Toronto Hydro (whether a Required Resource or not) in a timely fashion, but in no case longer than five (5) Business Days from such effective termination, in order to allow Toronto Hydro to make arrangements for its protection.

12. Health and Safety

The Vendor shall be responsible for:

a) managing the health and safety of its own personnel and its other Representatives;

b) ensuring compliance with all Applicable Laws related to health and safety, including without limitation the OHSA; and

c) ensuring that its personnel and its other Representatives are aware of any safety hazards involved in working in or around Toronto Hydro's facilities and all Applicable Laws with respect thereto.

Neither Toronto Hydro, nor its Representatives, shall be liable for any loss, damages or claims arising directly or indirectly from the Vendor's work in or around Toronto Hydro's facilities, and the Vendor hereby waives any claims to which it may become entitled for loss or damage and releases Toronto Hydro and its Representatives from any and all such claims.

13. Permits and Applicable Laws

a) The Vendor shall, at its sole expense, obtain and maintain during the Term of this Agreement, all permits, licences and approvals required by all Applicable Laws to perform its obligations under this Agreement. The terms and conditions of this Agreement shall be carried out in strict

compliance with all Applicable Laws and in the event of any conflict between any Applicable Laws, the Applicable Laws with the most stringent standard shall apply.

b) Without limiting the generality of subsection 13(a) above, the Vendor shall comply with the *Personal Information Protection and Electronic Documents Act* (Canada), MFIPPA and any other applicable privacy legislation with respect to any personal information collected, used or disclosed in connection with this Agreement and shall indemnify and hold harmless Toronto Hydro and its Representatives from and against any and all claims, demands, suits, losses, damages, causes of action, fines or judgments (including related expenses and legal costs) they may incur related to or arising out of any non-compliance therewith by the Vendor or its Representatives.

14. Compliance with Guidelines

The Vendor's personnel shall comply with all rules and direction of Toronto Hydro, whether specified in this Agreement or otherwise, while working on Toronto Hydro's premises, distribution system or when accessing or connecting to Toronto Hydro's information technology systems, including rules and directions concerning health, safety, security and environmental protection, including without limitation, Toronto Hydro's *Code of Business Conduct*, Toronto Hydro's *Disclosure Policy*, Toronto Hydro's *Social Media and Digital Communication Guidelines*, Toronto Hydro's *Accessibility Standards for Customer Service Policy*, Toronto Hydro's *Workplace Harassment Policy*, Toronto Hydro's *Violence Prevention in the Workplace Policy*, Toronto Hydro's *Environmental Policy*, Toronto Hydro's *Occupational Health & Safety Policy*, Toronto Hydro's *Privacy Policy Statement*, Toronto Hydro's *Cyber Security Policy*, Toronto Hydro's *Technology Use Guidelines*, and the *Affiliate Relationships Code for Electricity Distributors and Transmitters* issued by the OEB (together, the "Guidelines"). The Vendor acknowledges that it has been provided with a copy of the Guidelines, has provided and will provide a copy of the Guidelines to each of its Representatives and that it agrees to comply with and to direct its Representatives to comply with such Guidelines, as amended.

15. Liability and Indemnification

The Vendor shall be liable for and shall indemnify and hold harmless Toronto Hydro and its Representatives from all claims, demands, actions, penalties, damages, losses, judgments and settlements, liabilities, costs, expenses, including legal fees and other related costs and expenses arising out of, related to, or incident to, the Vendor or any of its Representatives' performance of the Services under this Agreement, including, without limitation:

a) any breach, violation or non-performance by the Vendor or any of its Representatives of any terms, conditions, warranties, obligations or covenants contained in this Agreement;

b) any breach or violation by the Vendor or any of its Representatives of any Applicable Laws; and

c) any actions, omissions, negligence or wilful misconduct of the Vendor or any of its Representatives.

Except for losses arising out of, related to or incident to: (i) breach of Applicable Laws; (ii) wilful misconduct; (iii) damage to persons or tangible property due to negligence; (iv) breach of confidentiality or privacy obligations; or (v) breach of Section 21 (Intellectual Property Protection), Vendor's total liability shall not exceed the greater of : (i) the total amount of fees paid to Vendor under the applicable purchase order; and (ii) five million dollars ($5,000,000.00) and the proceeds of insurance, as set out in Section 16 below. Subject to the foregoing, in no event shall either party be liable for any indirect or consequential damages (including lost profits or loss of revenue).

16. Insurance

a) Unless otherwise specified in this Agreement, the Vendor shall, during the Term of this Agreement, and at its own expense, maintain and keep in full force and effect:

i. commercial general liability insurance on an occurrence basis having a minimum inclusive coverage limit, including personal injury and property damage, of five million dollars ($5,000,000.00) per occurrence, which shall be extended to cover contractual liability, products and completed operations liability, contingent employer's liability, owners/contractors protective liability and must also contain a cross liability clause and a severability of interest clause, and must name Toronto Hydro and its Affiliates as additional insureds;

ii. Errors and Omissions Insurance (Professional Liability) covering actual or alleged acts, errors or omissions committed by the Vendor or its Representatives, arising out of the performance of this Agreement, which shall also extend to include personal injury, bodily injury and property damage from the performance of professional services, in the amount of two million dollars ($2,000,000.00);

iii. any and all insurance and/or financial assurance required by the Ministry of the Environment and any applicable Governmental Authority as well as environmental liability insurance and pollution liability coverage on at least a sudden and accidental basis, all on a per occurrence basis having a coverage limit of five million dollars ($5,000,000.00) per occurrence.

iv. automobile liability insurance on all owned and non-owned vehicles used in connection with this Agreement and such insurance coverage shall have a limit of two million dollars ($2,000,000.00) per accident, in respect of bodily injury (including passenger hazard) and property damage inclusive of any one accident and mandatory accident benefits.

b) All insurance coverages and limits required to be maintained by the Vendor shall be primary to any insurance maintained by Toronto Hydro, which shall be excess and non-contributory. Prior to the commencement of the delivery of the Services, the Vendor shall deliver to Toronto Hydro a certificate of insurance which evidences the Vendor's compliance with this Section, including the provision of a thirty (30) day prior written notice of cancellation to Toronto Hydro. The Vendor agrees that the insurance described herein does in no way limit the Vendor's liability pursuant to the indemnity provisions of this Agreement.

c) A waiver of subrogation shall be provided by the commercial liability insurer(s) to Toronto Hydro.

17. Subcontractors

The Vendor may only subcontract any of the Service under this Agreement with the prior written consent of Toronto Hydro. If subcontracting is permitted, the Vendor shall enter into agreements with such subcontractors to require them to perform the Services in accordance with all Applicable Laws and the terms of this Agreement and the Vendor shall be liable for any acts or omissions of such subcontractors as if such acts or omissions were those of persons directly employed by the Vendor. The Vendor agrees to incorporate the terms of this Agreement into all subcontract agreements with its subcontractors. Any subcontract shall not relieve the Vendor from any of its obligations or liabilities under this Agreement.

18. Termination

a) Toronto Hydro may, for its convenience and at its sole option, terminate this Agreement by providing at least sixty (60) days prior written notice of such termination. Upon issuance of such notice, the Vendor shall stop performance of the Services under this Agreement, except as may be necessary to carry out such termination and take any other action which Toronto Hydro may reasonably direct. Upon a termination for convenience, Toronto Hydro shall pay for such Services requested and accepted by Toronto Hydro up until the effective date of such termination. Toronto Hydro shall not be liable to the Vendor for any other costs or damages whatsoever arising from such termination, including without limitation, any indirect, consequential or special damages such as a loss of profit or loss of opportunity.

b) If the Vendor fails to fulfil any covenant or material obligation under this Agreement, including, without limitation, the failure to meet the delivery schedule or any specification contained herein, or breaches any representation or warranty contained herein, then Toronto Hydro may, without prejudice to any other right or remedy Toronto Hydro may have, notify the Vendor in writing that the Vendor is in default of its contractual obligations and instruct the Vendor to correct the default within five (5) Business Days immediately following the receipt of such notice. If the Vendor fails to correct the default in the time specified, then, without prejudice to any other right or remedy Toronto Hydro may have, Toronto Hydro may either correct such default and deduct the cost thereof from any payment then or thereafter due to the Vendor and/or terminate this Agreement.

c) If bankruptcy or insolvency proceedings are instituted by or against the Vendor or the Vendor is adjudicated a bankrupt, becomes insolvent, makes an assignment for the benefit of creditors or proposes or makes arrangements for the liquidation of its debts, or a receiver or receiver and manager is appointed with respect to all or part of the assets of the Vendor, Toronto Hydro may, without prejudice to any other rights or remedies it may have, immediately terminate this Agreement.

d) The termination of this Agreement shall not affect any rights or obligations which may have accrued prior to such termination or any other rights which the terminating party may have arising out of either the termination or the event giving rise to the termination.

19. Time of the Essence

Time is of the essence in this Agreement. The Vendor shall perform all Services in accordance with the dates and times for performance and delivery specified in SCHEDULE A hereto and Toronto Hydro shall have the right to take possession of and use any completed or partially completed portions notwithstanding any provisions expressed or implied to the contrary.

20. Force Majeure

a) As used herein, “Force Majeure” means events beyond the reasonable control of a party applying reasonable diligence and foresight given the nature of the Services being provided under the Agreement, including, as applicable, any acts of God and the public enemy, the elements; fire; accidents; vandalism; sabotage; power failure; strikes, lockouts or any other industrial, civil or public disturbances; any laws, orders, rules, regulations, acts or restraints of any government or governmental body or authority, civil or military, including the orders and judgments of courts and any other similar causes or acts.

b) If, by reason of Force Majeure, either party hereto (the "Frustrated Party") is delayed or unable, in whole or in part, to perform or comply with any obligation or condition of this Agreement, then it will be relieved of liability and will suffer no prejudice for failing to perform or comply or for delaying such performance or compliance during the continuance and to the extent of the inability so caused from and after the happening of the event of Force Majeure, provided that it gives to the other party prompt notice of such inability, reasonably full particulars of the cause thereof and the expected cessation. If notice is not promptly given, then the Frustrated Party will only be relieved from performance or compliance from and after the giving of such notice. The Frustrated Party will use its best efforts to remedy the situation and remove, so far as possible with reasonable dispatch, the cause of its inability to perform or comply, provided, however, that settlement of strikes, lockouts and other industrial disputes shall be within the discretion of the Frustrated Party. The Frustrated Party will give prompt notice of the cessation of Force Majeure. If at any time the Vendor cannot deliver the Services required to be provided pursuant to the Agreement due to Force Majeure, Toronto Hydro may engage any other party to provide such Services which the Vendor cannot provide. The benefit of this provision of Force Majeure shall only survive for thirty (30) days from the commencement of an event of Force Majeure. A requirement to disclose Confidential Information other than under Canadian law pursuant to the terms of this Agreement shall not be an event of Force Majeure. A failure by a sub-contractor to perform shall not be an event of Force Majeure for a Frustrated Party unless such sub-contractor is itself suffering from an event of Force Majeure and the provisos set forth above are followed.

21. Intellectual Property Protection

The Vendor expressly warrants that the manufacture, delivery, sale or use of the Vendor's Services will not infringe any Canadian or foreign patents, trademarks, copyrights, industrial design or other intellectual property rights and the Vendor shall indemnify and save Toronto Hydro harmless from all claims, judgments and decrees that may be entered against Toronto Hydro or its Representatives and against all damage, liability, costs and expenses (including legal fees and other attendant costs and expenses) Toronto Hydro incurs by reason of any infringement or claim thereof.

22. Confidential Information

The parties agree and acknowledge that, subject to Applicable Laws or court order,

a) each party (the "Receiving Party") shall maintain in strict confidence the terms of this Agreement and any and all proprietary and confidential information about the business, operations or customers of the other party or any of their Affiliates, which it acquires in any form from the other party (the "Disclosing Party") by virtue of this Agreement ("Confidential Information") and will not disclose to any third party or make use of such Confidential Information for itself or any third party without the prior written consent of the Disclosing Party;

b) the Receiving Party may disclose such Confidential Information to any of the Representatives of the Receiving Party or any of its Affiliates who agree to be bound by the obligations of confidentiality herein and who have a reasonable need to know such Confidential Information in the course of their duties for the Receiving party but only for the purposes of the Receiving party exercising its rights and obligations under this Agreement;

c) Toronto Hydro is subject to MFIPPA and is governed by governmental authorities such as the IESO and the OEB and shall have the right to disclose Confidential Information in accordance with the provisions of MFIPPA or as required by the IESO or the OEB;

d) a party shall be entitled to all remedies available at law or in equity to enforce, or seek relief in connection with any breach of obligations pursuant to this section;

e) the Receiving Party shall be responsible for any breach of this Agreement by it and its Representatives and by any other person to whom it discloses any Confidential Information. The Parties agree that the Disclosing Party would be irreparably injured by a breach of this Agreement by the Receiving Party, or by any person to whom it discloses any Confidential Information, and that monetary damages would not be a sufficient remedy. Therefore, in such event, the Disclosing Party shall be entitled to all available equitable relief, including injunctive relief without proof of actual damages, as well as specific performance. Such remedies shall not be deemed to be exclusive remedies for a breach of this Agreement but shall be in addition to all other remedies available at law or equity;

f) upon termination of this Agreement, or upon ten (10) days' prior written notice from the Disclosing Party requesting return of any or all Confidential Information, the Receiving Party shall forthwith return to the Disclosing Party all Confidential Information, including without limitation all copies of any form of the Confidential Information, the Receiving Party has received and, at the option of the Disclosing Party, deliver to the Disclosing Party, or destroy or have destroyed, any copies or other reproductions of the Confidential Information together with all notes, analyses, reports and other written material whatsoever prepared by, or on behalf of, the Receiving Party, from, or in respect of, the Confidential Information; provided that the Receiving Party shall be entitled to keep, subject always to all the provisions of this Agreement, one copy of such notes, analyses, reports or other written material prepared by, or on behalf, the Receiving Party for its records. The Receiving Party shall provide to the Disclosing Party, upon request, a certificate of an officer of the Receiving Party certifying such destruction; and

g) notwithstanding section 22(a), in the event that the Receiving Party believes it is required by law to disclose, or is requested by a Governmental Authority to disclose, any Confidential Information to a Governmental Authority, the Receiving Party may so disclose; provided that if legally allowed to do so, it shall, to the extent permitted by law, first inform the Disclosing Party of the request or requirement for disclosure to allow an opportunity for the Disclosing Party to apply for an order to prohibit or restrict such disclosure.

The terms of this Section 18 shall survive the expiry or termination of the Contract for a period of three (3) years.

23. Audit Rights

a) For the purpose of verifying the Vendor's compliance with this Agreement (including, without limitation, compliance with all Applicable Laws and verification of all amounts invoiced to Toronto Hydro), Toronto Hydro or its authorized Representative shall have access at all reasonable times to the Vendor's premises, financial data, personnel, files and records, correspondence, computer files, and books and accounting records relating in any manner to the Services. The Vendor shall ensure that Toronto Hydro or its authorized Representative has the same audit access with respect to subcontractors. All costs of conducting such audits shall be borne by Toronto Hydro.

b) If an audit indicates errors in any amount claimed by Vendor in respect of the Services, the Vendor shall make the appropriate adjustments to the amount claimed and promptly refund overpayments to Toronto Hydro.

c) Notwithstanding the foregoing, Toronto Hydro's right to inspect, copy and audit shall not extend to the composition of the Vendor's rates and fees, percentage mark-ups or multipliers but shall apply only to their application to the applicable units.

24. Workers' Rights

a) The Vendor shall at all times pay or cause to be paid any assessments or compensation required to be paid by the Vendor or its subcontractors pursuant to any applicable workers' compensation legislation, and upon failure to do so, Toronto Hydro may pay such assessments or compensation to the Workplace Safety and Insurance Board or other applicable authority, body or agency and may deduct such assessments or compensation from monies due to the Vendor. The Vendor shall comply with all regulations and laws relating to workers' compensation.

b) The Vendor agrees to indemnify and save harmless Toronto Hydro from and against all losses, liability, costs, charges, claims, damages, expenses or liens which may arise as a consequence of or result from any failure, including any delay in complying, of the Vendor or any of its subcontractors to comply fully with the provisions of this Section 24 or which may arise as a consequence of any illness, injury or death of any employee of the Vendor or any such subcontractor.

25. [INTENTIONALLY OMITTED]

26. Non-Solicitation

Unless Toronto Hydro's Chief Executive Officer provides prior written consent, the Vendor hereby covenants and agrees that during the term of this Agreement and for a period of two (2) years following the termination of the Agreement, however caused, the Vendor will not directly or indirectly, either individually or in partnership or jointly or in conjunction with any other Person,

a) hire or otherwise engage any Protected Employee who is currently employed by Toronto Hydro;

b) hire or otherwise engage any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause;

c) solicit or attempt to solicit any Protected Employee who is currently employed by Toronto Hydro or encourage any such person to leave his/her employment with Toronto Hydro; and

d) solicit or attempt to solicit any Protected Employee who was formerly employed by Toronto Hydro and is within the twelve (12) month period immediately following the Protected Employee's termination date provided that the Protected Employee's employment was not terminated without cause.

Given the unique expertise and intimate knowledge that the employees have of the operations of Toronto Hydro the Vendor acknowledges and agrees that the restrictions contained in this Section 23 are reasonable and necessary to preserve the value of Toronto Hydro's business.

27. Changes

a) Toronto Hydro may, without invalidating the Agreement, change or issue instructions or schedules for the Services, require the Vendor to perform extra or additional work, or require the Vendor to delete certain parts of the Services (any such change, a "Change Order"), with the purchase price and schedule for the Services being adjusted accordingly by the Change Order.

b) If the Vendor's costs or ability to meet the schedule are impacted by any failure by Toronto Hydro to perform any of Toronto Hydro's obligations under the Agreement in the manner or within the time periods required by the Agreement, the Vendor may submit a request for a Change Order pursuant to this Section for a change in the purchase price, the schedule or both, to the extent the Vendor incurs any additional costs or is delayed on account of Toronto Hydro's failure.

c) Upon receipt of notice of a required change in the Services, the Vendor shall promptly, and in any event within five (5) Business Days of receiving such written request, provide Toronto Hydro with a written estimate of the additional costs for such change or the cost savings with respect to deleted portions of the Services, as well as the impact to the schedule. In each case the estimate shall show the hours and costs to the Vendor for labour, materials, and equipment overhead, along with the impact on delivery, all with adequate supporting documentation.

d) After receipt of an estimate of costs related to a Change Order from the Vendor, Toronto Hydro will determine what amendments to the Agreement, if any, may be reasonably required by such changes. Any change to the scope of work will be agreed to by the parties prior to implementation and evidenced in a written Change Order signed by both parties provided that Toronto Hydro may direct the Vendor to proceed with a change pending dispute resolution.

e) Extra or additional work performed by the Vendor without a prior Change Order from Toronto Hydro shall be at the Vendor's sole cost and expense and Toronto Hydro shall not be liable for any claim by the Vendor.

f) The Vendor shall not suspend the unaffected portions of the Services while Toronto Hydro is in the process of making such changes and any related adjustment unless so initiated by Toronto Hydro.

28. Suspension

Toronto Hydro may, at any time during the term by notice in writing, suspend all or a portion of the Services. Upon receipt of such written notice, the Vendor shall perform no further work other than as directed by Toronto Hydro, and shall be entitled to payment for time spent in performing the Services up to the date of suspension.

29. Toronto Hydro Not Responsible

Notwithstanding any other provision in this Agreement, Toronto Hydro shall not be responsible for and shall not have control or charge of any means, methods, techniques, sequences or procedures used for or in respect of the Services, or for the safety precautions or programs required for the Services or otherwise prescribed hereunder. Toronto Hydro shall not be responsible for or have control or charge over the acts or omissions of the Vendor, subcontractors (if any) or their agents, employees or other persons performing any of the Services.

30. Preparation of the Agreement

Notwithstanding the fact that this Agreement was drafted by Toronto Hydro and its legal and other profession advisors, the parties acknowledge and agree that any doubt or ambiguity in the meaning, application or enforceability of any term or provision of this Agreement will not be construed or interpreted against Toronto Hydro or in favour of the Vendor when interpreting such term or provision, by virtue of such fact.

31. Publicity

The Vendor shall not use Toronto Hydro's (or its Affiliates') name, corporate logos or trade-marks in advertising or publicity nor the fact that any agreement between the Vendor and Toronto Hydro has been entered into without Toronto Hydro's express prior written consent, which may be withheld in the sole discretion of Toronto Hydro.

32. No Minimum Volume

The Vendor acknowledges and agrees that: (i) no portion of the Agreement shall be interpreted as imposing any minimum volume purchase commitment on Toronto Hydro; (ii) the Agreement does not obligate Toronto Hydro to award the procurement of any or all services associated with the Agreement to the Vendor, and services may be added or deleted in Toronto Hydro's absolute and sole discretion at any time; and (iii) the volume of purchase of the Services may diminish or be eliminated prior to the termination date of the Agreement without any liability on the part of Toronto Hydro, including but not limited to any claims by the Vendor for loss of anticipated profits.

33. Non-Exclusive Contract

It is expressly understood that the Agreement is non-exclusive with respect to the Vendor and Toronto Hydro. Toronto Hydro may contract with others for the procurement of the Services described herein in its sole discretion.

34. Assignment

Save and except for Toronto Hydro's right to assign this Agreement to any of its Affiliates, neither party may assign this Agreement or any of its rights or obligations hereunder, in whole or in part, without the prior written consent of the other party, which consent may not be unreasonably withheld.

35. Relationship of the Parties

Nothing contained in this Agreement shall be construed to constitute either party as the partner, employee or agent of, or joint venturer with the other party, nor shall either party have any authority to bind the other in any respect, it being intended that each party shall remain an independent contractor of the other. The Vendor is responsible for all deductions and remittances required by law in relation to its employees, including those required for Canada unemployment insurance, workers' compensation and income tax.

36. Severability

In the event that any of the covenants herein shall be held unenforceable or declared invalid for any reason whatsoever, to the extent permitted by law, such unenforceability or invalidity shall not affect the

enforceability or validity of the remaining provisions of this Agreement and such unenforceable or invalid portion shall be severable from the remainder of this Agreement.

37. No Waiver

A waiver of any provisions of this Agreement shall not constitute either a waiver of any other provisions or a continuing waiver, unless otherwise expressly indicated in writing.

38. Enurement

This Agreement and everything contained herein shall enure to the benefit of, and be binding upon, the parties hereto and their respective successors and permitted assigns.

39. Notice

All notices, requests, claims, demands and other communications hereunder shall be in writing and shall be deemed (in the absence of evidence of prior receipt) to have been validly and effectively given on the same day if personally served, the next Business Day if sent by e-mail or similar means of recorded communication or on the fifth Business Day next following if sent by registered mail. Notices shall be addressed as follows:

to Toronto Hydro:

Name:	Hani Taki
Title:	Director, Standards and Technical Studies
Address:	500 Commissioners St.
Telephone:	416 542 7853
Email:	htaki@torontohydro.com

with copy to:

Title:	Executive Vice-President, Public & Regulatory Affairs and Chief Legal Officer
Address:	14 Carlton Street, Toronto, ON M5B 1K5
Telephone:	(416) 542-3000
Email:	legal@torontohydro.com

to the Vendor:

Name:	Arielle Kadoch, P.Eng
Title:	Principal, Sector Leader
Address:	1060 Robert-Bourassa Boulevard, Suite 600
Telephone:	(514) 781-4488
Email:	Arielle.Kadoch@stantec.com

40. Compliance with Supplier Quality Manual

The Vendor shall comply with the Supplier Quality Manual which has been attached to this Agreement as SCHEDULE D.

41. ISN Compliance

The Vendor shall subscribe with ISN Software Corporation as a registrant for ISNetworld, maintain such subscription throughout the Term, provide all records and information as required by ISN Software Corporation and Toronto Hydro to allow for the maintenance of such subscription and maintain a rating of B or higher on the ISNetworld system by [insert date] and during the remainder of the Term.

42. Governing Law

This Agreement shall be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein. The parties irrevocably attorn to the jurisdiction of the courts of Ontario with respect to any matter arising under or related to this Agreement. Either party can terminate for cause without the obligation to engage in dispute resolution, mediation or arbitration.

43. Entire Agreement

a) This Agreement, including all schedules and appendices referred to herein and subsequent amendments, constitutes the entire agreement between the Vendor and Toronto Hydro relating to the subject matter hereof. This Agreement supersedes the terms of the RFP, the Proposal, any purchase order, and all prior correspondence, representations, warranties, covenants, collateral undertakings, discussions, negotiations, understandings or agreements, oral or otherwise, express or implied, unless otherwise provided in this Agreement.

b) No modification or amendment to this Agreement shall be binding on Toronto Hydro unless agreed to in writing.

44. Further Assurances

The Vendor agrees to execute such further assurances and documents, including any bills of sale, and to do all such things and actions which shall be necessary or proper for the carrying out of the purposes and intent of this Agreement.

45. Survival

In addition to the terms of this Agreement that by their nature survive the expiry or termination of this Agreement, the terms of Sections 9 (Representations, Warranties and Covenants), 15 (Liability and Indemnification), 21 (Intellectual Property Protection), 22 (Confidential Information), 36 (Severability), 38 (Enurement), 39 (Notice) and 42 (Governing Law) shall survive the expiry or termination of this Agreement for a period of five (5) years.

46. Execution and Counterparts

This Agreement may be executed in any number of counterparts (including by way of email) and all of such counterparts taken together shall be deemed to constitute one and the same instrument.

[*signature page follows*]

IN WITNESS WHEREOF, the parties have duly executed this Agreement as of the day and year first written above:

SCHEDULE A

Services Required

Introduction

Toronto Hydro requires the Vendor to provide the Services for various Toronto Hydro civil and electrical engineering projects. The Vendor shall have the resources and expertise available to execute a large volume of concurrent projects spread across various locations and range in a variety of scopes.

Continued assignments for the Services shall be based, at Toronto Hydro's discretion, on the quality of previous project work, timely submission of deliverables, and the ability of the Vendor to meet project expectations, as set out on a project-by-project basis.

Project Work Orders

Requests to perform the Services shall be assigned to the Vendor by Toronto Hydro in its sole discretion on a project by project basis through a project work order. The scope of work, staffing, and total price shall be determined prior to commencement of the Services on the project and set out in writing (the **"Project Work Order"** in the form provided at Appendix 1 to this Schedule).

Toronto Hydro may, in its sole discretion, terminate a Project Work Order by providing two (2) weeks' notice to the Vendor in writing, which notice shall specify the termination date of the Project Work Order. Upon termination of a Project Work Order, Toronto Hydro shall pay for such services requested and accepted by Toronto Hydro under the Project Work Order up until the effective date of such termination. Toronto Hydro shall not be liable to the Vendor for any other costs or damages whatsoever arising from such termination, including without limitation, any indirect, consequential or special damages such as loss of profit or loss of opportunity.

Services Required

1. Design, Development and Drafting of Construction Standards

a) Development of Construction Standards, including:

i. Electrical distribution system constructions standards development based on appropriate codes and regulations that govern a utility's practices, including, but not limited to, CAN/CSA C22.3 Overhead and Underground standards, Ontario Electrical Safety Code and Ontario Regulation 22/04, as applicable to:

- Overhead distribution systems
- Underground distribution systems
- Primary and secondary network systems
- Transformer and municipal stations
- Civil components of the standards
- Street Lighting
- Grounding
- Cable and conductors

- Switchgear

ii. Assessment of design and tool implications;
iii. Developing training documentation and provide technical training to Toronto Hydro staff and contractors;
iv. Instruction of engineering applications, as per field requirements; and
v. Approval of all standards by a Professional Engineer (P.Eng.), with Civil and Electrical disciplines required.

b) Drafting

i. Electrical equipment, civil equipment, and Construction Standards (both to scale or not to scale);
ii. Title blocks and cover page;
iii. Drafting to be completed in MicroStation; and
iv. Develop a quality assurance process to validate the outgoing quality of the completed work.

c) Design Consultation

i. Assess field requirements of system design and assess the applicability of components for fit and the provision of safe and reliable power;
ii. Identify different options and provide recommendations of the best designs;
iii. Research options for new requirements (code, regulatory, etc.) and applications;
iv. Assess safety, environmental, quality, and reliability impacts of design proposals;
v. Review and assess proposals and engineering drawings and provide recommendations;
vi. Ensure compliance with Standard Design Practices, Standard Practices, Conditions of Service and other internal policy documents;
vii. Review, revise and align Standard Design Practices, Standards Practices and other internal policy documents with industry best practices;
viii. Review design proposals from external parties and provide recommendations based on compliance to standards, design practices, codes and regulations and other internal processes/documents;
ix. Integrity evaluation/loading calculations and performing review and reporting on civil infrastructure such as vaults or pole lines over railway tracks;
x. Evaluation to ensure ample structural support when transporting equipment with flatbed or haulage company to worksite for overhaul or change out;
xi. Geotech Reporting for sensitivity areas;
xii. Excavation for areas with low water table to install or rebuild vaults and ducts; and
xiii. Preparing civil designs:

(a) where no underground infrastructure information is available for foreign utilities; and
(b) within private residential or commercial properties

d) Material Approval

i. Develop equipment and material requirements specifications for procurement purposes;

ii. Identification, technical assessments, verification of components, and how they are applied within the electrical distribution system while focusing on safety, productivity, quality, reliability, cost, and environmental impact;
iii. Review test reports and test results during the material approval process to ensure compliance; and
iv. Develop training documentation and provide technical training during new material introductions.

e) Quality Assurance

i. Perform statistical analysis of given data sets to generate trends, conclusions and recommendations;
ii. Perform root cause investigations of equipment failures and generate a technical report on subsequent analysis;
iii. Perform incoming source inspection of materials; and
iv. Perform inspections on equipment and construction installations against required specifications and Construction Standards.

Appendix 1 to Schedule A

Project Work Order

PROJECT WORK ORDER	
Retainer Date: (mm/dd/yyyy)	
Between (Firm name): ("Toronto Hydro") (the "Firm") and Toronto Hydro Electric-System Limited	
Title:	Reporting To:
Target Start Date: (mm/dd/yyyy)	Target Completion Date: (mm/dd/yyyy)
Description:	
Applicable Guidelines and/or Special Requirements: (By signing this Project Work Order, the Firm acknowledges having received a copy of the Guidelines and certifies it understands and agrees to the special requirements.)	
Ancillary Goods and Costs:	
This Project Work Order is subject to and governed by that certain Master Agreement for the Provision of Retained Staffing Services dated •, 2012 between Toronto Hydro and the Firm (the "Agreement"). Defined terms, usually denoted with initial capital letters, if not otherwise defined herein, shall have the respective meanings assigned thereto in the Agreement.	

SCHEDULE B

Purchase Price

Pricing for the supply of the Services shall be as according to one of the methods set out below, the method of compensation to be determined by Toronto Hydro in its sole discretion.

All pricing set out below shall be inclusive of the costs of equipment, materials, and required vehicles necessary for performing the Services. For clarity, the timing intervals used below shall have the following meanings:

1. Quarterly: 13 standard work-weeks, 40 hours per week;
2. Semi-annual: 26 standard work-weeks, 40 hours per week; and
3. Annual: 52 standard work-weeks, 40 hours per week.
4. Standard work week: 40 hours of work, excluding statutory and civic holidays in the Province of Ontario.

Price Schedule - Design, Development and Drafting of Construction Standards		
Name, if applicable	**Title/Role**	**Rate**
Jose Ribon	Account Manager and Team leader Distribution team	[redacted]

SCHEDULE C

Defined Terms

In this Agreement, the following definitions shall apply:

"Affiliates"	shall have the meaning as prescribed in the *Business Corporations Act* (Ontario);
"Agreement"	means this Agreement for Purchase of Services, including all Schedules and Appendices hereto and subsequent amendments;
"Applicable Laws"	means all federal, provincial and municipal statutes, regulations, codes, by-laws, orders in council, directives, rules, guidelines and ordinances applicable to this Agreement, including without limitation all applicable OEB codes, rules or guidelines;
"Business Day"	means a day on which banks are open for business in the City of Toronto, Ontario, but does not include a Saturday, Sunday, or a statutory holiday in the Province of Ontario;
"Change Order"	has the meaning prescribed to it in Section 27;
"Competent Persons"	shall have the meaning as prescribed in the OHSA;
"Confidential Information"	has the meaning prescribed to it in Section 22;
"DDP"	shall have the meaning prescribed to it in the Incoterms2010 rules published by the International Chamber of Commerce;
"Disclosing Party"	has the meaning prescribed to it in Section 22;
"EFT Information"	has the meaning prescribed to it in subsection 5(b);
"Force Majeure"	has the meaning prescribed to it in Section 20;
"Frustrated Party"	has the meaning prescribed to it in subsection 20(b);
"Governmental Authority"	means any government, legislature, municipality, regulatory authority, agency, commission, department, board or court or other law, regulation or rule-making public entity of similar authority, including, without limitation the OEB;
"Guidelines"	has the meaning prescribed to it in Section 14;
"HST"	means Harmonized Sales Tax;
"IESO"	means Independent Electricity System Operator;

"Initial Term"	has the meaning prescribed to it in subsection 4(a);
"MFIPPA"	means *Municipal Freedom of Information and Protection of Privacy Act* (Ontario) and the regulations thereunder, each, as amended;
"OEB"	means Ontario Energy Board;
"OHSA"	means *Occupational Health and Safety Act* (Ontario) and the regulations thereunder, each, as amended;
"Person"	means any individual, firm, corporation, unlimited liability company, partnership, limited liability partnership, joint venture, trust, unincorporated association, unincorporated syndicate, any governmental authority and any other legal or business entity;
"Project Work Order"	has the meaning prescribed to it in Schedule A and is in the form provided at Schedule E;
"Protected Employee"	means any individual who, during the course of their employment with Toronto Hydro, was directly or indirectly involved in: i. the procurement of the Services of the Vendor on behalf of Toronto Hydro; ii. the negotiation of the Vendor's Agreement on behalf of Toronto Hydro; and/or the awarding and/or approval of the Vendor's Agreement on behalf of Toronto Hydro;
"Quotation"	has the meaning prescribed to it in Recital D;
"Receiving Party"	has the meaning prescribed to it in Section 22;
"Renewal Term"	has the meaning prescribed to it in subsection 4(b);
"Representative"	in respect of a party, means such party's directors, officers, employees, agents and contractors, the party's Affiliates, and all such Affiliates' respective directors, officers, employees, agents and contractors;
"Required Resources"	has the meaning prescribed to it in subsection 11(a);
"RFQ"	has the meaning prescribed to it in Recital D;
"Services"	has the meaning prescribed to it in Recital A;
"Term"	has the meaning prescribed to it in subsection 4(c);
"Toronto Hydro"	has the meaning prescribed to in the preamble to this Agreement;
"Vendor"	has the meaning prescribed to in the preamble to this Agreement; and

"WSIA"	means *Workplace Safety and Insurance Act, 1997* (Ontario) and the regulations thereunder.

Toronto, Ontario M5B 1K5

Toronto Hydro
Climate Change Vulnerability Assessment Update

Scope of Work

June 2022

1 Purpose

Toronto Hydro is seeking to update the climate parameters as described in the engineering analysis results in the 2015 Toronto Hydro-Electric System Limited Climate Change Vulnerability Assessment (the "2015 Study") (copy enclosed) with newly available global climate modelling (GCM) data.

1.1 Background

The 2015 Study evaluated Toronto Hydro's electrical distribution system utilizing Engineers Canada's Public Infrastructure Engineering Vulnerability Assessment Protocol (PIEVC). The 2015 Study identified infrastructure climate change vulnerabilities and suggested opportunities for adapting infrastructure to climate change impacts. It included:

- The use of a system level approach to assess the impacts of climate change on the TH's electrical distribution system.
- Climate parameters and the annual probability including high temperature, heavy rainfall, snowfall, freezing rain, lightning strike, etc.
- A risk-based framework to assess vulnerability of TH's electrical system to the climate parameters A mapping of risk ratings was completed as part of the existing study.
- High level adaptation options under the themes of engineering actions, management actions, monitoring activities and further study.

The 2015 Study was filed with the Ontario Energy Board as part of Toronto Hydro's 2020-2024 Rate Application.

1.2 Updated Global Climate Modelling Data

The climate parameters in the 2015 Study were prepared using GCM data obtained from the Intergovernmental Panel on Climate Change's 5th Assessment Report (IPPC AR5). Earlier this year, the IPPC released updated GCM data in the 6th Assessment Report (https://www.ipcc.ch/assessment-report/ar6/) (IPPC AR6).

The purpose of this new engagement is to assess whether the IPPC AR6 data materially impacts the probability assessment set out in the 2015 Study (which relied on IPPR AR5).

2 Scope of Work

The scope of this engagement is to assess the impact of the new IPPC AR6 data to the 2015 Study assessment:

A) Does the new GCM data (IPPC AR6) materially impact the probability assessment set out in the THESL Climate Change Vulnerability Assessment?

B) If yes, is any further action required to address those revised/updated climate parameters in addition to those described in the Engineering Analysis Results at page 43 of the 2015 Study? For example, if the IPPC AR6 data supports a new finding that the projected incidents of daily maximum temperatures of 35°C in 2030 and 2050 have doubled (now 6 days per year, 16 per year respectively), would that materially modify the recommendations in the 2015 Study related to the impact of high temperatures on transmission stations.[1]

2.1 Timeline

This engagement shall be completed in final form, by no later than September 30, 2022.

2.2 Meetings with Toronto Hydro

Regular meetings with Toronto Hydro staff should take place to update status of work and discuss any issues that may arise. Frequency of meetings is to be jointly agreed upon when the contract is awarded.

[1] See Appendix A for excerpt.

3 Appendix A – Excerpts from 2015 Study re impact of high temperatures on transmission stations

6.1 Municipal and Transmission Stations and Communications Systems

…

2. High temperature above 35°C / transmission stations

Further action recommended, conclusions for high temperature and power transformers also apply (see Chapter 7). Transmission station designers will need to take into account the significant increase in days with maximum temperatures above 35°C, which reduces station capacity while, on the other hand, experiences an increased load demand. At the moment, no load growth rate for the period of this study was estimated. The recommendations given in Chapter 7 for transmission stations and maximum temperature above 40°C / average temp above 30°C also apply to this interaction.[2]

…

[Chapter 7] 7.1 Vulnerabilities to a Changing Climate

…

High Ambient Temperatures – Station and Feeder Assets

High ambient temperatures create problems for the distribution system because of the compounding effect of high demand (e.g. for cooling) and high ambient temperature affecting equipment cooling and electrical transmission efficiency. Two specific climate parameters were of most significant concern, daily peak temperatures exceeding 40°C (excluding humidity) and daily average temperatures exceeding 30°C. In these cases, the climate analysis found that such extreme temperatures have occurred only rarely in the past, but are projected to occur on an almost semi-annual to annual basis by the 2030's and 2050's respectively. Through preliminary demand and supply growth projections completed for this study, these vulnerabilities were identified based on the notion that extreme heat will generate electrical demand for cooling in areas where station excess capacity is projected to be marginal. Furthermore, such temperature extremes may cause equipment, notably power transformers, to operate beyond their design specifications and increases the likelihood of failure. It is anticipated that vulnerability to high heat events will be concentrated in the Former Toronto area,

[2] 2015 Study at pg. 44.

although there are several horseshoe station service areas which would also be vulnerable.[3]

[3] 2015 Study at pg. 49.

AMENDING AGREEMENT

THIS AMENDING AGREEMENT (the "Amending Agreement") is made effective as of June 1, 2023 (the "Effective Date") between **STANTEC CONSULTING LTD.** ("Vendor") and **TORONTO HYDRO-ELECTRIC SYSTEM LIMITED** ("Toronto Hydro") (collectively, the "Parties").

WHEREAS:

1. Toronto Hydro and the Vendor previously entered into an Agreement for Purchase of Services effective October 1, 2020 in connection with RFP #20P-0448 (the "Agreement"), pursuant to which the Vendor provides Toronto Hydro with various engineering services including the design, development, and drafting of construction standards; technical support for distributed energy resources connections and protection; systems planning and market analysis; program and project management services; data science and analytics; and enterprise asset management (EAM) for ERP (the "Services"); and

2. The Parties now wish to amend the Agreement by attaching the Ontario Energy Board's *Rules of Practice and Procedure* Rule 13A, and make associated amendments related to the Vendor's participation in Toronto Hydro's upcoming rate application, as provided herein.

NOW THEREFORE, THIS AMENDING AGREEMENT WITNESSES that in consideration of the mutual covenants contained herein and for other valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Toronto Hydro and Vendor agree as follows:

1. Any capitalized terms used but not defined herein shall be as defined in the Agreement. The recitals above are agreed by the Parties to be true and deemed to form part of this Amending Agreement as if specifically restated herein.

2. Section 2 of the Agreement is amended by adding the following subsection (e) immediately following subsection 2(d):

   (e) SCHEDULE E - Ontario Energy Board *Rules of Practice and Procedure* Rule 13A

3. Section 13 of the Agreement is amended by adding the following subsection (c) immediately following subsection 13(b):

   (d) Without limiting the generality of subsection 13(a) above, the Vendor shall comply with Rule 13A Expert Evidence of the OEB's *Rules of Practice and Procedure*, attached as SCHEDULE E hereto, in the course of providing the Services and agrees to accept the responsibilities that are or may be imposed on them by that rule.

4. SCHEDULE A is amended by adding the following heading and contents immediately following the "Services Required" section:

   Participation in Toronto Hydro's Regulatory Application Process

   The Vendor shall be available to speak to the Services in a regulatory proceeding as required by Toronto Hydro and/or the Ontario Energy Board relating to Toronto Hydro's 2025 rate application.

   The degree of Vendor's participation shall be dependent on the degree of interest in the Services by OEB staff or any intervenors. Vendor's participation in such proceeding may entail, but is not

DocuSign Envelope ID: 9A8ED8A7-19EB-4147-B23B-CF465C0C8537

limited to, preparation of expert report(s), responding to interrogatories and undertakings, provision of support prior to and during any hearings required by the OEB, and answers to any questions regarding the form, methodology, assumptions, and choices made in the provision of the Services, in either written or oral format (the latter in acting as a witness for Toronto Hydro).

The Vendor shall comply with the requirements and agrees to accept the responsibilities set out in Rule 13A of the OEB's *Rules of Practice and Procedure*, attached as SCHEDULE E to this Agreement, when providing any Services relating to Toronto Hydro's 2025 rate application.

5. The Parties agree to add a new SCHEDULE E to the Agreement, attached hereto as Appendix 1 to this Amending Agreement.

6. All other terms and conditions of the Agreement remain continuously in full force and effect, unamended, and shall be deemed to apply to this Amending Agreement.

7. This Amending Agreement, together with the Agreement, shall hereinafter constitute the entire agreement between the Parties with respect to the Services as further described in the Agreement, and supersedes any and all other agreements, understandings, discussions, negotiations, representations and correspondence which may have been made by or between the Parties respecting the same.

IN WITNESS WHEREOF the Parties hereto have executed this Amending Agreement as of the date first written above.

APPENDIX 1

SCHEDULE E

Ontario Energy Board *Rules of Practice and Procedure* Rule 13A

13A. Expert Evidence

13A.01 A party may engage, and two or more parties may jointly engage, one or more experts to give evidence in a proceeding on issues that are relevant to the expert's area of expertise.

13A.02 An expert shall assist the OEB impartially by giving evidence that is fair and objective.

13A.03 An expert's evidence shall, at a minimum, include the following:

a. the expert's name, business name and address, and general area of expertise;
b. the expert's qualifications, including the expert's relevant educational and professional experience in respect of each issue in the proceeding to which the expert's evidence relates;
c. the instructions provided to the expert in relation to the proceeding and, where applicable, to each issue in the proceeding to which the expert's evidence relates;
d. the specific information upon which the expert's evidence is based, including a description of any factual assumptions made and research conducted, and a list of the documents relied on by the expert in preparing the evidence;
e. in the case of evidence that is provided in response to another expert's evidence, a summary of the points of agreement and disagreement with the other expert's evidence; and
f. an acknowledgement of the expert's duty to the OEB in **Form A** to these Rules, signed by the expert.

13A.04 In a proceeding where two or more parties have engaged experts, the OEB may require two or more of the experts to:

a. in advance of the hearing, confer with each other for the purposes of, among others, narrowing issues, identifying the points on which their views differ and are in agreement, and preparing a joint written statement to be admissible as evidence at the hearing; and
b. at the hearing, appear together as a concurrent expert panel for the purposes of, among others, answering questions from the OEB and others as permitted by the OEB, and providing comments on the views of another expert on the same panel.

13A.05 The activities referred to in **Rule 13A.04** shall be conducted in accordance with such directions as may be given by the OEB, including as to:

a. scope and timing;
b. the involvement of any expert engaged by the OEB;
c. the costs associated with the conduct of the activities;
d. the attendance or non-attendance of counsel for the parties, or of other persons, in respect of the activities referred to in paragraph (a) of Rule **13A.04**; and
e. any issues in relation to confidentiality.

13A.06 A party that engages an expert shall ensure that the expert is made aware of, and has agreed to accept, the responsibilities that are or may be imposed on the expert as set out in this **Rule 13A** and **Form A.**

PROJECT INITIATION FORM (PIF)

The objective of this Project Initiation Form (PIF) is to confirm the scope of our work and the compensation for this project. This terms and conditions of our existing agreement (Agreement of Purchase Compensation Consulting Services – dated 1, December 2016) apply.

Project Details

1. Client Name: **Toronto Hydro Electric System Limited ("THESL")**
2. Project name: **Total Remuneration Review (Non-Executive)**
3. Description of Mercer responsibilities: **Mercer will work with THESL to complete the following:**

Step 1: Project Planning, Information Gathering, and Management

- Conduct a project planning meeting (approximately 1 hour) to:
  - Confirm project scope, timeline, and deliverables
  - Discuss current programs, challenges, and objectives going forward
  - Discuss data requirements
  - Confirm the current compensation philosophy (if available)

[redacted]

Step 2: Benchmark and Peer Group Confirmation

[redacted]

[redacted]

Step 3: Benefits and Pension Relative Value Analysis

[redacted]

Step 4: Market Research and Analysis

[redacted]

[redacted]

Step 5: Report Development

[redacted]

Step 6: Presentation to Senior Management

- Be available to attend a senior management team meeting to discuss the reports (assumes one 1-hour meeting)

4. Description of client responsibilities: **Provide requested data and information and be available to answer questions**

5. Estimated period of time over which work will be performed: We can begin this work immediately and estimate completing the above scope of work within between August 2022 to January 2023, following approval of this PIF. **For accounting purposes, this project will remain active to March 31, 2023.**

6. Estimated fees ($CDN) [redacted]

Fee Assumptions

- Applicable taxes are in addition to the above fees
- Fee estimates from any one step may be transferred to another
- If the scope of the project changes significantly, we will discuss the change with you and revise our fee estimates accordingly
- Any required travel expenses will be charged at cost (no travel is expected)
- THESL is expected to provide complete, consolidated, and up-to-date data. Any data "cleaning" will result in additional fees

[redacted]

Mercer issues detailed monthly invoices. The terms of our engagement would be covered within our standard engagement letter.

Should additional support be required beyond the scoped above, Mercer fees will be based on our hourly rates ($CDN) outlined below:

Role	Hourly Rate
Partner	[redacted]

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-12

Reference: Exhibit 1B, Tab 2, Schedule 1, p. 26

QUESTIONS (A) – (D):

With respect to the proposal to use a custom Toronto Hourly Salary and Wages Index:

a. Toronto Hydro notes that the "index can either be derived by the Conference Board of Canada ("CBC") economic data subscription service, or can be reproduced by purchasing relevant tax data from Statistics Canada". Is the Conference Board of Canada Toronto Hourly Salary and Wages Index based on the same relevant tax data from Statistics Canada that Toronto Hydro refers to, or would there be a difference in results based on the source of the information?

b. Please provide any documents from the Conference Board of Canada that details the methodology for its Toronto Hourly Salary and Wages Index.

c. The Toronto Hourly Salary and Wages Index appears to be an hourly wage index. Please provide a revised version of Table 4 that compares the proposed Conference Board of Canada Toronto Hourly Salary & Wages, with Statistics Canada Average Hourly Earnings (AHE) Ontario, and Toronto Hydro Average Blended Hourly Salary Increase.

d. Please provide a copy of any Conference Board of Canada forecast for Toronto and/or Ontario wage and salary information that is available to Toronto Hydro.

RESPONSE (A) – (D):

Please see response to 1B-Staff-93.

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-13

References: Exhibit 1B, Tab 2, Schedule 1, Page 30

QUESTION:

Toronto Hydro states: "Any combination between the empirical efficiency-factor and the performance incentive that make-up the total X-factor should be capped at 0.75 percent in order to maintain balance between the utility risk and customer reward derived from the PIM." Please explain, in detail, the basis of the view that the specific number of 0.75 percent should be a cap.

RESPONSE:

The proactive component of the X factor is a voluntary contribution by Toronto Hydro reflecting an amount that it ordinarily would be able to recover in rates as a fair return, but which Toronto Hydro has put at risk with the opportunity to earn it back upon the achievement of certain results under the Plan. This reflects the fact that the utility stands behind its plan as being the minimum amount of investment necessary to address grid needs and deliver customer outcomes. However, in setting the performance factor it needs to be recognized that the voluntary contribution and the ability to earn back its fair return must be matched with a reasonable level of risk. Otherwise, the X-factor would be placing Toronto Hydro in a position where instead of being able to have an opportunity to earn a fair return, it actually forfeits that right. This does not yield just and reasonable rates, nor does it create suitable performance incentives.

Any level of the X-factor is a reduction of revenue that the utility must fund in order to achieve its Plan and provide customer benefits. The X-factor cannot be so large that it either is inconsistent with the results of total cost benchmarking or transfers risk to such a degree that Toronto Hydro cannot fund the activities necessary to deliver the plan and its objectives and outcomes. Toronto Hydro believes that a X-factor greater than 0.75 – which is already 0.15% larger than the OEB-approved X-factor for Price Cap IR – would reflect an inordinate transfer of risk, and would not be in the best

interest of customers because it would mean that the plan and its outcomes are less likely to be achieved.

A 0.75% X-factor reflects a cap that should not be increased as it would: (i) distort a reasonble balance of risk/benefit between the utility and customers as illustrated in the scenarios below; (ii) put at risk Toronto Hydro's ability to deliver a plan which is necessary to address both foundational and emerging outcomes that being a distributor requires and customers value; and (iii) place an unacceptable level of financial risk on the utility that effectively preclude it from having a reasonable opportunity (*not guarantee*) to earn the allowed rate of return.

As shown in the response to 1B-Staff-3(b) the proposed Custom Revenue Cap Index (CRCI) reduces the revenue that the utility can collect (relative to the revenue it requires to fund the 2025-2029 Investment Plan) by approximately $81.5 million over the rate term, through the application of the 0.75% X-factor as part of the CRCI.

By constraining the utility's revenues relative to its true costs, the X-factor creates a significant upfront rate reduction benefit for customers, in addition to the benefits associated with achievement of the PIM targets as detailed in Exhibit 1B, Tab 3, Schedule 1. Table 1 below summarizes the risk that X-factor places on the utility compared to the benefits it provides to customers.

Utility Risk (Revenue Deficiency)	Utility Reward (PIM)	Net Utility Risk/Reward	Minimum Customer Benefits	Customer Cost (PIM)	Net Customer Cost/Benefit
($81.5M)	$65.1M	($16.4M)	$90.3M	($65.1M)	$25.2M

In Table 1 above, the utility risk is the $81.5 million revenue deficiency imposed by the CRCI, and the utility reward represents the proposed $65.1 million PIM incentive. The utility net risk/reward is the difference between the two previous items, which is the unmitigated revenue risk imposed by empirical efficiency factor (0.15%) to find continuous improvement in efficiency and productivity.

The customer benefits represent the direct minimum benefits associated with the achievement of the PIM targets over the 2025-2029 rate period as outlined in the evidence in Exhibit 1B, Tab 3, Schedule 1 at pages 57-58. The customer cost is the PIM incentive to be paid by customers if the utility achieves the targets. The net customer cost benefit is the difference between these items. The analysis above, shows that through the X-factor, the CRCI provides customers a net benefit of $25.2 million and places a net risk of $16.4 million on the utility. Toronto Hydro considers this to be a balanced outcome between the utility and its customers with a net favorable impact for customers. In addition to striking this balance, the 0.75% X-factor imposes a financial risk on the utility that is within an acceptable range, and that provides the utility a reasonable opportunity (*not guarantee*) to earn the allowed regulated rate of return. The table below shows the annual ROE risk imposed by the CRCI through the X-factor.

2025-2029 Financial Performance (ROE) under the proposed CRCI

	2025	2026	2027	2028	2029
CRCI Revenue Deficiency	n/a	7.3	14.9	22.9	31.5
ROE Impact (basis points)	n/a	27	55	85	117

Toronto Hydro's believes that the 0.75% X-factor reflects a cap that should not be increased for the reasons discussed above. For illustrative purposes, please see the hypothetical scenarios below where a higher X-factor imposes an additional $10M revenue deficiency on the utility.

Balanace of Risk and Benefits between the Utility and Customers – Scenarios

Scenario A – higher PIM

	A	B	C	D	E	F
	Utility Risk (Revenue Deficiency)	Utility Reward (PIM)	Net Utility Risk/Reward	Minimum Customer Benefits	Customer Cost (PIM)	Net Customer Cost/Benefit
Base	**($81.5M)**	**$65.1M**	**($16.4M)**	**$90.3M**	**($65.1M)**	**$25.2M**
1	**($91.5M)**	**$75.1M**	**($16.4M)**	**$90.3M**	**($75.1M)**	**$15.2M**

In Scenario 1, the balance is distorted relative to the base case, because the spread between utility net risk (column C) and customer net benefits (column F) gets narrower to the detriment of customers (i.e. net customer benefit decreases by $10M relative to the base case).

Scenario B – higher Efficiency-Factor

	A	B	C	D	E	F
	Utility Risk (Revenue Deficiency)	Utility Reward (PIM)	Net Utility Risk/Reward	Minimum Customer Benefits	Customer Cost (PIM)	Net Customer Cost/Benefit
Base	**($81.5M)**	**$65.1M**	**($16.4M)**	**$90.3M**	**($65.1M)**	**$25.2M**
2	**($91.5M)**	**$65.1M**	**($26.4M)**	**$100.3M**	**($65.1M)**	**$35.2M**

In Scenario 2, where the efficiency factor is higher, the balance is distorted relative to the base case, because the spread between utility net risk (C) and customer net benefits (F) gets wider to the detriment of the utility. In this scenario, Toronto Hydro assumes that the revenue reduction imposed on the utility through a higher efficiency-factor would depart from total cost benchmarking that *appropriately* takes into consideration the unique and distinct asset needs and operational challenges of serving Canada's largest and one of North America's fastest growing city. In that case, the level of financial risk placed on the utility becomes unacceptable. The is because efficiency expectations that are not supported by empirical evidence are unachievable, and thus preclude the utility from having a reasonable opportunity (*not guarantee*) to earn the allowed rate of return.

Scenario C – both factors are higher (i.e. allocate $10M additional risk equally to each factor)

	A	B	C	D	E	F
	Utility Risk (Revenue Deficiency)	Utility Reward (PIM)	Net Utility Risk/Reward	Minimum Customer Benefits	Customer Cost (PIM)	Net Customer Cost/Benefit
Base	**($81.5M)**	**$65.1M**	**($16.4M)**	**$90.3M**	**($65.1M)**	**$25.2M**
3	**($91.5M)**	**$70.1M**	**($21.4M)**	**$95.3M**	**($70.1M)**	**$25.2M**

In Scenario 3, where both the PIM and the efficiency factor are increased, the balance is also distorted because additional revenue risk is placed on the utility without any corresponding net benefit to customers (i.e. column F comparison).

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-14

Reference: Exhibit 1B, Tab 2, Schedule 1, p. 32

QUESTION:

Toronto Hydro proposes that the PIM-DA be "brought forward for review and disposition in the utility's next rebasing application, based on known (or forecasted) performance results for the 2025-2029 rate period." As that application will be filed and considered before the end of the rate term, for performance targets that have not been achieved (or can properly be assessed at that time), when does Toronto Hydro propose for them to be reviewed and relevant PIM-DA balances to be recovered from customers?

RESPONSE:

Toronto Hydro envisions that by the final year of the 2025-2029 rate period, the utility can either confirm that the target was achieved, or can forecast with confidence that the target will be achieved. This forecast can either be provided at the pre-filed evidence stage or during the bridge year update process that typically occurs during the discovery phase. In the event that a target is forecasted to be achieved, but is not in fact achieved at year-end 2029, the utility would withdraw its request to recover the associated balances in the PIM-DA at the Draft Rate Order stage which normally occurs in the first quarter of the new rate period (i.e. Q1 of 2030).

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-15

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 36

With respect to the proposed Demand-Related Variance Account - Expenditure Variance sub-account:

QUESTION (A):

a) Please provide a table that shows for each year of the rate term (2025-2029),
   i. the total proposed revenue requirement,
   ii. the total proposed revenue requirement that would be subject to the proposed sub-account,
   iii. total in-service additions,
   iv. total in-service additions subject to the proposed sub-account,
   v. total OM&A costs, and
   vi. total OM&A costs subject to the proposed account.

RESPONSE (A):

The Total Revenue Requirement presented below is based on pre-filed evidence (November 17, 2023) whereas the DRVA revenue requirement below is based on an estimate of the updated 2025-2029 Total Revenue Requirement, which includes impact from: (i) the 2023 actuals and updated 2024 forecast (presented in 2A-Staff-104), and (ii) the January 29, 2024 evidence update. The final PILS models for the updated 2025-2029 total Revenue Requirement (Exhibit 6) are not yet available because it was not possible to complete this work within the timelines for responding to interrogatories. This information will be provided in advance of the Technical Conference as indicated in 1A-Staff-01 and noted in the Application Evidence Update cover letter.[1]

[1] EB-2023-0195, Evidence Update Letter (January 29,2024)

With respect to parts (i) and (ii), Table 1 shows total revenue requirement and total revenue requirement subject to the proposed sub-account.

Table 1: 2025-29 Revenue Requirement ($ Millions)

	2025	2026	2027	2028	2029
Total Revenue Requirement (i)	972.4	1,027.0	1,074.4	1,175.7	1,219.2
DRVA Revenue Requirement (ii)	22.0	34.8	48.5	64.1	77.1
DRVA % of Total Revenue Requirement	2.26%	3.39%	4.51%	5.45%	6.32%

With respect to parts (iii) and (iv), Table 2 show total In-Service Additions and total in-service additions subject to the proposed sub-account.

Table 2: 2025-29 In-Service Additions ($ Millions)

	2025	2026	2027	2028	2029
Total In-Service Additions (iii)	653.8	699.9	795.1	770.1	860.1
DRVA In-Service Additions (iv)	144.0	167.1	158.5	157.8	198.6
DRVA % of Total In-Service Additions	22.03%	23.87%	19.93%	20.49%	23.09%

With respect to (v) and (vi) of this question, Table 3 shows total OM&A costs, and total OM&A costs subject to the proposed sub-account.

Table 3: 2025-29 OM&A ($ Millions)

	2025	2026	2027	2028	2029
Total OM&A (v)	343.0	358.0	370.2	385.5	399.6
DRVA OM&A (vi)	4.9	5.7	6.3	7.0	7.6
DRVA % of Total OM&A	1.43%	1.59%	1.70%	1.82%	1.90%

QUESTION (B):

b) Please provide a table that for each year between 2016 and 2024 shows,

i. the approved revenue requirement,

ii. the total approved revenue requirement that was subject to a similar symmetrical variance account treatment as the proposed sub-account,
iii. total approved in-service additions,
iv. total approved in-service additions that was subject to a similar symmetrical variance account treatment as the proposed sub-account,
v. total approved OM&A costs, and
vi. total approved OM&A costs that was subject to a similar symmetrical variance account treatment as the proposed sub-account.

RESPONSE (B):

With respect to subparts (i) and (ii) of this question, Table 4 shows 2016-2024 total approved revenue requirement and total approved revenue requirement that was subject to similar symmetrical variance account treatment – i.e. Externally Driven Capital (2016-2024) and Derecognition (2015-2019).

Table 4: 2016-2024 Revenue Requirement ($ Millions)

	2016	2017	2018	2019	2020	2021	2022	2023	2024
Total Revenue Requirement (i)	659.2	709.0	749.7	781.5	750.2	786.2	799.4	852.2	892.9
Revenue Requirement subject to Symmetrical Treatment (ii)	33.1	33.3	33.4	35.7	1.6	3.7	4.2	4.3	4.5
Similar Symmetrical Variance Treatment % of Total Revenue Requirement	5.02%	4.70%	4.46%	4.57%	0.21%	0.47%	0.53%	0.50%	0.50%

With respect to subparts (iii) and (iv) of this question, Table 5 shows total in-service additions ("ISA") and total approved in-service additions that were subject to similar symmetrical variance account treatment as proposed by the sub-account.

Table 5: In-Service Additions ($ Millions)

	2016	2017	2018	2019	2020	2021	2022	2023	2024
Total ISA (iii)	621.1	459.5	397.7	477.2	527.4	456.2	565.1	565.8	559.1

	2016	2017	2018	2019	2020	2021	2022	2023	2024
ISA Subject to Symmetrical Variance Treatment (iv)	4.0	4.0	4.0	4.0	11.4	20.8	4.6	4.7	4.5
Similar Symmetrical Variance Treatment % of Total ISA	0.64%	0.87%	1.01%	0.84%	2.16%	4.56%	0.81%	0.83%	0.80%

With respect to subparts (v) and (vi) of this question, Table 6 shows total OEB-approved OM&A cost for 2020, the USoA 4380 adjustment,[2] and the reclassified Total OEB-Approved OM&A for 2020. To determine the approved-OM&A over the period, Toronto Hydro escalated the 2020 Test Year by the OEB inflation factor (I) and the approved 0.6% X factor for the current rate period.

For 2023-24, OM&A costs subject to similar symmetrical variance account treatment reflects costs that are eligible for variance treatment under the *Getting Ontario Connected Act* Variance Account (see 4-Staff-296 for more information).

Table 6: OM&A Costs Subject Symmetrical Variance Treatment ($ Millions)

	2016	2017	2018	2019	2020	2021	2022	2023	2024
Total Approved OM&A	247.6	250.8	252.3	254.6	272.2	276.6	284.0	292.8	305.1
USoA 4380 adjustment	(3.5)	(3.5)	(3.5)	(3.5)	(5.5)	(5.6)	(5.7)	(5.9)	(6.2)
Reclassified Total Approved OM&A (v)	244.1	247.3	248.8	251.1	266.7	271.0	278.3	286.9	298.9
OM&A Subject to Symmetrical Variance Treatment (vi)	-	-	-	-	-	-	-	4.8[3]	5.0

In addition to the OM&A costs subject to symmetrical variance treatment listed above, Toronto Hydro also notes that distributors (including Custom IR filers) are eligible to apply for deferral accounts for (1) cloud-related implementation costs,[4] and (2) operations, maintenance, and

[2] See 1B-SEC-8 for more information about the shared services reclassification.
[3] Please see the response to interrogatory 4-Staff-296 related to locates.
[4] Ontario Energy Board, *Accounting Order (003-2023) for the Establishment of a Deferral Account to Record Incremental Cloud Computing Arrangement Implementation Costs* (November 2, 2023)

administration (OM&A) costs related to DER integration and use, pending their rebasing applications.[5]

QUESTION (C):

c) Please explain how Toronto Hydro plans to incorporate any approved X-Factor into the calculation of any sub-account balance.

RESPONSE (C):

Toronto Hydro proposes to set the base amount against which actuals are tracked based on the revenue requirement (i.e., before the application of the X-factor) and to track symmetrical variances against this amount. This approach ensures that the X-Factor (which places earnings risk on the utility that can only be mitigated through productivity and performance achievements) cannot be mitigated (i.e. earned-back) through recoveries under the variance account.

QUESTION (D):

d) Toronto Hydro lists the programs for which both capital and operations variances from actuals will be recorded in the Expenditure Variance Sub-Account: Customer Connections, Customer Operations, Stations Expansion, Load Demand, Non-Wires Solutions, Generation Protection Monitoring and Control and Externally-Initiated Plant Relocations and Expansions. Only one of the Programs listed above is a specific OM&A Program (Ex. 4-2-8) however other listed programs impact a wide number of OM&A Programs, e.g. Non-Wires Solutions affects Asset and Program Management and Control Centre Operations. For each of the OM&A Programs and segments in which the cost variance will be included in the sub-account, please provide information on the forecasted costs for 2025-2029.

[5] Ontario Energy Board, *Framework for Energy Innovation: Setting a Path Forward for DER Integration (January 2023)* at page 4

RESPONSE (D):

Table 6 below shows the OM&A segments for which cost variance would have been included in the DRVA expenditure sub-account. Although the Control Center program will support the delivery of the Flexibility Services segment, Toronto Hydro has not proposed variance account treatment for the Control Center program because the costs in this program are driven by many factors other than demand.

Table 6: OM&A Costs Subject to the Proposed DRVA Expenditure Sub-Account ($ Millions)

Program	Segment	2025	2026	2027	2028	2029
Customer Operations (Exhibit 4, Tab 2, Schedule 8)	Customer Connections	3.2	3.3	3.5	3.6	3.8
	Key Accounts	1.5	1.5	1.7	1.8	1.9
Asset & Program Management (Exhibit 4, Tab 2, Schedule 9)	Flexibility Services (see the Non-Wires Solutions program in Exhibit 2B, E7.2)	0.2	0.9	1.1	1.6	1.9
Total		**4.9**	**5.7**	**6.3**	**7.0**	**7.6**

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-16

Reference: Exhibit 1B-2-1, Page.46

QUESTION (A-C):

With respect to the proposed Demand-Related Variance Account - Revenue Variance sub-account:

a. Please provide a table that shows for each year of the rate term (2025-2029), a) total forecast revenue, and b) total forecast revenue subject to the proposed sub-account.
b. Please provide a table that shows for each year of the rate term (2016-2024), a) total approved revenue, and b) total approved revenue subject to a similar symmetrical variance account treatment as the proposed sub-account.
c. Please provide a table that shows for each year of the rate term (2016-2024), a) total revenue, and b) total weather normalized revenue.

RESPONSE (A-C):

Table 1 below provides the information requested in part (a). Since the 2025-2029 load forecast in Exhibit 3 is weather-normalized, the total forecasted revenue in the application is subject to the proposed sub-account, as summarized in the table 1 below.

Table 1

2025	2026	2027	2028	2029
$972 M	$1,020 M	$1,059 M	$1,151 M	$1,185 M

Historically, there were no revenues subject to similar symmetrical variance account treatment as the proposed sub-account. Table 2 below provides the 2016-2023 total revenue before and after weather normalization, and the weather normalized revenue for 2024 forecasted in Exhibit 3.

Table 2

Year	Actual Revenues ($M)	Weather-normalized Actual Revenues ($M)	Board-Approved Revenues ($M)	Variance ($M)
2016*	$657.7	$651.5	$659.2	-$7.7
2017	$692.0	$694.8	$709.0	-$14.2
2018	$746.1	$737.4	$749.7	-$12.3
2019	$763.1	$761.0	$781.6	-$20.0
2020*	$721.6	$720.9	$750.2	-$29.3
2021	$756.1	$756.8	$786.2	-$29.4
2022	$782.5	$780.7	$799.4	-$18.7
2023	$834.4	$839.5	$852.2	-$12.6

**The revenues for 2016 and 2020 have been normalized due to delay in the approval of rates for respective years.*

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-17

Reference: Exhibit 1B, Tab 2, Schedule 1, Page 48

In addition to the revenue requirement and DVA accounts that may be approved in this application, please detail all other distribution ratepayer funding mechanisms Toronto Hydro believes would be available to it during the rate term.

RESPONSE:

Toronto Hydro would continue to have access to the Z-factor mechanism in accordance with the OEB's standard criteria, as well as any generic DVA accounts that distributors may be granted, or have the opportunity to apply for, under applicable existing or future OEB policy instruments.

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-18

Reference: Exhibit 1B, Tab 2, Schedule 1, Appendix A

QUESTION (A):

With respect to Scott Madden, Review of Rate Framework Report:

a) [p. 4-5] The Report provides examples of jurisdictions that have approved Attrition Relief Mechanisms, Alternative Cost Recovery Mechanism, Performance Incentive Mechanisms, and separate funding for innovation projects. For each of the jurisdictions referred to, please provide a summary of all the components of their respective rate and regulatory framework and how each compare to what is being proposed by Toronto Hydro.

RESPONSE (A) - PREPARED BY SCOTTMADDEN:

Please refer to the response to 1B-SEC-19.

QUESTION (B):

b) [p.14] Please provide more details on the difference between building blocks vs the stair-step approach.

RESPONSE (B) - PREPARED BY SCOTTMADDEN:

The stair-step approach sets rates annually based on pre-determined rate levels. By comparison, the building blocks approach sets rates annually based on pre-determined formula that reflects forecasted capital, OM&A expenditures, and adjustments to account for performance incentives, tax impacts, inflation, and other supplementary funding mechanisms.

QUESTION (C):

c) [p.14-15] Is the trend in distribution rate framework towards building block rate mechanisms, the stair-step approach, or forms of incentive regulation? Please discuss your answer.

RESPONSE (C) - PREPARED BY SCOTTMADDEN:

ScottMadden did not evaluate trends in distribution rate frameworks. ScottMadden evaluated Toronto Hydro's proposed custom IR plan for its relative consistency with other electric utility ratemaking frameworks and practices that support a clean energy transition. Please refer to the response to 1B-EP-23, part (a).

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-19

Reference: Exhibit 1B, Tab2, Schedule 1, Appendix B

Preamble:

With respect to Scott Madden, Jurisdictional Review of Modernized Performance-Based Regulation Report:

QUESTION (A):

a) [p. 20-41] The Report provides examples of jurisdictions that have approved Modified Attrition Relief Mechanisms, Alternative Cost Recovery Mechanism, Performance Incentives, and separate funding for innovative/demonstration projects. For each of the jurisdictions referred to in the Report, please provide a summary of all the components of the respective rate and regulatory framework and how each compare to what is being proposed by Toronto Hydro.

RESPONSE (A) - PREPARED BY SCOTTMADDEN:

Please refer to the table below.

Utility (Jurisdiction)	Framework Overview
ATCO Electric (Alberta)	**ARM:** Formulaic approach linked to average historical capex; indexed O&M **Cost Recovery**: Capital trackers for costs related to extraordinary events or net-zero laws **PIM:** None **Innovation Funding:** None
SDG&E (CA)	**ARM:** Uses utility-specific cost index for O&M rather than general inflation; capital investments based on an escalated seven-year historic and forecast average of capital additions **Cost Recovery**: Various two-way balancing accounts and riders, such as AMI balancing account **PIM:** IDER Pilot **Innovation Funding:** Rate Rider (Public Purpose Programs)

Utility (Jurisdiction)	Framework Overview
PG&E (CA)	**ARM:** Uses utility-specific cost index for O&M rather than general inflation; most capital costs escalated using utility specific cost index ; certain capital costs (that are "unique and not appropriately projected with any available index mechanism") forecasted in post-test years **Cost Recovery**: Various two-way balancing accounts and riders **PIM:** IDER Pilot **Innovation Funding:** Rate Rider (Public Purpose Programs)
Hawaiian Electric (HI)	**ARM:** Annual revenues adjusted using indexed formula **Cost Recovery**: EPRM and various riders **PIM:** 3 reward only performance incentives; 2 symmetrical performance incentives **Innovation Funding:** "Pilot Process" recovers innovative pilot costs through annual target revenues
Ameren (IL)	**ARM:** To be determined (MYRP rate case decision pending) **Cost Recovery**: To be determined (MYRP rate case decision pending) **PIM:** 8 symmetrical performance incentives **Innovation Funding:** "Pilot Process" recovers innovative pilot costs through annual target revenues
Central Maine Power (ME)	**ARM:** Forecast O&M and capital **Cost Recovery**: No alternative cost recovery mechanisms **PIM:** 6 penalty-only service quality metrics **Innovation Funding:** None
Eversource (MA)	**ARM:** O&M adjusted annually by I-X ; K-bar for supplement capital funding based on average historical capex **Cost Recovery**: 10% variance allowed for forecasted capital budget; Forecast excludes certain capital projects, such as solar investments, meter-related capital, and grid mod, eligible for recovery through other rate mechanisms outside of base rates **PIM:** 7 penalty-only service quality metrics; reward-only energy efficiency metric **Innovation Funding:** None
Xcel (MN)	**ARM:** Forecast O&M and capital **Cost Recovery**: Various riders/trackers to recover various pass-through costs, related to energy efficiency, services for specific customer classes, and environmental improvement, among other areas. **PIM:** None (tracking-only metrics) **Innovation Funding:** None
PSE&G (NJ)	**ARM:** N/A – no MYRP **Cost Recovery**: Multiple trackers, including Energy Strong **PIM:** None **Innovation Funding:** None

Utility (Jurisdiction)	Framework Overview
Con Edison (NY)	**ARM:** Forecast O&M and capital (used in settlements) **Cost Recovery**: Multiple riders, such as the Systems Beneift Charge **PIM:** 7 reward-only incentives (based on 2020 rate case) **Innovation Funding:** Rate Rider for REV demonstration projects
National Grid (NY)	**ARM:** Forecast O&M and capital (used in settlements) **Cost Recovery**: Multiple riders, such as the Systems Beneift Charge **PIM:** 9 reward-only incentives **Innovation Funding:** Rate Rider for REV demonstration projects
Duke Energy (NC)	**ARM:** Commission-authorized "step-ups" in revenue requirements for incremental capital spending projects and associated O&M for each year of the MYRP **Cost Recovery**: Multiple riders, such as the Systems Beneift Charge **PIM:** 1 penalty-only metric; 2 reward-only metric **Innovation Funding:** Rate Rider for REV demonstration projects
Nova Scotia Power (NS)	**ARM:** Forecast O&M and capital **Cost Recovery**: Various riders **PIM:** None **Innovation Funding:** Rate Rider
AEP (OH)	**ARM:** N/A – no MYRP **Cost Recovery**: Various riders, such as the Enhanced Service Reliability Rider **PIM:** None **Innovation Funding:** None
PECO (PA)	**ARM:** N/A – no MYRP **Cost Recovery**: Various riders, such as the Distribution System Improvement Charge **PIM:** None **Innovation Funding:** None
Rhode Island Energy (RI)	**ARM:** Forecast O&M and capital **Cost Recovery**: Various adjustment provisions, such as the Infrastructure, Safety, and Reliability Provision **PIM:** 4 service quality penalty-only metrics; 1 demand reduction reward-only metric **Innovation Funding:** None
UK RIIO	**ARM:** Forecast O&M and capital (building blocks method) **Cost Recovery**: Uncertainty mechanisms **PIM:** 10 symmetrical performance incentives **Innovation Funding:** Multiple funding mechanisms, including the Strategic Innovation Fund and the Network Innovation Allowance

Utility (Jurisdiction)	Framework Overview
Green Mountain Power (VT)	**ARM:** Hybrid ARM approach with forecasted CAPEX capped over the plan period and OPEX treated in one of three ways: forecasted and capped, capped and tied to an external inflation index, or reforecast annually **Cost Recovery**: Various riders **PIM:** None (tracking-only metrics) **Innovation Funding:** Recovers innovative pilot costs through annual target revenues

The table shows Toronto Hydro's proposed Custom IR Framework is comparable with the other electric utility ratemaking frameworks and practices referenced in the report, as summarized in Exhibit 1B, Tab 2, Schedule 1, pp. 5-8, Appendix B.

QUESTION (B):

b) Please identify which jurisdictions are the referenced regulatory mechanism/approach applied to vertically integrated utilities vs. distribution only utilities.

RESPONSE (B) - PREPARED BY SCOTTMADDEN:

Utilities in Alberta, UK, Illinois, Maine, Massachusetts, New Jersey, New York, Ohio, Pennsylvania, and Rhode Island are distribution-only.

Utilities in Nova Scotia, California, Hawaii, Minnesota, North Carolina, and Vermont are vertically integrated.

QUESTION (C):

c) [p.40-41] For jurisdictions that have separate funding mechanisms for innovation projects, please provide information regarding the parameters and any conditions related to the projects and funding. Please provide a comparison with what Toronto Hydro has proposed in its application.

RESPONSE (C) - PREPARED BY SCOTTMADDEN:

Please see the response to 1B-PP-19 (b). Toronto Hydro's proposed Innovation Fund is similar to the other electric utilities referenced in the report, including program objectives, characteristics, and funding mechanisms.

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-20

Reference: Exhibit 1B, Tab 3, Schedule 1, Pages 6-68

With respect to the proposed 2025-2029 Performance Incentives Scorecard Measures:

QUESTION (A):

a) Please detail all Performance Incentive Measures that Toronto Hydro considered, but ultimately rejected.

UPDATED RESPONSE (A):

Toronto Hydro's proposed scorecard measures for the 2025-2029 rate period were the result of consideration and internal discussions that evolved over a period of many months leading to the finalization of the measures. It is the actual measures that have been put forward on the application which will be assessed by the OEB on their merits. It would be impractical, and Toronto Hydro's position is that it would be of no probative value, to try to provide details of the evolution of the various internal discussions or considerations and ideas on this topic that led to the final measures. Further, Toronto Hydro's internal discussions and consideration on this topic would be subject to litigation privilege in the process of the development of the rate application, and to some extent would also involve information subject to solicitor-client privilege in light of the participants in the discussions. For the above reasons, Toronto Hydro has objected to this request.

/C

QUESTION (B)

b) Please explain the basis for the relative weights for each measure.

RESPONSE (B):

Toronto Hydro applied a balanced scorecard approach to determine the relative weight for each measure on the Custom Scorecard. This approach entailed two steps: (1) an assessment of the weight

to be attributed to each area of performance, and (2) a determination of the weight for each measure within that area of performance based on a consideration of value to customers.

In the first step, the utility was guided by the customer needs and priorities ascertained through the Phase 1 engagement study:

- **Price and reliability are the top customer priorities**: Relative to price, reliability has become increasingly important to residential customers. When it comes to reliability, customers prioritize reducing the length of outages.
- **New Technology**: Almost as equally important to price and reliability, customers expect the utility to invest in new technologies that will reduce costs and make the system better, even if the benefits aren't immediate, as long as the costs and benefits are clear.
- **System Capacity**: Customers expect Toronto Hydro to invest proactively in system capacity to ensure that high growth areas do not experience a decrease in service levels.

With these key considerations in mind, Toronto Hydro attributed:

- 30% weight to Reliability and Resilience;
- 30% weight to Efficiency and Financial Performance,
- 20% weight to Customer Service & Experience,
- 20% weight to Environment Safety and Governance.

In step 2, once the performance measures were finalized, Toronto Hydro's subject matter experts worked cross-functionally to allocate weight to each measure, applying their judgement and expertise to determine a leading measure for each category and to place the greatest weights on the measures that (i) best align customer and utility priorities, and (ii) provide high value to customers as quantified by the Benefits Analysis in section 3 of the evidence (Exhibit 1B, Tab 3, Schedule 1 starting on page 56) and summarized at Table 21. For example, within the Reliability and Resilience category Toronto Hydro placed greater weight on Outage Duration (SAIDI) over Outage Frequency (SAIFI) because when it comes to reliability, customers prioritize reducing the length of outages over

the total number of outages. In the Efficiency and Financial Performance category, Toronto Hydro prioritized Efficiency Achievements to recognize the importance of cost-effectiveness in (i) providing value for money to customers, and (ii) achieving the utility's financial performance objectives with respect to being able to earn the allowed rate of return.

QUESTION (C):

c) If the application is approved as filed, does Toronto Hydro expect to achieve each Performance Incentive Measure?

RESPONSE (C):

Yes.

QUESTION (D) :

d) [p.16] Please explain why a 2 standard deviation range is an appropriate target for SAIFI defective requirements measure.

RESPONSE (D):

Standard deviation measures the amount of variation or dispersion in SAIFI Defective Equipment historical values and quantifies how much the metric's performance varies from the average. Two standard deviations encompass approximately 95% of the data points. This means that setting SAIFI Defective Equipment PIM within this range can account for the variability of outcomes expected based on the past performance, making the target realistic and achievable in the face of typical volatility. The target range set too close to the average might be unachievable/demotivating due to inherent volatility leading to the performance being outside of the range despite the utility's efforts. A target of two standard deviations strikes a balance, challenging the organization to be proactive in managing SAIFI Defective Equipment while still being within a statistically reasonable range of outcomes.

See response to 2B-SEC-42 for a detailed explanation of Toronto Hydro reliability projection methodology.

QUESTION (E):

e) [p.37] Please explain in detail Toronto Hydro's methodology for calculating its scope 1 emissions.

RESPONSE (E):

Scope 1 emissions are calculated by multiplying the activity data for Toronto Hydro's sources of direct emissions by the appropriate emissions factor. The activity data includes cubic meters of natural gas, litres of fuel, and kilograms of sulfur hexafluoride (SF_6) emissions. Toronto Hydro uses the emission factors published in the National Inventory Report ("NIR"), which is prepared by Environment and Climate Change Canada and submitted annually to the United Nations.

QUESTION (F):

f) [p.41-42] Toronto Hydro proposes an Efficiency Achievement measure which "tracks this commitment over the next rate period by holding the utility accountable for delivering sustained (and quantifiable) efficiency benefits to customers in the next rebasing application."
   i. Please explain the methodology for calculating efficiency achievements.
   ii. Please provide how the methodology ensures that the savings or cost avoidance are sustainable.

RESPONSE (F):

The proposed custom measure tracks efficiency benefits realized through cost reduction and cost avoidance strategies that Toronto Hydro would deploy in the next rate term in order to manage the revenue deficiency and meet the efficiency expectation imposed by the 0.15% efficiency factor proposed as part of the custom revenue cap index.

Toronto Hydro would ensure that benefits are sustained into future rate periods by excluding any savings related to expenditures that are simply deferred into future periods. For example, the deferral of the S4 Hana upgrade in the current 2020-2024 rate period would not have met the criteria for this measure, because the costs associated with this project were deferred into the 2025-2029 rate period.

Efficiency achievements would be tracked and measured in accordance with the following methodologies:

- **Cost Reduction:** Projects with cost reduction efficiency benefits yield an absolute reduction in an overall expenditures. Cost reduction benefits are measured by comparing actual costs in a defined area of scope (e.g. an expense category) against an annual (or justified pro-rated amount) baseline cost based on previously funded expenses in rates. For example, if the utility introduces process automation to reduce OM&A expenses associated with completing a manual work process, the OM&A savings would be tracked as a cost reduction benefit.
- **Cost Avoidance:** Projects with cost avoidance efficiency benefits yield an avoidance of future cost increases which were not included in the forecasts used to set base rates for 2025-2029. Cost avoidance benefits are measured by determining a forecast annual (or justified pro-rated amount) incremental cost that the utility must manage. For example, if the utility faces an incremental business requirement that was not included in the 2025-2029 Investment Plan, such as the need to lease additional office space to house its growing workforce, and is able to reconfigure its existing workspaces to avoid the incremental costs associated with obtaining additional office space, the annual savings would be tracked as a cost avoidance benefit.

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-21

Reference: [Exhibit 1B-3-1, p.46-68]

QUESTION:

SEC seeks to understand how changes in the capital budget as may be ordered by the OEB would impact the PIM targets. For each of the following scenarios, please provide the revised PIM targets, and a detailed explanation of the basis of any change, including any underlying calculations.

a. Scenario 1: The OEB reduced the proposed capital expenditure budget by 10% (envelope reduction).
b. Scenario 2: The OEB reduced the proposed capital expenditure budget by 20% (envelope reduction).
c. Scenario 3: The OEB reduced the proposed capital expenditure budget by 30% (envelope reduction).

RESPONSE:

Toronto Hydro is unable to forecast PIM targets on the basis of the scenarios outlined above. To determine targets, the utility would need to undertake a bottom-up planning exercise to assess and evaluate the implications of the proposed reductions on its capital expenditure plan. It is not possible to complete such an exercise within the context of IRs. Furthermore, Toronto Hydro notes that the scenarios are "incomplete" in that they do not contemplate any consideration of operational funding requirements. Nonetheless, to be helpful and responsive to this question, in Table 1 below Toronto Hydro gauges the impact of not investing in programs that have a direct link to specific targets. The total cumulative impact of these programs is approximately $1,121 million, which is close to the 30% scenario above. For the reasons noted above, Toronto Hydro underscores that the information provided below does not reflect an investment plan and that the noted impacts on specific metrics cannot be treated as targets. The only way to set meaningful PIM targets is to undertake a holistic

evaluation of total expenditures levels along with consideration of other key approvals outlined in this application (e.g. the proposed Deferral and Variance Accounts).

Capital Investment	Program Cost ($ Millions)	Impacts to Performance Outcomes					
		SAIDI (2025-2029 Avg.)[1]	SAIFI (2025-2029 Avg.)[2]	System Security	Grid Automation	GHG Reductions	Efficiency Achievements
Horseshoe Renewal: Underground and Overhead	~$784[3]	6% Decline	15% Decline				
Downtown Renewal: Underground and Network	~$164[4]	0.1% Decline	1.2% Decline				
System Enhancements	~$151[5]	1.7% Decline	1.4% Decline		Cannot be achieved		
ADMS	~$34[6]						
Cyber and Physical Security	~$50[7]			Cannot be achieved			
Fleet and Building Electrification	$52[8]					Cannot be achieved	
Process Automation	$50[9]						Cannot be achieved

1

[1] Toronto Hydro calculated deterioration in SAIDI (Excluding Loss of Supply, Major Events and Scheduled Outages) based on the five-year rolling projection for each scenario compared to the 2025-2029 Investment Plan. Note, the underlying rate of deterioration is different when comparing 2029 annual performance instead of a rolling average. 10%, 0.2%, and 2.9%, respectively, for Horseshoe Renewal, Downtown Renewal, and System Enhancements. See 2B-SEC-42.
[2] Toronto Hydro calculated deterioration in SAIFI (Defective Equipment) based on the five-year rolling projection for each scenario compared to the 2025-2029 Investment Plan. Note, the underlying rate of deterioration is different when comparing 2029 annual performance instead of a rolling average. 26%, 0%, and 2.3%, respectively, for Horseshoe Renewal, Downtown Renewal, and System Enhancements. See 2B-SEC-42 for more information.

Horseshoe Renewal: Overhead, Underground

In addition to the originally filed scenarios (Toronto Hydro's 2025-2029 Proposed Investment Plan, and IRM filed under Exhibit 1B, Tab 3, Schedule 1, Pg. 10 & 17), Toronto Hydro has made its best effort to produce additional Reliability Projections that reflect hypothetical budgetary reduction scenarios. These scenarios should be used for comparative purposes only. Please see the response to interrogatory 2B-SEC-42 for more information on Toronto Hydro's reliability projection methodology.

This Reliability Projection (SAIDI and SAIFI Forecast) scenario reflects a reduction to renewal spending in the Horseshoe region over the 2025-2029 period, with some investment in 2025 to continue the removal of PCB transformers from Toronto Hydro's distribution system. These reductions would almost entirely eliminate the Underground System Renewal – Horseshoe (Exhibit 2B, Section E6.2) and Overhead System Renewal (Exhibit 2B, Section E6.5) programs, going from a combined cost of approximately $834 million down to approximately $50 million over the 2025-2029 period.

Downtown Renewal: Underground and Network

This Reliability Projection (SAIDI and SAIFI Forecast) scenario reflects a reduction to Downtown Renewal spending over the 2025-2029 period, with some investment in 2025 to continue the removal of PCB transformers from Toronto Hydro's distribution system. These reductions would eliminate almost all of the 2025-2029 funding for Underground System Renewal - Downtown (Exhibit 2B, Section E6.3), from a cost of approximately $165 million to less than $1 million over the 2025-2029 period.

System Enhancements

This Reliability Projection (SAIDI and SAIFI Forecast) scenario reflects the elimination of System Enhancements spending over the 2025-2029 period (primarily the elimination of additional SCADA switches and mid-line reclosers). The entire funding proposed for the System Enhancements

Program (Exhibit 2B, Section E7.1) for 2025-2029 would be cut to zero from a cost of roughly $151 million.

INTERROGATORY 1B-SEC-22

Reference: Exhibit 1B, Tab 3, Schedule 1, Pages 46-68

With respect to the proposed System Capacity (Non-Wires) Performance Incentive Measure:

QUESTION (A):

a) [p.49] Please explain why the target is based on capacity procured (30 MW) and not financial benefit ($10M).

RESPONSE (B):

Toronto Hydro's proposal is consistent with the reference measures outlined in the fixed incentive option outlined at page 8 of the OEB's *Filing Guidelines for Incentives for Electricity Distributors to Use Third-Party DERs as Non-Wires Alternatives*. Specifically, the target will be based on actual versus forecast "*amount of system capacity provided by third-party owned DER solutions that would otherwise have to be provided by a wires solution.*" Furthermore, the utility notes that the amount of capacity procured is trackable and measurable, whereas the financial benefit associated with that capacity could be different because of (i) an updated BCA methodology as the OEB framework evolves and takes shape, and (ii) the actual load demand projects that are deferred or avoided in the next rate period, which could change as noted the response to 1B-Staff-89(a).

QUESTION (B):

b) [p.51] Toronto Hydro has provided a benefit-cost analysis ("BCA") of the proposed non-wire investment in its Horseshoe north area.

   i. Please provide a copy of the full BCA calculation, including any live Excel spreadsheet used.

ii. Please undertake a similar BCA analysis for the same investment, using the proposed OEB BCA Draft Framework. Please provide all calculations and any live Excel spreadsheet used.

iii. Based on Toronto Hydro's BCA, the total NPV benefits of the investment is $3.32M which is equal to the benefit it would receive if it met the System Capacity (Non-Wires) Performance Incentives Measure. Please explain why it is appropriate for Toronto Hydro to receive 100% of the NPV benefit of undertaking the investment.

RESPONSE (B):

i) Please see 1B-Staff-49 Appendix A for the live Excel spreadsheet.

ii) Please see 1B-Staff-89 part (c).

iii) Refer to pages 54-55 of Exhibit 1B, Tab 3, Schedule 1 under *Concluding Remarks* re Toronto Hydro's Non-Wires Incentive Proposal.

RESPONSES TO SCHOOL ENERGY COALITION INTERROGATORIES

INTERROGATORY 1B-SEC-23

Reference: Exhibit 1B, Tab 3, Schedule 2

With respect to Toronto Hydro's scorecard:

QUESTION (A) AND (B):

a) [p.22] Please update Table 3 Custom Measure Performance to include 2023 results, as well as include the measure targets as set out in EB-2018-0165.

b) For each of the measures on Toronto Hydro's OEB scorecard, please provide the 2023 results.

RESPONSE (A):

Below is an updated table for Toronto Hydro's 2020-2024 Custom Measures which includes 2023 results as well as the targets set out in EB-2018-0165.[1]

2020-2023 Toronto Hydro Custom Measure Performance Results and Targets[2]

Toronto Hydro Outcome	OEB Reporting Category	Toronto Hydro's Custom Measures	2020 Results	2021 Results	2022 Results	2023 Results	Target
Customer Service	**Customer Satisfaction**	Customers on eBills	317,341	350,993	381,490	405,505	Improve
Safety	**Safety**	Total Recordable Injury Frequency	0.58	0.56	0.47	0.30	Maintain
		Network Units Modernization	61%	63%	65%	68%	Improve
Reliability	**System Reliability**	SAIDI - Defective Equipment	0.36	0.36	0.34	0.25	Maintain
		SAIFI - Defective Equipment	0.40	0.46	0.46	0.33	Maintain
